E. C. T. writes : " *A sum of money is held on retention under a contract, and has become due for payment. During the maintenance period defects developed in the floor, but, owing to the building being fully equipped with machinery, it is not convenient to effect the necessary repairs. Under the circumstances, is it legal to withhold part of the retention money for a further period ? The defects consist of a settlement and cracks, which are still moving.*"

From the facts before me it appears that a sum of money is due under a contract, and before payment has been made certain defects have developed in the building consisting of a settlement and cracks which are still extending.

The question is whether it is legal to continue to withhold payment of the whole or part of the money which is due and payable under the contract for a further period, having regard to the events that have happened.

In my view, and I am clearly of opinion that, the rights of the parties are governed by the terms of the contract. In the absence of the contract before me it is impossible to give a final opinion of the rights of the parties thereunder. In the absence of provision to the contrary expressed in the contract or any custom of the trade to the contrary, the money is due and payable when the parties so agree. The person to whom it is payable is in a position to issue a writ forthwith for the whole amount, unless the defendant alleged that he had a counter-claim for damages which equalled or exceeded the amount then due and payable.

Unless the defendant could swear to the truth of this, the plaintiff would be entitled to judgment for the whole of the amount due under the contract, or, alternatively, if the counter-claim did not equal or exceed the amount of the claim, then the plaintiff would be entitled to judgment for the balance.

If the defendant alleges that his rights are based on custom in the trade, it is necessary for him to prove, first, that the custom is reasonable; secondly, that it is not contrary to the general law.

The onus of proof lies on the person alleging the custom, and if he fails to prove it, the plaintiff will succeed in his claim for moneys due under the contract. E. F. I.

Plan, elevation and details of the fireplace in the old dining-room at Steine House, Brighton, measured and drawn by William J. Thrasher. The fireplace is one of the few remaining relics of this historical house, which was built for Mrs. Fitzherbert, a Regency beauty, from the designs of Porden.

SOCIETIES AND INSTITUTIONS

WEST YORKSHIRE SOCIETY OF ARCHITECTS

A STUDENTS' evening, under the auspices of the above society, was held at its Leeds headquarters on Thursday last, when a debate "Is the Skyscraper Architecture?" took place. Mr. J. G. Sidebottom occupied the chair.

Opening in the affirmative, Mr. D. B. Smith observed that owing to the methods of construction now at their disposal, the sky was literally the only limit to vertical design. The skyscraper instead of being an innovation was now a matter of history. In Europe, however, it was not regarded as architecture, but merely as a feat of engineering, but when the practical requirements of a building formed a beautiful composition, without any major sacrifice, then architecture could be said to have been achieved. The skyscraper confined itself to commercial architecture, and was more adapted to the office block than any other type of structure, admirably fulfilling such requirements.

Mr. J. L. Crowther, taking the negative view, said that although some skyscrapers were undeniably fine, they were not a true expression of modern life or ideas. Modern architecture had not only to provide buildings that were efficient in themselves, but to provide structures that were pleasant to live and work in. Skyscrapers were not a natural growth, due to the needs of modern civilization, but merely the outcome of speculation and opportunities for advertisement. They congested the streets and subways of a city. Skyscrapers, he pointed out, had been forced upon New York owing to the growth of the city being limited by the confines of the island of Manhattan.

Among the other speakers were Messrs. J. Addison, Norman Culley, B. R. Gribbon, F. Chippindale, G. L. Broadbent and C. Smith.

After a lengthy discussion the motion "That the skyscraper is not architecture" was defeated.

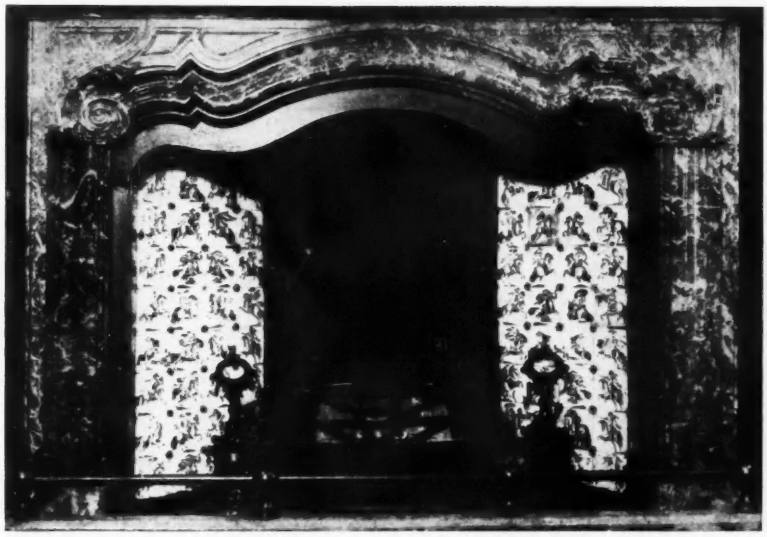
LIVERPOOL ARCHITECTURAL SOCIETY'S DINNER

Professor C. H. Reilly, F.R.I.B.A., proposing the toast of "Liverpool," at the Liverpool Architectural Society's annual dinner, said that they must look at their towns as works of art. That, he said, seemed an impossible ideal, but it must be there. He visualized Liverpool as it might be, and asked those present to imagine brightly-lit streets of elegant, refined, and happy buildings, and, as they climbed the hill, broad tree-lined avenues leading to the fanes they were building, and would build. Those races which built temples were the races which had affected the culture of the world, and they in Liverpool were temple-builders. No other city had had Liverpool's extraordinary fortune, of beginning one cathedral before another was finished.

Sir Banister Fletcher, P.R.I.B.A., urged architects to come out of their offices, and by serving on borough councils and such-like bodies to help to give an artistic end to the community. He did not think the R.I.B.A. were beaten yet over the Charing Cross bridge scheme. The St. Paul's Bridge was passed twice, but they managed to have it postponed until the Commons threw out the original scheme.

Mr. Duncan Campbell, president of the Society, occupied the chair.

SOUTH WALES INSTITUTE OF ARCHITECTS



At the annual general meeting of the South Wales Institute of Architects, the following officers of the Institute were re-elected for the session 1930–31, which commences on July 31: President, Mr. T. Alwyn Lloyd, F.R.I.B.A.; vice-presidents, Messrs. C. S. Thomas, F.R.I.B.A., and J. Herbert Jones, F.R.I.B.A.; hon. treasurer, Mr. H. Teather, F.R.I.B.A.; hon. auditor, Mr. E. H. Fawckner, F.R.I.B.A.; hon. librarian, Mr. R. H. Winder, M.A., A.R.I.B.A.; and hon. secretary, Mr. Ivor P. Jones, A.R.I.B.A.

THE NATIONAL GRID SYSTEM

Reviewing the position of recent developments in the electricity supply of Great Britain, with special reference to rural electrification, Sir Harry Haward, speaking at a meeting of the Surveyors' Institution, said that the national grid system no longer existed on paper only, but was on its way to becoming an established fact. Substantial progress was being made with the work of construction in face of some difficulties. The question of routes in certain picturesque parts of the country, which threatened to impede progress, was in process of solution and, with goodwill and the frank recognition of the paramount claims of the national scheme, difficulties would disappear.

Smoke and grit, he pointed out, should no longer be a nuisance in a modern power station, and recent experiments showed that the oxides of sulphur could be eliminated. The national scheme would go ahead rapidly, and in a few years' time the country would be served by a comprehensive system of generation and bulk transmission based on the most modern technical practice, which would effect large economies and cheapen the cost of electricity to consumers all over the country.

He stated that the potential demand in the country districts during the next ten years had been computed at 280 million units, which represented a very substantial addition to the load on the national system.

The fireplace in the dining-room, Steine House, Brighton, measured drawings of which are reproduced on the facing page. The fireplace has a marble surround, an old firegrate with iron fireback, and Dutch tiles.

L.C.C. SCHOOL OF BUILDING PRIZES DISTRIBUTION

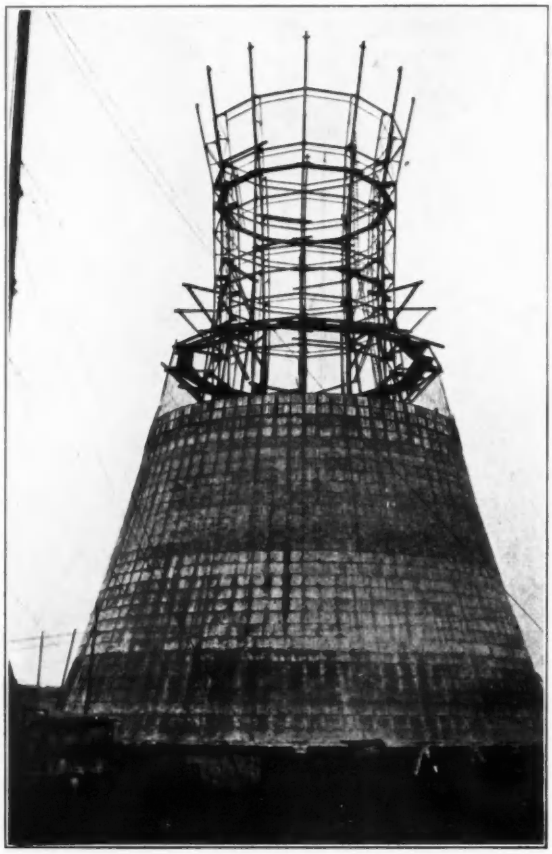
At the annual exhibition of work and distribution of prizes of the L.C.C. School of Building, the Rt. Hon. Philip Snowden, M.P., presented the

medals, prizes and certificates. Mr. H. D. Searles-Wood, F.R.I.B.A., occupied the chair.

Mr. Snowden, in addressing those present, said it was a deplorable thing that so many of the children of today left school and drifted into unskilled occupations. He wanted to see workmen trained so that their work would be a joy to them, for the men to feel satisfaction in it, and also to feel that they were not merely earning a week's wages, but doing work which would be a benefit to the community.

THE CHURCH IN EARLY DAYS

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts, on Early Christian Architecture, said that the first Christian churches were of special interest as the forerunners of all the wonderful developments in architecture and craftsmanship devoted to the service of the Christian religion throughout the world, and the style, both in respect to its predecessors and successors, illustrated the continuity of architectural development.



REINFORCED CONCRETE COOLING TOWERS

Mr. A. T. J. Gueritte, reading a paper on "Reinforced Concrete Cooling Towers," at a meeting of the Institution of Structural Engineers, said that one of the most striking applications of reinforced concrete during the last few years had been in the shape of large cooling towers which were a most prominent and impressive feature in some of the power-stations recently erected or developed in this country under the general scheme of electrification of the Central Electricity Board.

He pointed out that the type of natural draught cooling tower which was most widely known as used in this country up to 1924 was the timber type of rectangular shape in plan, and the chimney of which tended to assume a square section at the top. He explained the many drawbacks of such towers, and said they had led to the use of steel in some cases; but it was found that, notwithstanding heavy cost in painting and upkeep of various kinds, the damp and sulphurous atmosphere in which such towers were generally situated, and the fact that the water circulated in them was often chemically impure, rendered the life of steel towers too short. In two of the most important cities of Great Britain the life of such towers did not exceed eight years.

Reinforced concrete was consequently thought of, and at first the design followed closely the lines of the rectangular timber towers. However, it was soon discovered that the regulations governing the design of such large expanses of walls in reinforced concrete rendered this material too costly when taking into account the impact of the wind on structures of such height not braced at short intervals by floors, as were ordinary buildings.

Designs of polygonal shape were gradually evolved and were of two kinds: the first composed of a number of vertical stanchions, from 8, 10 or 12 ft. apart, braced horizontally at intervals of some 12 to 18 ft., forming the framework for wall panels, the whole being moulded *in situ*, an arrangement which proved also somewhat too costly; and the second, based upon the general principle first introduced by Monnoyer, in Belgium, about 1909, and mostly known for its application to the construction of chimney shafts; precast blocks provided with a kind of hook at one end, in plan, and built up on the top of each other with a mortar joint, the ultimate result being a multi-polygonal structure with a projecting rounded rib at each apex, the distance from rib to rib being approximately 3 or 4 ft. Such walls could be built vertical, or if preferred, a slight batter could be given (see illustration below).

The lower part of the first Leicester cooling tower in course of erection. The steel scaffolding shown is somewhat in advance of the concrete work, and the metallic forms can be clearly seen. No external scaffolding was necessary, with the exception of suspended flying hangways.

OBITUARY

JOSIAH GUNTON: 1861–1930

We regret to record the death, which occurred in the South of France, of Mr. Alderman Josiah Gunton, F.R.I.B.A. He had been in comparatively ill-health for some time.

Mr. Gunton, who was in his sixty-ninth year, commenced his architectural practice in 1885 and, up to the time of his death, was in partnership with members of his family as architects and surveyors. He was responsible for the design of many buildings in London and the provinces.

He was a member of the City Corporation since 1904, and chairman of many of the principal committees of that body. For the last three years he was one of the City's representatives on the London County Council. He was also a member of the Metropolitan Water Board, the Wheelwrights' Company, a director of the Eagle, Star and British Dominions Company, and one of His Majesty's Lieutenants for the City of London.

WILLIAM B. WALTON: 1883–1930

The death took place at Cleveleys, near Blackpool, of Mr. William Billingham Walton, F.R.I.B.A., who was, until his retirement a year ago, a member of the firm of Lumb and Walton, architects and surveyors. He was forty-seven years of age, and a recipient of

the Society of Architects' travelling studentship and silver medal for 1908.

The firm with which Mr. Walton was associated was responsible for the the design of many of the public buildings in the Fylde's, including the following: Savoy Hydro, Blackpool; Regent Picture House, Blackpool; Manchester and Liverpool district branch banks at Blackpool, Cleveleys and Bispham; a large number of residences in Blackpool, St. Anne's, Lytham, Thornton, Halifax and Huddersfield districts; also various offices, works and factories.

GEORGE S. NICHOL: 1878-1930

We regret to record the death of Mr. George Salway Nichol, F.R.I.B.A., of Birmingham. Mr. Nichol, who was fifty-two years of age, was a member of the firm of Nichol and Nichol.

He was educated at the Architectural Association, and a winner of their Travelling Studentship. He also won the R.I.B.A. Tite Prize.

Among the buildings executed by him, in partnership, were: Hearts of Oak Benefit Society's Offices, Euston Road, London (won in competition); Picture House, and St. Benedict's Church, Birmingham; St. Chad's Church, Bradford; and housing for Birmingham Corporation, etc.

ROBERT E. WINDER: 1858-1930

Mr. Robert Edmund Winder, L.R.I.B.A., died recently at his home in Sheffield, at the age of seventy-two. He was articled to his father, and served five years' apprenticeship in the Duke of Norfolk's estate office, before founding the firm of Edmund Winder & Co., architects and surveyors. His chief architectural works were buildings in Sheffield, and one of these, the Blind Institution, was won in competition.

COMPETITION CALENDAR

March 31. — The Accrington Corporation invites architects of British nationality to submit designs in competition for new Police and Fire Stations which it is proposed to erect on a site in Manchester Road, Accrington. Assessor: Herbert J. Rowse, F.R.I.B.A. Premiums: £250, £150 and £100. Conditions of the competition, together with a plan of the site and all particulars, may be obtained from William Henry Warhurst, LL.B., Town Clerk, Town Hall, Accrington. Designs to be submitted before March 31.

April 28.—Messrs. Josiah Wedgwood and Sons, Ltd., invite designs in competition for a Wedgwood Vase, to be made in commemoration of the Bicentenary of the Birth of Josiah Wedgwood, which will be celebrated in 1930. Assessors: Philip Connard, R.A., W. Reid Dick, A.R.A., H. S. Goodhart-Rendel, F.R.I.B.A., and Frank H. Wedgwood. Premiums: £100, £50 and £25. Full particulars may be obtained on application to the Secretary, Messrs. Josiah Wedgwood and Sons, Ltd., Etruria, Stoke-on-Trent. Latest date for submission of designs: April 28.

June 14. — The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit, £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

No date.—The Leicester Corporation invites local architects to submit designs for the erection of a library at West Humberstone. Assessor: Hugh Gold, F.R.I.B.A. Premiums: £75, £50, and £25.

The Hackney B.C. Establishment Committee recommends a competition in connection with the town hall extension. The Committee is of opinion that the amount to be spent on the building extension should be £100,000, exclusive of the cost of the site.

TRADE NOTES

The Underground Railway, in collaboration with the Electric Lamp Manufacturers' Association of Great Britain, Ltd., have just completed an exhibition at Charing Cross Station for the purpose of indicating to the public the possibilities of modern electric lighting both from the utility and decorative points of view. Mr. R. W. Maitland was responsible for the design of the stand.

For the convenience of architects interested in the manufacture of glass, Messrs. Chance Brothers & Co., Ltd., have opened an office in London at 23 Old Queen Street, Westminster. This office is conducted by Mr. M. L. Anderson, who will be pleased, at any time, to give architects actual demonstrations of the behaviour and effects of different glasses under different circumstances and conditions of treatment. He will also be glad to call at architects' offices to give any information or advice of which they may stand in need, on all questions of glass and glazing.

A fusion of manufacturing interests has been arranged between the Relay Automatic Telephone Company, Limited, and the Sterling Telephone and Electric Company, Limited. The manufacturing facilities at Relay House, Streatham Hill, will be considerably augmented to deal with the dual output of these two companies, which will manufacture automatic telephone apparatus and manual telephone apparatus respectively. All inquiries in connection with the Sterling Company's products should now be addressed to: Relay House, Streatham Hill, London, S.W.2.

Many new ideas in steel shutter construction are given in the revised edition of the Rolador catalogue, just published by Messrs. E. Pollard & Co., Ltd. Since the issue of the last catalogue many ingenious and interesting innovations have been made to this well-known shutter. The thickness of Rolador laths is 14 B.W.G., and the firm's engineers consider that this is the minimum thickness advisable if heavy wind pressure and hard usage is of first consideration. With the object of obtaining great rigidity, the underlying section of the Rolador lath is that of a channel, and this, together with its thickness, results in a curtain able, it is claimed, to withstand high winds even in very wide sections. The shape of the lath forms a perfect drip. The unique method of coiling forms one of the principal Rolador patents and results in a coil of small diameter.

Healthy Heating, a folder just issued by Messrs. Young, Osmond and Young, Ltd., illustrates and describes the "Unity" tubular electric skirting heaters. These can be fitted along the skirting boards under bay windows, in the hall, on landings and in passages. They can be placed on all four walls of a nursery or a bedroom. They consist of a heating element enclosed in 2-in. diameter steel tubes, and are light in weight, but are claimed to be tremendously strong, to eliminate fire risks, and to be entirely free from dust and soot. They are made in lengths from 2 to 17 ft. The tubular system has also been adapted for the linen cupboard, and as towel rails for bath, bed and dressing rooms. A useful thermostat can also be used where "Unity" tubular electric heaters are installed, either as the sole means of heating or in conjunction with an open coal or gas fire. It controls the temperature of a room. You set it at, say, 60°. As soon as the warmth of the room reaches a fraction more, the thermostat automatically switches off the skirting heaters. Alternatively, as soon as the air temperature of the room drops below 60° the thermostat switches on the heaters. It does this without personal attention. The thermostat is fitted on the wall in the same manner as an electric light switch. It is connected with the skirting heaters, but all the fittings, wires, etc., can be hidden in the wall.

In compiling their new booklet of light constructional work, the main aim of Messrs. H. and C. Davis & Co., Ltd., has been to show, by means of illustrations, the extent and variety of their ramifications in this direction, all photographs being of jobs actually carried out. The photographs include fire-escape staircases, spiral stairs, ornamental staircases, wrought-iron railings and gates, lift enclosures, ornamental wrought-iron panels, balconies, bank grilles, casements and ventilators, turntables for cars, washdowns for garages, etc. The firm have manufactured and fixed their fire escape, service and spiral staircases, and other light constructional steel and iron work, for Government departments, public authorities, public and private companies. Their ornamental ironwork for cinemas and other places of amusement has been used in all parts of the United Kingdom, including: Aldwych Theatre, W.C.; Opera House, Croydon; New Theatre, W.C.; Queen's Theatre, W.; Wyndham's Theatre, W.C.; Royal Theatre, Bradford; and at Balham, Eltham, Allenton, Camberwell, Richmond.

Messrs. Drytone, Ltd., have opened new showrooms and offices at Drytone House, 65 High Street, Camden Town, N.W.1 (telephone: Museum 9938), in direct connection with their works immediately behind. All communications should now be addressed there.

A draft Order-in-Council was laid before Parliament on January 29, 1930, in pursuance of section 7 of the Merchandise Marks Act, 1926, to require imported roofing slates to bear an indication of origin. Copies of the draft Order are obtainable from H.M. Stationery Office, or through any bookseller.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Probationers' Training School, Huntley Street, W.C. (pages 455–460). General contractors, Ashby and Horner, Ltd., who were also responsible for various joinery work, including tiled benches in kitchen. Sub-contractors: Redpath, Brown & Co., Ltd., steelwork; British Reinforced Concrete Engineering Co., reinforced steel; Lawfords & Co., asphalt; Excelsior Stone Co., stairs, etc.; Pilkingtons Tile and Pottery Co., Ltd., dado tiles to stairs; J. Jeffreys & Co., Ltd., heating; Smith, Major and Stevens, Ltd., lift; Mitchell & Co., wood block floors; James Gibbons, Ltd., lifts, screens and door furniture; Crittall Manufacturing Co., Ltd., metal windows; W. Hichens, panelling; Dent and Hellyer, Ltd., sanitary goods; Clarke & Co., Ltd., electric work; Adrian Stokes, wrought-iron balcony, etc.; J. Daymond and Son, Ltd., carving on exterior panels; Camden Tile Co., Ltd., terrazzo paving; Bratt Colbran & Co., grates.

All Saints' Church, East Sheen (pages 461–465). General contractors, Dove Bros., Ltd., who were also responsible for the oak altars, choir stalls, Communion benches and font. Sub-contractors: Mumford, Bailey and Preston, Ltd., heating installation; Thomas Mitchell (Guildford), Ltd., external facing bricks; S. and E. Collier, Reading, internal facing bricks; Wiggins, Sankey, Ltd., roofing tiles; A. Beanes & Co., Ltd., steel casements; R. E. Pearse & Co., Ltd., lead glazing; J. W. Gray and Son, Ltd., lightning conductor; Mears and Stainbank, bell; Hollis Bros. & Co., Ltd., oak block floors; John Tann, Ltd., safes and alms boxes; Yannedis & Co., ironmongery; Gray and Davison, Ltd., organ; West and Collier, Ltd., chairs; Brown and Englefield, pewter ornaments for altars, processional cross, etc.; The Warham Guild, Ltd., silver chalices and altar hangings.

Nos. 35–37 Beech Street, Barbican, E.C. (page 472). General contractors, John Marsland and Sons, Ltd., who were also responsible for the excavation and demolition. Sub-contractors: B. Goodman, Ltd., demolition; Limmer and Trinidad Lake Asphalte Co., Ltd., asphalt; S. E. Collier, Reading, bricks; Stuart's Granolithic Co., Ltd., artificial stone; Lambourne & Co., structural steel; W. H. Heywood & Co., Ltd., patent glazing; Automatic Sprinkler Co., Ltd., sprinklers; Rosser and Russell, Ltd., central heating; the Gas Light and Coke Co., Ltd., gas fixtures and gasfitting; Burn Bros. and H. Pontifex and Sons, Ltd., sanitary fittings; Nettlefold and Sons, Ltd., and Lips, Ltd., door furniture; Crittall Manufacturing Co., Ltd., casements; Haywards, Ltd., folding gates and iron staircases; the Express Lift Co., Ltd., lifts; Marryat and Scott, Ltd., cranes. The whole of the timber was supplied by the owners, Ingram, Perkins & Co., Ltd.

Thames House, Millbank, S.W. (page 452). General contractors, John Mowlem & Co., Ltd.; Dorman, Long & Co., Ltd., steelwork; Mr. Harley H. Dalrymple-Hay, M.INST.C.E., in association with Sharman and Travers Morgan, consulting engineers.

The shopfront at Nos. 21–22 Sloane Street, S.W.1 (page 449), was carried out by F. W. Sage & Co., Ltd.

House at Reigate, Surrey (pages 480–481). General contractor, T. Nightingale. Sub-contractors: Wotton and Son, glass; Teuten & Co., Ltd., stoves, grates, sanitary fittings, door and window furniture, and mantels.

The stand of Messrs. John Walsh Walsh, Ltd., at the British Industries Fair, Olympia. The pelmets, panels and wall lights were in Vesta glass, and provided an effective foil to the darker shades of the woodwork.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.

LATEST PATENT APPLICATIONS

5630. Chettle, W. A. Shuttering reinforced-concrete structures. February 28.

5832. Hokanson, A. E. Collapsible framework structures. March 1.

6221. Kotrbaty, G. F. Building construction. February 25.

6179. Swindells, C. W., and Swindells, H. Cement building-block. February 25.

THE ARCHITECTS' DIARY

WEDNESDAY, MARCH 19

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Annual Reception. **8 p.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Design in Town Planning." By Dr. Raymond Unwin, F.R.I.B.A. **8 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Portrait in Later Monumental Sculpture." By K. B. Esdaile (Mrs.). Charles Reed Peers, C.B.E., P.S.A., F.B.A. will preside. **8 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "The Beautiful Town." By the Very Rev. the Dean of Manchester. Rev. Harold Anson, M.A., will occupy the chair. **8 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Early Christian Architecture (A.D. 300–900)." By Sir Banister Fletcher, P.R.I.B.A. **6 p.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C. 2. Open every Tuesday, Wednesday, Thursday, and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

THURSDAY, MARCH 20

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Working Drawings. Until April 3. Also Students' Evening in connection with this Exhibition. **8 p.m.**

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. General Meeting. Election of Officers. "Mainly About Germany." By Howard Robertson, F.R.I.B.A., S.A.D.G. **7 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "London in the Middle Ages." By D. Martin Roberts, M.A. (Lantern Illustrations.) **7.30 p.m.**

FRIDAY, MARCH 21

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. **4.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Ordinary Meeting. "The Medical and Surgery Applications of Electricity." By Dr. Bernard Leggett. **6 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Annual Meeting at the Royal Institute Galleries, Piccadilly, W.1. 3 to 5.30 p.m. **3 p.m.**

BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION. Annual Luncheon at the Savoy Hotel, Strand, W.C. 12.45 for 1 p.m. **1 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "The Healthy Town." By Dr. Leonard Hill, F.R.S. Lady Maurice will occupy the chair. **8 p.m.**

SATURDAY, MARCH 22

Sunrise, 6 a.m. Sunset, 6.15 p.m.

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "Houses at Home and Abroad." By Oswald P. Milne, F.R.I.B.A. (Lantern Illustrations.) **3 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Visit to the Post Office (London) Railway, Mount Pleasant, N.W. **4 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visits to the offices of the Allied Newspapers, 200 Gray's Inn Road, W.C. 1. 4.30 p.m. and 6.30 p.m. **4.30 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. Conference on "Architecture and Modern Civilization." W. H. Ansell, M.C., F.R.I.B.A., and Elizabeth Scott (Miss), A.R.I.B.A. 2.30 till 4.15 p.m. Frederic Towndrow, A.R.I.B.A., and Minnie Pallister (Miss). 5 till 6.30 p.m. Helen Ward (Miss) will occupy the chair on both occasions. **2.30 p.m.**

MONDAY, MARCH 24

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "Style in Sculpture." By Eric Gill. **8 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, North-Eastern Centre. At the Armstrong College, Newcastle-on-Tyne. "The Imperial Chemical Industries, Ltd.'s Steam and Electric Power Plant at Billingham." By H. A. Humphrey, D. M. Buist and J. W. Bansall. (To be illustrated by a cinematograph film.) **7 p.m.**

IDEAL HOME EXHIBITION, Olympia, W. Organized by *The Daily Mail*. Open until April 17.

TUESDAY, MARCH 25

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Dominions and Colonies Meeting. "The Work of the British Association in Relation to the Empire." By O. J. R. Howarth, O.B.E., M.A. **4.30 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Ordinary Meeting. "Tyne Bridge, Newcastle." By David Anderson, B.SC., M.INST.C.E.; also "The New Wearmouth Bridge, Sunderland." By Geoffrey L. Groves, B.SC., M.INST.C.E. The papers will be followed by a discussion. **6 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. North Midland Centre. At the Hotel Metropole, Leeds. "The Imperial Chemical Industries, Ltd.'s Steam and Electric Power Plant at Billingham." By H. A. Humphrey, D. M. Buist and J. W. Bansall. (To be illustrated by a cinematograph film.) **7 p.m.**

WEDNESDAY, MARCH 26

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "Architecture of To-day and To-morrow." By Howard Robertson, M.C., F.R.I.B.A., S.A.D.G. Charles Marriott, HON. A.R.I.B.A., will preside. **8 p.m.**

The LEEDS Corporation is considering the utilisation of land in Compton Road, for the erection of baths and washhouses.

The LEEDS Corporation is to extend the Rodley sewage works at a cost of £24,360, in accordance with the scheme of Mr. E. H. Howatson.

The LEEDS Corporation is offering a site on the York Road housing estate to the Yorkshire Association of Baptist Churches, for the erection of a church and Sunday school.

The Durham County Education Committee is seeking sanction to borrow £6,000, for the erection of an elementary school at MARSDEN.

The ROTHERHAM Education Committee has purchased land adjoining Park Street and Clough Road, for the purpose of erecting a new central school.

Plans passed by the SOUTH SHIELDS Corporation: Shop and store, Vincent Street, for Messrs. Hanlons, Ltd.; paper store, Derwentwater Lane, for Mr. Howard Hill; extension, "Volunteer Arms," Cambridge Street, for Mr. F. W. Newby; bungalow, St. Peter's Avenue, Harton, for Messrs. J. H. Morton and Son; fifteen tenement dwellings, Hardings Bank, for the Riverside Tenants Co.

The SOUTH SHIELDS Education Committee has received final approval of the plans of the projected new junior schools at Cleadon Park, at a cost of £21,800.

The SOUTH SHIELDS Watch Committee has adopted revised plans, prepared by Mr. Page, for the new fire station and alterations at the police buildings, at a cost of £12,000.

The STOCKTON-ON-TEES Education Committee has purchased a site for the erection of a secondary school.

The Otley U.D.C. is to purchase a site for the erection of 100 houses at WESTBOURNE.

MISCELLANEOUS

Messrs. Mactaggart and Mickel, Ltd., are to erect twenty-six bungalows at Menock Road, Cathcart, GLASGOW.

Plans passed by the NEWPORT (I.O.W.) Corporation: Alterations, "Row Barge," Pyle Street, for Mr. F. J. T. Mew (architect); additions to offices, Nodehill, and auction mart, South Street, for Messrs. Stratton and Millgate (architects); garage and offices, Pyle Street, for Mr. F. Chiverton (architect); two bungalows, Beech Road, for Mr. W. Basterfield.

The Council of the University College of Swansea has decided to erect a sports pavilion at Singleton, SWANSEA, and has appointed Mr. Glendinning Moxham, F.R.I.B.A., of Swansea, to carry out the work.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0 11 6
Thames ballast, per yd.	0 10 0
Pit gravel, per yd.	0 15 0
Pit sand, per yd.	0 12 6
Washed sand, per yd.	0 13 0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2 8 0
Lias lime, per ton	2 0 0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3 0	*Trailer*	£0	15 0
3-ton motor lorry	3	15 0	*Steam roller*	4	5 0
Steam lorry, 5-ton	4	0 0	*Water cart*	1	5 0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0 1 6
SPREAD and level, including wheeling, per yd.	0 1 6

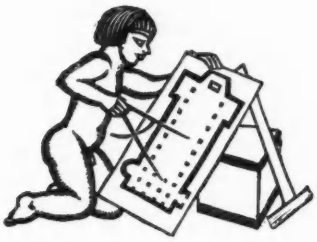
ENTRANCE DOORWAY, ELEMENTARY SCHOOL, NEW WINDSOR, BERKS.
By
LEATHART AND GRANGER

THIS main entrance doorway is one of four in the new school which is being opened today by the Rt. Hon. Sir Charles Trevelyan, Bt., M.P., President of the Board of Education. All the doorways and grilles are of the same architectural design, and are finished in green, picked out in black. An interesting variation, however, occurs in some cases at roof-level—the substitution of overhanging eaves (see the architects' detail drawing overleaf) in place of the parapet wall. Further views of the school appear on pages 498–505.



* Leadwork to be read as soakers and not dressings over tiles as shown.

SLUMS

" A certain squalid knot of alleys
where the town's bad blood once slept corruptly."

ROBERT BROWNING: *Christmas Eve.*

THE ordinary middle-class person who quietly pays for most of the social work that is done in the towns today knows very little about life in the slums or its evils. As his train to the City does not stop at that kind of station, and the hoardings along the line conceal most of the hinterland, perhaps he is not to blame—for where else could he afford to give his mind to the cure of such remote evils? Some photograph or article in his paper may carry him behind those hoardings for a moment on his morning journey; in the evening it is dark, and quite naturally he dozes. The problem is therefore taken up by those who have to work in the slums—doctors and officials—and by those with money whose social consciousness gives them no rest.

The slum problem has become that kind of thing that is perpetually discussed at conferences, and gradually the accumulation of " resolutions " and " demands " is having concrete effect. The problem has been approached from several points of view, the sociological, since it started the whole movement for slum abolition, taking first place.

Quite properly, professional and other social workers ask why, now that there are so many facilities for the poorer classes—schools, primary, secondary and technical, free libraries, museums and art galleries, hospitals, clinics and day nurseries, swimming baths and public parks, and even free music—decent housing was not established many years ago; adequate housing that would have lessened the need for some of the social and medical services which cost us so much now. There is no pleasant reply; the reason is that improved housing conditions on a sufficiently large scale seemed to be too radical a problem to be attacked directly, too upsetting to established systems of ownership, and our fathers and grandfathers therefore placed a fence at the bottom of the cliff instead of the top, so that those who fell over would at any rate be saved from drowning, even if a leg or two were broken on the way down.

For many years we have increased the number of palliatives to cope with the evils arising from poor housing, and yet the situation, until recent efforts stemmed the tide, has continued to grow more and more unpleasant. Elsewhere it is apt to be different. A glance at the nineteenth-century housing adjoining Copenhagen Docks, for instance, reveals our contemporary shortcomings with damaging candour.

The picture, however, must not be painted too black, for much valuable and interesting rehousing of slum populations has taken place in recent years in England and Scotland. It is divided broadly into two groups — new houses and tenements, and reconditioned " blocks." Of the former, little need here be said, for in every big town housing schemes have been created, and they have been illustrated often in these pages. Reconditioning (i.e. the use of existing buildings, largely replanned and refitted) is less prominent and less easy to discover. The reconditioning of country cottages as a means of abolishing rural slums has received considerable publicity, but the work done in urban districts—examples from Edinburgh are given in this issue—is in larger units and is equally interesting and often demands far greater ingenuity. Sometimes it is frowned upon; and indeed no amount of newly-installed plumbing will do away with that chief evil of slums, the overcrowding of children, as long as families of more than four or five are allowed to occupy two-roomed flats or " houses "—but these, one hopes, are only the results of temporary pressure; the two-roomed flats are often excellent in themselves and ingeniously evolved from existing buildings, and as the number of large families is decreasing the abuse of their amenities by overcrowding will probably diminish.

The two key points in slum abolition are the removal of the evil of the overcrowding of children and the provision of adequate accommodation at a rental within the means of those for whom it is intended, and it is likely that the present Government will attempt to deal with the problem of housing large impoverished families by some system of rent rebates based on the number of children involved, so that large families may afford to occupy sufficiently large houses. Anyone who has read a medical officer of health's report on overcrowding will examine the proposals with sympathetic interest, provided that undue encouragement is not given to those who rear large families when unable to bear the expense of their upbringing.

CRAIG'S COURT, WHITEHALL, WITH HARRINGTON HOUSE: FROM A DRAWING BY P. M. STRATTON.

The increased width of so many London streets is giving a fresh artistic value to the narrow lanes and small squares. Craig's Court, for instance, is more precious to true Londoners now than it was when Canaletto painted his picture of Whitehall (hung in the Italian Exhibition) which shows not only half the road blocked by the old gateway to Whitehall Palace, but a highly congested neighbourhood on the east of the road. Further, the amplitude of Trafalgar Square makes Craig's Court seem very snug and intimate to us, though Craig himself be a nobody in limbo. Probably he built Harrington House, on the right hand of the drawing, and formed the courtyard in front; this all became Lord Harrington's property later, and so remained till 1916, a convenient town lodging from which his Lordship rode on horseback to the Park.

Then "Cox's," suddenly expanded by the war, moved into the house with a flutter of paper forms and a huge stove which they fixed against the famous wooden staircase with an incendiary's zeal for heat.

After the war, the Post Office bought the building and, since it had been scheduled as a monument worthy of preservation, the Office of Works saved the front and the hall. A new story was added and screened by a new roof.

The addition facing us in the drawing has been conceived as a separate design, lightly modelled to act as a foil to the gross and hearty ordonnance of the old mansion. It is the spirit of the latter which dominates the Court, for it is effective in its rough-and-ready way. To distribute the weight of one of the floors, a tree trunk was chosen, which forked at one end on to its wall. [P. M. S.]

NEWS & TOPICS

Raymond McGrath, winner, as regards the bedroom and dining-room, of the recent competition for interior designs, organized by The Daily Mail *and the General Electric Company: the rooms are shown at the Ideal Home Exhibition at Olympia.*

WARNING !

THE Select Committee which is to consider the Charing Cross Bridge Bill was expected to begin its work yesterday, Tuesday, March 25th. Now is the time for all good men to come to the aid of the party !

THE SOUTHERN RAILWAY'S CHANCE

Cheers greeted the plea of Sir Samuel Hoare, at the annual meeting of the London Society, that pressure should be brought upon the Southern Railway not to build yet another terminus in South London, but to amalgamate it with Waterloo. As he pointed out, New York having successfully concentrated its lines into two main termini, with electrical haulage through the tunnels connecting to the trunk lines, here is obviously the place and the opportunity to lead a reform on the same lines. It is to be hoped that this alternative to the dreary, dismal, uneconomical arches of the official scheme will be stressed before Sir Henry Cautley and Messrs. J. S. Wardlaw-Milne, Andrew MacLaren and Guy Rowson, who form the present Parliamentary Committee.

THE VALUE OF ART TRAINING

High aspirations were voiced by the President at the recent banquet of the Royal Institute of Painters in Water Colours. Sir David Murray referred with gratification to the approaching intention of the Board of Education to make the teaching of art part of the training of the schools—a course often advocated in these pages. If a man of Sir David's standing could describe friendship and art as "the two greatest boons in life," access to the boon of art should assuredly not be withheld from any boy or girl in the land—*pace* Lord Birkenhead's opinion that "there was enough waste of public money today without recommending profligate expenditure in teaching people to draw who never could draw." Supposing that they never will draw, what then? Will his lordship deny that they will at least have been given what is quite as important—the opportunity of acquiring the first principles of good taste ?

★

Sir David's observation that it was art that developed true love of Nature, not *vice versa*, was a profound one, and his plea that the thousands of spectators who crowded to the late Exhibition of Italian Art might be influenced to visit, occasionally, our free art galleries, was most timely. Only by such courses as he advocated can we hope to arrive at a condition of civilization wherein the ordinary member of society will have absorbed a working knowledge of what architecture really means, and so come to demand the fruit of the architect's laborious training. From that elysian state we are far enough removed, as yet, Heaven knows !

CONSERVATIVE ENGLISH IDEAS

Such was, in fact, the conclusion enunciated by Howard Robertson, at the end of his international bird's-eye review of the state of architecture, in speaking at the Leeds meeting, last week. "There is plenty of architectural talent available in this country," said he, "but it receives most mediocre encouragement." Few can deny the justice of his summing-up of the relative positions in this country and in Germany. Over here we are so much preoccupied with age-old tradition that a truly modern building does really come as a shock. The progressive feeling, across the North Sea, however, does not date from yesterday : a pre-war exhibition at Cologne showed ideas as essentially modern as anything of today. Whatever the ostensible colour of our Government, we remain Conservative in our ideas.

RAYMOND MCGRATH'S CAREER

Raymond McGrath—whose bedroom and dining-room now erected at Olympia are the result of the competition for architects, promoted by *The Daily Mail* and the General Electric Company, and noted, at the time of its inception, in this JOURNAL—is already, at the age of twenty-seven, a designer of fame. For did not he devise the glittering glass interior of "Finella," recently illustrated and described ? He was born at Sydney, Australia, and, originally intending to follow journalism, entered the Faculty of Arts, Sydney University, in 1920. Exchanging into the Faculty of Architecture, he duly graduated as B.Arch., with the University Medal and Wentworth Fellowship to his credit. He arrived in London less than four years ago and, after studying at the Westminster School of Art, entered Clare College, Cambridge, as Research Student of Architecture, in 1927. There, his inclination towards journalism again showed itself: for a time he edited the *Clare College Magazine*. Among his hobbies are wood- and glass-engraving; and his sister is an accomplished Australian sculptor.

MILLBANK'S MILLENNIUM

The rebuilding of Lambeth Bridge has reacted with remarkable celerity upon the queerly assorted district of Westminster of which Horseferry Road is the uncertain backbone. Notwithstanding the fact that this road ends in a jumble of narrow streets leading somehow into Victoria Street, the presence of a great bridge is sufficient to galvanize its decrepitude into activity on a scale commensurate with the rather overwhelmingly grandiose ideas of Lord Melchett and Sir Frank Baines.

★

The Duke of Westminster has recently sold a large block of property lying to the south of Horseferry Road to a syndicate who will develop it in the wholesale manner we have learnt to associate with our rebuilding of London. It cannot pretend to be town planning of the order of Bloomsbury and Mayfair, the last products of ground-landlord development, but it may be organized and coherent street architecture if it is carried out with something of the unified and imposing massiveness of the three great riverside blocks of Imperial Chemical Industries.

ANOTHER IMPOSITION OF BUREAUCRACY

Let us not forget, in the midst of this distressing battle for the life of Charing Cross Bridge, that in another and serious matter bureaucracy appears to triumph over the manifest will of an educated public. The imposition of an official Office of Works' design for the Calton Jail site, arousing at first a storm of resentment in England and Scotland, has at last inflamed something like real anger among those to whom Edinburgh—and, with Edinburgh, Scotland—is something more than a site for Whitehall officials.

★

A letter from the Royal Incorporation of Architects in Scotland to Scottish Peers and Members of Parliament, stating what has on several occasions been given prominence in these columns, goes on to say that "the reiterated statements emanating from the Office of Works have been couched in language of a nature highly disparaging to the architectural profession in Britain," and that "they apprehend one danger, among others—the reduction of the Scottish Capital's architecture to the level of that of an ordinary English town. Towards this disastrous end nothing could contribute more effectively than that outstandingly important buildings in the Capital should be departmentally designed."

★

I see this definite political manœuvring for position on the part of the Office of Works, evidenced in statements seeking to lower the value of the work of private architects, as a sign of weakness which will, I hope, put still further heart in the bodies who represent architects in England and Scotland. We must indeed return to this charge again, and again.

THE "BEAUTIFUL ENGLAND" CAMPAIGN

Most of us have the beauty of England at heart, but few agree as to how to attain our ends. To some, London is the greatest city of the world, with its seven million inhabitants; or is it seventeen now? To others, London is evidence of a lack of organization unparalleled in a civilized country. To some, again, electricity pylons are things to be ashamed of; to others, they are evidence of the power of man, calling for an architectural treatment in keeping with that power. To some, a bungalow is a "growth"; to others, it means the happiness of a family. It is to discuss these questions and many others that the "Beautiful England" Campaign has been organized at the Guildhouse, Eccleston Square.

★

The campaign was opened on March 16 by the Minister of Transport, who gave conclusive evidence of his sympathetic consideration of the countryside. A week has been devoted to towns—the beautiful town and the healthy town; a week is being given to roads, with protagonists of the pedestrians and the motorists giving their views; a week to regional planning and the decentralization of industry; and the final week to modern civilization and the countryside. Among the speakers announced are the Dean of Manchester, Dr. Leonard Hill, Mr. C. E. M. Joad, Mr. George Lansbury, Dr. Raymond Unwin, Mr. Clough Williams-Ellis, Dr. Percy Dearmer, and Dr. Saleeby. These names give evidence that the question of "Beautiful England" is being tackled in a thoroughly scientific manner. It may be stated that there is no intention of adding to the already long list of societies who are struggling to preserve our amenities. The object of the campaign is to back the efforts of those societies. Full particulars can be obtained from the Hon. Secretary, the Guildhouse, Eccleston Square, S.W.1.

£5,000 FOR A REGIONAL PLAN OF MADRID

A novel idea has been adopted in Madrid to encourage regional planning. A Committee of experts has been appointed by the Municipal Council under the chairmanship of the Chief Engineer and the Chief Architect. A prize of £5,000 is offered for the best regional plan submitted, and there are four other prizes of about £400 each for good suggestions. It is interesting to note that one of the chief recommendations of the Committee, in their recently published report, is that the English, or natural, type of park, with trees and landscape features, should be encouraged, rather than the formal garden so popular on the Continent. The Committee further advise that the public should have free access to the pathways and be allowed to walk on the grass. The city is to be zoned, with manufacturing and industrial areas near to the railway stations. The competition is international, and the Municipal Architect at Calle España No. 7, Madrid, will give further particulars.

AMERICAN FLATS IN MOSCOW

Some time ago I noted the appointment of an American firm as consulting architects to the Soviet. Moscow has, in fact, invoked the aid of capitalist America to build even tenement dwellings. This year about £1,000,000 is to be spent in order to try and meet the serious housing shortage. Already, American machinery has been sent to Russia, and Russians are being taught by American building experts how to use the machines. The model tenements will be on the lines of a New York house, six stories high, provided with lifts and central heating. The Moscow City Council have insisted that all the materials and the equipment used must be purchased in Russia. The contractors consider that they can teach the Russians a good deal about plumbing and sanitation generally. Accordingly, an American model flat is being constructed as an object-lesson. I am told that hundreds of persons have gathered together to gaze at the steam shovels and the other machinery used to expedite building operations.

THE IDEAL HOME EXHIBITION

The Ideal Home Exhibition enters upon a new period eclipsing all previous records; for not only has the new addition to Olympia allowed a greater freedom of movement among the exhibits, but these are now expanded to a number so increased that a day's visit is not long enough for anything but a cursory inspection. The appearance of the main hall, its fine spaces flooded with light and colour, and the air vibrating with music have nothing to do with *my* ideal home, but it "catches me where I live," as the Americans have it. Indeed, I could say a lot about the general effect of lighting and colour were it not that the place teems with more particular interest. There are two exhibits that are certain to draw great crowds. One is the Pavilion of Light, wherein electricity and modernity are wedded in the most expensive matrimony: the other is the Room in the Roof—a series of alternative ways of utilizing the old box-room.

ASTRAGAL

CLEARING THE SLUMS OF EDINBURGH

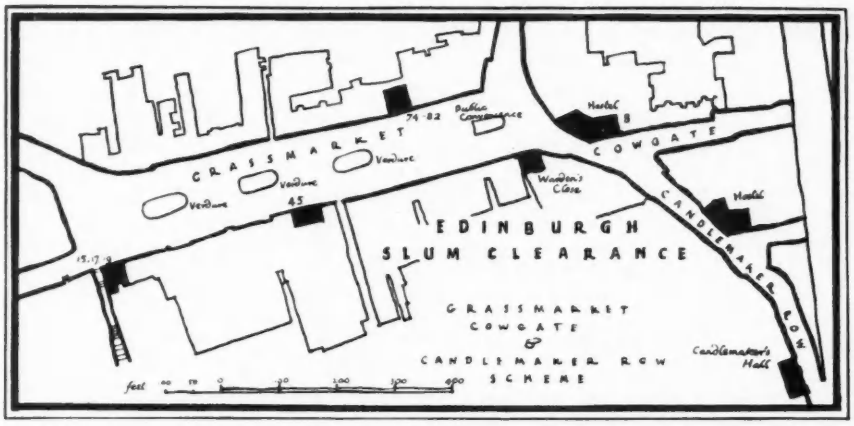

Figure one. Map showing the area of the Grassmarket, Cowgate and Candlemaker Row slum clearance scheme.

Some Typical Reconditioning and Rebuilding Schemes

BY ROBERT HURD

SLUM clearance in most cities involves a wholesale transformation of the area under treatment. In London rows of two- or three-story nineteenth-century dwellings in narrow streets are removed to make room for model tenements from three to five stories high, which house the families on a smaller ground area, giving them greater space in their homes and at the same time playgrounds off the streets for the children.

No one doubts when this change takes place that it is altogether for the better, not only from the point of view of health, but also architecturally, for the exteriors of slum streets rarely have anything to recommend them. The

Figure two. Candlemakers' Hall (the second building from the left of the picture) at the junction of Candlemaker Row with George IV Bridge.

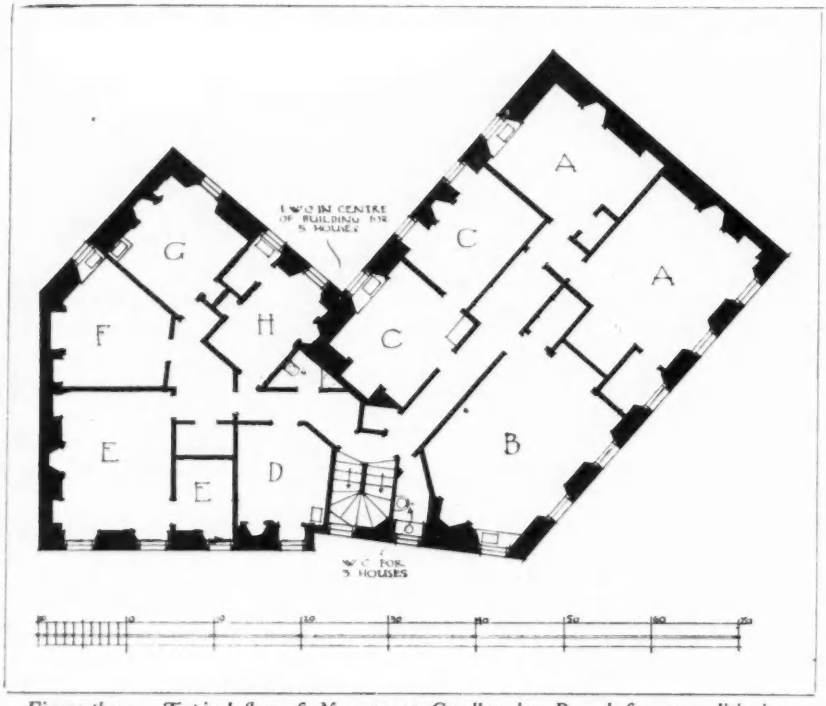

Figure three. Typical floor of Nos. 35-43 Candlemaker Row before reconditioning. A to H denote the accommodation provided for eight families on this floor.

problem is a matter of regrouping the housing accommodation in tenements in the same locality, at the same time providing outside accommodation for surplus population. The main difficulty, only of a temporary nature, is the housing of the tenants while their old homes are being demolished and the site re-used for healthier apartments, planned in blocks of flats.

In Edinburgh the problem is more complicated. To begin with, we are dealing here not with jerry-built nineteenth-century boxes, but with seventeenth and eighteenth-century buildings which are virtually blocks of flats, and always have been, though socially they have more than come down in the world. Before the Union in 1707, and previous to the development of the area beyond Princes Street, the more aristocratic members of society lived on the lower floors of these tall six-floor buildings in the Old Town—in the Grassmarket, in the Canongate, and so on; but when the seat of government shifted to London, and the streets of the West End started to arise, the Old Town was deserted by the wealthy and so fell gradually into decay, for the poorer classes who had previously occupied the upper floors of these

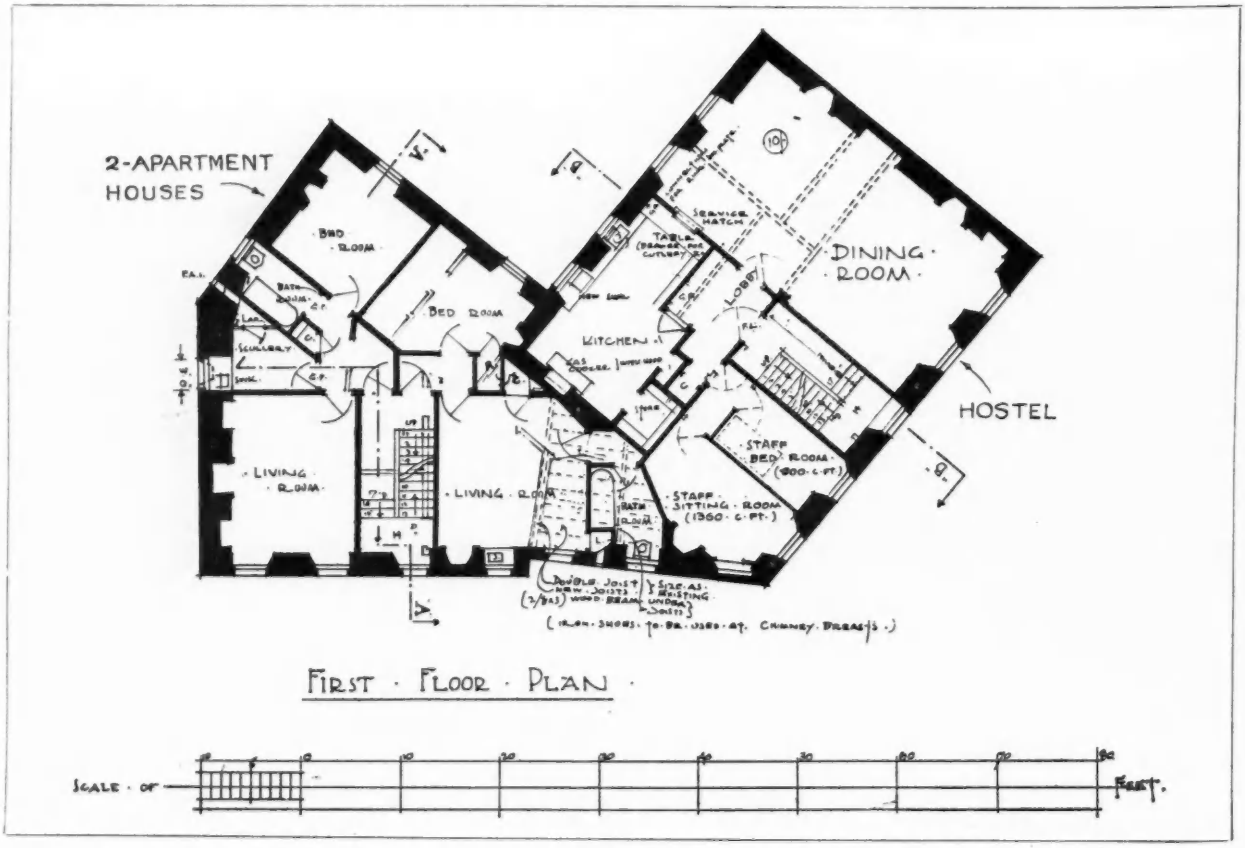

Figure four. Plan of a typical floor of Nos. 35-43 Candlemaker Row after reconstruction and partial adaptation into a women's hostel.

blocks now spread to all the floors, with the result that the squalor, originally limited to the attics, began to display itself at the very gates of Holyrood House. This process has affected the whole of the Old Town, and matters have continued to go from bad to worse for so long that the living conditions in some of the buildings have to be seen by the ordinary person to be believed.

As these buildings were originally erected in flats, it is not surprising to find that where the façades are structurally sound they serve the modern plan of a block of flats as well as any modern built front. In most towns one would not worry about the preservation of the façade of a block of tenements, but here there is a difficulty which does not usually arise. Slums are no commercial asset to London or any Midland town, and their historic and sentimental value is generally negligible; but in Edinburgh the position is different, for not only is it unnecessary from the practical point of view, as we shall see, to demolish the outer walls of a block of "apartment houses" where the structure is sound, but it is actually undesirable to change radically the architectural appearance

Figure five. No. 45 Grassmarket before rebuilding. In the rear obstructions were removed to provide a playground and drying ground.

Figure six. No. 45 Grassmarket after rebuilding. Instead of the two side doorways one entrance only is provided at the back of the building.

of the streets; for these tall buildings, with their height, their abundant fenestration and picturesque roof-line, form the background to Edinburgh as a place of pilgrimage. The Edinburgh Corporation is therefore concerned in cleaning up the Old Town by buying up condemned properties, replanning them, and thinning out the appalling density of the population, while at the same time preserving as far as possible the architectural appearance of the streets as we have grown to know them.

Fortunately, this desire of theirs does not lead the City Architect, Mr. E. J. MacRae, into the trap that has so evidently captured such English towns as Chester, and he has not had to catch a million mediæval minnows in order to make a passably deceptive mediæval whale. The stone-built streets which he has to doctor are so eminently practical in appearance, and so free from rigidly "period" decoration, that were he to attempt to evolve a new type of street front, given the same material, it is doubtful whether any solution more simple and straightforward than that of the seventeenth- and eighteenth-century builders could be arrived at. It would, therefore, be illogical for the modernist to cavil at the traditional flavour of the work produced by the City Architect's department; it is right, both æsthetically and practically, for its place and purpose.

Before giving details of the slum clearance work carried through by the Edinburgh Corporation, it is necessary to explain that we are here only dealing with a portion of their activities in this direction. The map (figure one) indicates the area under consideration; it includes the Grassmarket, Cowgate and Candlemaker Row, all of which are in the Old Town on the south side of the Lawn Market. The Grassmarket was the place appointed for the sale of horses, beasts and sheep, etc., within the city, and the wall with the West Port closed one end of it.

From the map it can be seen that the Grassmarket holds out much greater hope of improvement, without undue disturbance of existing sites, than most slum streets, the distance from one side to another being about 45 yards. Cowgate has the average width of Edinburgh streets of this type, i.e. 16 yards, while Candlemaker Row is comparatively narrow. The general appearance of all three is at first discouraging, but on closer acquaintance the dignity and almost modern simplicity of the buildings become apparent, and one realizes that squalor and social misuse here tend to mask architectural merits of some importance.

In this area were three types of buildings to be dealt with: those that were very inconveniently planned for adaptation or too far gone for salvation, and which have had to be pulled down and entirely rebuilt (17, 45, and 74-82 Grassmarket); those of which the outer walls were sound, but which needed interior replanning to make them habitable, according to a reasonably decent standard of living (35-43 Candlemaker Row, and Candlemakers' Hall: figure two); and those blocks the position of which, at the back of tenements facing the street, rendered them detrimental to the health of the neighbourhood (i.e. blocks behind 45 and 17 Grassmarket).

The plan (figure three) of a single floor of 35-43 Candlemaker Row tells a typical tale of misery. These premises were originally built as two large houses, but later, on each floor, there were as many as five one-apartment and three two-apartment houses, accommodating some thirty-five persons, with one w.c. and sink for the use of each group of apartment houses. Figure four shows the reconstructed edition of a typical floor in the same premises; the left-hand half, previously a group of five one-apartment houses, now consists only of two two-apartment houses with ample offices, while the right-hand half has been transformed from apartment houses into a women's hostel containing dining-room, kitchen, and staff sitting- and bedrooms, and three floors of dormitories with baths and w.c.'s, etc. To enable the division of these premises to be made, two separate staircases on either side have been substituted for the former central flight to the upper floors, and in several other ways, apparent on examination of the plan, much ingenuity has been shown in the replanning of this oddly shaped block.

No. 45 Grassmarket is an example of straightforward planning. The squalid appearance of this block prior to rebuilding can be seen in the photograph (figure five). In this case much building obstruction in the rear was removed, so that there might be an ample area to serve as a children's playground and a drying ground for the tenants' washing. The appearance of the new block (figure six), though marred by the slope of the roof and small size of the chimney stack—the result of enforced economy—is sturdy and the plan (figure seven) is excellent. The whole of this block is devoted to two-apartment houses, and instead of the two street entrances of the former building there is one main entrance from the newly-cleared close at the back, away from the public highway.

(*To be concluded*)

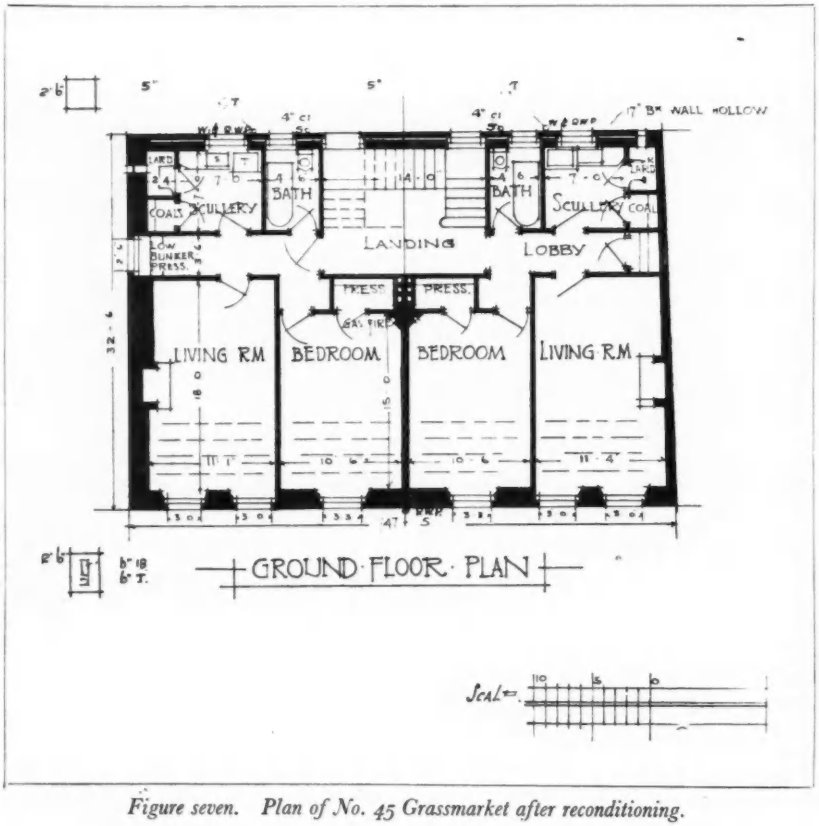

Figure seven. Plan of No. 45 Grassmarket after reconditioning.

JOHN NASH, SPECULATOR

A Century-old Parliamentary Debate on his Conduct

THE following abridged account of certain proceedings in the House of Commons when the professional conduct of John Nash, architect and surveyor to the Crown, and designer of Regent Street, was called in question, is taken from The Morning Chronicle *dated March 3, 1830.*

This is a sheet of four pages, each about the same depth as The Times *today, but about 2½ ins. less in width, bearing five columns of closely-printed type, and was published at the price of sevenpence.*

In the previous year a Committee had sat to investigate the matter, and now a member of the House and of that Committee sought to re-open it in relation to dealings in land in Pall Mall East and Suffolk Street, and adjoining the Regent's Park Canal, in connection with the improvements then in progress, alleged to have been improperly undertaken by Nash. Reference is made to the fact that his health was broken in consequence of attacks of the kind, and one Member is reported as saying that "If Mr. Nash had not been speculator as well as surveyor, Regent Street would never have been finished."

*The illustration is of a portion of a cartoon, published in 1824, showing the architect impaled on the spire of All Saints, Langham Place, and is entitled "*Nashional *Taste ! ! ! ", is dedicated, "without permission, to the Church Commissioners," and bears the following lines: "Providence sends meat; the Devil sends cooks; Parliament sends Funds; But, who sends the Architect ? ! ! ! "*

COLONEL DAVIES rose, in fulfilment of a pledge he had given last session, to bring forward an inquiry into the conduct of an individual against whom he said he was under the necessity of bringing a charge of the gravest nature, and which had already been the subject of inquiry before a Select Committee. He assured the House that he felt considerable pain in the discharge of this duty. The world was so apt to attribute motives of a private nature to an accuser, that their sympathies were generally excited against him, and in favour of the accused. If that was the ordinary case, his situation was tenfold more embarrassing, as he had, in some degree, to contend with the resolutions of a Committee, appointed at his own suggestion. He said he should not confine his charge to Mr. Nash only, for he had to bring a serious accusation against one of the principal Ministers of the Crown—the Chancellor of the Exchequer. In the Committee that Right Honourable Gentleman had exerted his talents and his influence to throw a cloak over the delinquencies of Mr. Nash; and, instead of discharging the duty of an impartial judge, he had assumed the character of a partisan. Colonel Davies asked the House to recollect that a Select Committee had been appointed to inquire into the conduct of Mr. Nash, architect and surveyor to the Crown. In 1819, when the improvements in Pall-mall east and Suffolk Street were in contemplation, Mr. Nash received directions from the Commissioners of Woods and Forests to survey and report upon the Crown Lands in that neighbourhood. After the report was made, a person of the name of Edwards, a near relation of Mr. Nash, applied for a large plot of the ground which had been cleared. He finally obtained a grant upon the valuation made by Mr. Nash, and according to his statement, employed him as his agent to sub-let the ground. Edwards then went abroad for about a year, and on his return, according to the evidence, an interesting scene took place between him and Mr. Nash, in consequence of which he surrendered his interest to Mr. Nash, who offered Edwards £4,500 for his bargain, and for that sum he became the purchaser. During Edwards's absence Mr. Nash had let the plot of ground at improved rents, although he had not laid out a single shilling in improvements to the property. Having thus become the purchaser for £4,500, Mr. Nash received no less than £14,600 in improved ground rents. Thus, Mr. Nash himself became the lessee of the Crown, although that fact was not known until three years afterwards; and in the meantime the Office of Woods and Forests supposed he was acting on behalf of the Crown. In order to make out a case, Mr. Nash had brought forward a highly respectable and eminent surveyor and architect, of the name of Shaw, who had also valued the land, and had arrived at nearly the same conclusion as Mr. Nash; but then he omitted a very material circumstance, that this ground, the rental of which to Mr. Edwards was £900, was to be held for the first three years at a peppercorn rent, making, as he himself acknowledged, a difference of no less than £2,700. Mr. Shaw had said as a reason for putting a lower value upon the property, that it was a hazardous speculation—but Colonel Davies denied that this was so. As soon as the Noble Lord at the head of the Woods and Forests had become acquainted with some of the leading facts of the case, he wrote to the Chancellor of the Exchequer, objecting to the course that had been pursued, especially to the circumstance that Mr. Nash had become the purchaser from Edwards; and stating in addition, that the frontage which had been stated by Mr. Nash to be only eighty-two feet, was, in fact, between ninety-seven

and ninety-eight feet. This discovery was made by the Noble Lord himself, who, on coming one day from the University Club, stepped the distance, and found that it had been greatly understated; from 1820 to 1829, however, this important variance had escaped notice. It could not be alleged by Mr. Nash that he was ignorant of the true measurement, because the extent of frontage to each house was stated in the margin of each lease he had granted, as the purchaser of the interest from Edwards. He referred the House to the evidence of Mr. Shaw, in which he strongly censored the situation in which Mr. Nash had placed himself; and said that as a broad principle, no agent ought to be allowed to become a party. Mr. Nash, employed by the Crown, had first become the agent of Edwards, then the purchaser of the grant to Edwards, and kept the Crown in complete ignorance of the whole transaction.

Having gone through the case as far as concerned Suffolk Street, Colonel Davies then proceeded to refer to the circumstances connected with the grant of Crown Lands in Regent's Park. He said that the facts of the case connected with the Regent's Canal were as follows :

In 1816 the Committee of that undertaking made application to the Office of Woods and Forests to obtain a lease of four acres of Crown Lands abutting on the Regent's Canal, in consideration of various expenses in making a collateral cut, basin, etc. Mr. Nash was at that time a very active member of the Committee of the Regent's Canal, and, being called upon to do so, he made his report to the Commissioners of Woods and Forests. After consideration, the Commissioners expressed their opinion that it would be more advantageous to have the canal company for tenants instead of an individual, and accordingly it was determined that the request of the company should be conceded. It was suggested, however, that no valid lease could be made with the company; and in order to avoid this legal difficulty the Committee of the Regent's Canal Company consented that the lease should be made out in the name of Mr. Nash. The Commissioners of Woods and Forests believed that the reason for this change was merely to overcome the legal difficulty, and that Mr. Nash was only to stand forward as the trustee of the company. The understanding, however, between Nash and the company was, that he was to be its nominee; some of the members of the company, when examined before the committee, stated that they thought Mr. Nash had stepped forward to relieve the company, and not for his own pecuniary advantage. Nevertheless, six years afterwards, the Committee of the Canal Company applied for a grant of four more acres of Crown land, and the application was signed by Edwards and Lyon, as solicitors of the company. Strange as it might appear, the Company were in no respect privy to this request—they knew nothing of it; for it happened that Edwards and Lyon, besides being solicitors to the company, were also solicitors to Mr. Nash, and they had applied for a further grant of Crown land in the name of the Company, when, in fact, it was for the sole private benefit of Mr. Nash. Mr. Nash was required by the Commissioners of Woods and Forests to report upon these circumstances, and instead of saying, "I cannot properly report upon a matter in which I am personally interested," he did execute his task; and with the result that he recommended that the subsisting leases, to which he was a party for fifty years, should be extended to sixty-one years. All this time the Department of Woods and Forests supposed that the leases had been granted to the Regent's Canal Company; and five years afterwards they were in ignorance of the real nature of the transaction. Before the Committee the solicitor for Mr. Nash admitted that fifteen out of seventeen wharves had been let for terms not exceeding fifty-four years, and upon these wharves Mr. Nash had not spent a shilling. For the first seventeen years of the term it was stipulated that Mr. Nash should pay for the wharves a rent of £54 14s., while he received from his tenants £1,698. For the next seven years he was to pay £63, and for the following fourteen years his rent to the Crown was to be £634, and he would consequently gain £1,064 during this last period. This advantage had been obtained, contended Colonel Davies, on false pretences, Mr. Nash having taken advantage of the situation he filled and of the influence he enjoyed. Colonel Davies went on to refer to the fact that Mr. Nash, as architect to the Crown, was responsible for the quality of the building materials used, and that he had sold bricks at 16s. a thousand as being bricks of the best quality; and those intended for Cursitor Street he used in Regent Street, though they were an inferior quality.

Further, Mr. Nash was paid for reporting upon his own work; it was also in evidence that he first got four acres of ground, and then eight, and disposed of that land at a profit of £1,643, and that was effected under false pretences. Colonel Davies asked the House what they would think if the Chancellor of the Exchequer jobbed in the public funds as Mr. Nash had jobbed in the public land, and yet the whole conduct of the Chancellor of the Exchequer was that of a partisan. If a new committee were appointed, Colonel Davies promised that he could throw much new light upon the matter which had been referred to the former committee, evidence which he had no doubt would lead to Mr. Nash's removal from his present situation. He concluded by moving that a Select Committee be appointed to inquire into the conduct of Mr. Nash with respect to the Crown Lands in the County of Middlesex.

The Chancellor of the Exchequer then spoke, and said that last year the Honourable and Gallant Officer had made assertions which were not borne out by the evidence laid before the Committee; and by the results attendant upon these assertions they could judge how far his accusations of this year were to be regarded, accusations which were ten times as great and important as those preferred last year. As to the charges made against himself, of partisanship and improper support of Mr. Nash, he was sure the House would do him the justice to believe that his sole object was to do his duty to the public on the one hand, and to the individual accused on the other. He had carefully attended to the evidence on both sides, and having arrived at a different conclusion from the Hon. Member, he certainly felt bound to propose to the Committee a resolution expressive of the view which he took of the subject generally, and of the conduct of Mr. Nash; and he would defend that resolution without being deterred by any threat or by any imputation that might be attempted to be thrown upon his honour or character. He could satisfy the House as he had satisfied the Committee, that the views he took of the conduct of Mr. Nash were perfectly correct. The House had entertained charges against Mr. Nash, had appointed a Committee to inquire into those charges : would they then, at the instance of a minority of that Committee, re-try the same individual on the same charges? Here was a gentleman tried and acquitted before a committee; and if a new committee were to be appointed to do the work of the former committee over again, in that way Mr. Nash might be hunted session after session until the most unjust decisions were at length arrived at; more especially when the state of the health of the individual in question made it extremely doubtful whether or not it would be in his power to attend the sittings of the committee. Finally, he had only to add that if any honourable member, besides the mover, thought him capable of all that had been charged against him, he hoped that such a sentiment might be openly stated, for then, though not till then, he should feel it

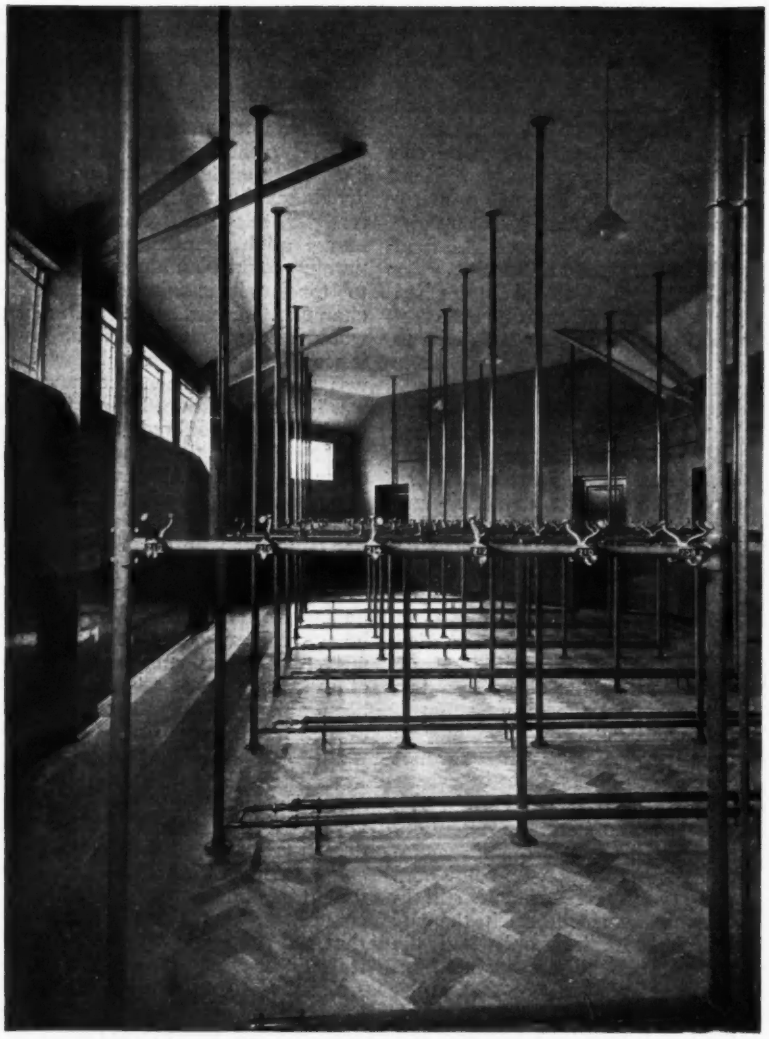
This contemporary print of Lower Regent Street, looking towards Waterloo Place, is of particular interest as showing, on the left, Nash's own house (with three semicircular-headed windows). The old Carlton House is seen, in the distance, at the other side of Pall Mall.

necessary to enter at length into the evidence and proceedings of the Committee for the purpose of removing any such impression. This much only should he say, that he never had the slightest knowledge of Mr. Nash till he entered upon his present situation. With these few observations he should content himself, unless further accusation should lead him to go through the ninety-seven documents laid before the Committee. (Hear, hear !)

Mr. Warburton, in the course of the debate, called the attention of the House to the resolution agreed to by the Committee, in which they stated " that although there was no evidence that any loss had accrued from the conduct of Mr. Nash, yet it was the opinion of the Committee that the Commissioners of Woods and Forests ought not to grant leases to surveyors or architects having any immediate interets, or being liable to be called in to give their opinions—until their duty, as surveyors or architects, had ceased." Thus, by implication, they did convey that Mr. Nash had an immediate interest in the lands which had been made the subject of observation.

Mr. Ward said he was a member of the Regent's Canal Committee, and there the conduct of Mr. Nash had been made the subject of discussion. The facts there brought to light were certainly such as enabled him to bear favourable testimony to the conduct of Mr. Nash.

Mr. Maberley supported the motion. In his opinion, however, the attack that had been made upon the Chancellor of the Exchequer was not warranted. (Hear, hear !) From the resolutions passed by the Committee, it was a fair inference that they were dissatisfied with the transaction, and though the Committee had not actually pronounced that fraud existed on the part of Mr. Nash, it was pretty evident that that gentleman had not properly discharged his duty, and that any one acting as he had done would be held culpable in the public estimation.



Mr. Calcraft said Colonel Davies had not given a fair statement of the case, as he had quoted the answers given to his own questions only, and not one tittle of any other part of the evidence which was before the Committee. It had been proved in evidence that there was no connivance whatever between Mr. Nash and Mr. Edwards; on the contrary, when the ground in Pall-mall east was leased to Mr. Edwards, that gentleman was abroad, and when he returned, he found that the ground was much more than he wanted, and he was therefore very anxious to get rid of it. The Committee had decided that Mr. Nash ought not to have appeared in a double character; but this he could tell the House—that if Mr. Nash had not been speculator as well as surveyor, Regent Street would never have been finished. Mr. Nash, at great risk and hazard, had carried that noble project into complete execution. In respect of his attack on the Chancellor of the Exchequer, he considered Colonel Davies less fortunate still in his accusations, for whereas in the case of Mr. Nash he had only had the committee and witnesses against him, in his foul aspersion on the Chancellor of the Exchequer he had the whole House against him. (Hear, hear !)

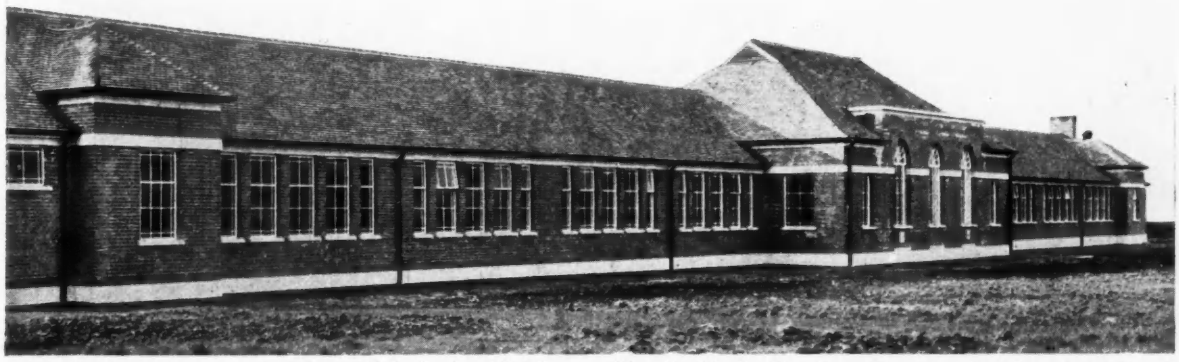
Sir M. W. Ridley said that, though he opposed the Committee, he was authorized by Mr. Nash (who was now suffering under illness severely aggravated by the repeated attacks upon him) to state that he had no desire to avoid any inquiry; and that he was ready to adopt any course which the House might impose, as he felt that nothing could be adduced against him to touch either his honour or his character. (Hear, hear !) One fact he would state about Mr. Nash, because it would show the spirit by which he was actuated. When the new street was first in agitation, Foley House and gardens were offered for sale, and Mr. Nash gave £4,000 more than any other bidder, and afterwards cut it up into shreds and patches for the purpose of suiting the objects of the new street line, by which he greatly depreciated the value of his property. (Hear, hear !)

Colonel Davies, in reply, said he had no wish to re-try Mr. Nash, but he wanted an examination into fresh matter, which, owing to the lateness of the inquiry last year, he had not been able to bring forward. At all events he trusted that Government would cause the houses in Regent's Park and Regent Street, and, still more, Buckingham Palace, to be surveyed; for he thought that a great deal of foul play would in consequence come to light. As the Minister had said that he would not allow the committee, he (Colonel Davies) knew that the matter was settled, and that it would be of no use to press a division. At all events, he had the satisfaction of knowing he had discharged his duty to the House and the country.

A general view of the school, showing the Imperial Road front (right). The building will accommodate 780 children, and is faced with Binfield bricks, with dressings of pre-cast stone. The roof is covered with hand-made sand-faced tiles, and the plinth is finished in white cement rendering. Built into the walls beneath the semicircular-headed windows are two stones. That on the

Every care has been taken by the architects to safeguard the health of the scholars. In the cloakrooms, of which there are four, each hat and coat hanger is numbered, and beneath each rack at floor level are hot-water pipes to dry the children's clothes during wet weather.

BOYS' AND GIRLS'



Designed to form a

BY LEATHART

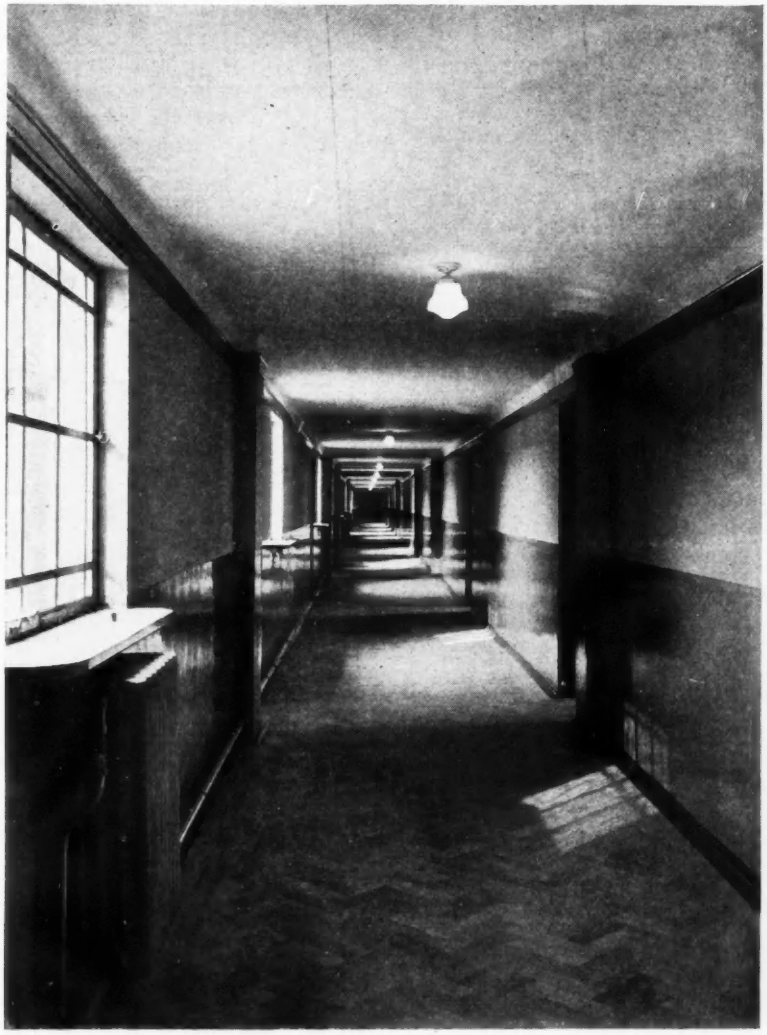
TODAY, March 26, the President of the Board of Education will open the new elementary school which has been erected for the Borough of New Windsor Education Committee at the corner of Clarence Road and Imperial Road. The school accommodates 780 children, in three departments: senior boys, senior girls and junior mixed. There are two assembly halls, one for the senior school and one for the junior school and, of course, the various classrooms. In addition, there are administration rooms, staff rooms for the heads of the departments and the teaching staff, together with independent lavatories and headmistress's room and headmaster's room.

The site is eleven acres in extent, and provides a large common playing-field at the rear of the school. The aspect of the classrooms runs slightly west of south and slightly south of east, with the corridors on the north and west sides of the respective blocks. Four entrances are provided to the school, i.e. for junior and senior girls, and junior and senior boys.

Externally the building is treated in a simple Georgian manner with the two assembly halls emphasized as central features. The elevations are faced with Binfield bricks in English bond, pointed with a flush white cement joint, toned down with yellow sand to approximate to a lime mortar pointing.

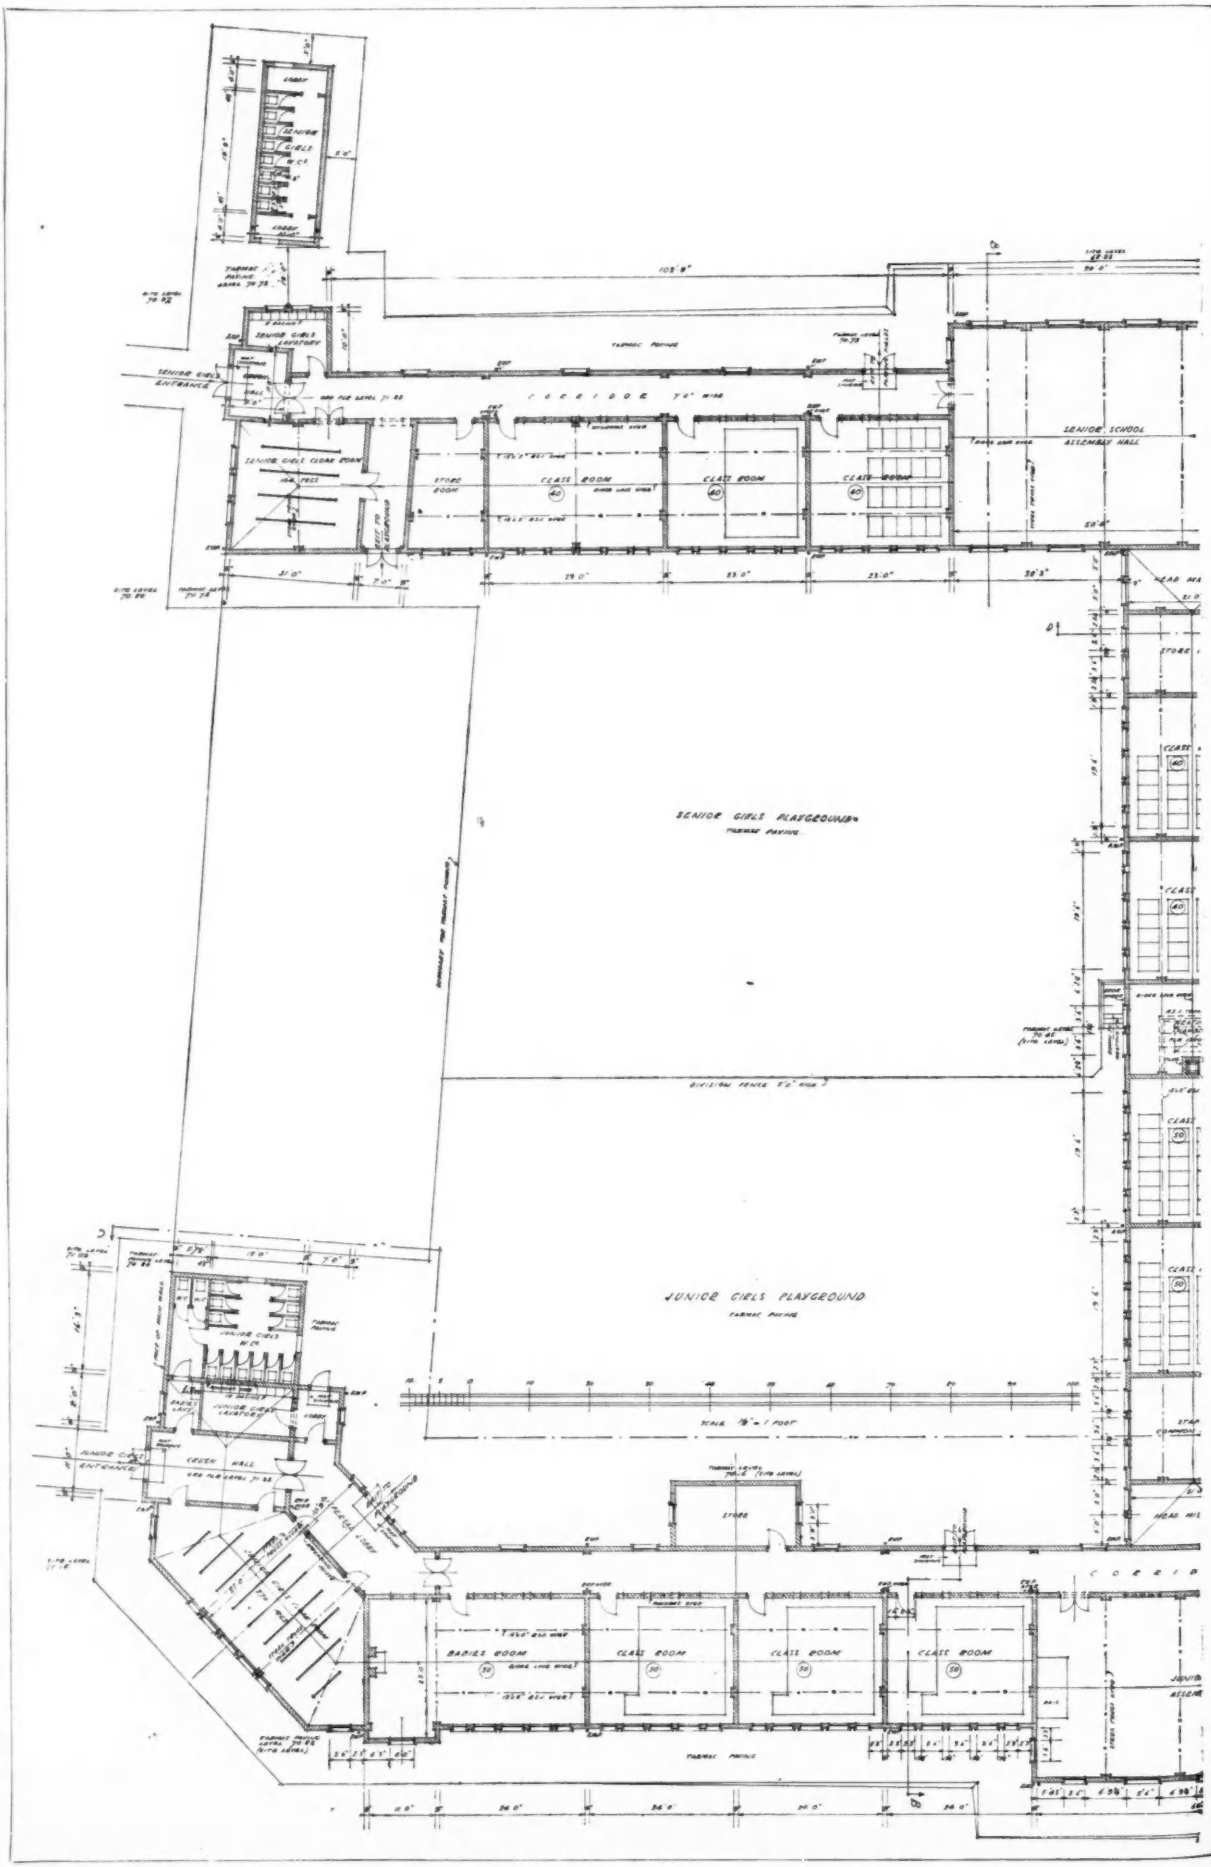
left is the foundation stone, laid by Lt.-Col. Stephen Wright, C.B.E., Mayor of Windsor, on June 26, 1929. That on the right records that the school was opened by the Right Hon. Sir Charles Trevelyan, Bt., M.P., President of the Board of Education, on March 26, 1930. This stone is also inscribed with the names of the architects and builders.

SCHOOL, WINDSOR



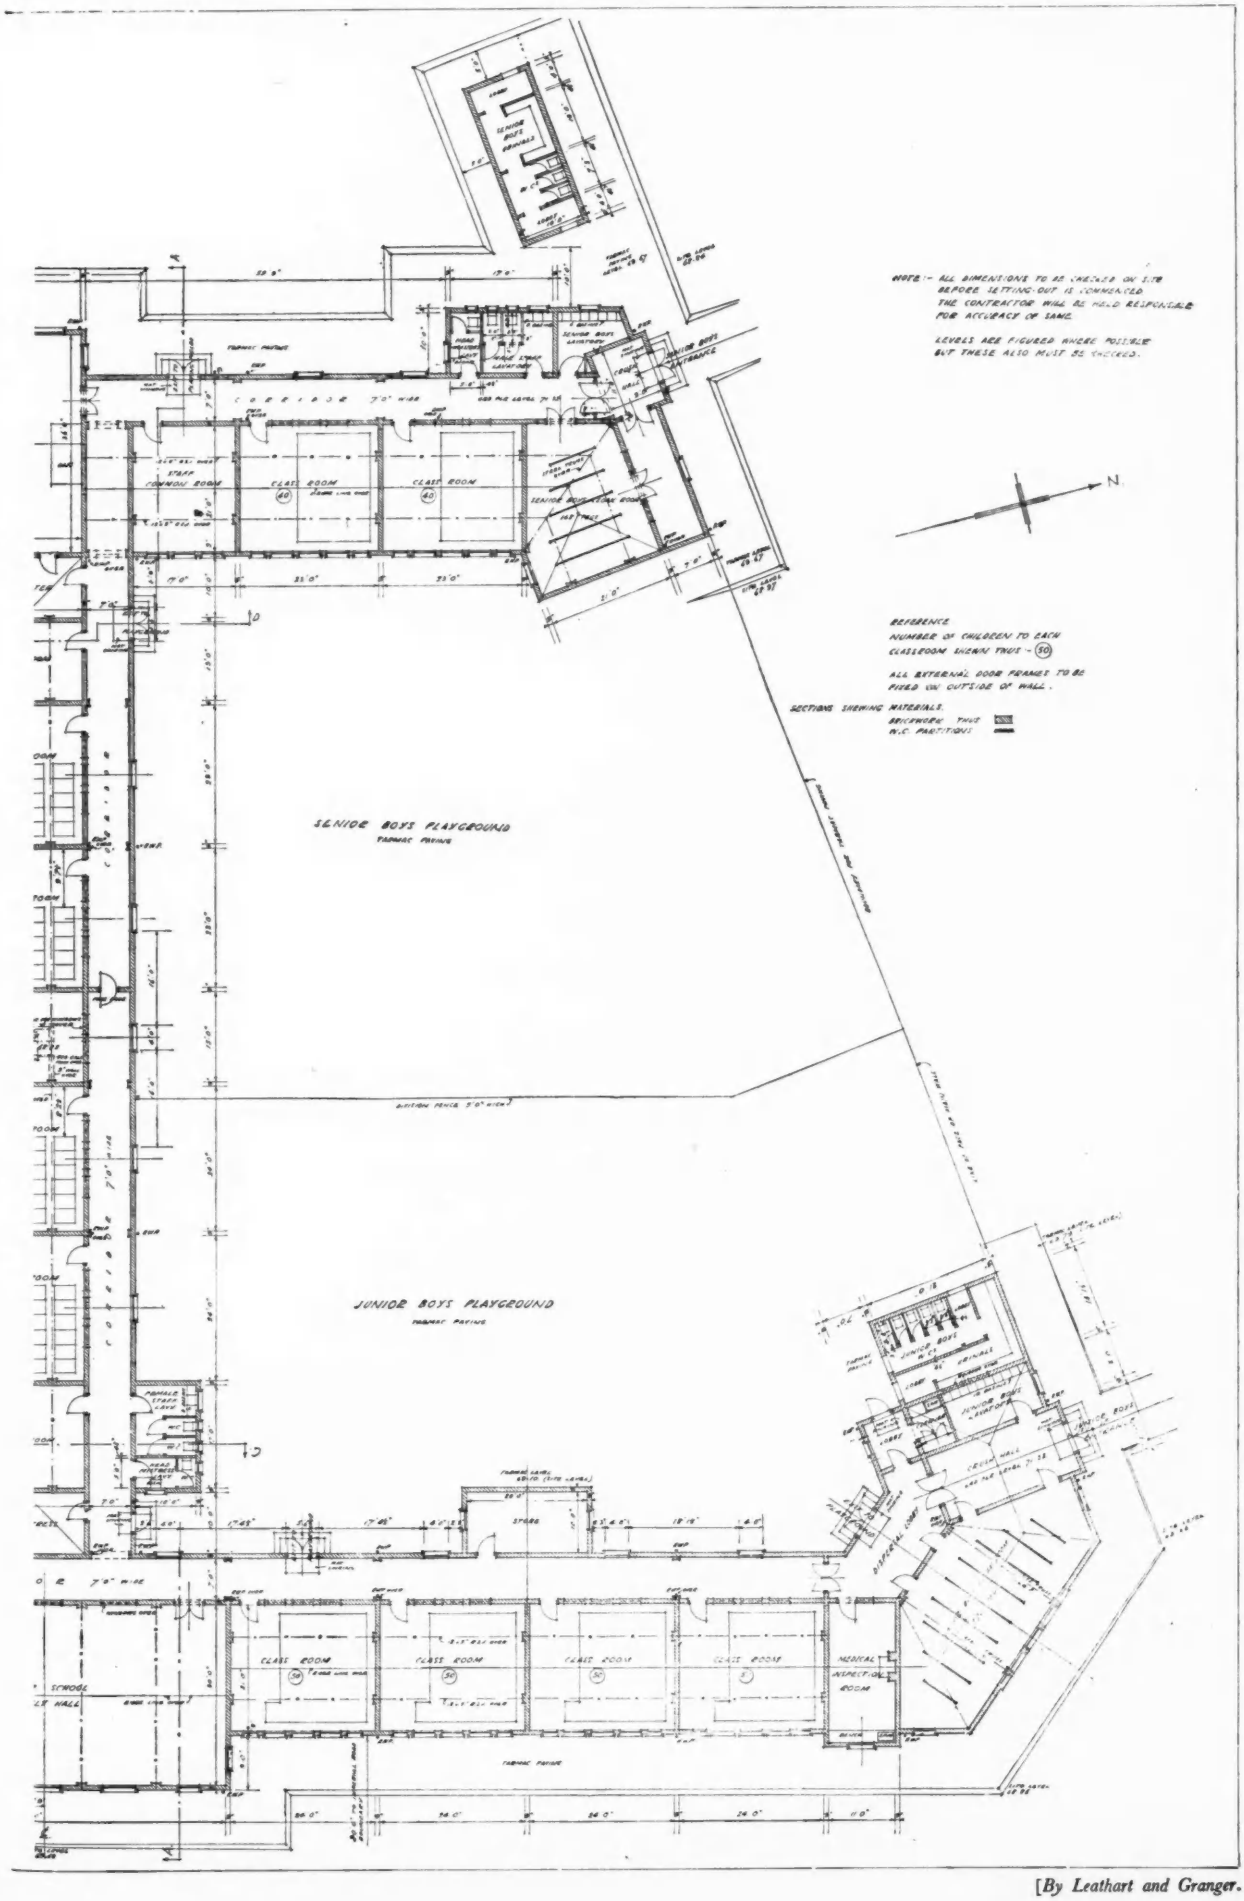
Double Quadrangle

AND GRANGER

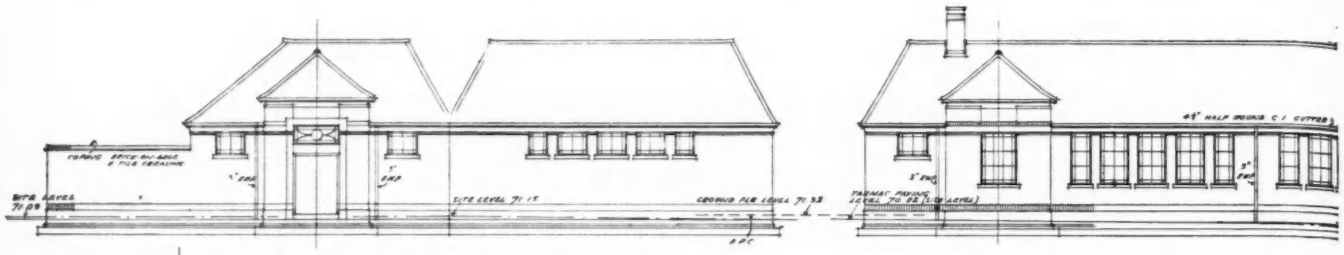


The roofs are built to a pitch of 40°, and are covered with hand-made sand-faced tiles of a rich cherry red. Eaves are in pre-cast stone, and the plinth is finished in white cement rendering. In the classrooms the casements are of the austral type, the metal windows being painted white externally and yellow internally.

All the classrooms, halls, etc., are plastered and finished with buttercup yellow walls with a grey-blue painted dado; and the floors are of Austrian oak blocks. The internal angles of the rooms, the junctions between the walls and ceilings and the junctions between the walls and the floors are coned to a 3-in. radius. For ventilation purposes the classrooms are designed to a greater height than the corridors, the roofs of which have been kept as low as possible. Heating is by a low-pressure hot-water system by means of radiators and exposed flow-pipes in the corridors and classrooms. The doors throughout are single panel Columbian pine. All woodwork inside is royal blue, the doors dark blue and the architraves light blue. Tarmac is used for the playgrounds and approaches.



The school is so planned that it is capable of extension by future class-rooms for each department. When this extension is completed the building will have a double quadrangular plan with the playgrounds in the quadrangles.



The corridor in the junior girls' department is similar in design to those of all the departments. It is 7 ft. wide. One side, the left, overlooks the playground, from which it receives good natural lighting, and on the other are planned the assembly hall and the classrooms.

IN PARLIAMENT

BY OUR SPECIAL REPRESENTATIVE

AT question time in the House of Commons, Mr. Simon asked the Secretary to the Treasury what was the present rate of interest charged by the Public Works Loan Board to local authorities for loans for the purposes of housing construction; when the last alteration in the rate came into effect; and whether any decrease in the said rate of interest could now be made in view of the recent reductions in bank rates.

Mr. Pethick Lawrence said that loans to local authorities for the purpose of housing construction were made at the minimum rate in force for the time being. Since October 15 last that had been 5¼ per cent. per annum, but in view of the present monetary conditions it had been decided to reduce the minimum rate for local loans from 5¼ per cent. to 5 per cent. as from March 21. The other rates would at the same time be lowered by ¼ per cent.

Dr. Hastings asked the Minister of Health whether any convictions had been secured by local authorities since 1926 for the emission of smoke other than black smoke from buildings.

Mr. Greenwood said he had no information of convictions for the emission of other than black smoke, and he did not think that the expense of a general inquiry in order to obtain comprehensive information would be justified. Local authorities generally proceeded by representations and usually prosecuted only as a last resort.

Dr. Hastings asked if the Minister would be prepared to approve by-laws under section 2, sub-sections (1) and (2), of the Smoke Abatement Act, 1926, defining noxious smoke as smoke of some specified density as measured by the Ringlemann test, which had been used for many years in the United States of America.

Mr. Greenwood said he was aware that in some places in the United States this test had been used, but no local authority in this country had proposed to embody it in by-laws under the Act of 1926 and, as at present advised, he did not think it was suitable for that purpose.

Major Nathan asked the Minister of Health whether he was yet in a position to state when he proposed to introduce the projected Bill dealing with slum clearance.

Mr. Greenwood said he hoped to introduce the Bill at a very early date.

Asked by Mr. Sawyer what was the annual expenditure incurred by his department in connection with town-planning schemes and their preparation, the number of his staff engaged in such work, and how many town-planning schemes had actually been adopted and were in operation, Mr. Greenwood said the number of staff at present employed was twenty-nine, and the expenditure for the current financial year would amount approximately to £13,500. The number of town-planning schemes approved and in operation was thirty-four. In addition, thirty-two schemes had been submitted and were under consideration, 150 preliminary statements had been approved, and another 141 had been submitted and were being examined, and in 492 other cases resolutions to prepare schemes had been passed and proposals were in various stages of consideration. Further, appeals on a number of town-planning matters had to be decided by him.

Mr. Greenwood also informed Mr. Sawyer that since 1918 local authorities had acquired 73,033 acres of land under the Housing Acts, at a total capital cost of approximately £15,200,000.

Mr. Lansbury, the First Commissioner of Works, stated that the cost of the restoration of the stonework, etc., of the Houses of Parliament had been tentatively estimated as being in the neighbourhood of £1,000,000.

Mr. Mathers asked the First Commissioner of Works if the model and plans of the building to be erected upon the Calton jail site in Edinburgh had now been completed; if so, when they would be made available for inspection by the Scottish Fine Art Commission and the Edinburgh City Corporation; and whether the model would be made available for examination by Members of the House after these two bodies had inspected it.

Mr. Lansbury said that the answer to the first part of the question was in the affirmative, and the model and plans of the proposed buildings were now before the Royal Fine Art Commission for Scotland for their consideration and advice. Until he had received and considered their report, he would not be in a position to consider what further steps should be taken as to submitting the designs either to the Edinburgh City Corporation or to Members of the House.

THE LONDON BUILDING ACTS

From a Correspondent

SINCE the year 1667, when the "Act for rebuilding the City of London" was passed, after the Great Fire, its citizens have constantly been guided and controlled in their building activities by amendments and extensions of the law affecting buildings and their surroundings. The growth of the metropolis, the introduction of new materials, and changes in the mode of life of the population have called for periodical revisions of the enactments for the protection of the public.

From footings and foundations to chimney-caps and sky-signs, from private streets and noxious businesses to buildings of mixed construction, the details of buildings and their appendages have been regulated. Twelve Acts have passed into law since the London Building Act of 1894, containing further provisions controlling building.

The Bill now before Parliament was deposited in 1928. It is framed to consolidate into one Act the enactments relating to streets and buildings in the County of London.

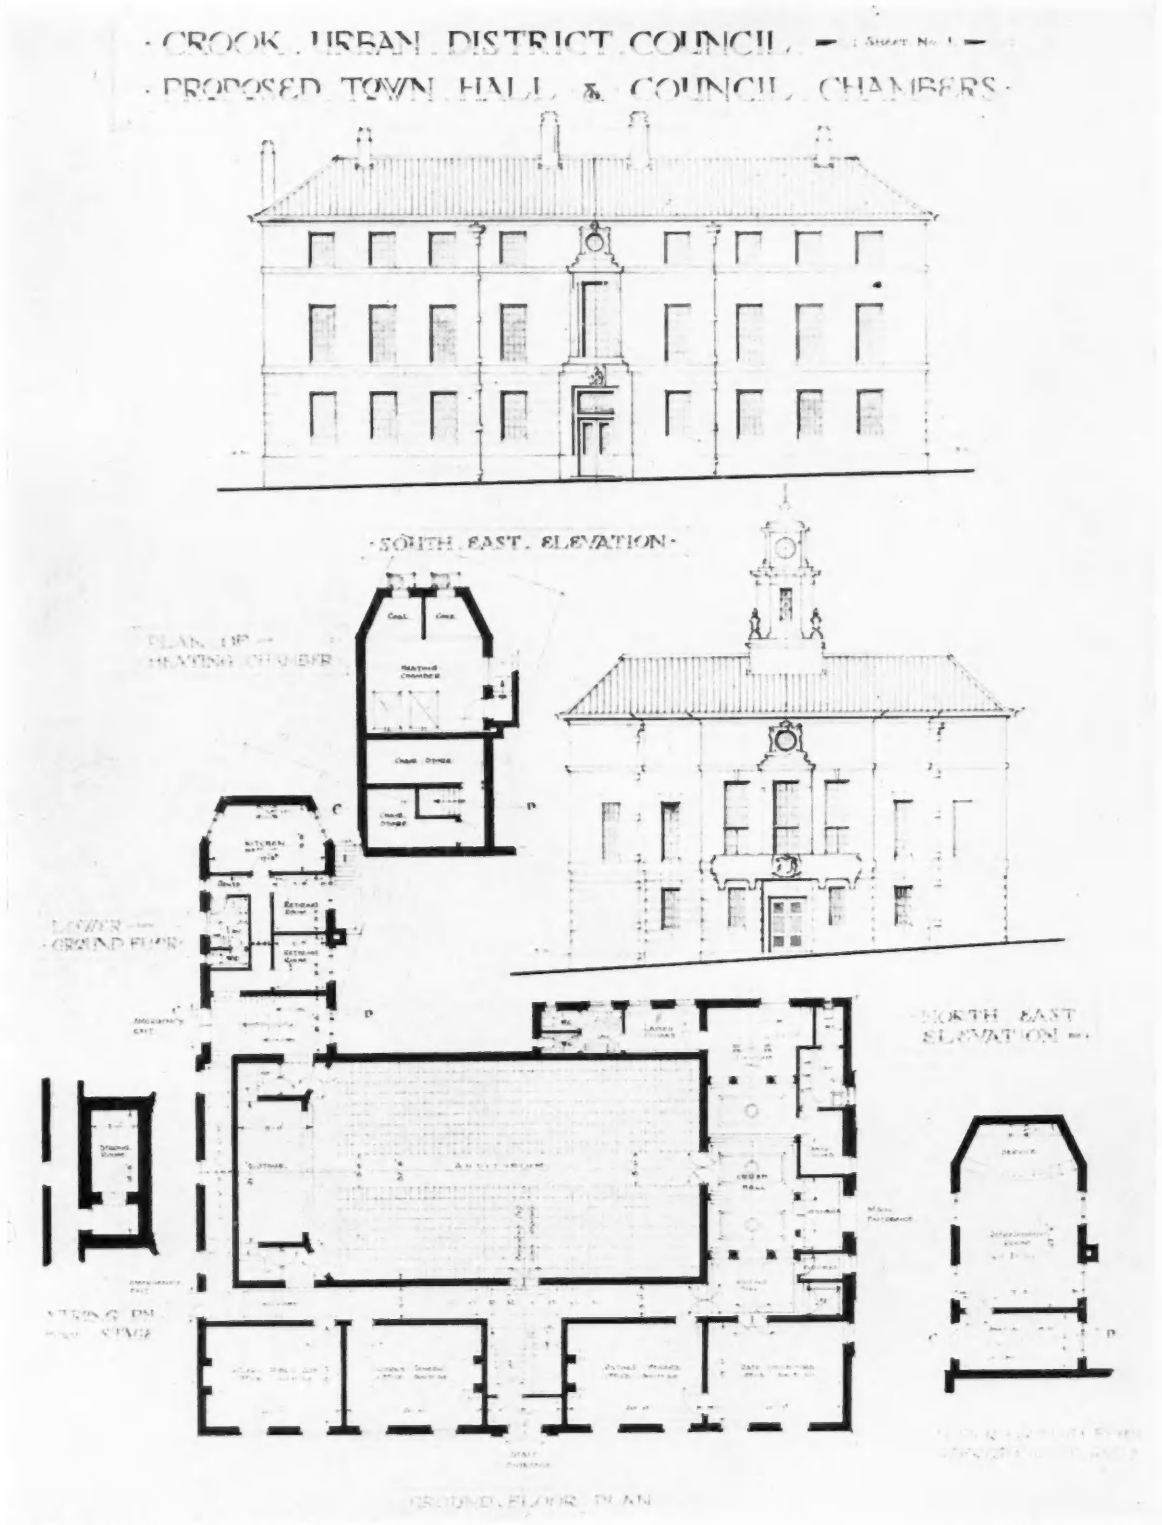
Upon a perusal of the draft Bill it will be noticed that section 54 of Part VI contains the general regulations for steel-framed buildings. Section 55 authorizes the County Council to make regulations for reinforced concrete buildings, whilst section 230 provides for the continuance of the present regulations. The portion of the 1908 Act dealing with cubical extent and the uniting of buildings appears as sections 76 to 79. Means of escape in case of fire is covered by Part VIII, and the rights of building and adjoining owners by Part IX.

The six schedules set out the materials classed as "fire-resisting," rules for wall thicknesses, details of steel-framed buildings, fees payable to the council and district surveyors, and a list of enactments repealed.

Those in contact with the administration of the Acts in London will observe with some regret that the familiar numbers designating the sections of the Act will be altered in most cases. Sections 22, 73, 83, 201 and 207, for instance, now become 21, 74, 85, 216 and 223 respectively. The meaning of some sections has been elucidated by a slight simplification of the text.

No attempt has been made to introduce any amendments of the Acts now in force; but when the Bill passes into law the time will be opportune for the framing of an amending Bill to incorporate such variations as have been found to be desirable. Proposals to this end have been under the fullest consideration for many years by the R.I.B.A., the technical societies, and others whose interests are involved.

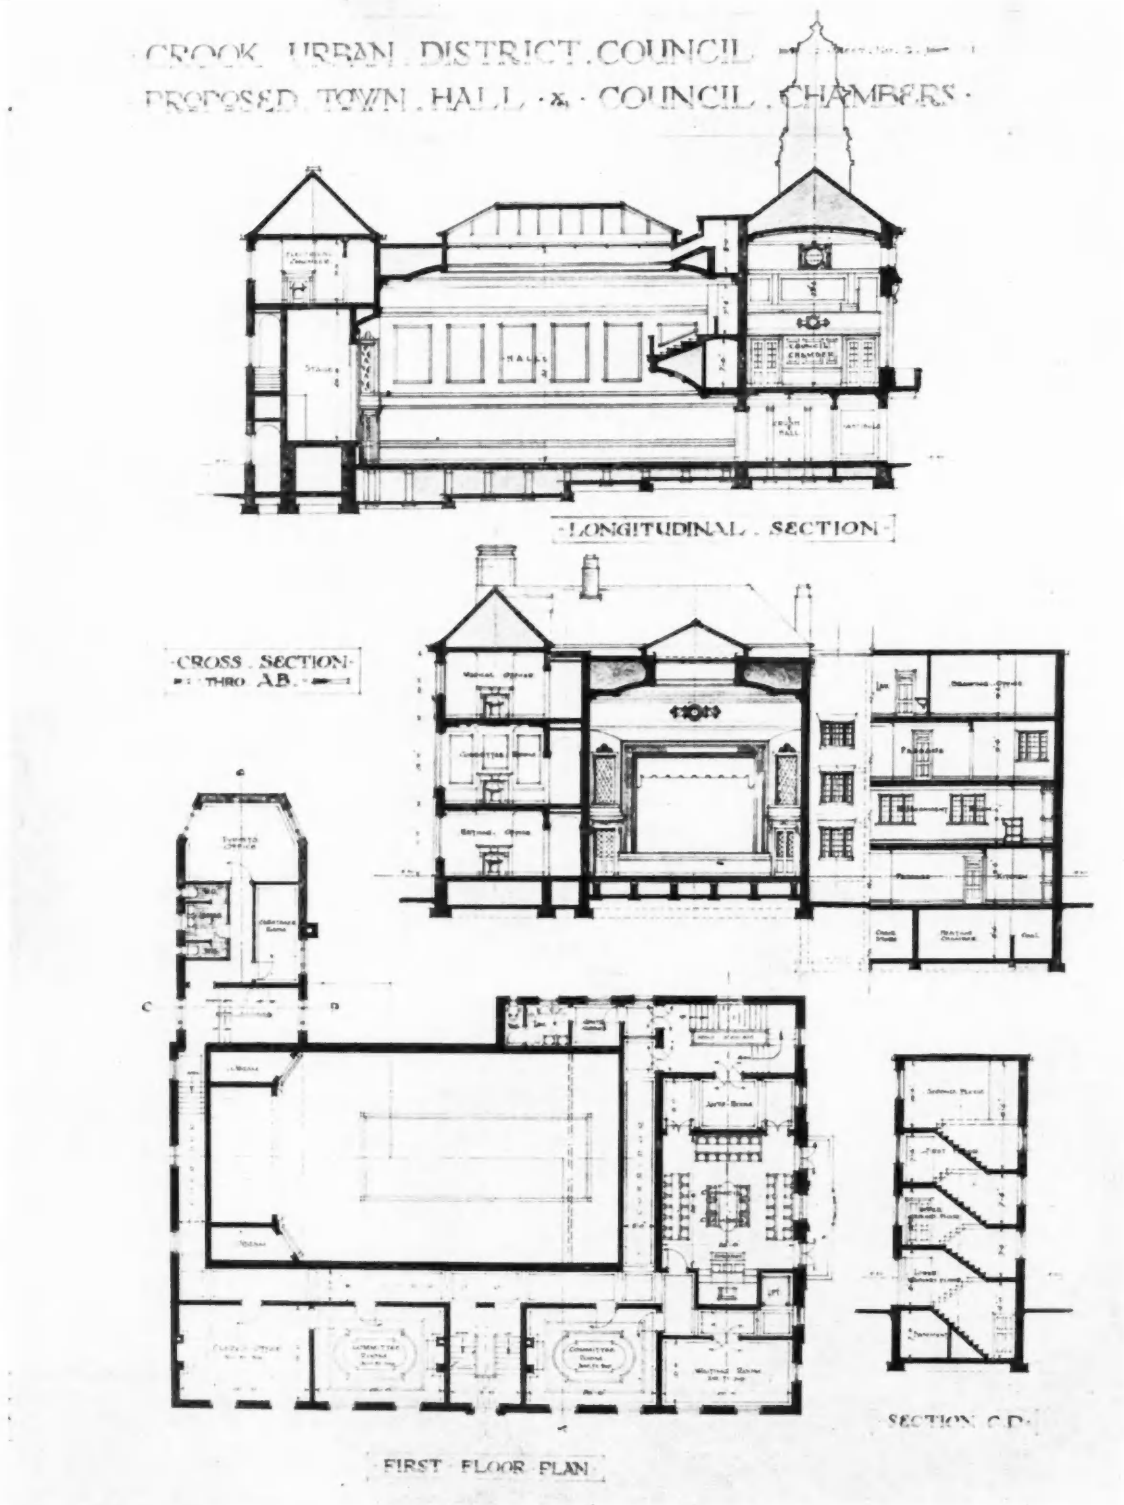
ENGLISH PRECEDENT No. 108



HOUSE IN BANBURY, OXON

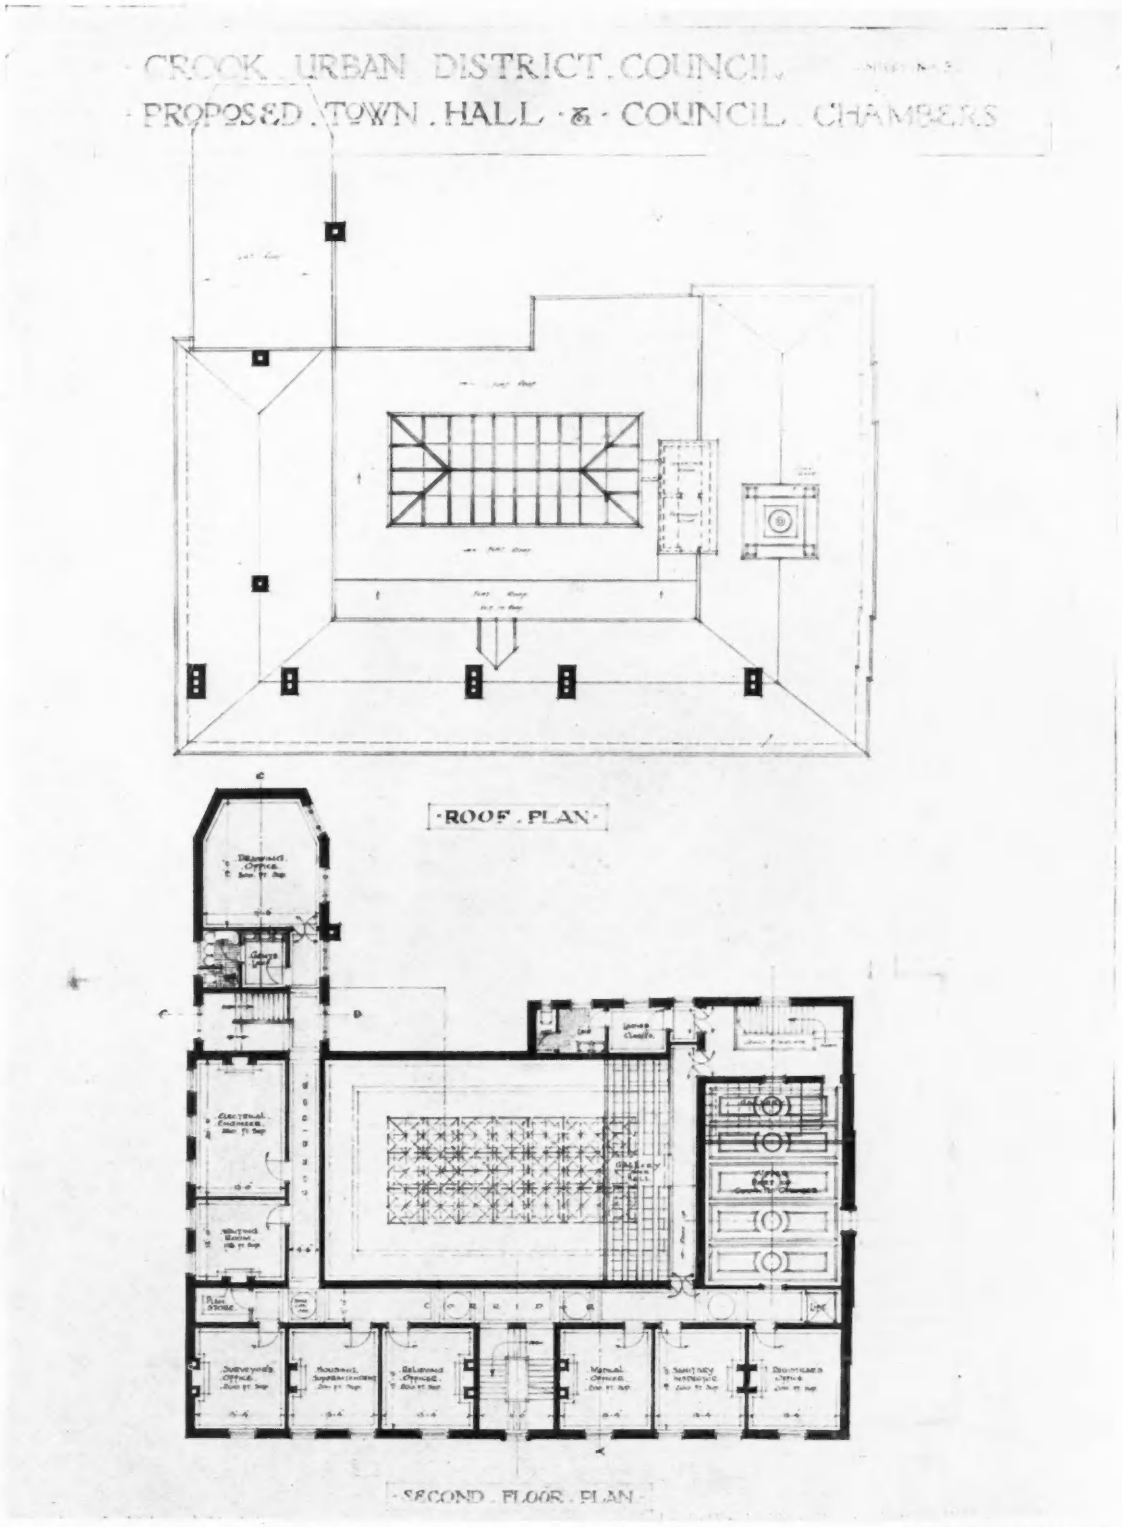
This, at first sight, homogeneous assemblage of Tudor details resolves itself, on examination, into a hotchpotch, mixed and confused as only the early days of the Renaissance in England could produce.

The house itself emerges from the fortified keep, wearing still its crenellated headdress, even though the large windows have forgotten the art of defence. The porch, in which traditional mouldings play with importations from the Continent, bears proudly the arms of the owner, flanked by a pair of nervous, intruding columns, slim forerunners of a mighty invasion.



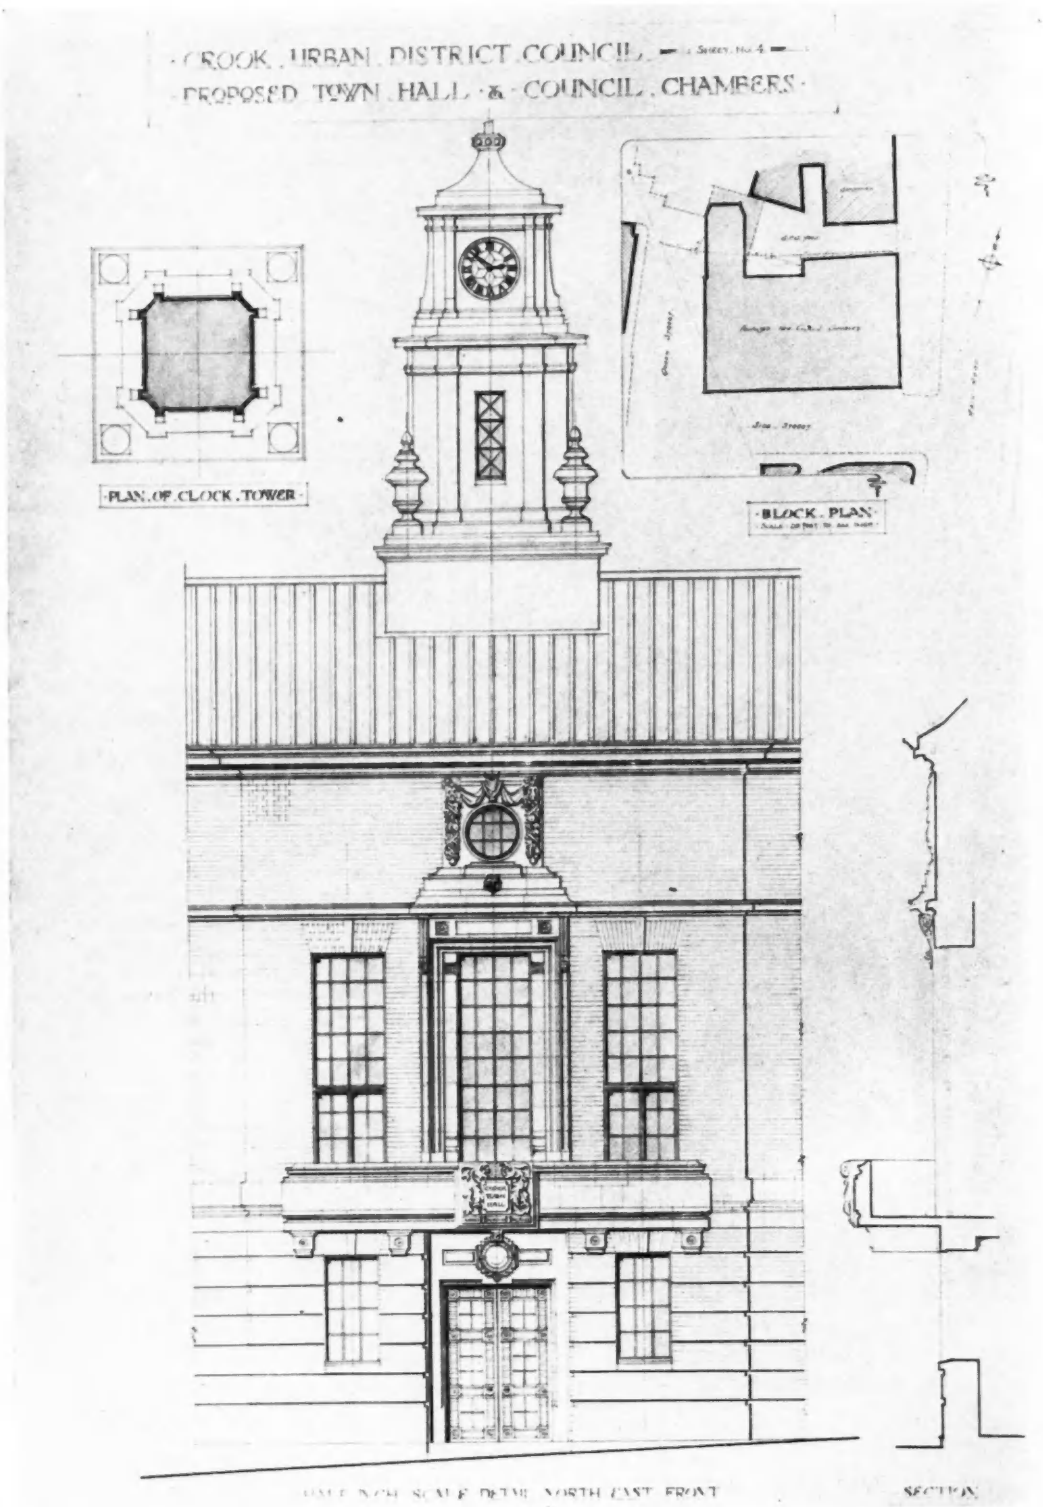
Everything about it is old now, and none of these things matters.

—[E. MAXWELL FRY.]



Crook Town Hall Competition. The Winning Design.] *[By Hicks and Charlewood.*

On this and the following three pages is illustrated the winning design in the Crook Town Hall competition. Mr. F. Willey, of Durham, the assessor, made his awards as follows: First, Hicks and Charlewood, Newcastle-on-Tyne; second, M. A. Cordingley, Durham; commended, Harrison and Ash, Newcastle-on-Tyne.



Crook Town Hall Competition. The Winning Design.] [*By Hicks and Charlewood.*

The most important feature of the first floor is the council chamber, with seating for thirty-six members of the Council, six officials, and three reporters. It is provided with a gallery with separate access for the public. The town hall, accommodating 500, and having a stage arranged for lectures, concerts and amateur plays, is planned on the ground floor (see previous page).

Crook Town Hall Competition. The Winning Design.] *[By Hicks and Charlewood.*

The second floor provides accommodation for officials of the Council. Crook is a small town with a population of about 13,000, in the centre of a mining and agricultural valley in the county of Durham. In addition to meeting the needs of the Council, the building would house, if necessary, local County Council officials engaged in public assistance and education work.

Crook Town Hall Competition. The Winning Design.] [*By Hicks and Charlewood.*

The block plan reproduced in this page of details shows the limitations of the site upon which the new town hall is planned. Exits from the building could only be arranged into Queen Street and no right of access or exit could be obtained from the General Post Office yard. The assessor of the competition estimates the cost of erecting the winning design as £18,355.

SOCIETIES AND INSTITUTIONS

ANNUAL RECEPTION OF THE A.A.

MR. F. WINTON NEWMAN, F.R.I.B.A., President of the Architectural Association, and Mrs. Newman, received the guests at the eighty-second annual reception which was held at 34 Bedford Square on Wednesday last. About 800 members and friends were present.

ULSTER ARCHITECTS' ANNUAL DINNER

Sir Banister Fletcher, P.R.I.B.A., was the principal guest at the annual dinner of the Ulster Society of Architects, held at Belfast. Mr. E. Kennedy, F.R.I.B.A., occupied the chair.

Dr. R. W. Livingstone, proposing the toast of "The Government of Northern Ireland," said it was satisfactory to know that in the near future they might look forward to a Town-planning Bill, and they also appreciated the Government's practical interest in architectural education, a matter of as great importance to local architects as to the public for whom they built and who received from them the buildings of the future.

The toast of the "R.I.B.A. and its Allied Societies" was proposed by the Recorder of Belfast, Judge Thompson, who spoke of changes in the popularity of styles of architecture, and said he sometimes wished there were not quite so violent or such sudden swings from one extreme to another.

Sir Banister, in response, said he was glad to learn that a regional planning scheme was about to be started in Ulster. It was very necessary to have such a scheme for a large and growing city like Belfast. The Greater London scheme now afoot covered an area of 20,000 square miles, and extended as far as twenty-five miles from the centre of the city. It was a big scheme, but a regional planning scheme must be big, and in London they were looking for a new town-planning measure that would stop ribbon development and prevent the erection of unsightly elevations. They were also up against the question of the erection of public buildings with the aid of the Office of Works.

He was also extremely interested to learn that there was a proposal to have a school of architecture attached to the University and under their own control. He hoped and trusted it would become an effective proposition, and he wished it every success.

POST-WAR ARCHITECTURE

Mr. Stanley C. Ramsey, F.R.I.B.A., lecturing in the Arts Building of the Manchester University on Post-War Architecture, said that extremely modernistic work was expressive of urban and suburban conditions, rather than of the more traditional conditions of the countryside. The work of modernist architects was an attempt not so much to replace the country house and the country cottage, as to offer an alternative to the work of the speculative builder; or, in other words, to try to clear up the industrial mess of the nineteenth century.

The design of both the interior and exterior of the post-war house, he added, seemed to show far greater changes than did the planning itself. For example, they might have a simplified Georgian house, indicative of modernistic tendencies on the part of the architect, with very thick brick walls and conventionally arranged rooms.

Speaking of the practical requirements embodied in a post-war house, the lecturer said that far greater importance was given to labour-saving devices and the demand for a greater number of bathrooms in proportion to the number of inhabitants. Quite small houses of four and five rooms nowadays frequently had two bathrooms, whilst any house with over five bedrooms had three bathrooms—one for the family, one for the guests, and one for the servants.

Mr. Ramsey concluded by saying that now that they could effectively warm their houses, not only by steam, but by electric panels in ceilings and walls, they had nothing to be afraid of in great areas of glass.

The lecture was profusely illustrated by lantern slides of modern work.

EDUCATIONAL POLICY OF THE INSTITUTE OF ARBITRATORS

The educational policy of the Institute of Arbitrators was the subject of a paper, read at a luncheon given by them to kindred bodies, by Mr. Alan W. Davson, F.S.I., Chairman of the Education Committee. Mr. E. S. Underwood, F.R.I.B.A., President of the Institute, was in the chair.

In considering the educational programme, Mr. Davson pointed out that the general policy of the Institute was never lost sight of, namely, to provide efficient arbitrators and to overcome the objections to arbitration which in the past have been made, not without some justification. The business man wanted an efficient arbitrator; they were looking forward and they felt that, whilst an arbitrator did not require, in addition to his specialist knowledge, to be in any sense a legal expert, he would not be fitted for the onerous position without an elementary knowledge of the law and procedure with which he had to deal. In the interest of the parties and the arbitrators, the Institute established, in 1926, a code of rules under which arbitrations conducted under the auspices of the Institute would be carried through. These rules were recently revised, and, in addition, a new code initiated to meet the needs of business men in suitable cases where all were agreed that the cost should be kept down to the minimum.

He invited the representatives of the various institutions present to give consideration to the following suggestions: (1) As their panels of tested arbitrators become depleted, to fill them from their own members who were also on the panel of the Institute of Arbitrators. (2) To make it clear to younger members that the dual qualifications would be looked upon with favour. (3) To assist the Institute to get its activities better known to members of the respective bodies by ways and means to be discussed.

In conclusion, Mr. Davson said that membership was not restricted to professional members, although it was hoped everyone eligible would assist the cause by joining.

Mr. L. S. Sullivan, Chairman of the Board of Architectural Education, offered a few warnings on the educational policy, which were gratefully accepted by Mr. Underwood on behalf of the Institute.

MR. MORRISON ON ELECTRICAL DEVELOPMENT

The annual luncheon of the British Electrical Development Association was held at the Savoy Hotel on Friday last. Captain J. M. Donaldson, chairman of the Association, presided over a gathering of about 400 members and guests.

Mr. Herbert Morrison, M.P., Minister of Transport, who was the principal guest, referring to progress in the electrical industry, said that the output of authorized undertakings in Great Britain had grown from 3,600,000,000 units in 1922 to 7,600,000,000 units in 1928. Substantial as this progress was, Britain was still much behind the United States of America, where the total output in 1928 was 97,000,000,000 units. It was claimed that 68 per cent. of the population of the United States were living in electrified homes, that 500,000 farms were electrified, and that three-quarters of all power in industry was electrical, while, in Britain, it was estimated that only 18 per cent. of the houses were wired, that not one in fifty of these was completely electrified, and that the present output represented only some 15 per cent. of the possible home field.

He pointed out that if British con-

sumption was to reach a level corresponding to that in the United States, our annual output should be 30,000,000,000 units instead of the probable 8,500,000,000 units in 1929.

He stated that the Electricity Commissioners, in association with the Ministry of Transport and the Central Electricity Board, had manifested great energy in the development of electricity supply, and it was his ambition as Minister of Transport to enable the work of these bodies to become even more effective than it had been, with the object of establishing a great nationally organized industry.

R.I.B.A. COUNCIL MEETING

Following are notes from a recent general meeting of the Council of the R.I.B.A. :

Examinations. The Board reported that one candidate had been examined for the R.I.B.A. Diploma in Town Planning and had been relegated.

R.I.B.A. Final Examination. It was decided, on the recommendation of the Board, to amend the regulations relating to the submission of Theses for the Final Examination by adding a fourth section, entitled "Town Planning," to the list of subjects.

R.I.B.A. Intermediate Examination. It was decided that the syllabus, which is at present "A paper on the General History of Architecture," be amended to read as follows : "A paper on the General History of Architecture up to and including the first quarter of the nineteenth century."

R.I.B.A. Intermediate Examination Testimonies of Study. It was decided that the existing regulation for Section C, Measured Drawings—which is as follows : "Section C, Measured Drawings. Sheets 4 and 5, Measured Drawings of an existing building or portion of a building, not of recent construction, to be selected by the candidate. His plottings and sketches are also to be submitted"—be amended to the effect that Section C, Sheet 4, shall consist of "Measured Drawings of an existing building or portion of a building, not of recent construction, to be selected by the candidate. His plottings and sketches are also to be submitted. Care must be exercised to select a building of architectural merit, and such essentials as stone jointing, etc., should be clearly indicated. If the candidate is in doubt as to a suitable subject he should communicate with the Secretary to the Board of Architectural Education. Sheet 5 shall consist of simple design based on the subject measured for Sheet 4 after that sheet has been approved by the Examiners."

Acoustics and the R.I.B.A. Final Examination. It was decided that (1) Two out of the six subjects set annually as R.I.B.A. Problems in Design be subjects involving a simple acoustic treatment with calculations to give the appropriate time of reverberation. It will be compulsory for all candidates before applying for admission to the Final Examination to include in the four Testimonies of Study at least one of these two subjects. (2) A list of articles and books on the subject be issued with each list of R.I.B.A. Problems in Design to guide candidates in obtaining the necessary information.

Schools. It was decided that the recognition of the three years' Degree Course and the three years' Diploma Course for exemption from the R.I.B.A. Intermediate Examination be continued.

Architectural Students and (a) Experience on Buildings in the Course of Erection and (b) Records of Historic Buildings. On the recommendation of the Board it was decided that : (1) The Institute of Builders be invited to draw up lists of builders willing to give facilities to architectural students for studying building work. (2) The Surveys in London and elsewhere be requested to furnish the R.I.B.A. with lists of typical or essential buildings which should be recorded. It is suggested that types of local building in all parts of the country should be included. (3) These lists when furnished to the R.I.B.A. be sent to the recognized Schools of Architecture.

Competition for new R.I.B.A. Building. On the recommendation of the Allied Societies' Conference it was decided that the competition for the new R.I.B.A. building be thrown open to members of allied societies as well as the members of the R.I.B.A.

The Institute of South African Architects and Registration. On the recommendation of the Registration Committee it was decided to make a grant of £100 to the Institute of South African Architects towards their expenses in securing the passing of the South African Architects' Registration Act.

Reinstatement. The following ex-members were reinstated. As Associates : Messrs. C. J. Brooks, Frank G. Geary, W. J. Leahy. As Licentiate : Mr. Ernest Pawley.

Five applications were approved for election as Licentiates under Section III. (f) of the Supplemental Charter of 1925.

The following member was transferred to the Retired Fellowship : Mr. John Bilson (elected Associate 1881, Fellow 1891).

Resignation. The following resignation was accepted with regret : Mr. William Finlayson, F.R.I.B.A.

Election of Students. The following Probationers were elected as Students of the R.I.B.A. :

Aitken, J. M. (Edinburgh College of Art).
Day, E. A. (Northern Polytechnic).
Dumville, M. R. (Northern Polytechnic).
Eaton, N. M. (University of Witwatersrand).
Furbur, E. R. (Liverpool School of Architecture).
Goodacre, N. W. (Liverpool School of Architecture).
Haywood, N. B. (Liverpool School of Architecture).
Hughes, H. J. (Welsh School of Architecture).
Kerr, F. A. (Edinburgh College of Art).
Laing, J. W. (Edinburgh College of Art).
McIntosh, W. G. (University of Witwatersrand).
McRae, D. G. W. (University of Toronto).
Martienssen, R. D. (University of Witwatersrand).
Miles, M. (Liverpool School of Architecture).
Nunn, A. V. (Special Exemption).
Stacy, E. F. (Northern Polytechnic).
Richards, I. F. B. (Welsh School of Architecture).
Smith, P. C. (University of Cambridge).
Turnor, C. R. (Architectural Association).

EARLY CHRISTIAN CHURCHES

Sir Banister Fletcher, P.R.I.B.A., described the Early Christian Churches in Syria and the Near East, and at Ravenna and Torcello in Italy, and also gave a brief description of Early Christian baptisteries and tombs, in his lecture at the Central School of Arts and Crafts on Wednesday last.

SHORT COURSES FOR TEACHERS

The Board of Education has arranged a short course of lectures for teachers in recognized technical colleges and schools, art schools, junior technical schools, etc., in England and Wales, to include the following subjects : Engineering science and electrical engineering, to be held at Oxford; and building, painting and decorating, gas engineering and gas supply and methods of teaching upholstery, to be held in London.

The lectures will be held in July. Further particulars may be obtained after April 1 on application to the Secretary, Board of Education, Whitehall, London, W.C.1.

ANNUAL DINNER OF THE NORTH STAFFORDSHIRE ARCHITECTURAL ASSOCIATION

The fourth annual dinner of the North Staffordshire Architectural Association was held at Stoke on March 18, with Mr. E. T. Watkins, president, in the chair.

Sir Banister Fletcher, P.R.I.B.A., in reply to the toast of the "R.I.B.A. and the North Staffordshire Architectural Association," proposed by Ald. F. Hayward, said that while there were regulations dealing with the thickness of the walls they were to build, the area and height of the rooms and the sanitary arrangements, the only things that the public saw were the elevations of buildings. They wanted, if possible,

to have some control in that respect. The treatment and control of elevations was essential, because they were seen by almost everybody, and, if possible, any offence to people's sense of beauty should be prevented.

Mr. Joseph Emberton, A.R.I.B.A., in proposing the toast of the "City of Stoke-on-Trent," expressed the hope that new buildings in that city would have much glass, and would be well ventilated and comfortably heated, and that they would really express what they were doing. In that way each building would attain an individuality which would be both interesting to the public and of commercial value to the proprietor. The advertising value of a building with individuality was very considerable. Hitherto they had tried to disguise it—to make it respectable by covering it up with some ancient form of ornament which had nothing to do with the job. Mr. Emberton thought that it was not a man's job to make pretty buildings, but to make useful ones, and discounted the value of the public control of elevations.

COMPETITION CALENDAR

March 31. — The Accrington Corporation invites architects of British nationality to submit designs in competition for new Police and Fire Stations which it is proposed to erect on a site in Manchester Road, Accrington. Assessor: Herbert J. Rowse, F.R.I.B.A. Premiums: £250, £150 and £100. Conditions of the competition, together with a plan of the site and all particulars, may be obtained from William Henry Warhurst, LL.B., Town Clerk, Town Hall, Accrington. Designs to be submitted before March 31.

April 28.—Messrs. Josiah Wedgwood and Sons, Ltd., invite designs in competition for a Wedgwood Vase, to be made in commemoration of the Bicentenary of the Birth of Josiah Wedgwood, which will be celebrated this year. Assessors: Philip Connard, R.A., W. Reid Dick, A.R.A., H. S. Goodhart-Rendel, F.R.I.B.A., and Frank H. Wedgwood. Premiums: £100, £50 and £25. Full particulars may be obtained on application to the Secretary, Messrs. Josiah Wedgwood and Sons, Ltd., Etruria, Stoke-on-Trent. Latest date for submission of designs: April 28.

June 14. — The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit, £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

LAW REPORTS

PLANS FOR A CINEMA

Winstanley v. *Smith and Beech. Manchester Assizes*

This was an action for a breach of agreement in respect of the plans of a Winsford cinema. The case was heard at Manchester Assizes, when Albert Winstanley, architect, of St. Annes, was awarded £120 and costs against Richard Smith and John Beech, cinema proprietors, of Sandbach.

It was stated for the plaintiff that at the request of the defendants he prepared plans for alterations to the Magnet Cinema, Winsford. His charge was £246 15s. The alterations were not proceeded with, and at an interview which took place between the parties defendants complained that the charge was heavy, and offered to pay £25. Plaintiff refused to accept, but agreed to give a receipt in full settlement on consideration that they would employ him as architect of a new cinema which they proposed to erect at Sandbach. Later he learned that another architect had been engaged for that work. Defendants said they did not mention the new cinema at Sandbach during the interview, but promised that they would employ him as architect if they proceeded with the alterations at the Winsford Cinema.

FLAT LAW—RIGHT OF INGRESS AND EGRESS

Macmorran v. *Flats Construction Co., Ltd. Chancery Division. Before Mr. Justice Luxmoore*

This case raised a point as to the right of a tenant to free ingress to and egress from a flat by the front door of a block of flats at Queen's Gate, London, for herself and persons visiting her on business or otherwise.

Sir Thomas Hughes, K.C., for plaintiff, Mrs. Edith Kate Macmorran, said his client was the occupier of a flat on the fourth floor at 52 Queen's Gate, of which she took possession early in 1928. The hall porter was a servant of the defendants, her landlords, and she discovered that he was in the habit of questioning visitors to her flat as to the nature of their business. His instructions were that in some cases the hall porter had refused admission unless the individual produced a permit issued by the landlords. Her complaint under these circumstances was that the right of access to her flat had been seriously interfered with by the defendants. Plaintiff therefore sought a declaration that she was entitled to reasonable ingress and egress by the front door for all persons who wished to visit her.

Mr. F. Archer, K.C., for the defendants, said his clients had made a rule that persons coming to the flats to work should not be admitted to the building without a permit. The hall porter would, therefore, ask persons who were strangers the purport of their business. The tenants held their flats under a lease, and defendants' contention was that they had acted justifiably and reasonably having regard to the obligations of the lease.

His lordship held that the plaintiff was entitled to the declaration she sought, with costs. The document creating the tenancy, said his lordship, meant that the tenant should have all reasonable facilities for ingress and egress for herself and her visitors and all persons coming to the premises. There was no limitation as to the persons who were to have that right beyond the fact that they must be persons coming to the flat lawfully as guests or on the business of the plaintiff. He granted the declaration asked for with costs.

TRADE NOTES

The recently completed showrooms at 36 Newman Street, W.1, which the Merchant Trading Co., Ltd., has just opened for the convenience of architects, are designed to afford facilities to members of the profession for becoming practically acquainted with the series of building specialities now exclusively handled by this Company. These include various Celotex products, numerous examples of Metco, Woco and Laminex doors, and Salubra and Tekko wall coverings. The showrooms serve the purpose of exhibition galleries and embody in their construction and finish between forty and fifty decorative and acoustic applications of Celotex. In addition, they are equipped with apparatus for demonstrating the sound-absorptive and insulating properties of the material. Of particular interest to architects are the highly suggestive decorative effects produced by stencilling in colour directly on to the surface. Other applications illustrate the satisfactory results which untouched Celotex panels present when the nailed

margins at the joints are merely covered with 2½-in. strips of the same material, rounded at the edges with sandpaper. Where economy is a consideration—such as in housing work—this method of finishing has much to commend it.

How many miles of clear legible line can be made with 6 ins. of an HB. Venus pencil? The manufacturers have made a test—6 ins. of the pencil were used—and the mileage found. What was the mileage? It is a matter of drawing fine lines, which, if scientifically applied, will obtain nearest results. The manufacturers are giving a prize of £100 to the sender of the correct figure of their own sealed mileage (miles, yards, feet), or the estimate nearest their figure. If more than one correct (or nearest) result is given, the prize will be divided. The decision of the directors is final. The conditions of the competition are as follows: Buy a 4d. Venus HB. grade pencil at a stationer's and receive a coupon with it—then use the pencil—6 ins. only—fill in the coupon with name, address (in capitals) and estimate of mileage, and send, together with last inch stub of pencil, showing graded end. Estimates are to be sent to Competition Department, Venus House, Lower Clapton Road, E.5. Watch stationer's window for closing date and results.

The firm of John Booth and Sons, says Ashley Sterne, in an amusing introduction to *Problems of a Structural Engineer* by W. Heath Robinson, are "the men who put the bolt in Bolton, and thus succeeded in riveting the attention of every earnest student of the steeling art, from the days of the late Charles Peace up to the present time." "Do you want a nice bridge?" he asks. "They will make one to measure for you—a 'contract' bridge, guaranteed to score heavy honours. A dinky little theatre? They will erect you structural steelwork so stout that even the most famous 'star' would fail to bring the house down." All the sketches—and some are in colour—show Heath Robinson at his best. There are many laughs in every sketch, but perhaps the funniest is an extension of business premises without the dislocation of trade. The publication, however, has a serious side: the illustration of some of the more recent big contracts for which the firm has been responsible.

A new company, styled the General Asphalte Co., Ltd., has been established with registered offices at Australia House, W.C.2. The managing director is Mr. Stewart Mitchell, who has considerable experience of all branches of the asphalte industry, and the firm is run throughout by men having a wide knowledge of the trade. The company is in a position to carry out any work that may be entrusted to it, and is also able to supply and lay high-grade Seyssel asphalte from the well-known mines in the Bassin de Seyssel, France.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Boys and Girls' School, New Windsor (pages 485, 486 and 498-505). General contractors, Y. J. Lovell and Son, who were also responsible for the excavation, foundations, dampcourses, joinery, plaster, and fixing of stonework. Sub-contractors: Lawfords & Co., asphalt; Binfield Brick Co., bricks; Pearson Bros. and Campbell, artificial stone; Edward Wood & Co., structural steel; Kleine Patent Fire Resisting Flooring Syndicate, Ltd., fireproof construction; Ames and Finnis, tiles; Luxfer Ltd., patent glazing; Stevens and Adams, Ltd., wood-block flooring; R. I. W. Products, Ltd., waterproofing materials; G. N. Haden and Sons, Ltd., central heating and boilers; C. Harvey & Co., electric wiring and electric light fixtures; Leeds Fireclay Co., Ltd., sanitary fittings; J. Gibbons, Ltd., door furniture; Henry Hope and Sons, Ltd., casements and window furniture; Thomas Elsley, Ltd., metalwork; Lockerbie and Wilkinson, Ltd., cloakroom fittings.

House in Southway, Hampstead Garden Suburb, N.W.11 (pages 518–519). General contractors, F. Troy & Co., Ltd., who were also responsible for the electric wiring. Sub-contractors: Ames and Finnis, tiles; Jefferiss & Co., wood-block flooring; Granwood, Ltd., and C. Robinson (Cork), patent flooring; Rosser and Russell, Ltd., central heating; Teale Fireplace Co. (London), Ltd., grates; Davis Gas Stove Co., Ltd., gas fixtures; Gas Light and Coke Co., gasfitting; National Radiator Co., Ltd., boilers; Shanks & Co., Ltd., and John Bolding and Sons, Ltd., sanitary fittings; James Gibbons, Ltd., door furniture; Henry Hope and Sons, Ltd., casements.

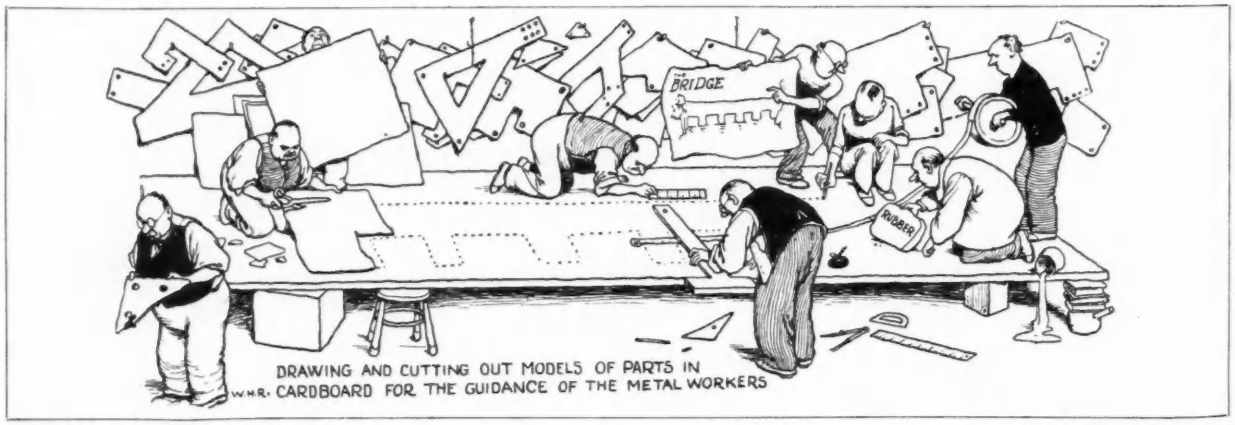
NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office, by our own patent expert. All enquiries concerning inventions patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, London, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATION

7439. Symentis Products, Ltd., and Jones, W. A. Panels, blocks, etc., for constructional, etc., purposes. March 7.

SPECIFICATIONS PUBLISHED



325911. Watson, J. A. Parquetry and like sectional flooring.

326012. Masterman, O. J., and Dixon, J. Concrete and analogous floor construction.

326124. Junkers, H. Structural members, more particularly for use in building walls.

ABSTRACT PUBLISHED

324184. Tabanou, J. Building blocks.

From Problems of a Structural Engineer.] [*By W. Heath Robinson.*

"Do you want a nice bridge? They will make one to measure for you—a 'contract' bridge, guaranteed to score heavy honours."

THE ARCHITECTS' DIARY

WEDNESDAY, MARCH 26

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Working Drawings. Until April 3. Also Students' Evening in connection with this Exhibition. **8 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "Architecture of To-day and To-morrow." By Howard Robertson, M.C., F.R.I.B.A., S.A.D.G. Charles Marriott, HON. A.R.I.B.A., will preside. **8 p.m.**

GOLDSMITHS' HALL, Foster Lane, E.C.2. "Nature and Modern Design." By Professor R. V. Gleadowe. (Lantern Illustrations.) **7 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Roman Architecture." By Sir Banister Fletcher, F.R.I.B.A. **6 p.m.**

WEST SURREY BUILDING TRADES EMPLOYERS' ASSOCIATION. At the Lion Hotel, High Street, Guildford. "The Causes and Prevention of Dry Rot." By E. H. B. Boulton. **6.30 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Meeting. "Nomography as Applied to Engineering." By Philip J. Pollock, B.A. Dr. Oscar Faber, O.B.E., M.INST.C.E., will occupy the chair. **6.30 p.m.**

MANSARD GALLERY, 196 Tottenham Court Road, W.1. Exhibition of Modern Glass and Colour Prints, Mansard Annexe. Exhibition of Landscape Painting. Open until April 17.

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C. 2. Open every Tuesday, Wednesday, Thursday, and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

IDEAL HOME EXHIBITION, Olympia, W. Organized by *The Daily Mail*. Open until April 17.

THURSDAY, MARCH 27

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee. **4.30 p.m.**

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At the Town Hall, Croydon. "The Construction of Modern Shop Fronts." By H. V. Lanchester, F.R.I.B.A. The Mayor of Croydon, Alderman T. Arthur Lewis, J.P., will preside. (Lantern Illustrations.) **7 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Some New Ideas on the Design of Dams." By E. Godfrey. **6.30 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Lacquerwork: Its History, Influence and Decorative Qualities." By E. R. Gribble. **7.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. "Development in Machine Telegraph Systems and Methods of Operation." By H. H. Harrison. (Light refreshments, 5.30 p.m.) **6 p.m.**

FRIDAY, MARCH 28

INSTITUTION OF ELECTRICAL ENGINEERS. North-Western Centre. At the Engineers' Club, 17 Albert Square, Manchester. "Marine Diesel Installations, with particular reference to Auxiliary Machinery." By J. Calderwood, M.Sc. **7.15 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. Annual General Meeting. Discussion on "Mechanical Solution of Statically Indeterminate Structures." To be opened by H. W. Coultas, M.Sc. **6.30 p.m.**

MASTER SIGN MAKERS' ASSOCIATION. First Annual Conference, to be opened by Arthur Chadwick, at the Holborn Restaurant (Kingly Street Entrance), W.C.1. **10.30 a.m.**

UNIVERSITY SETTLEMENT, Nile Street, Liverpool. Latest date for application for accommodation at the Housing and Town Planning Meetings.

SATURDAY, MARCH 29

Sunrise, 5.44 a.m. Sunset 6.27 p.m.

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. Various lectures and conferences for children on "Beautiful England in Education." 3 and 6.30 p.m. Also visit to Welwyn Garden City. (3s. return.) Meet at rear entrance of Guildhouse at 2.30 p.m. **2.30 p.m.**

MONDAY, MARCH 31

CARPENTERS' COMPANY, Carpenters' Hall, E.C.2. "Charing Cross Bridge." By Arthur Keen, F.R.I.B.A.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Discussion on "Loud-Speakers." To be opened by Captain P. P. Eckersley. **7 p.m.**

ACCRINGTON COMPETITION. Latest date for submission of designs for the New Police and Fire Stations.

TUESDAY, APRIL 1

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. Paper by H. Stratton Davis, M.C., F.R.I.B.A. **8 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. North-Western Centre. At the Engineers' Club, 17 Albert Square, Manchester. "The Imperial Chemical Industries, Ltd.'s Steam and Electric Power Plant at Billingham." By H. A. Humphrey, D. M. Buist and J. W. Bansall. (To be illustrated by a cinematograph film.) **7 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, Lancashire and Cheshire Branch. At the College of Technology, Manchester. Annual Business Meeting. **7 p.m.**

WEDNESDAY, APRIL 2

LONDON SOCIETY, Lancaster House, St. James's, S.W. 1. Visit to Wellington Barracks and the Guards' Chapel, under the guidance of Sir Neville R. Wilkinson, K.C.V.O., F.S.A. **2.30 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Building Craftsmanship." By Nathaniel Lloyd, O.B.E., F.S.A. Professor Charles H. Reilly, O.B.E., M.A., F.R.I.B.A., will preside. **8 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "Regional Planning." By Raymond Unwin, F.R.I.B.A. Helen Ward (Miss) will occupy the chair. (Lantern Illustrations.) **8 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Tees-side Sub-Centre. At the Cleveland Technical Institute, Middlesbrough. Annual General Meeting, 7 p.m. "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch." 7.30 p.m. **7 p.m.**

THURSDAY, APRIL 3

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. Students' Evening. **7 p.m.**

FRIDAY, APRIL 4

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "The Decentralization of Industry." By Captain R. L. Reiss. Dr. Sybil Plant will occupy the chair. **8 p.m.**

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION, The Castle, Winchester. Council Meeting, 3 p.m. General Meeting, 6.15 p.m. **3 p.m.**

ROYAL SANITARY INSTITUTE. In the Council Chamber, Plymouth. Sessional Meeting. Discussion on "The Reconstruction and Reconditioning of Working Class Houses," to be opened by Councillor A. E. H. Webb. Edward Willis, M.INST.C.E., F.S.I., M.INST.T., will preside. **6 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. "Studies in Low-Power-Factor Measurements at High Voltages." By E. H. Rayner, D.Sc., W. G. Standring, M.A., R. Davis, M.Sc., and G. W. Bowdler, M.Sc. **7 p.m.**

SATURDAY, APRIL 5

Sunrise, 5.29 a.m. Sunset, 6.38 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Visit to Marble Arch Flats, adjoining Regal Cinema. Meet main doorway in Great Cumberland Place at 2.30 p.m. **2.30 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. Conference on "Planning the England of the Future." Hon. Humphrey Pakington, A.R.I.B.A., and A. T. Pike. 2.30 till 4.15 p.m. Professor Percy Dearmer, D.D. 5 till 6.30 p.m. F. J. Horms will occupy the chair on both occasions. (Lantern illustrations.) **2.30 p.m.**

ROYAL SANITARY INSTITUTE. In the Council Chamber, Plymouth. Discussion on "Port Sanitation," to be opened by Dr. P. B. P. Mellows. 10.30 a.m. Lunch at 1 p.m. Meet at Guildhall Square at 2.30 p.m. for visits (1) the Council Housing Estates; (2) the Co-operative Society's Pasteurising Plant: (3) the Hospital Ship "Flamingo" (weather permitting). **10.30 a.m.**

MONDAY, APRIL 7

R.I.B.A., 9 Conduit Street, W.1. General Meeting. "Antonio da San Gallo the Younger." By J. Hubert Worthington, O.B.E., M.A., A.R.I.B.A. **8 p.m.**

CARPENTERS' COMPANY, Carpenters' Hall, E.C.2. "The Rainbow." By Professor Wagstaff.

TUESDAY, APRIL 8

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. "Textile Lighting." By S. Anderson, B.Sc. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Scottish Centre. At the Royal Technical College, Glasgow. Annual General Meeting and Ordinary Meeting. **7.30 p.m.**

UNIVERSITY SETTLEMENT, Nile Street, Liverpool. At the David Lewis Club, Great George Place, Liverpool. Lectures on Housing and Town Planning subjects. Visits to new housing estates, tenements and slum districts. Papers will be given at 9.45 a.m. and 8 p.m. Applications for accommodation not later than March 28. Also lectures on April 9 and 10. **9.45 a.m.**

WEDNESDAY, APRIL 9

ARCHITECTURE CLUB, 229 Strand, W.C.2. At the Architectural Association, 34 Bedford Square, W.C. Supper. Discussion on "Relation of Sculpture to Architecture." Supper, 7.45 p.m. Discussion, 8.30 p.m. **7.45 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. "Preserving our Heritage." By Clough Williams-Ellis, F.R.I.B.A. Hon. Humphrey Pakington, A.R.I.B.A., will occupy the chair. **8 p.m.**

THURSDAY, APRIL 10

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. General Meeting. "Liverpool Cathedral." By Rev. Canon W. Thompson Elliott, M.A., Vicar of Leeds. (Lantern Illustrations.) **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. "Surge Investigations on Overhead Lines and Cable Systems." By S. W. Melsom, A. N. Arman, B.Sc. (ENG.), and W. Bibby, B.Sc. (ENG.). Light Refreshments at 5.30 p.m. **6 p.m.**

INSTITUTION OF WELDING ENGINEERS, 30 Red Lion Square, W.C.1. "Some Interesting Arc-Welded Jobs." By H. B. White and R. Tuddenham. (Lantern Illustrations.) **7.30 p.m.**

NORTHERN POLYTECHNIC, Holloway, N.7. Department of Architecture, Surveying and Building. Annual Speech Night. **7 p.m.**

FRIDAY, APRIL 11

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION, The Castle, Winchester. Excursion to Motor Vehicle and Engine Works of Messrs John I. Thornycroft, Basingstoke.

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. "Modern Civilisation in the Country-side." By J. M. Kennedy. Professor Percy Dearmer, D.D., will occupy the chair. **8 p.m.**

ROYAL SANITARY INSTITUTE. At the Town Hall, Chatham. Sessional Meetings. Tea 4 p.m. Discussion on "Modern Elementary School Construction," to be opened by R. L. Honey, F.S.I., M.INST.M. and CY.F.; and "Special Difficulties in Housing," to be opened by T. Topping, F.S.I.A. Edward Willis, M.INST.C.E., F.S.I., M.INST.T., will preside. 4.30 p.m. **4 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Address by Colonel Sir T. F. Purves, O.B.E., President of the Institution. **6.15 p.m.**

SATURDAY, APRIL 12

Sunrise, 5.13 a.m. Sunset, 6.50 p.m.

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. Visit to St. Albans. (2s. 6d. return). Meet at rear entrance of Guildhouse at 2.30 p.m. **2.30 p.m.**

ROYAL SANITARY INSTITUTE. At the Town Hall Chatham. Meet at Town Hall for visits to the Rochester and Chatham Joint Sewerage Works, the Royal Naval Hospital, and to a certified Milk Farm and Pasteurization Plant. **10 a.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Visit to the Deptford Power Station of the London Power Co. **2.30 p.m.**

SUNDAY, APRIL 13

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. "Sunlight." By Dr. C. W. Saleeby, F.R.S.E. Clare Greet (Miss) will occupy the chair. **3.30 p.m.**

MONDAY, APRIL 14

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "The Decentralization of Industry." By Dr. Raymond Unwin. **5 p.m.**

CARPENTERS' COMPANY, Carpenters' Hall, E.C.2. "The Preservation of St. Paul's Cathedral." By Canon Alexander. The Lord Bishop of London will preside.

INSTITUTION OF ELECTRICAL ENGINEERS. North-Eastern Centre. At the Armstrong College, Newcastle-on-Tyne. Annual General Meeting. Mersey and North Wales (Liverpool) Centre. At the Laboratories of Applied Electricity, The University, Liverpool. Annual General Meeting. Both meetings will be held at 7 p.m. Western Centre. At Cheltenham. "The Heating of Buildings Electrically by means of Thermal Storage." By Lt.-Col. S. E. Monkhouse, R.E. (T.R.) and L. C. Grant. **7 p.m.**

WEDNESDAY, APRIL 16

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Ultra-Violet Ray Transparent Window Glass." By S. English. **8 p.m.**

THURSDAY, APRIL 17.

IDEAL HOME EXHIBITION, Olympia, W. Last day of the exhibition organized by *The Daily Mail*.

THURSDAY, APRIL 24

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Architecture in its Relation to Modern Life." By Alfred C. Bossom, F.R.I.B.A. **6.30 p.m.**

FRIDAY, APRIL 25

INSTITUTION OF ELECTRICAL ENGINEERS. West Wales (Swansea) Sub-Centre. "Surge Investigations on Overhead Line and Cable Systems." By S. W. Melsom, A. N. Arman, B.Sc. (ENG.), and W. Bibby, B.Sc. (ENG.).

SATURDAY, APRIL 26

Sunrise, 5.43 a.m. Sunset, 8.14 p.m.

MONDAY, APRIL 28

R.I.B.A., 9 Conduit Street, W.1. General Meeting. "Architects' Drawings of 1800–1850." By Professor A. E. Richardson, F.R.I.B.A., F.S.A. **8 p.m.**

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed at BALHAM: Showroom, offices and garages, Balham High Road, for Messrs. Sampson and Hutchcroft; addition to Messrs. Rawlings Manufacturing Co., Ltd.'s premises, Larch Road, for Mr. A. W. T. Richards; public-house, Bedford Hill, for Messrs. John Garratt and Sons, Ltd.; alterations, 167 and 169 Balham High Road, for Messrs. Chubb and Son.

The London, Midland and Scottish Railway is to provide a station on the L.C.C. housing estate at BECONTREE, near Church Elm Bridge.

The BERMONDSEY B.C. is borrowing £7,400 for the acquisition of a housing site in Rotherhithe Street and West Lane.

The CITY OF LONDON Corporation has passed plans for the rebuilding of 86-95 Leadenhall Street, Bury Street and Creechurch Lane, and also the rebuilding of 91 and 93 Charterhouse Street.

The CITY OF LONDON Corporation has under consideration a proposal to construct pedestrian subways at the junction of King William Street, Cannon Street and Gracechurch Street. This will necessitate the removal of the statue of King William IV.

St. Mark's Church Council has obtained a site at the corner of Grovelands Road and Downlands Road, COULSDON, for the erection of a church.

The CROYDON Corporation is obtaining tenders for the erection of eighty-four houses on the Mitcham Road Estate.

Plans passed by the CROYDON Corporation: Six houses, Ballards Way, for Mr. G. W. Peachey; eight flats, Lancaster Road, for Mr. S. Malthouse; nineteen houses, Covington Gardens, for Messrs. Thomas and Son; alterations and additions, 88-92 North End, for Messrs. J. Lyons & Co.; workshop, Stafford Road, for Harper Automatic Machine Co.; garages and stores, Beulah Road, for Messrs. Truett and Steel; showroom and sixty garages, Coombe Road, for Mr. L. H. Harrington; nine houses, Zermatt Road, for Mr. A. Andrews; classroom, Mersham Road, for Mr. H. Hemmings; two houses, Springfield Road, for Mr. W. Pritchett; alterations and additions, 6 Crown Hill, for Mr. H. Macintosh; shop, 150 High Street, for Mr. M. K. Matthews; fifty houses, West Way, for Messrs. M. Brown and Sons, Ltd.; twenty-four houses, High View Close, for Mr. J. M. Ross; vestry additions, Christ Church, Sumner Road, for Mr. T. F. M. Grant; seventeen houses, Foxle Road, for Mr. F. H. Willcocks; six houses, Berne Road, for Mr. W. T. Joyce; nurses' homes, Lennard Road, for Messrs. H. Berney and Son; house, Beulah Road, for Mr. W. F. Bond; alterations and additions, 259, Lower Addiscombe Road, for Messrs. Boots, Ltd.

The FULHAM B.C. has passed plans for buildings in Parsons Green Lane for the Metropolitan District Railway Co., and a building, in Addison Bridge Place, for Mr. W. E. Saunders.

The Great Western Railway Co. is to erect lock-up shops in the vicinity of West Brompton Station, Richmond Road, KENSINGTON.

The KENSINGTON B.C. is in negotiation with the L.C.C. regarding an improvement at Warwick Gardens and Warwick Road, where the Prudential Assurance Co., Ltd., is about to re-develop land.

Plans passed by the KENSINGTON B.C.: Additions, rear of 8 Edge Street, abutting upon Kensington Place; building, Fulham Road; additions, "Churchill Arms" public-house, Church Street; building, Holland Park Avenue and Ladbroke Grove.

The East Ham Corporation has asked the borough engineer to report as to the erection of a bridge across the River Roding, at LITTLE ILFORD.

The L.C.C. reports that since the war it has erected 37,510 houses and tenements, and that 3,051 houses are now in course of erection.

The L.C.C. has adopted a scheme for raising the standard flood level of the Thames, which is estimated to cost at least £500,000.

The Metropolitan Railway Co. has in view proposals for developing property between Chapel Street, Burne Street and Mitcham Street, MARYLEBONE.

Plans passed by the MARYLEBONE B.C.: Block of flats, Abbey Road, for Mr. G. Wills; building, Seymour Place, Wythburn Mews and Williams Mews, for Messrs. Joseph; building, Hallam Street, for Mr. S. H. Burdwood.

The L.C.C. proposes to lease three sites on the St. Helier estate, MORDEN, for the erection of model public-houses on lines similar to those at Becontree.

The L.C.C. is arranging for the provision of travelling facilities to MORDEN, where the St. Helier housing estate is being developed. The estate is 825 acres of land in extent, and 10,000 houses are to be built.

Plans passed by the STOKE NEWINGTON B.C.: Additions, 111 High Street, for Messrs. Robertson and Charles, Ltd.; buildings, Carysfort Road, for Messrs. Chamberlain and Willows; building, Church Street, for Messrs. A. J. King, Ltd.

The WANDSWORTH B.C. has authorized the preparation of schemes for the improvement of the Saxby Street and North Street area, at CLAPHAM.

Plans passed by the WANDSWORTH B.C.: Addition to Messrs. Aluminium Plant and Vessel Co., Ltd.'s premises, Point Pleasant, Southfields, for Messrs. Sampson and Hutchcroft; bungalow, Leigham Court Road, Streatham, for Mr. L. A. Gorringe; house, Dover House Road, for Messrs. W. Willett, Ltd.

Plans passed by the WESTMINSTER City Council: Additions, 22 Bruton Street, for Messrs. Lenygon and Morant, Ltd.; buildings, Petty France, for Mr. B. L. Suteliff; two subways connecting Cavendish Hotel, Jermyn Street, for Messrs. Wimperis, Simpson and Guthrie; bridge across Brick Street, connecting Park Lane Hotel extension with hotel offices, for Mr. Henry Tanner.

Mr. R. S. Campbell is obtaining further land from the WESTMINSTER City Council, in connection with his proposals for rebuilding property in Wardour Street.

House in Southway, Hampstead Garden Suburb, N.W.11. Designed by Slater and Moberly. The walls are of brick, and metal casement windows have been fitted. The roof is covered with tiles. *For plans see page 519.*

SOUTHERN COUNTIES

The BEXHILL Corporation recommends the construction of a further fifty houses.

Plans passed by the BEXHILL Corporation: Two houses, Cooden Drive, for Mr. J. E. Maynard; addition, "The Playhouse," Western Road, for Mr. S. C. Addison; two houses, Barnhorn Road, for Mr. C. Thurloe; bungalow, The Byeway, for Mr. G. E. Matthews; two houses, De La Warr Road and Richmond Grove, for Mr. G. Cash; house, Pebsham, for Mr. L. Turner.

The BOURNEMOUTH Housing Committee has decided to invite fresh tenders for the erection of forty-three houses at Luckham Road.

The BOURNEMOUTH Education Committee has decided to prepare plans for the erection of new buildings on the Lowther site, comprising classrooms, chemistry and physics laboratories, central hall, art room, library, etc., at a maximum cost of £25,000.

Plans passed by the BOURNEMOUTH Corporation: Garage and flats, 263 Holdenhurst Road, for Messrs. Lawrence; alterations and additions, 366 and 368 Holdenhurst Road, for Mr. F. F. Tarrant; two houses and shops, Tuckton Road, for Mr. S. Kermode; six houses, Covena Road, and Seafield Road, for Messrs. M. Brown and Sons; building extension, rear of 10 Kemp Road, for Messrs. J. Clark and Sons, Ltd.; four houses, Truscott Avenue, for Mr. G. F. Jordan; additions, Hinton Road and Gervis Place, for Messrs. Beales, Ltd.; meat store shop, St. Swithun's and Holdenhurst Roads, for Messrs. Swift & Co.; showroom and garage, Christchurch Road, for the Stanbourne Motor Co.; alterations, the Westover Garage, Westover Road, for Westover Garage, Ltd.; eight shops, Bloomfield Avenue and Wimborne Road, for Mr. F. Thoroughgood & Co., Ltd.; warehouse, 27 and 28 Park Street, for the South Wales Furnishers, Ltd.; four houses, Bohun Street, for Mr. John Willis; house, Zouch Street, for Mr. J. Jewell; additions, Cwm Garnlwyd, for Messrs. E. and D. Lewis; alterations, Cwmrhydyceirw, for Mr. A. Ellis; house, Llangyfelach Road, Clasmont, for Mr. D. H. Jones; new road off Pentregethin Road, for Mr. J. I. James; two houses, Middle Road, for Mr. C. Williams; house and shop, Birchgrove Road, for Mr. W. Roberts; recreation ground, Bethesda Street, for the G.W.R. Social and Educational Union; additions, *Daily Leader* building, for the Swansea Press, Ltd.; two houses, Goitre Fawr Road, for Messrs. J. C. Oliver & Co.; house and shop, Waunwen Road, for Mrs. M. Tucker; two houses, Goitre Fawr Road, for Messrs. M. Davies & Co.; house, Penyrheol Drive, for Messrs. J. C. Oliver & Co.; sixteen houses, new road, off Cockett Road, for Mr. Syd Davies; house, Le Mayals, for Mr. J. R. Heath; alterations, The Dunns, for Messrs. Lloyds Bank, Ltd.; additions, 26 Oxford Street, for Messrs. W. R. Tarr, Ltd.; rebuilding, 31 Waterloo Street, for Messrs. J. Bloomberg and Son; two new streets and fifty-two houses, Garnglas Estate, for Messrs. T. and G. Spragg.

SCOTLAND

The GLASGOW Corporation is negotiating for sixty-two acres of land at Victoria Drive, for a housing scheme.

The GLASGOW Parish Council is to erect a new reception block and to carry out alterations to the maternity block at Stobhill Hospital.

The GLASGOW Corporation Libraries Committee has passed plans, prepared by the city engineer, for the erection of a branch library at Barrhead Road, Pollokshaws, at an estimated cost of £20,000.

At a meeting of the GLASGOW Corporation Housing Committee, the housing director submitted plans of the proposed development of the site at Carntyne Hall Road, Carntyne, showing twenty-four houses of four apartments and eight of three apartments, and twelve shops. He was authorized to obtain offers for the construction of the tenements.

Plans passed by the GLASGOW Corporation: Terraced houses, Randolph Road, for Messrs. P. T. Wilson and Son; two bungalows, Roxburgh Circus, Cardonald, for Messrs. W. and G. Taylor; temporary church hall, Castlemild Road, King's Park, for the Church of Scotland Presbytery; three shops, Garteraig Road, Riddrie, for Messrs. James Parker, Ltd.; roads, drains and sewers, Broomhill, for Messrs. A. and R. B. Stewart.

The GLASGOW Corporation Housing Committee has passed plans for the erection of eighteen two-apartment and forty-eight three-apartment houses on the Whiteinch estate.

MISCELLANEOUS

Plans passed by the DOUGLAS (I.O.M.) Corporation: Improvements, Athol Hotel, for Athol Hotel Co.; parish hall, for the vicar and wardens of St. Ninian's Church; rebuilding, Stand Street, for Messrs. G. N. Gore and Sons.

The NEWPORT (I.W.) Corporation is considering the provision of a bathing pool with shelters, abutting on the Medina and adjacent to the Seaclose recreation ground.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0 11 6
Thames ballast, per yd.	0 10 0
Pit gravel, per yd.	0 15 0
Pit sand, per yd.	0 12 6
Washed sand, per yd.	0 13 0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2 8 0
Lias lime, per ton	2 0 0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day:

Cart and horse	£1 3 0	*Trailer*	£0 15 0
3-ton motor lorry	3 15 0	*Steam roller*	4 5 0
Steam lorry, 5 ton	4 0 0	*Water cart*	1 5 0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0 1 6
SPREAD and level, including wheeling, per yd.	0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0 10 6
TRIMMING earth to slopes, per yd. sup.	0 0 6
HACKING up old grano. or similar paving, per yd. sup.	0 1 3
PLANKING to excavations, per ft. sup.	0 0 5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.	
IF left in, add to above prices, per ft. cube	0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0 2 1
DO. 5 in. thick, per yd. sup.	0 2 10
PUDDLING, per yd. cube	1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube	1 17 6
DO. 6-2-1, per yd. cube	1 12 6
DO. in upper floors, add 15 per cent.	
DO. in reinforced-concrete work, add 20 per cent.	
DO. in underpinning, add 60 per cent.	
LIAS-LIME CONCRETE, per yd. cube	£1 14 0
BREEZE CONCRETE, per yd. cube	1 7 0
DO. in lintels, etc., per ft. cube	0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0 3 9
FINE concrete benching to bottom of manholes, per ft. cube	0 3 0
FINISHING surface of concrete spade face, per yd. sup.	0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0 0 10
DO. *6 in., per ft.*	0 1 3
DO. *9 in., per ft.*	0 2 3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0 5 6
DO. *6 in., per yd.*	0 8 0
Portland cement and sand, see "Excavator" above.	
Leadwool, per cwt.	£2 0 0
Gaskin, per lb.	0 0 4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4 5 6
Flettons, per M.	2 12 6
White facing bricks, per M.	5 0 0

Glazed salt, white, and ivory stretchers, per M.	21 10 0
DO. *headers, per M.*	20 10 0
Colours, extra, per M.	5 10 0
Seconds, less, per M.	1 0 0
Cement and sand, see "Excavator" above.	
Lime, grey stone, per ton	£2 11 6
Mixed lime mortar, per yd.	1 6 0
Dampcourse, in rolls of 4½ in., per roll	0 2 6
DO. *9 in. per roll*	0 4 9
DO. *14 in. per roll*	0 7 6
DO. *18 in. per roll*	0 9 6
BRICKWORK in stone lime mortar, Flettons or equal, per rod	30 0 0
DO. in cement do., per rod	32 10 0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0 1 0
BEDDING plates in cement mortar, per ft. run	0 0 3
BEDDING window or door frames, per ft. run	0 0 3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0 0 2
CUTTING do. in old walls in cement, per ft. run	0 0 4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0 0 7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0 3 6
DO. 14 ft. by 9 in. do., per ft. run	0 6 0
FLAUNCHING chimney pots, each	0 2 0
CUTTING and pinning ends of timbers, etc., in cement	0 1 0
FACINGS fair, per ft. sup. extra	0 0 3
DO. picked stocks, per ft. sup. extra	0 0 7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0 4 9
DO. in salt white or ivory glazed, per ft. sup. extra	0 5 6
TUCK pointing, per ft. sup. extra	0 0 10
WEATHER pointing, do. do.	0 0 3
TILE creasing with cement fillet each side, per ft. run	0 0 6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0 5 0
DO. 1½ in., per yd. sup.	0 6 0
DO. 2 in., per yd. sup.	0 7 0
If coloured with red oxide, per yd. sup.	0 1 0
If finished with carborundum, per yd. sup.	0 0 6
If in small quantities in finishing to steps, etc., per ft. sup.	0 1 4
Jointing new grano. paving to old, per ft. run	0 0 4
Extra for dishing grano. or cement paving around gullies, each	0 1 6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup	0 0 7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0 8 0
DO. vertical, per yd. sup.	0 11 0
SLATE DAMP COURSE, per ft. sup.	0 0 10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0 8 6
DO. SKIRTING, 6 in.	0 0 11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0 5 3
DO. DO. 3 in.	0 6 6
BREEZE fixing bricks, extra for each	0 0 3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:	
Whitbed, per ft. cube	£0 4 6
Basebed, per ft. cube	0 4 9
Bath stone, per ft. cube	0 3 0
Usual trade extras for large blocks.	
York paving, av. 2½ in., per yd. super.	0 11 0
York templates sawn, per ft. cube	0 7 6
Slate shelves, rubbed, 1 in., per ft. sup.	0 2 6
Cement and sand, see "Excavator," etc., above.	

HOISTING and setting stone, per ft. cube	£0 2 2
DO. for every 10 ft. above 30 ft. add 15 per cent.	
PLAIN face Portland basis, per ft. sup.	£0 2 8
DO. circular, per ft. sup.	0 4 0
SUNK FACE, per ft. sup.	0 3 9
DO. circular, per ft. sup.	0 4 10
JOINTS, arch, per ft. sup.	0 2 6
DO. sunk, per ft. sup.	0 2 7
DO. DO. circular, per ft. sup.	0 4 6
CIRCULAR-CIRCULAR work, per ft. sup.	1 2 0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0 1 1
DO. circular, do., per ft. run	0 1 4
HALF SAWING, per ft. sup.	0 1 0

Add to the foregoing prices, if in York stone, 35 per cent
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0 0 6
RUBBED round nosing to do., per ft. lin.	£0 0 6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1 7 6
YORK SILLS, W. & T., ft. cub. fixed	1 10 0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0 1 3
DO. 2½ in. thick, per ft. sup.	0 1 6

SLATER AND TILER

SLATER, 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

Portmadoc Ladies	£14 0 0
Countess	23 0 0
Duchess	32 10 0

Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	8 3 9
Grey-green do., per ton	7 3 9
Green peggies, 12 in. to 8 in. long, per ton	5 13 9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0 0 6
Clips, copper, per lb.	0 2 0
Nails, compo, per cwt.	1 6 0
Nails, copper, per lb.	0 2 2
Cement and sand, see "Excavator," etc., above.	
Hand-made tiles, per M.	£5 18 0
Machine-made tiles, per M.	5 8 0
Westmorland slates, large, per ton	9 0 6
DO. *Peggies, per ton*	7 5 0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4 0 0
Countess, per square	4 5 0
Duchess, per square	4 10 0
WESTMORLAND, in diminishing courses, per square	6 5 0
CORNISH DO., per square	6 3 0
Add, if vertical, per square approx.	0 13 0
Add, if with copper nails, per square approx.	0 2 6
Double course at eaves, per ft. approx.	0 1 0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	Med. Green
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0
Green randoms	6 7 0	
Grey-green do.	5 9 0	
Green peggies, 12 in. to 8 in. long	4 13 6	

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3 17 6
DO., machine-made do., per square	3 7 6
Vertical Tiling, including pointing, add	18s. 0d. per square.
FIXING lead soakers, per dozen	£0 0 10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0 10 0
LABOUR only in laying slates, but including nails, per square	1 0 0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour;* JOINER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):

7 × 3, per std.	£22 0 0
11 × 4, per std.	30 0 0
Memel or Equal. Slightly less than foregoing.	
Flooring, P.E., 1 in., per sq.	£1 4 6
DO. *T. and G., 1 in., per sq.*	1 4 6
Planed boards, 1 in. × 11 in., per std.	30 0 0
Wainscot oak, per ft. sup. of 1 in.	0 1 6

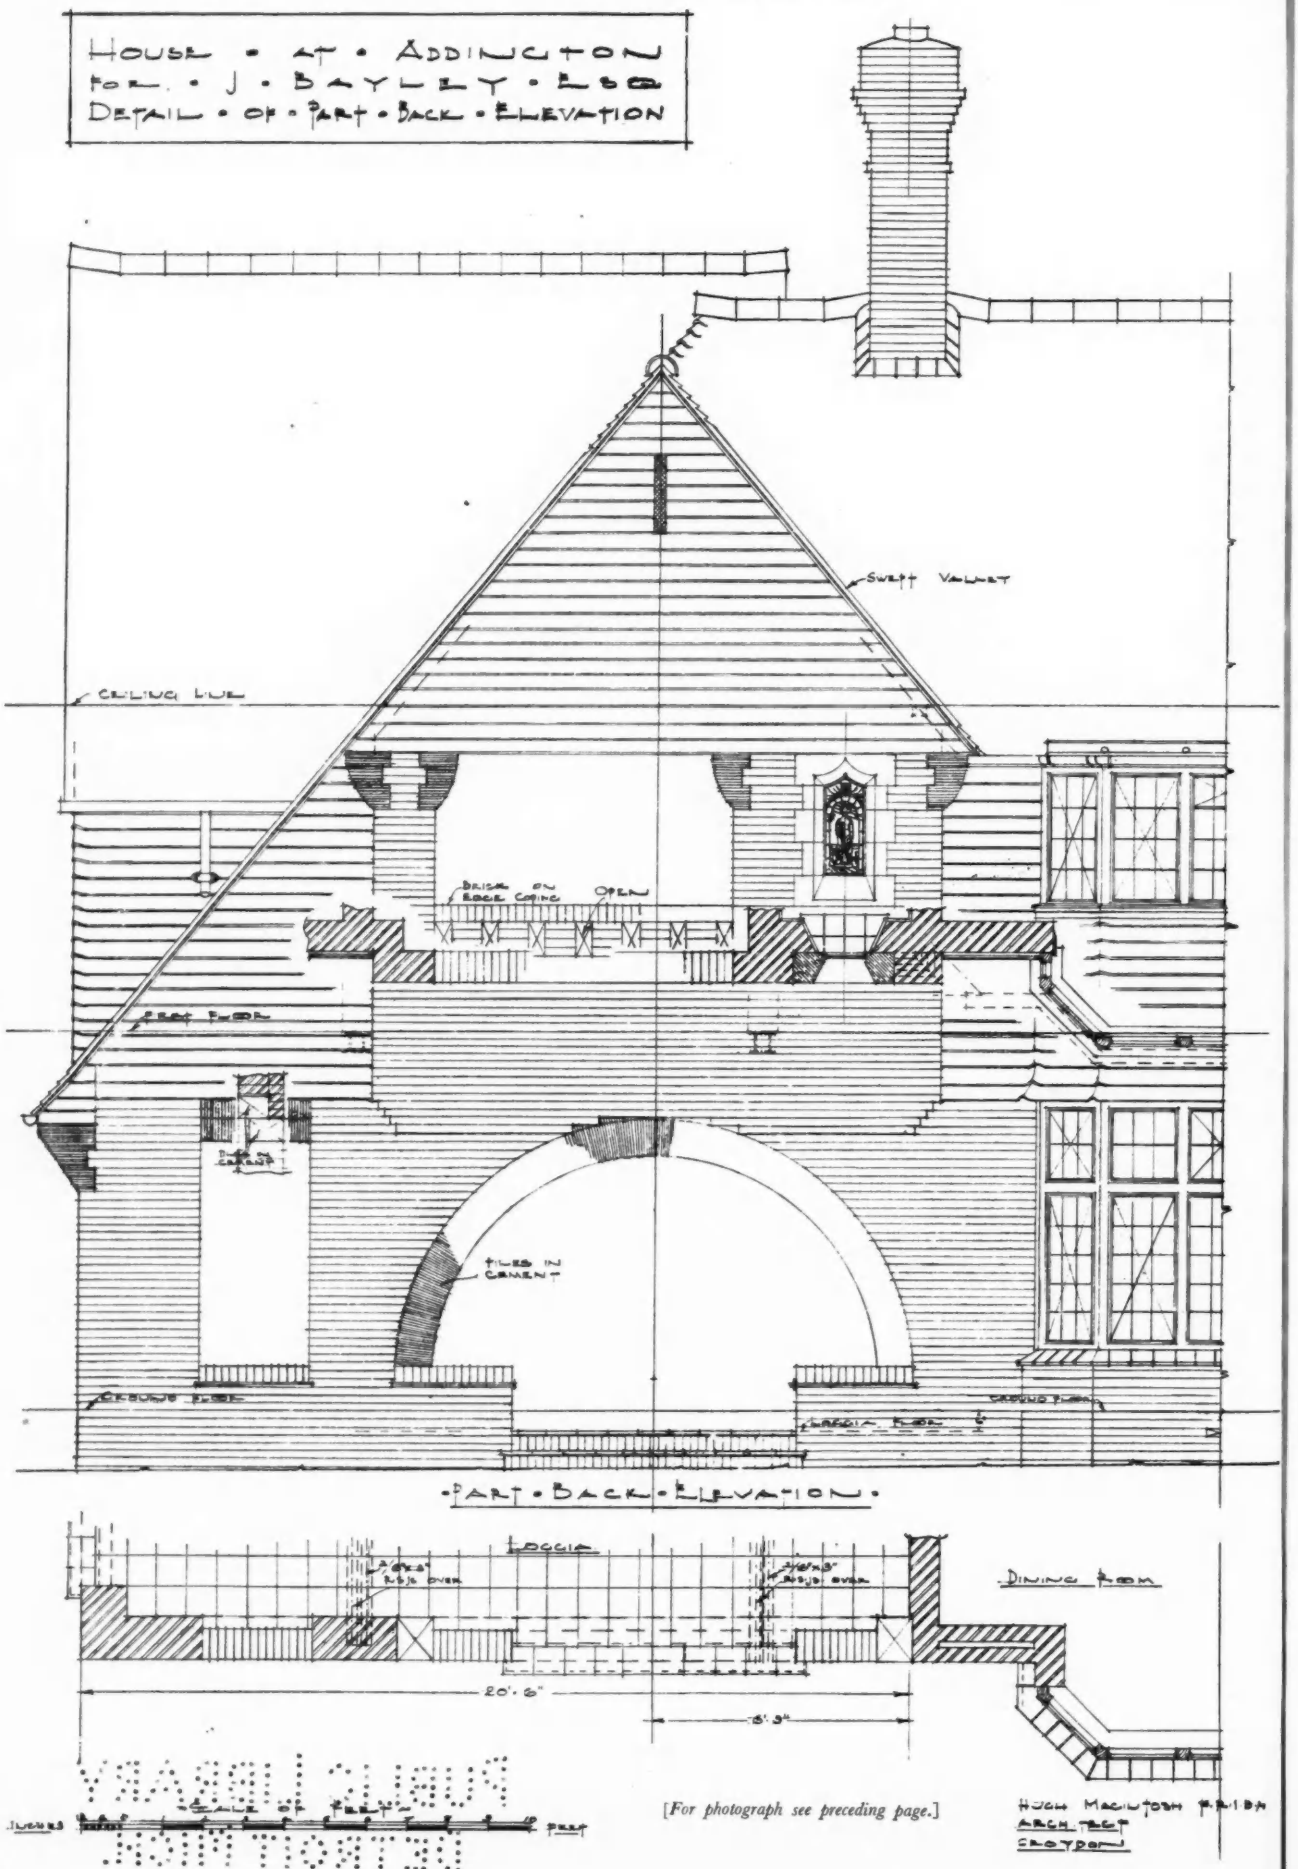
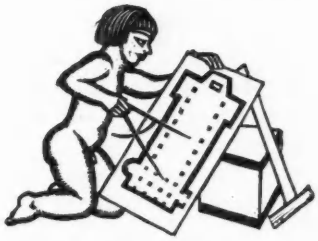
LOGGIA, WITH SLEEPING BALCONY AND ORATORY ABOVE: HOUSE ON ADDINGTON PARK ESTATE, SURREY



By

HUGH MACINTOSH

OCCUPYING the south-easterly corner of the house of which other illustrations and plans are reproduced on pages 546–7 of this issue, this feature forms a part of the elevation facing towards the wooded garden.



Access to the loggia is from the dining and drawing rooms, while the first-floor balcony opens out from a playroom, and is intended to be used for open-air sleeping. Adjacent to it, on the right, is seen the window, glazed with stained glass to the architect's design, of a private oratory, entered from the best bedroom, adjoining.

The materials are 2 in. facing bricks for the walls, tiles in cement for the arch, and stone for the oratory window. The building is tiled, and metal casements are used. For detail drawing, see overleaf.

[For photograph see preceding page.]

THE ARCHITECTS' JOURNAL

WEDNESDAY, APRIL 2, 1930

THE BRIDGE OF OUR DESIRES

"The London County Council are prepared to give an undertaking that designs for the bridge would be obtained by competition or otherwise."

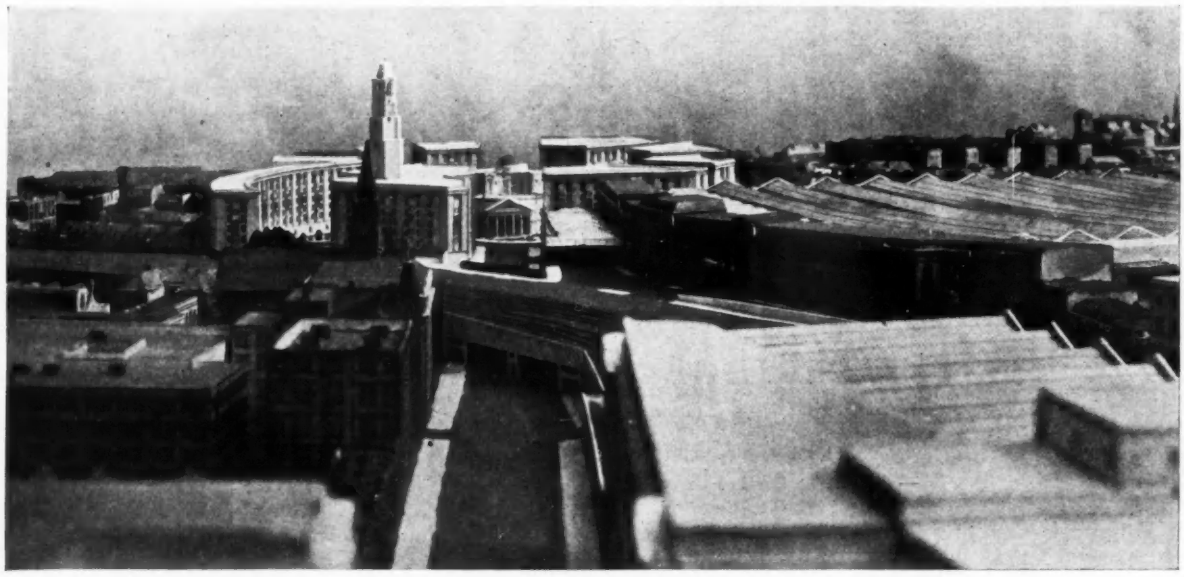
—SIR PERCY SIMMONS, BEFORE THE CHARING CROSS BRIDGE BILL PARLIAMENTARY COMMITTEE.

IF there is anything from amid the disheartening struggle for an ideal Charing Cross Bridge which we may regard as some reward for the hard blows we have suffered and the insults we have had to swallow, it is the grudging assurance, given in cross-examination by Sir Percy Simmons, that the L.C.C. are "prepared to give an undertaking that designs for the bridge would be obtained by competition in fulfilment of the instruction given by Parliament to the Committee."

It has been the policy of this JOURNAL to press for an open competition for the bridge as perhaps the one form of recognition of the existence of a body of interested architects which it would be permissible under the circumstances to make. This assurance by the L.C.C. is therefore not only something to clutch at, but a definite step in the reinstatement of architects as responsible persons.

The history of the Charing Cross Bridge scheme is marked by the extraordinary attention given to it by architects and town planners over a very considerable number of years, and by the nearly complete disregard of this body of highly interested and very well-informed opinion by those into whose hands has since fallen the work of evolving a workable scheme. It is quite naturally recognized that the evolution of these later stages involved much negotiation with large financial interests, and that the mere laying down of routes is but a part, even if a very important part, of what must be done before a bridge becomes possible.

Yet upon our shoulders is to fall the burden of expressing in architecture the meaning of the great thing which this generation is about to undertake, and just as it would never be expected of us to make a town hall out of a disused cinema, so we should find it difficult to design a bridge and its approaches commensurate with the fine things that everyone is prepared to say of Charing Cross Bridge when all this fighting is over, out of the tangled wreckage left to us by the secretive committee-work of the L.C.C., the Ministry of Transport, and the Southern Railway.



It seems to us that the scheme before Parliament is the result of three forces working in disunion. First is the Southern Railway fighting for its money and a new station; second, the Ministry of Transport, fighting for the fulfilment of traffic requirements, and making traffic an inhuman and ridiculous monster to be satisfied at whatever cost to amenity and sound civic development; and, third, a very personal architecture dressing this thing of the twentieth century in grandiose eighteenth-century trimmings. It is no wonder that the scheme is a compromise for everything but the railway; and even there it will be proved that, by comparison with better and clearer schemes that seek to use the south bank for *real* development by means of a bridge serving all purposes, the station which this scheme gives will be still a compromise.

And the tunnels are a compromise, the embankments, the twisted and severed joint of the bridge as it sways uncertainly towards the Strand, and the lateral approach roads; all these are compromises. The magnificent architecture of the station and the buildings that flank it, these which, let us be very clear about it, are *not* included in the sum allotted, are shams made for the edification of Parliament.

The promise of a public competition for the bridge is therefore small comfort at the moment. Take away the buildings, and we are left with tunnels and wandering viaducts, bewildering circuses and unremunerative dead ends—poor groundwork for a bridge to express the grandeur of an Empire capital.

If, therefore, we are to be given something better to work at when the competition is announced, now is the time, while the scheme is in committee, and before it reaches Parliament again, to bring forward the views of architects as they bear upon the larger questions of design.

The R.I.B.A. was very active in this work when the negotiations began, but whether by reason of the mistakes it committed, or because of its very disunited attack upon the forces opposed to it, or because it has never at any time sponsored ONE particular scheme, its fire seems to have diminished exactly at the time when it is most needed, and it is left to Westminster and to Lambeth to make official opposition. This is a pity, because everything that is said and done today will affect the final scheme; and it is not too late to hope that Parliament may be induced to agree with the mass of critical opinion and throw out this present bridge, to mould one nearer to our hearts' desire.

THE DOG-LEG IN LAMBETH:

AS REVEALED BY THE MODEL

HOW the proposals of the Charing Cross Bridge Bill would affect the area immediately concerned in South London is revealed with damning candour by the model prepared for the use of the Committee now sitting.

These two photographs show, in perspective, and in plan, the desperate imbroglio of dismal tunnels and streets aslant that would confront a traveller faring southwards across Waterloo Bridge. In the upper, the roofs of the new south-side Charing Cross Station are on the right, with the present Waterloo Station beyond. Between, on a vast diagonal viaduct, are to run not only railway lines but the approach road from the new Charing Cross Bridge, that is only to decline to earth on traversing the dog-leg and reaching the circus, in the midst of which, closing the vista down Waterloo Bridge Road, is seen the pediment of the "New" Vic. The tower on the left is that of Toc H.

What is to happen to York Road, which crosses both bridge approach roads—and many subsidiary streets —is best seen on reference to the plan. The whole of York Road from Waterloo Bridge Road to the farther side of the new approach road from Charing Cross Bridge, part of the first span of which is seen in the bottom right-hand corner, is to disappear under another tunnel.

Foot passengers on the high-level road are to traverse what has been termed a positive Clovelly of stairs to reach Waterloo Station or Belvedere Road or a dozen other objectives.

The L.C.C. have disclaimed responsibility for laying out the south side embankment which figures in the model.

E. A. Stone, architect of the Prince Edward Theatre, Old Compton Street, Soho, illustrations and plans of which are reproduced in this issue. He has an extensive practice in the cinema world and has designed many of the "Astoria" picture theatres, two of which have recently been the subject of articles in this JOURNAL.

NEWS & TOPICS

E. Vincent Harris, whose extension to the Surrey County Hall is also illustrated, was born in 1879, and has been pre-eminently successful in competitions, among them that for the Reference Library and Town Hall extension at Manchester. His design for Board of Trade offices, though accepted, has never been built.

FULSOME OPTIMISM

CAPTAIN SWINTON, in a letter to *The Times* of March 27, gives rein to such a burst of optimistic panegyric upon the model of Charing Cross Bridge as might well cause the authors of the scheme to look closely again to see if it be really the thing so praised. "On the south side," he says, "we are to have a concentration of rail services *above* and below ground, where everything from South England and the Continent . . . can be scientifically brought together, catered for, and distributed."

*

I shall know I am scientifically catered for when I walk sadly through beetling tunnels, or pass by the side of railway sidings, blinking an eye, until the *architecture* commences again where the engineer has first had his say.

*

If this model is enough to evoke such enthusiasm from Captain Swinton, what chance have the opposers to the bridge without a counter-model?

DINNER TO ROBERT ATKINSON

The announcement that Robert Atkinson is to be "dined" on April 10 will be received with pleasure by the whole of the profession. The compliment marks the termination of seventeen years of close and successful contact with the Architectural Association School, and will render honour, where honour is due, to a great architect and an inspiring leader. He was appointed Master in Design at the A.A. in 1912 and promoted to the post of Headmaster in 1913. In 1920, when the needs of his own practice became too insistent, he handed over the reins to Howard Robertson and was elevated to the post of Director of Education, resigning that appointment last year.

*

During his term of office and under his firm and enthusiastic leadership, he has had the satisfaction of seeing the school blossom like a bay-tree, and now leaves it possessed of a definite tradition and clear policy, firmly planted in the affections of English architects as one of the great teaching institutions of the country. That this happy state of affairs is largely the result of his own efforts all those who have had the privilege of working with him will be only too glad to allow. A strong personality, he was able to inspire others with something of his own enthusiasm. While anything but a pedant, he is a scholar who owns quite the best privately owned architectural library in England, and can discourse upon authors, editions, illustrations and bindings with the same fluency and authority that he can bring to bear upon a piece of antique furniture, a blue-and-white drug pot, or an architectural drawing. His criticisms in the school were always listened to with the greatest respect and interest. A master of witty, vivid and often pungent phrase, he left the student in no possible doubt as to his shortcomings, while his praise was treasured.

POWERS TO RE-PLAN OUR CITIES NEEDED

The English delegates who attended the Twelfth International Housing and Town Planning Congress at Rome were impressed by the powers which are vested in Continental town planners. Not only in Italy but in Germany the town and regional planner can control the development of whole districts so that new streets, so great a burden to our own towns, can be made to pay for themselves out of the rise in value of surrounding land already bought by the town for the purpose of realizing the benefits of the new values their work creates. The great drawback in this country is the restriction of town planning to undeveloped areas. Until Parliament passes a new Act to widen the scope of town planning, so that it may really deal with the *insides* of large cities, we are at great disadvantage with our neighbours, and cannot hope to tackle our problems where they are worst.

KEEPING AN EYE ON HULL'S NEW STREETS

Hull has probably done the right thing in retaining the services of Sir Reginald Blomfield, R.A., to keep an eye on the progress of building the new street frontages that formed the subject of a recent competition. It seems that the Corporation, having instituted the competition and accepted winning drawings, are either not in a position to maintain the complete design in detail, or regard it as guiding rather than binding them. They are seeking powers that will enable them to erect buildings themselves, and in the meantime Sir Reginald is to see that the demands of shopkeepers and other occupants for this thing and that are not allowed to spoil a really fine design.

THE UTILITY OF EMPIRE TIMBERS

In a recent letter to *The Times* Lord Passfield, the Secretary of State for the Dominions and Colonies, asks readers for additional records of home-grown timbers that can be used structurally and decoratively. Some of the fine old woods such as oak and walnut have, of course, been in use for centuries in public and domestic work. But there are other lesser-known woods, of which home-grown beech, ash, Scots pine, larch, poplar, sycamore, sweet chestnut, spruce and elm may be mentioned.

★

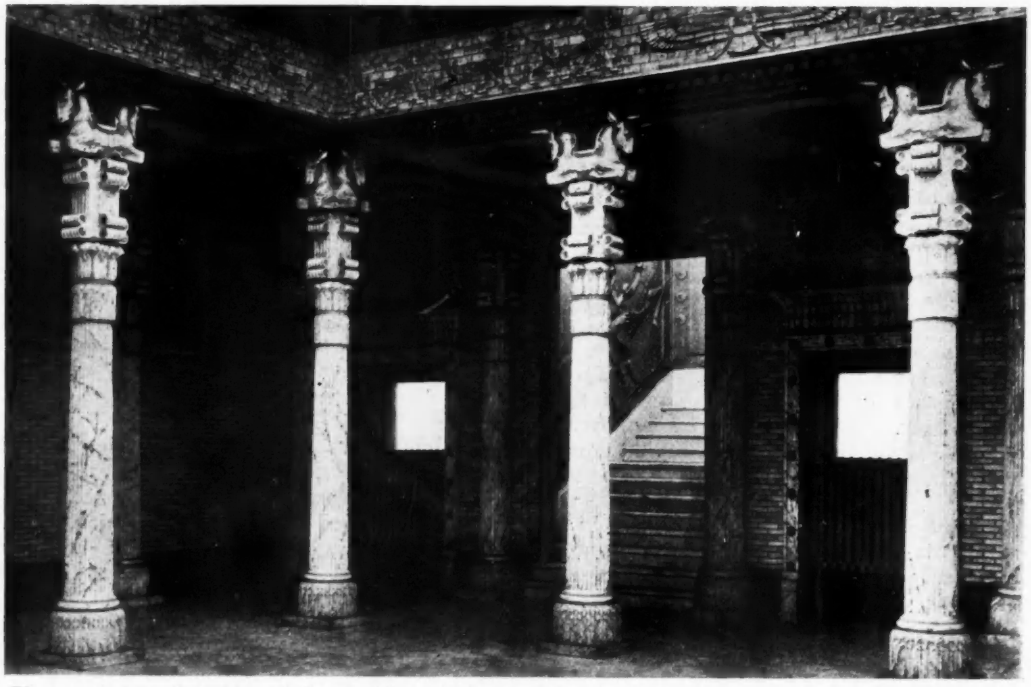
Further records are necessary before the more general use of these lesser-known timbers can be advocated and the woods themselves marketed, and any notable examples of their use for structural or decorative purposes would be welcomed by the Empire Marketing Board.

HAMPSHIRE AND THE ISLE OF WIGHT ARCHITECTS' YEAR BOOK

Of the provincial architectural associations affiliated to the R.I.B.A., none has made greater progress during recent years than has that of Hampshire and the Isle of Wight. I have received a copy of this "Association's" *Diary and Year Book*, which is indeed a model of its kind. Its contents include not only a frontispiece portrait of their president, a well-arranged and "tabbed" diary, with memoranda pages giving times for early closing in the principal towns of the area, dates of meetings, lectures and excursions and the days of the week by which plans must be submitted for the consideration of the city engineers. Room has also been found for reports of lectures and annual exhibitions, a list of architectural books recommended to students, and the questions set in the R.I.B.A. examinations during the current year.

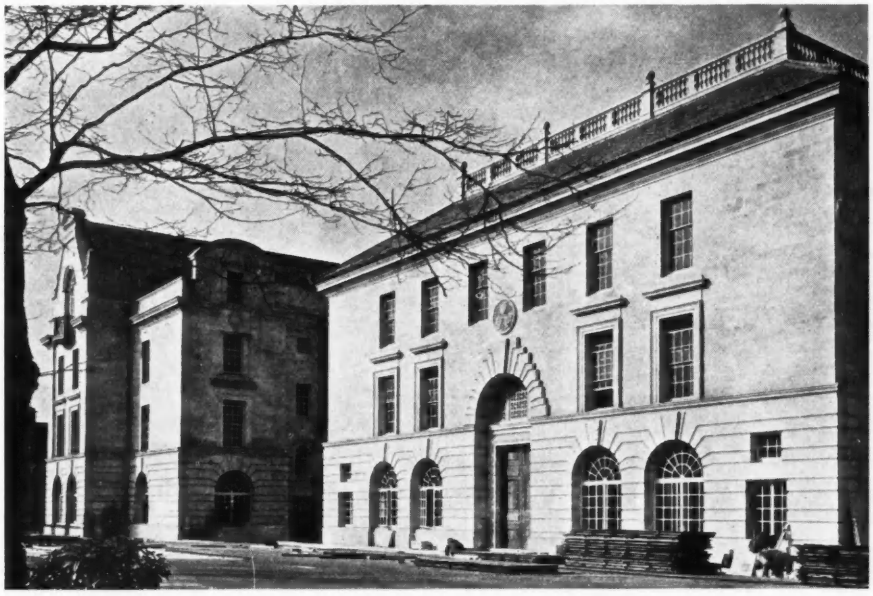
★

Other useful sections are devoted to the Department of Industrial and Scientific Research, regulations concerning architectural competitions and to the activities of the Hampshire and Isle of Wight Architects and Builders' Consultation Board. It is difficult to conceive of a more useful diary, and the editor, A. L. Roberts, who was appointed Honorary Secretary to the Association in 1925, is to be heartily congratulated. Since his period of office the membership figures have increased from 73 to 237. The *Diary and Year Book* is posted to members free of charge, and the advertisement revenue is sufficient to ensure that no expenses are incurred to the Association in its production.



HALL OF DARIUS IN LONDON

There are some very unusual and not a few peculiar interiors hidden away behind the uniform London façade. The threatened destruction of 47 Brook Street discloses a hall which is a replica, in the materials of interior decoration, of the "Hall of a Hundred Columns" at Persepolis, attributed to Darius and built in the fifth century B.C. The most essential feature of the hall is the columns, the slender shafts of which widen into a bell-like curve of inverted leaves, while at their heads a rather Egyptian-looking palm-leaf capital is surprisingly carried up into a four-sided abacus with rows of volutes. Each of these in its turn supports the roof on the heads and shoulders of conventional bulls placed back to back.



★

The marble of the original columns is carried out here in scagliola, and their multicoloured glazed bricks in similar bricks with the coloured "Archer" procession above them. The hall has a definite interest in view of the forthcoming exhibition of Persian art, though it is doubtful whether its interest is sufficiently vital, in the form in which it exists, to make it worthy of preservation.

ASTRAGAL

The reproduction of the Hall of Darius, King of Persia, erected in the London home of Sir John Bland-Sutton in 1905. The house being threatened with demolition, this hall is for disposal.

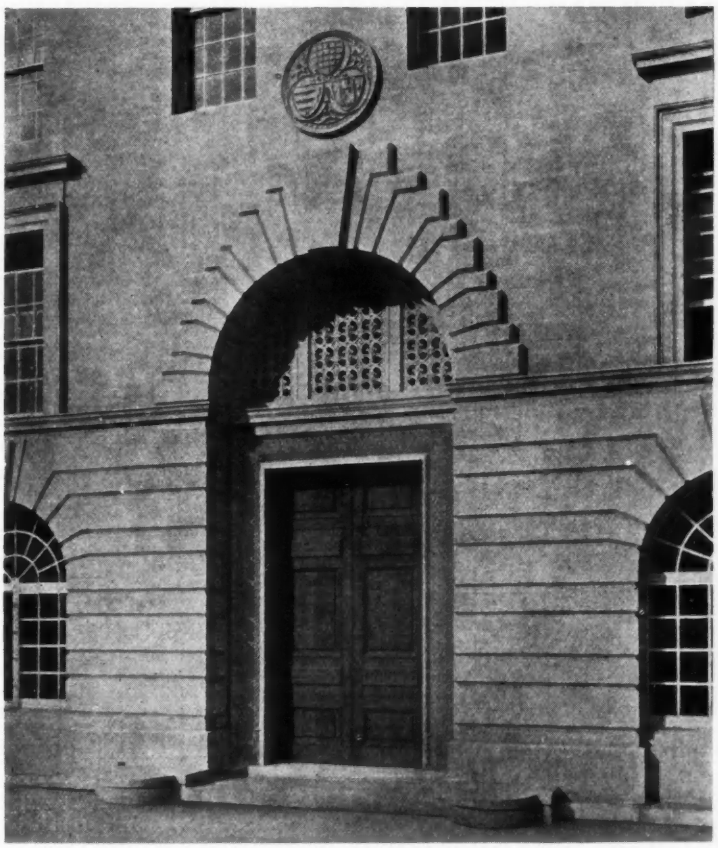
The main, east, front of the new extension, to be opened by H.R.H. the Duke of Gloucester on Monday next, April 7. In the foreground is seen the building material for the construction of a huge marquee to be used in connection with the opening ceremony. A general view showing the skilful manner in which the new extension has been linked up with the old building, with its clock Tower, appears *on page 531*

SURREY COUNTY HALL: NEW EXTENSION

DESIGNED BY E. VINCENT HARRIS

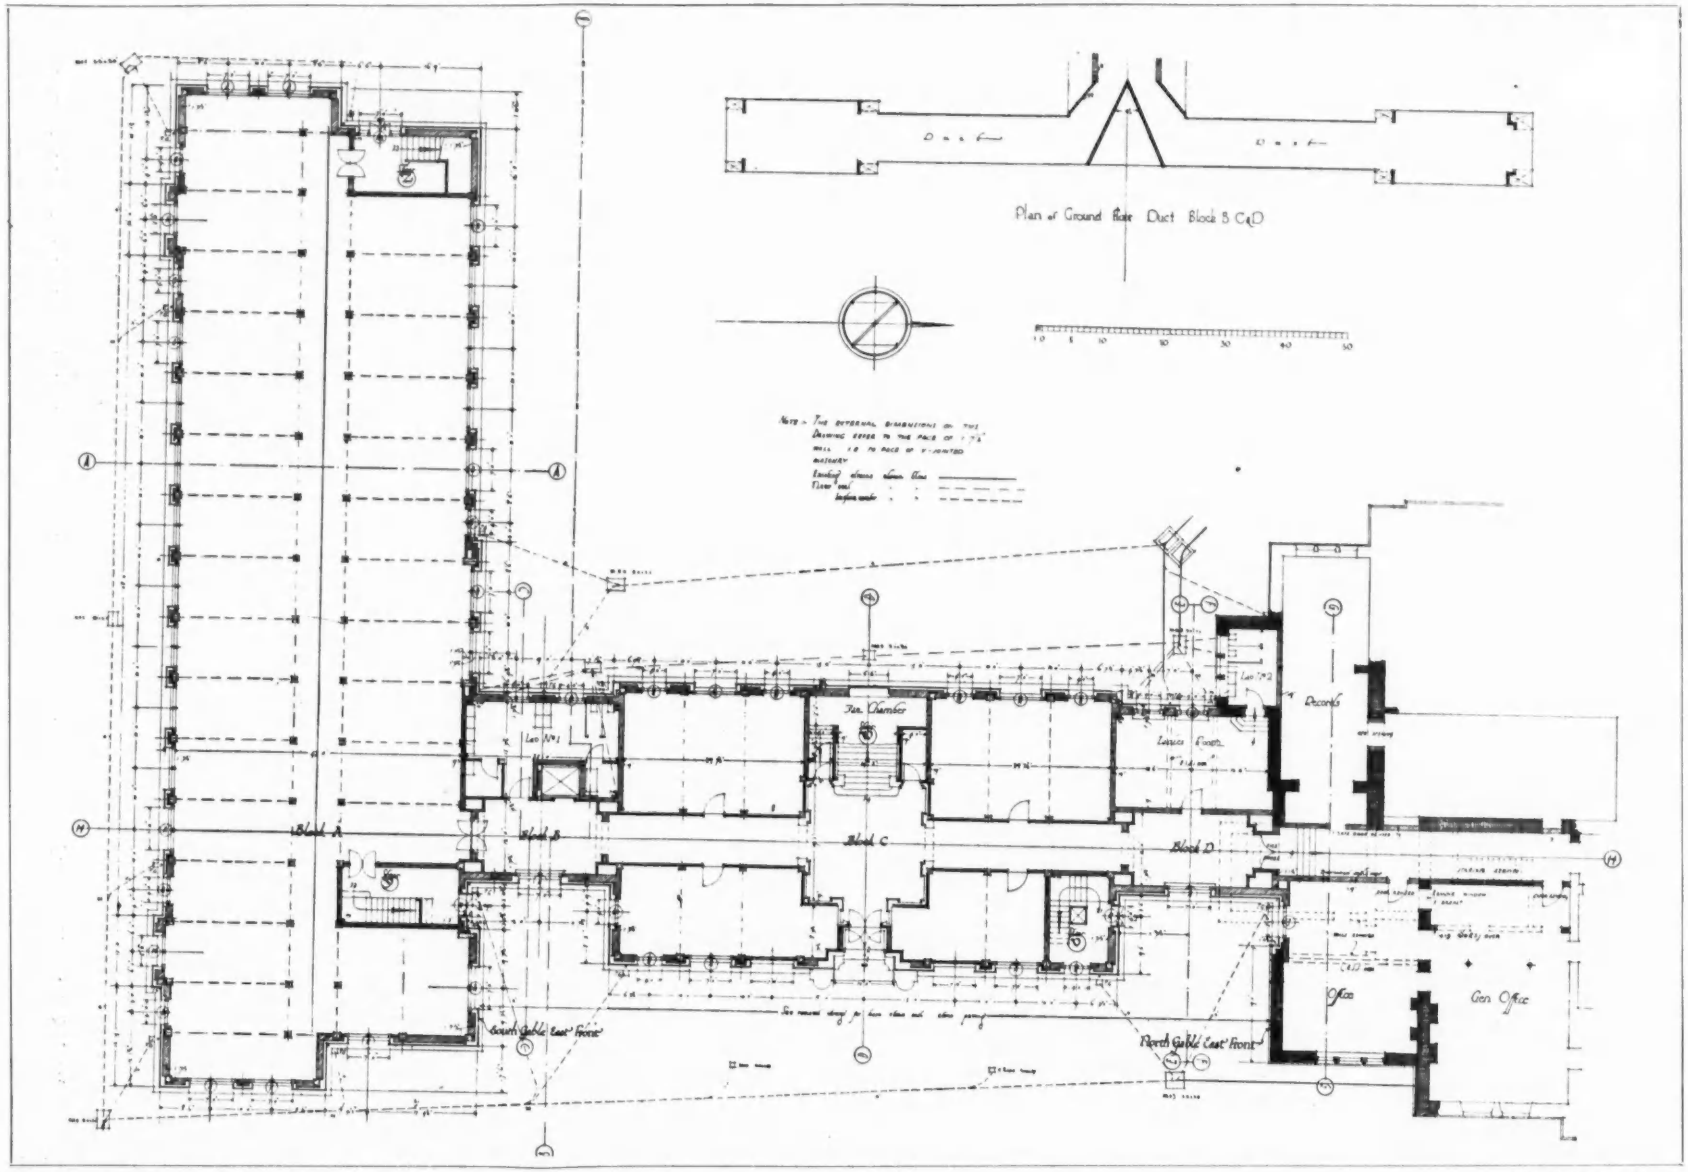
ON Monday next H.R.H. the Duke of Gloucester will open the new extension to the Surrey County Hall, Kingston-on-Thames. The extension provides a block with a frontage 200 ft. long to Penrhyn Road, and a wing block 160 ft. deep running towards Milner Road. At present the work of the County Council is done in small houses in the vicinity of the main hall, and the new extension will make it possible to house the whole of the staff under one roof.

Externally, the building, a reinforced concrete structure, is faced with Portland stone, and the roof is covered with green slates, graduated in colour and size. Windows are of wood, and the balconettes have ornamental iron balustrades and Portland stone floors. The main problem confronting the architect in designing the exterior was to provide a new building which would link up with the old and form a complete architectural whole, without detracting from the importance of the old hall.



Among the rooms of outstanding interest are the chairman's room, the committee room, and the members' lounge and dining-room.

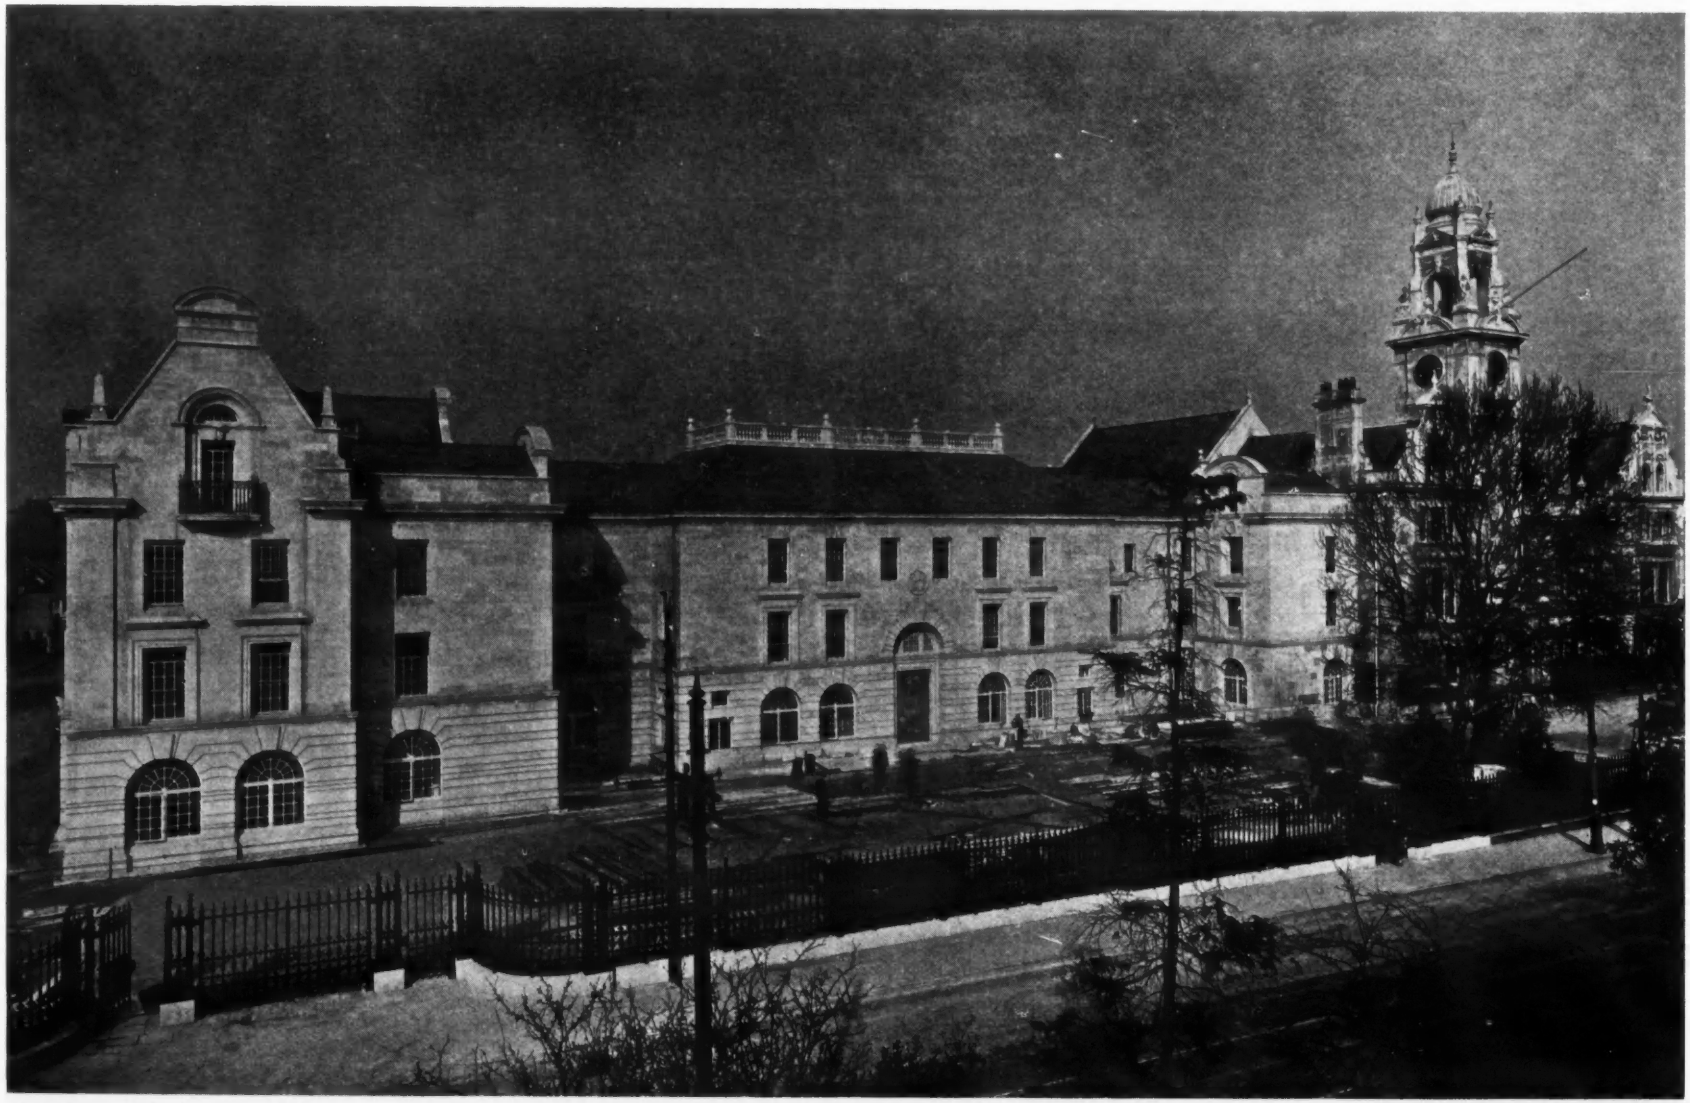
The chairman's room has panelled walls in quartered figured English walnut, the doorway and cornice being carved in leaf design.



The members' lounge is panelled in Australian bean wood, and the pilasters are surmounted by shields on which are painted the coats of arms of the boroughs as well as the badges of the Surrey Yeomanry, the East Surrey Regiment and the Queen's Royal West Surrey Regiment.

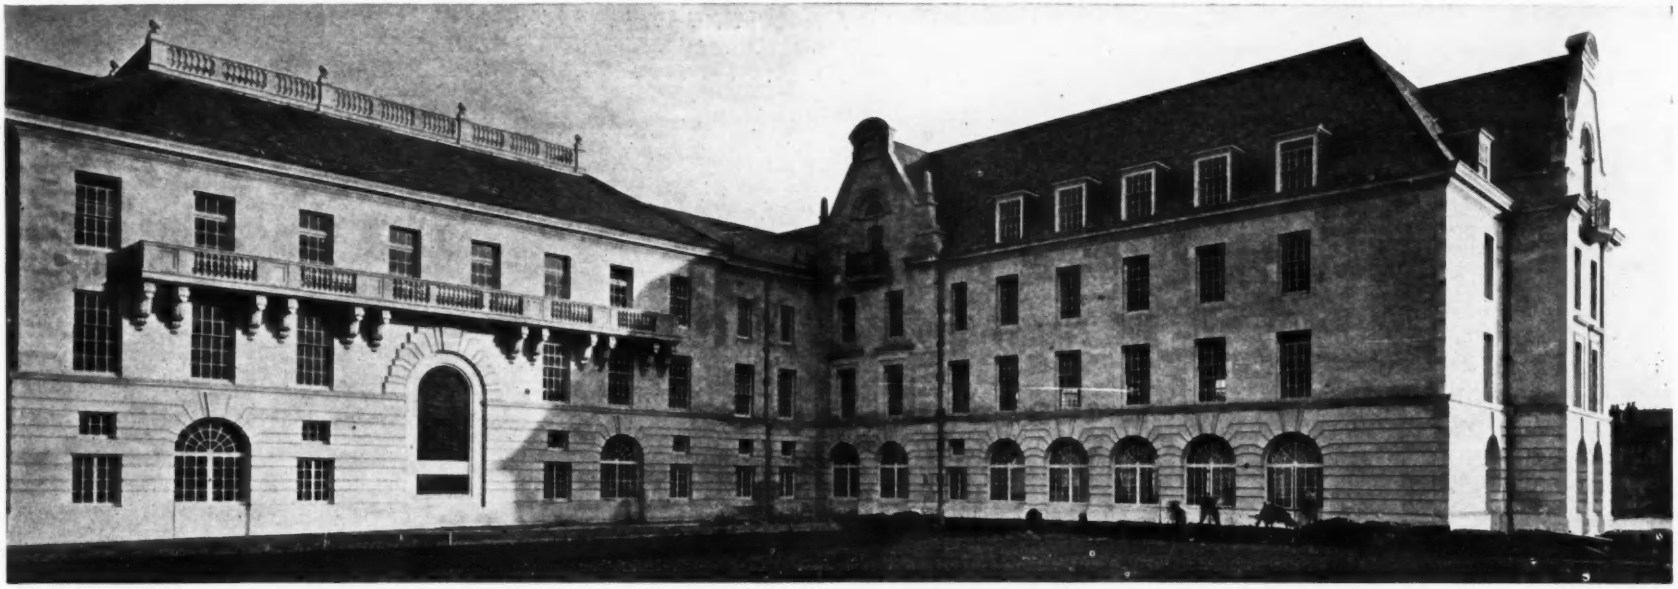
The decoration of the committee room and the dining hall is described beneath the illustrations on pages 532 and 533.

Dining room accommodation, with the necessary kitchen arrangements, has also been provided for the staff.



The main entrance of the new extension is in Portland stone, and has oak doors. The stone medallion above the lattice fanlight bears the seal of the Surrey County Council and the coats-of-arms of Kingston and Guildford.

Surrey County Hall : New Extension.] *[By E. Vincent Harris.*

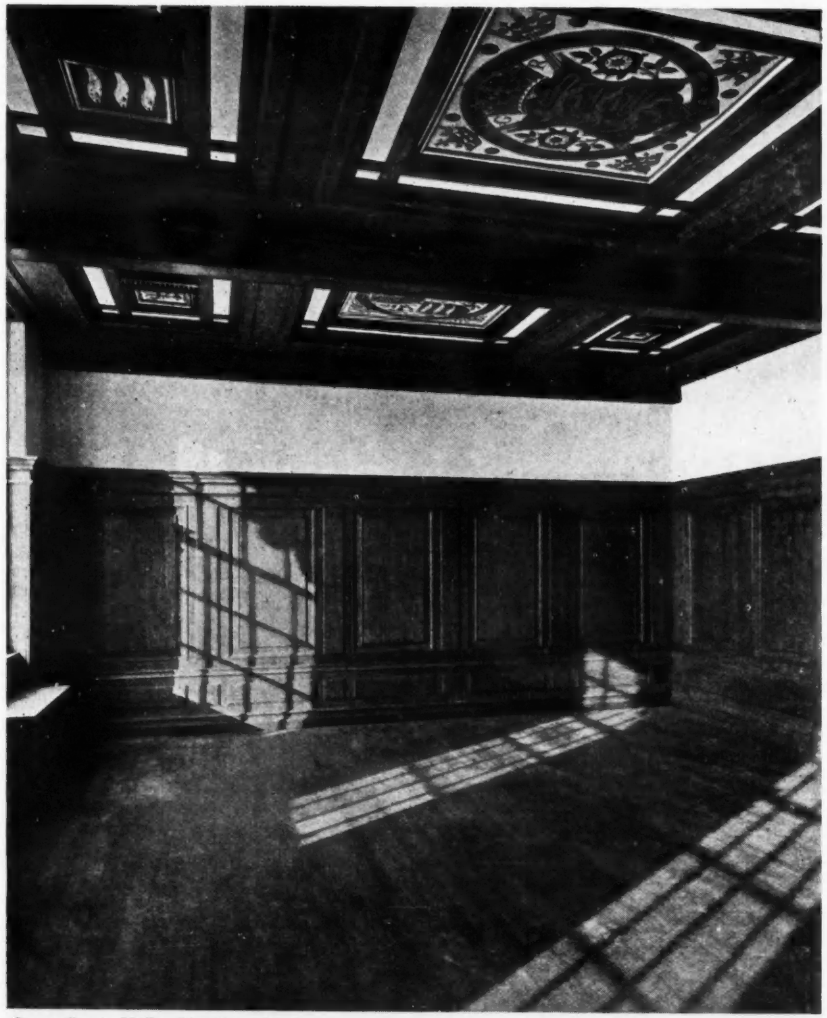


The ground floor plan. Approximately 50,000 square feet of extra office accommodation has been provided. The aim of the architect has been to allocate to the various departments of the council a large floor area sufficient for their individual needs. Division partitions are used only to secure a certain amount of privacy for the heads of departments. This arrangement makes for easy supervision, as each floor area has two aspects.

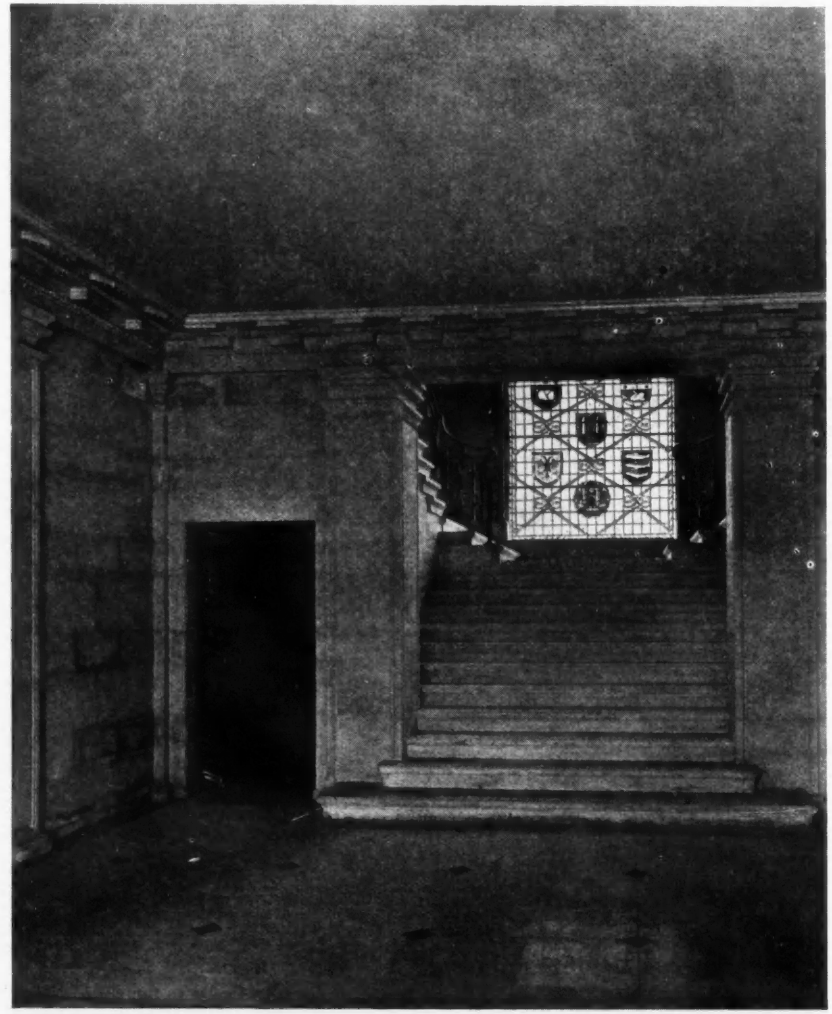
arrangement makes for easy supervision, as each floor area has two aspects.

Surrey County Hall : New Extension.] [*By E. Vincent Harris.*

A general view of the main, Penrhyn Road, front. The old portion of the building is surmounted by the clock tower. The extension was necessary to house the staff of the county council under one roof. At present the work is done in small houses in the vicinity of the main hall, causing great difficulties in the administration and handling of the ever-increasing legislative work which is being delegated to county authorities by the Government.



On the west front of the extension, in front of the windows of the general conference room and the members' dining-room, is a carved stone balcony, with turned columns and carved trusses. The stained-glass window beneath it lights the staircase, and is a gift of Mr. H. E. Smith, a county councillor.



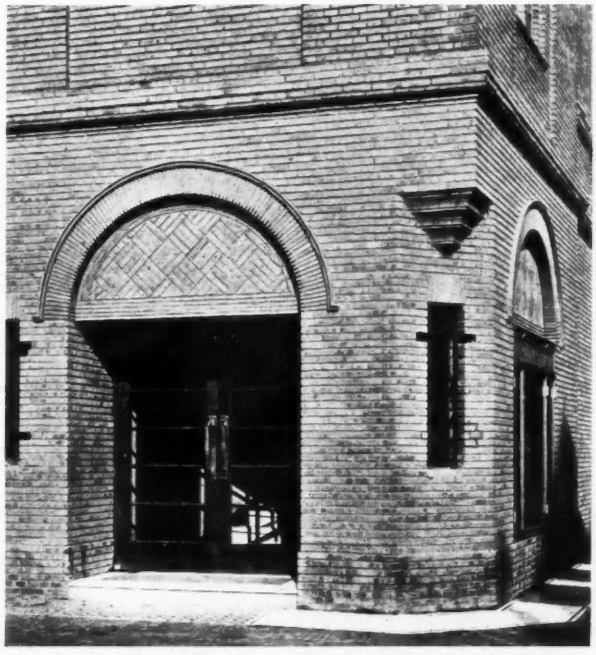
A view from the south-west ; and the members' dining-room. In the grounds are five tennis-courts, a large flower-bed, a bowling-green and a garage shelter nearly two hundred

A view from the south-west ; and the members' dining-room. In the grounds are five tennis-courts, a large flower-bed, a bowling-green and a garage shelter nearly two hundred feet long. The members' dining-room is panelled in weathered oak.

Surrey County Hall : New Extension.] [*By E. Vincent Harris.*

The committee room ; and the entrance hall. The former is panelled in English oak. On the ceiling, also in oak, are three large centre panels painted with the Royal Arms and the coats-of-arms of the diocese of Guildford and the county of Surrey. Smaller panels bear the arms of six county boroughs : Kingston, Guildford, Richmond, Reigate, Godalming and Wimbledon. The entrance hall and staircase are in Portland stone, and the floor is of artificial marble. The balustrade is of wrought iron; the handrail of bronze.

PRINCE EDWARD THEATRE, OLD COMPTON ST., W.C.



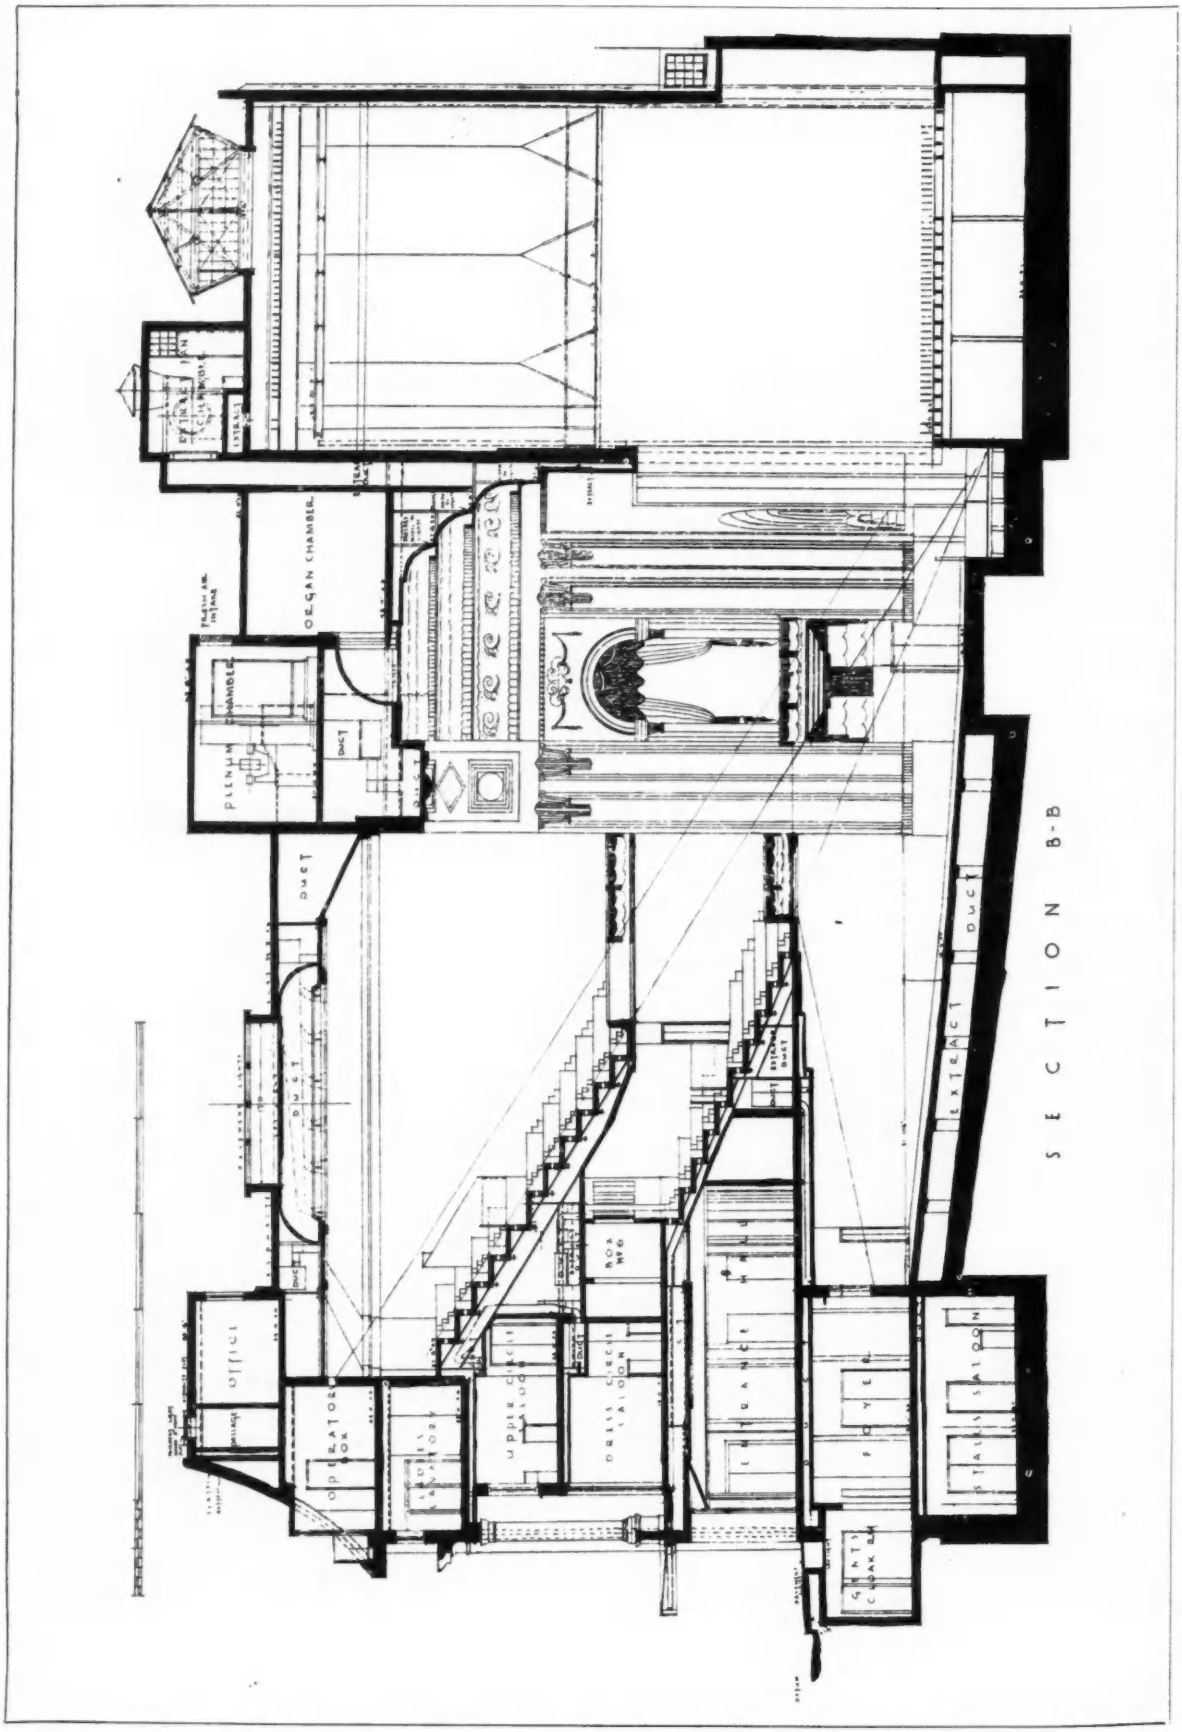
[*By E. A. Stone*]

The proscenium and Royal box of the Prince Edward Theatre, which opens tomorrow. The proscenium arch is formed of a series of glass coves tinted in amber to match the lights of the circle front. The main colouring-scheme of the auditorium is a reddish purple, known as "fuschia" and gold, while the hangings and carpets are in various tones of red. The Royal box is entered direct from Greek Street, through a foyer.

PRINCE EDWARD THEATRE, OLD COMPTON ST., SOHO

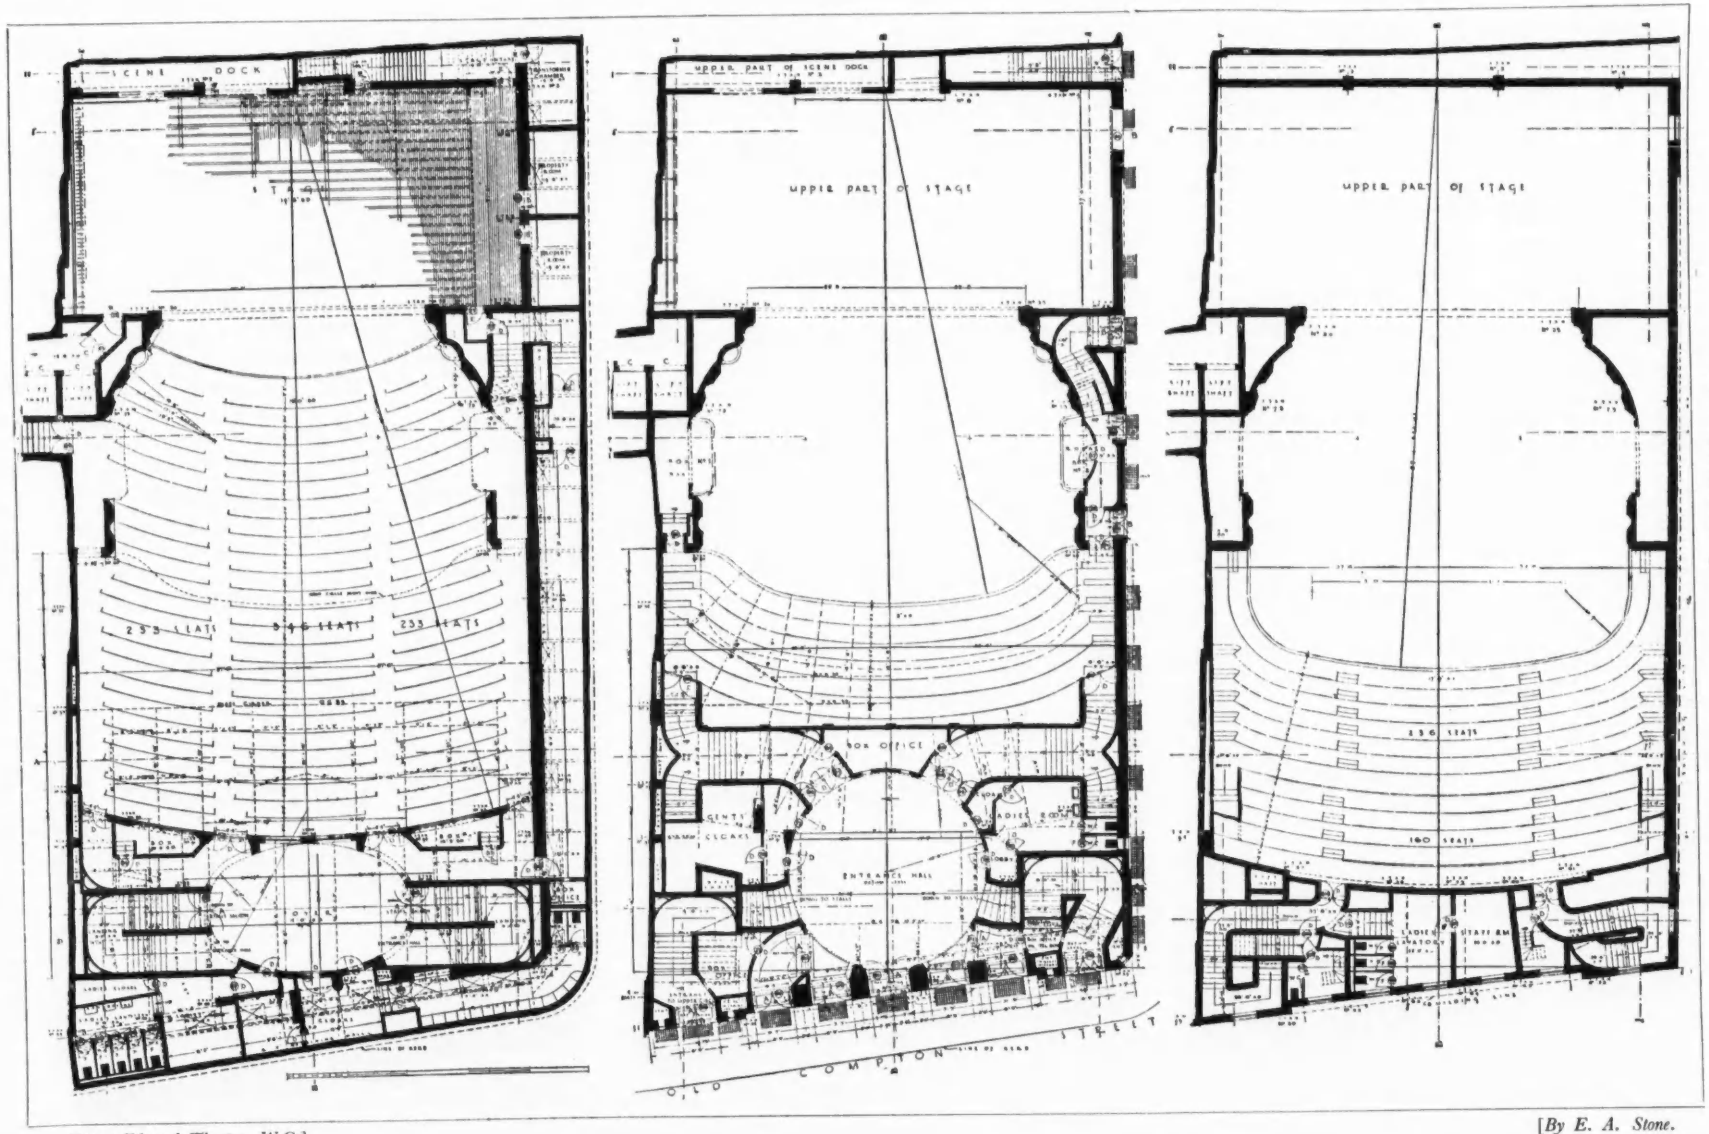
DESIGNED BY E. A. STONE

A detail of the brickwork, small mauve bricks with raked joints, at the corner of Old Compton Street and Greek Street.



TOMORROW, April 3, London's latest theatre opens with a big musical production. The theatre is situated at the corner of Greek Street and Old Compton Street, in the very heart of Theatreland. The ground on which it is built was formerly occupied for nearly a century by Messrs. William Reddan and Son's premises known as "The Emporium." This building formed a link with Georgian days, when Old Compton Street was one of the most fashionable shopping thoroughfares in London. With its low ceilings and quaint interior, the shop always had a fascination for lovers of old London and foreign visitors, and was patronized regularly by members of the Royal Family.

An inspection of the accompanying plans and section of the new theatre shows that there is no seat in the house but has a perfect view of the stage. Corridors and staircases appear in duplicate, and the foyers and buffets at all levels are of ample size, so that there should be no cause for complaints regarding accessibility and service.



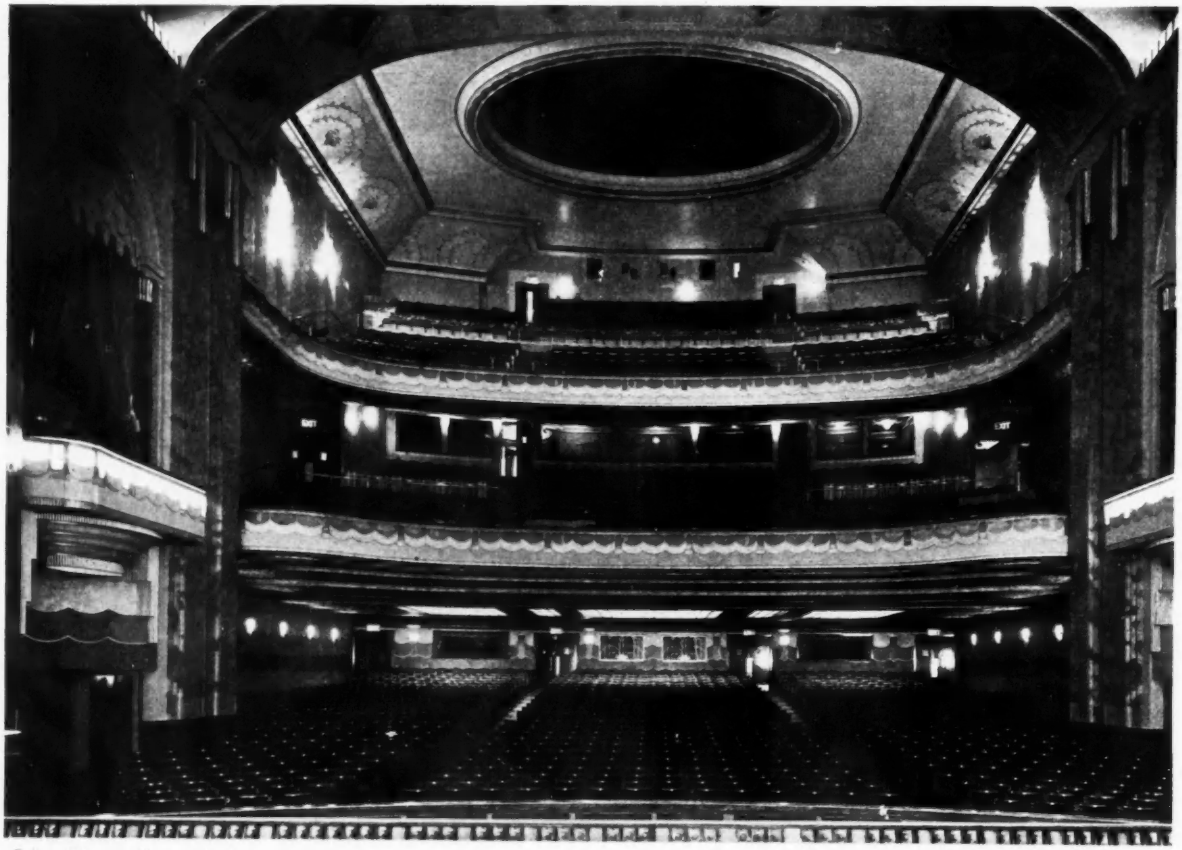
The theatre accommodates approximately 1,650 people, divided as follows: Stalls and pit stalls, 850; dress circle, 322; upper circle, 396; boxes, 82. The upper circle is divided into two sections at

A general view, taken from approximately the same viewpoint as the abov detail. The brick façades harmonize with the surrounding buildings and are enlivened by the introduction of bright green windows and shutters. At night the theatre is flood-lit from the canopy and cornice.

Longitudinal section. For the artistes there are nearly forty large dressing-rooms, and all the "stars" have their own sitting-rooms. Two large lifts are installed, adjacent to the stage, to take the artistes to the various levels. The stage entrance and exit is in Frith Street.

Prince Edward Theatre, W.C.] [*By E. A. Stone.*

Plans at stalls, entrance hall, and upper circle levels. The theatre is designed for the production of musical plays and revues, and accommodates approximately 1,650 persons. It has a stage second in size only to those of Drury Lane and Covent Garden, which are the largest in London.



Patrons enter from Old Compton Street into a circular entrance hall, lined in walnut. There are foyers above and below for the dress circle and stalls respectively.

different levels with separate approaches, and the back portion of this circle, therefore, takes the place of gallery.

Full consideration has been given to the democratic spirit of the times by the arrangements thus made in the planning of the upper circle and gallery. The comfort and finishings are equal to those of the stalls and dress circle.

A novel feature is the planning of the boxes, the greater number of which are placed at the back of the dress circle with a view unsurpassed in the house. A similar remark applies to the Royal box, and to the box opposite.

The stage has been built on the latest principles, and the best features of American and Continental stages have been adopted. A special feature is the electrical switchboard, which is constructed to allow all the lighting for eight scenes to be pre-set, requiring only the movement of one switch to light each entire scene. An operator's box is provided in order that the theatre may also be used for trade shows in connection with the "talkies" and silent pictures.

Prince Edward Theatre, W.C.] [*By E. A. Stone.*

The auditorium, looking from the stage. Every seat is a cosy armchair with ample leg-room and giving a perfect view of the stage. The upper circle is in two sections, provided with separate approaches, the rear portion taking the place of the old-time gallery.

ENGLISH PRECEDENT No. 109

WESTERN SCREEN, CHAPEL OF TRINITY COLLEGE, OXFORD

Trinity College Chapel, Oxford, a building commenced in 1691, incorporates some decorative woodwork of exceptional interest and beauty, consisting of an altar-piece and other fittings at the east end, the wainscoting of the side walls, and a screen at the west end dividing the chapel from the ante-chapel, together with canopied seats and rows of benches. The wainscoting generally is of oak, the expanses of plain surface in the altar-piece and screen being veneered with walnut-wood, cross-banded and inlaid with a parquetry design, the applied wood-carving being of limewood, while the pierced panels flanking a central opening in the screen are variously described as of cedar or of "a sweete outlandish wood not much differing from Cedar but of a finer Graine."

The east and west ends of the chapel exhibit a general correspondence in the design of the woodwork. In the screen at the west end the centre is occupied by an opening, flanked by detached columns of the Corinthian order supporting a segmental pediment, bearing reclining figures of the four Evangelists and a central vase, below which, fronting the tympanum, is a richly-carved inclined cartouche. On either side of the central opening is a niched and canopied seat, surmounted by a flammate vase and flanked by a large panel of elaborately carved and perforate scroll-work, bearing, on the ante-chapel side, amorino-heads, etc., in high relief, and, on the chapel side—that shown in the photograph—a central bunch of fruit, flowers, wheat-ears and hops, the whole panel being enframed within a bold bolection-moulding and encompassed by rich applied carving representing an open book festooned with swags and drops of tasselled drapery.

It is not known whether Wren was responsible for the design of this sumptuous woodwork, or what share is attributable to that prince of craftsmen, Grinling Gibbons, the only name actually to be identified with the work being that of Arthur Frogley, the Oxford joiner, though records are extant of payments for bringing carvings from London. —[I. C. GOODISON.]

CHARING CROSS BRIDGE BILL: COMMITTEE'S PROCEEDINGS

BY OUR SPECIAL REPRESENTATIVE

THE Private Bills Committee of the House of Commons on the London County Council (Charing Cross Bridge) Bill, under the chairmanship of Sir Henry Cautley, began their proceedings last week by examining Sir Percy Simmons, chairman of the Improvements Committee of the London County Council. He said the present proposal had originated more immediately from the circumstances attending Waterloo Bridge. The Royal Commission recommended that Waterloo Bridge should be reconstructed with four, and not six, lines of traffic, the corollary being that there should be a bridge constructed at Charing Cross.

The Chairman: And also a bridge at St. Paul's?

Sir Percy Simmons: I do not think they ever considered that St. Paul's was interlocked with Charing Cross Bridge.

In reply to further questions, Sir Percy said that the Government offered a grant of 75 per cent. from the Road Fund of the approved cost of reconstructing Waterloo Bridge, and accepted the position that its preservation involved the construction of a road bridge at Charing Cross.

The Chairman: What business had the Minister of Transport in this at all, except that he was providing the money?

Sir Percy Simmons: He must see that there are proper facilities for transport, and a bridge would come under his authority. For ordinary street widenings the Government contribute 50 per cent. of the cost from the Road Fund, and on a big scheme more.

In reply to further questions, Sir Percy Simmons said that the Southern Railway regarded the first proposal for transferring Charing Cross station to the south side of the river as impossible. They did not want to adopt the Lion Brewery site scheme, and only did so as a result of pressure from the Government. They were now satisfied that everything would be done under this scheme to meet the convenience of their passengers. The Underground Railway and omnibus facilities for getting from the new station to other parts of London would be even better than those provided at the present terminus.

Questioned as to the objections of Westminster City Council to the Bill, witness said that they were asking for an undertaking that the L.C.C. should forthwith get compulsory powers to widen St. Martin's Lane. They would not admit that it was necessary with the present amount of traffic, but only that it would be necessary when the new bridge was completed.

In reply to Mr. Charteris, K.C., for the promoters, witness agreed that while the traffic towards St. Martin's Lane would be increased by the bridge, there must be set off against that the construction of the circus at the entrance to St. Martin's Lane, which would immensely increase the fluidity of the traffic.

Witness said that the L.C.C. were prepared to give an undertaking that designs for the bridge would be obtained by competition or otherwise.

In reply to further questions, he said that the L.C.C. were giving the railway about two-and-a-half times as much space as they had now, and were paying them £2,126,000. That sum did not include the cost of purchase of the site on which the new station was to be erected.

Counsel: The Southern Railway did not make a bad bargain?

Sir Percy Simmons: I can say without hesitation that the Southern Railway made a fair bargain and that the L.C.C. made an exceedingly satisfactory bargain.

Counsel: And it results in allotting to the Southern Railway a site for a station that might become one of the finest sites in the Empire?—No; we are getting what is already one of the finest sites in the Empire.

Witness agreed that under the present scheme about 100 yards of York Road would be covered in. He could not agree that earlier schemes in which a covered way over the Strand was a central feature had been rejected mainly because of that feature. They were rejected because the present scheme was better.

The L.C.C., witness agreed, would not provide the buildings and embankment gardens that were shown in the model on each side of the bridge on the Surrey side.

Counsel: So that what Lambeth can look forward to is not a charming site like that in the model, but a hole in the ground, probably 28 ft. deep, rather like a quarry?—I am advised that there will be no difficulty in disposing of this site.

Mr. Frederick Palmer, consulting engineer, who acted jointly with Sir George Humphreys as engineer to the Charing Cross Bridge project, was then called.

In reply to Mr. Charteris he said that the scheme now being discussed would reduce the existing amount of viaduct by 2,000 ft. An important consideration in determining the site of the new bridge had been the question of navigation.

He regarded the embankment on the south side of the river as a desirable feature which would add considerably to the amenities of the Lambeth area. An area of eight-and-a-half acres would be covered by the new station on the Lion Brewery site, with the main entrance about 200 ft. back from the river embankment. This latter area represented roughly what would be reclaimed from the river. They had got the railway level down as far as possible consistent with the required head-room for the bridges.

Replying to further questions, witness said that the London County Council had satisfied themselves that there need be nothing unsightly in connection with the covered way over Waterloo Road. It would be made into an arcade with shops. The bridge over York Road would be 360 ft. long. The land between Belvedere Road and York Road already belonged to the L.C.C. It would probably be used as an approach to the new station.

The Chairman: What will be the end of Belvedere Road?

Mr. Palmer: It will really become an approach to the County Hall.

The Chairman: Why is the road approaching the new bridge to be 120 ft. wide and the bridge only 90 ft.?

Witness explained that the traffic on the road would be frequently pulling up, whereas no traffic would pull up on the bridge itself.

The Chairman: You are making this road 50 per cent. wider than the Waterloo Bridge road.

Mr. Palmer said that the Waterloo Bridge road was too narrow for the traffic it had to carry at present, and, in any case, the road they were now discussing was a much more important road.

Sir Henry Cautley announced that the Committee had decided to ask the R.I.B.A. to send a representative of their own selection to give evidence before the Committee. They would be guided on the architectural treatment of the viaducts by that evidence.

Sir Percy Simmons agreed that the present scheme was really cut and dried by July, 1929. Asked whether, except for what was obtained from the newspapers and reports of the London County Council proceedings, Westminster City Council would not have known anything about it, the witness said that that was so, but Westminster City Council, he added, were not going to be asked to contribute to the cost of the scheme. He would accept counsel's statement that it was not until August that a copy of the proposed plan was sent, and then unofficially, to the city engineer.

CLEARING THE SLUMS OF EDINBURGH

Some Typical Reconditioning and Rebuilding Schemes

BY ROBERT HURD

The author here concludes his survey of recent work in the Scottish Capital within an area embracing the Grassmarket, Cowgate and Candlemaker Row, the relative positions of which were indicated in the map forming figure one in last week's issue.

THE example given in the first part of this article has no outstanding architectural merit, except as regards plan, but there are three others of a different order. The first is No. 17 Grassmarket, alongside the Vennel (the site of the City Wall). Of the original building there is both a photograph and a plan (figures eight and nine). On the ground floor there were two shops, and a typical upper floor contained one two-apartment and three one-apartment houses, all sharing one sink and w.c., the entrance to these floors being by a turret stair at the back of the building. Though the new plan (figure eleven) has the shops as before, the entrance stairs are moved to the front, opening off the Grassmarket, but with direct access to the very necessary close created at the back by demolition. The accommodation on a typical upper floor consists of two two-apartment houses with very ample offices, thus reducing the total residential accommodation of the block from three two-apartment and nine one-apartment houses to six two-apartment houses.

The street elevation of the new building (figure ten) is strictly symmetrical compared with the casual regularity of its predecessor, but to have reproduced the irregularities of the older block would have been sheer pedantry, and the new elevation seems to combine very happily the main lines of the old one, with direct expression of the modernized planning.

Only in one respect does the new offend, and that is in its advertisements. They say that a revision of the Advertisement Regulation Acts of 1906 and 1925 may be coming before Parliament soon, to make it illegal for any shop to disfigure a frontage by displaying the advertisements of a whole series of goods which it happens to sell. May this revision come soon! Here, now, is an example joyous in its blatancy and positively smart in the speed with which disfigurement of a carefully balanced front has been achieved in record time—for the building was first occupied only a few months ago. Edinburgh has so much to teach us with its early-nineteenth-century commercial architecture and lettering that it is doubly lamentable when the Corporation cannot prevent their own new buildings from being thus despoiled.

Figure twelve shows Nos. 74-82 Grassmarket in the last stages of picturesque but despondent squalor. The elements of the plan are evident—two houses with separate entrances to staircases at either side, sharing the ground floor with a fish restaurant and a public-house. The City Architect, having consulted with the Ancient Monuments Commission for Scotland, produced a new design for the site, sensibly reminiscent of its predecessor and very cleverly planned (figure fourteen). He has designed the block as one whole, having one central staircase leading to six two-apartment houses on the first, second and third floors, and only the public-house (double its original size) on the ground floor. The charming elevation (figure thirteen) is full of interest and is an improvement on the old one, and does, as much as the new 17 Grassmarket, combine the best features of the old elevation with direct expression of the new planning. In particular, the design of the public-house entrance and windows should be noticed.

On the edge of the area which we are considering is Candlemakers' Hall (figure fifteen). This interesting building, which is on a steep slope at the top of Candlemaker Row (see figure two), backing on to Greyfriars, had ceased for some time to have anything to do with candlemakers, and had been divided and subdivided until very few traces of the former richness of its interior decorations were left. It was also much decayed, and in most cities would probably have been long since demolished.

Fortunately, however, the outer walls were sound, and it has been gutted, partly replanned, some good panelling restored to its former state, and the whole put to new and more ambitious social uses than a series of apartment houses. The long-established smithy has continued in occupation of part of the ground and first floors, but the monks of St. Giles have taken the second and third floors of the lower part of the premises, and Toc H the first, second, third and attic floors of the upper and smaller part. In the attic is their chapel. The strong vertical emphasis which the two stair turrets give to the street front makes this building stand out very effectively from its neighbours; and the present attractive appearance of Candlemakers' Hall, not marred by unsightly signs, quite apart from its social value to such a neighbourhood, alone justifies the decision of the Corporation to allow the City Architect's department to undertake its reconditioning.

A good example of partial demolition and careful replanning is at Wardens Close, in the Grassmarket; and a hostel for men, planned on the lines of the women's hostel in Candlemaker Row, is about to be established at No. 8 Cowgate (figures sixteen and seventeen). The replanning of both these premises has been particularly tricky, and the finished result at Wardens Close is worth visiting.

If we take the premises at No. 17 Grassmarket (figure ten) as typical, it is possible to give some idea of the financial side of slum clearance. These premises have two shops on the ground floor (Nos. 15 and 19 Grassmarket) and six two-apartment houses above. This separation of the two parts is important, because the Government grant under the Housing Act of 1923, which is in the form of a repayment of half the deficit between the income (rents and rates) and expenditure (maintenance and loan charges) of the Corporation for all property of this kind, is only made in respect of residential property, and not for shops. No. 17, it will be remembered, was entirely rebuilt, and to give extra space at the back considerable demolition took place.

The cost was as follows:

Demolition—Building site	..	£54
space at back	..	275
Building—shops ..	.. ..	833
six two-apartment houses	.. ..	2,500
		£3,662

and the income:

Rates per annum—				
Shop	£3	8	3½	(average)
Two-apartment house ..	3	7	6	
Rent per annum—				
Shop	22	0	0	(average)
Two-apartment house ..	12	0	0	

(The rent per week of a two-apartment house works out at 4s. 6d. plus 1s. rates.)

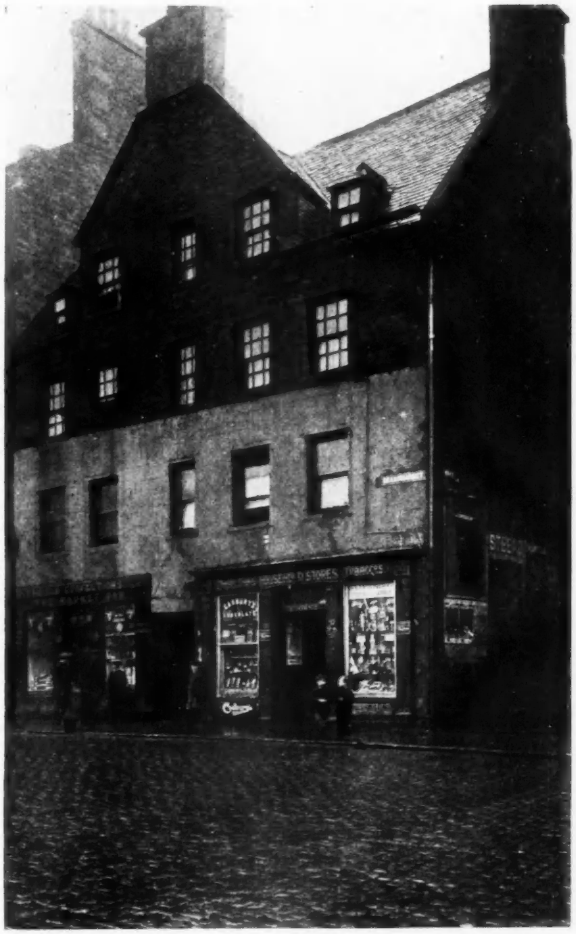


Figure eight. No. 17 Grassmarket before rebuilding. The front has but a casual regularity.

Figure ten. No. 17 Grassmarket after rebuilding. Its new symmetry was early spoiled by the signs.

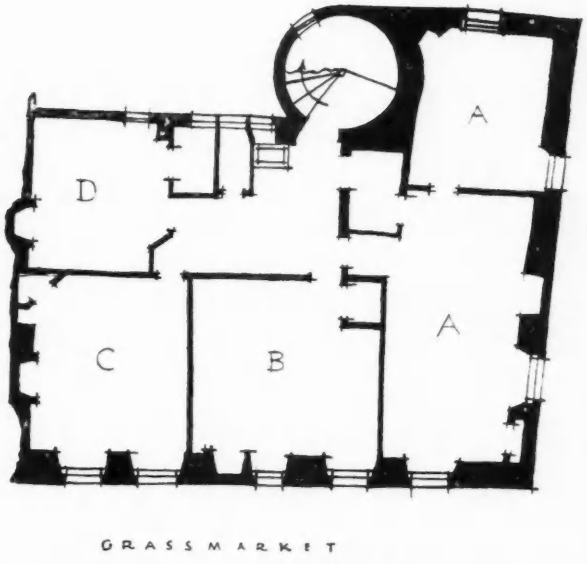

Figure nine. Plan of a typical floor of No. 17 Grassmarket, before rebuilding. Here lived four families, all sharing one sink and one w.c.

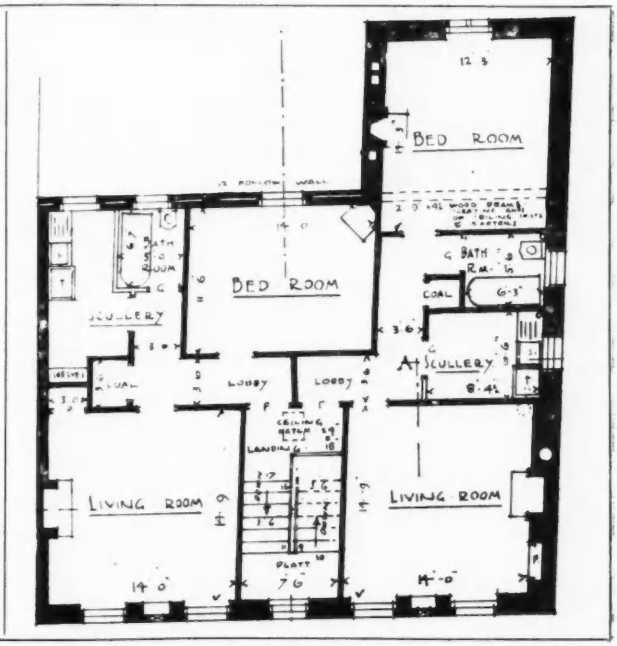

Figure eleven. Plan of a typical floor of No. 17 Grassmarket, after rebuilding, showing two two-apartment houses, with ample and convenient offices.

Figure twelve. Nos. 74–82 Grassmarket before rebuilding was taken in hand.

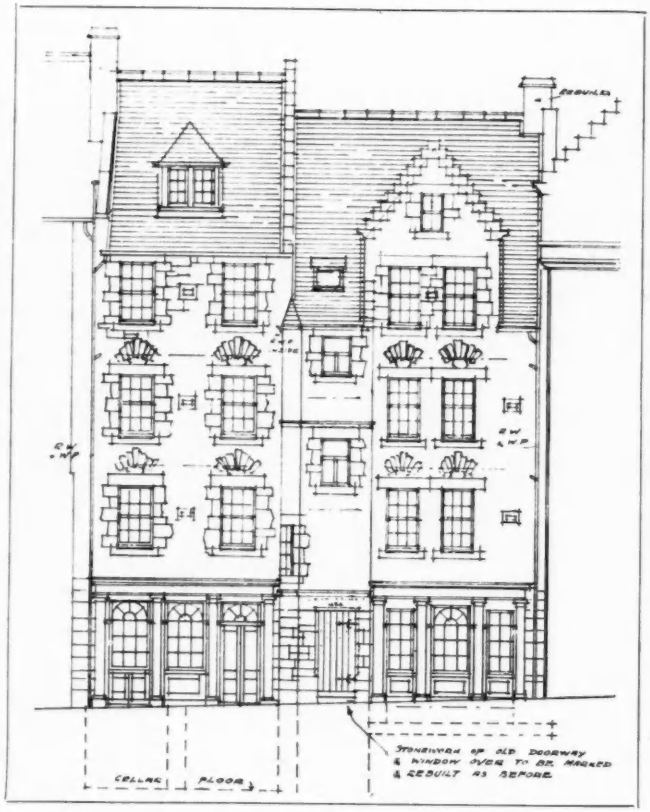

Figure thirteen. New elevation of Nos. 74–82 Grassmarket, now being built.

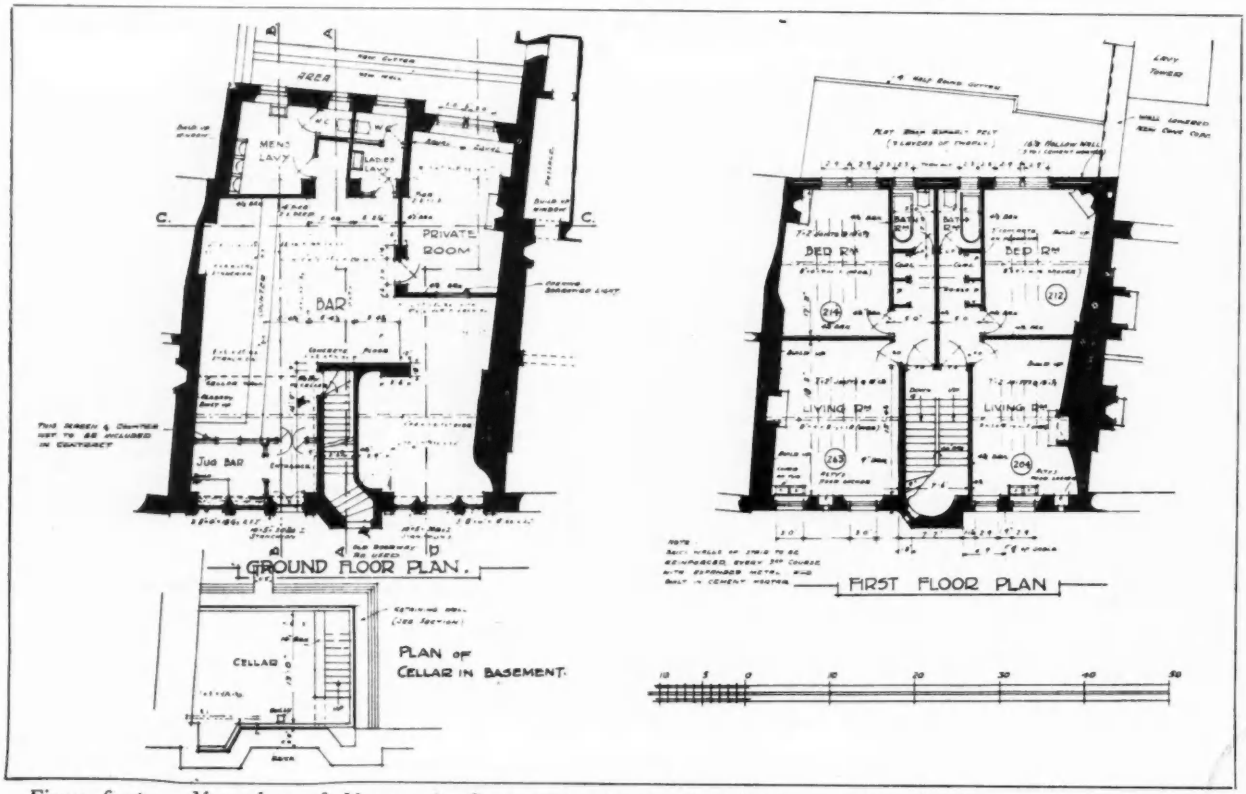

Figure fourteen. New plans of Nos. 74–82 Grassmarket, showing the public-house, replanned with an unusually large bar, on the ground floor and typical apartment houses on an upper floor.

The process of slum clearance obviously involves a severe reduction in the housing capacity of the area under treatment—for instance, we find that, whereas No. 17 Grassmarket formerly lodged twelve families, now only six live there.

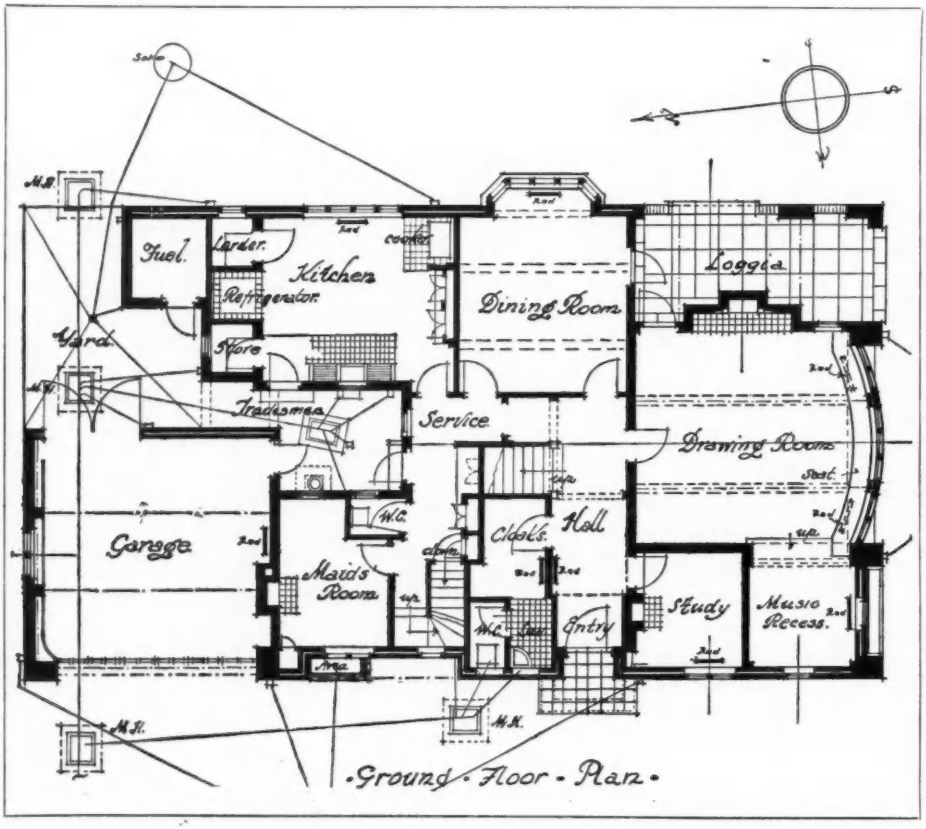
It is not possible here to go into the problem consequent upon slum clearance—the rehousing of surplus population—beyond indicating that the Edinburgh Corporation have a scheme at Prestonfields, consisting of blocks of two-, three-, and four-apartment houses especially designed to ease the situation created by their slum clearance activities in the city.

In dealing with the Grassmarket only, instead of with the whole of Edinburgh's slum clearances, I have run the risks of selective treatment, but the complete nature of the slum clearance scheme in this area, including in its scope buildings of considerable interest, such as shops, a public-house, a social centre, and both men's and women's hostels, as well as ordinary apartment house accommodation, seemed to make it sufficiently representative to merit description by itself as a separate entity.

Of the enterprise, good taste and ingenuity of the City Architect and his department, these examples of reconditioning and rebuilding are ample evidence, and they will serve, one hopes, as an encouragement to other cities where slum clearance schemes are not so well conceived and carried out.

(Concluded)

Figure fifteen. Candlemakers' Hall, now divided between a smithy, the Monks of St. Giles, and Toc H. Figure two, in last week's issue, showed a general view of Candlemakers' Row and the Hall.



Figures sixteen and seventeen. The left- and right-hand portions, respectively, of No. 8 Cowgate, before reconditioning. Plans have been prepared for conversion into a hostel for men, on the lines of that for women illustrated, last week, in figure four.

The westerly, or main entrance front, showing the garage, with chauffeur's flat over, on the left, balanced against the study and music recess to drawing-room, with bedroom over, on the right. The walls are of brick to first-floor level and tile-hung above.

HOUSE IN

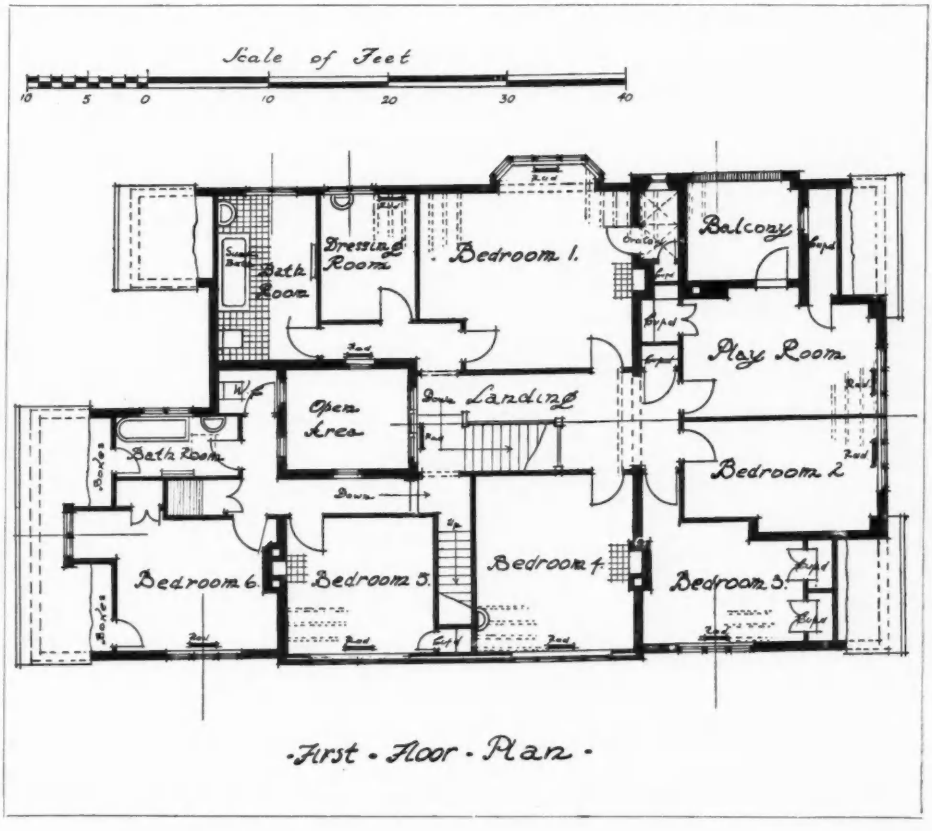
Addington

DESIGNED BY

FACING the Shirley Hills, and standing amidst pines, this house was planned to meet the special requirements of the owner. The ground-floor accommodation includes a comparatively small dining-room, a drawing-room, with a music recess, a study, and kitchen, etc. That on the first floor presents several points of interest. A self-contained flat, with bathroom, intended for the use of a chauffeur and his wife, has access by separate service stairs. Above the arched loggia of the ground floor is a sleeping balcony, with access from the play-room. Adjoining, but entered from the owner's bedroom, is a

In the southerly end, on the ground floor, the slightly bowed window of the drawing-room is the central feature, between a shallow seat recess and the end of the loggia. The window opening above lights two rooms—a bedroom on the left and playroom on the right of a central partition.

SURREY



Park Estate

HUGH MACINTOSH

small private oratory, with a stained-glass window.

The incorporation of the garage gives symmetry to the front elevation. Similarly, in the end facing south, the loggia is balanced by a recess with a garden seat, under cover, and these flank the large, slightly bowed window of the drawing-room.

The ground-floor reception rooms are floored with oak, which is also used for panelling in the hall and dining-room; all joinery is in oak. The oratory has panelled walls and a domed ceiling. The kitchen is tiled to the ceiling, and has a refrigerator chamber; the service yard is completely screened.

LITERATURE

HOLIDAY IMPRESSIONS FROM ABROAD

SIR REGINALD BLOMFIELD's latest book, *Byways*, is a collection of holiday impressions from Provence, Central Europe, and Scandinavia.

In France, as in this country, many buildings have been ascribed to famous architects without a shadow of evidence, and not the least interesting part of the chapters on Provence deals with some of the provincial architects of the sixteenth and seventeenth centuries whose names have been overshadowed by their more eminent brethren.

The author's admiration for the cause of the French Protestants and a visit to the Musée du Desert, near Nîmes, is the excuse for a short history of the Camisard revolt in the Cevennes.

Sir Reginald's taste and fine scholarship render him an ideal travelling companion in South Germany and Austria, where under his guidance we are assisted to disentangle the fine points of baroque architecture from the meretricious overlay of the exuberant ornament. He traces the origin of this inconsequent art to the Italian architects, especially to Borromini, and his work at the Villa Falconieri at Tivoli as the *fons et origo* of all the trouble. In Italy the classic tradition was too strong for baroque to take deep root, but in Austria and Bavaria it flourished and achieved its most complete expression. Such buildings as the Abbey at Melk on the Danube and the work in Munich, with the exquisite little Amalienburg, go far to show that the style has a right to be called architecture, although, as the author points out, in many buildings the architect has been reduced to the position of organ blower to the decorator.

The chapter on Sweden pays a tribute to the work of the modern architects of the northern capital. Modern work in other countries is either ignored or treated brusquely; even the new City Hall at Stockholm receives some hard criticism. But, in spite of the asymmetry to which Sir Reginald objects, the building contains many traditional motifs. It is the hold Sweden has upon the past while reaching out to solve the modern problems that gives her architecture its academic balance.

The delicate pencil sketches by the author are beautifully reproduced, and sufficiently reinforced by photographs and plans to form a perfect balance of illustrations.

LEEDS AND BRADFORD REGIONAL SCHEME: PART II

THE area covered by this large scheme stretches from the Ilkley moors in the north to Dewsbury and Wakefield in the south. It is, in the main, a region of big manufacturing towns and scattered industries, spread over a countryside cut into by rivers and streams, railways and canals: a hard-bitten, badly-worn country.

The problem of reducing the results of a century of haphazard growth into even the faintest semblance of order constitutes a test case for regional planning. This order is represented by three main divisions.

First, the areas covered by industry are to be limited to the positions best suited to it, which are to a certain extent those it now occupies, but with well-defined extensions along low-lying ground served by railways, roads and canals.

Secondly, residential districts are to be encouraged on higher ground above the level of industrial smoke, though not on the high moors. The residential problem is complicated by unusual factors, such as the habit among miners of living within reach of several mines, and, if possible, near factories where their womenfolk may work. This leads to the formation of complete dormitory towns in districts where it will be possible to protect amenities.

The third division is that of open space, and herein lies the salvation of the region; for if the process of straggling growth may be checked by zoning, the preservation of rural and rustic belts will define the new limits, and restore a disappearing sense of locality. It must be noted that segregation of residential districts is only possible with rapid transport and a network of communications. The sense of locality is of a new order.

A great many interesting matters, such as the question of restoring amenity in the wake of a fading coal-mining industry; the preservation of the beautiful valley of the Wharfe and the moorlands in the north of the region; methods of dealing with ribbon development, etc., must be left to be discovered.

E. M. F.

Leeds and Bradford Regional Scheme. Part II and conclusion. Thos. Thornton, Hon. Sec. to the Joint Town Planning Advisory Committee, 11 Park Street, Leeds. Price 11s. 3d., post free.

CORRESPONDENCE

CHARING CROSS BRIDGE

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—Does anyone know the reason why the proposed new Charing Cross Bridge does not land on the north bank opposite the end of Northumberland Avenue, thus giving a more direct line and some sort of a vista?

Surely, anything more awkward than the line shown by the model, with its nowhere-in-particular northern landing, it is hard to imagine.

H. R. FINN

ANCIENT WINDMILLS

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I was exceedingly interested in the views of some old windmills, reproduced in your issue for February 5 last.

One of these, the Chesterton Mill, is, in my opinion, a "freak" windmill. This building, generally supposed to have been erected from the designs of Inigo Jones, was built in 1632 for use as an observatory. It was converted into a windmill about the middle of the last century, and therefore—from a miller's and an antiquarian point of view—is of no special interest. I believe I am correct in stating that it is the first windmill to be scheduled by the Office of Works, but as a specimen of a windmill it can hardly be called a genuine one.

The accompanying photographs are of the Skirlaugh postmill in Holderness, near Hull, and the Meling Bout wind and water mill, Bryndu, Llangwyfan, Anglesey, North Wales. The former has just been "scheduled," and is of an early type with a roundhouse of brick, added, probably, in the eighteenth century. The main post is a magnificent piece of oak and the framework on which it rests is supported on brick pillars (four) raised from the ground about six feet. These pillars were evidently built at the same time as the roundhouse, thereby raising the mill six feet. There are three pairs of French stones in the mill—two on one floor and one (a smaller pair) on another. This is a most unusual arrangement—in fact I know of no other mill where there are no grey-stones. Skirlaugh Mill worked with one pair of arms until 1911. The beam for turning the mill to the wind is to be seen above the stairway. The roof is of the old pattern—not semi-circular eighteenth-century style.

The latter, the Meling Bout wind and water mill, is the only one of its kind in existence. The wind power has not been used since 1911, and the owner will not provide new canvas for sails,

The Meling Bout Mill, Bryndu, Llangwyfan, Anglesey, North Wales.

but the water-wheel is geared to the same machinery as the wind sails, thus working the mill.

E. MITFORD ABRAHAM

IN PARLIAMENT

Bromley Town Planning

MR. SMITHERS asked the Minister of Health if he would state when a public inquiry was held into the preliminary statement of the Bromley Rural District Council, under the Town Planning Act; where the inquiry was held; whether public notice of the inquiry was given; and whether any copy of the evidence given and the conclusions arrived at can be obtained or inspected.

Mr. Greenwood: The public inquiry into the preliminary statement of the Bromley Rural District Council was held at the Council Offices, Orpington, on July 20, 1927, and public notice was given in the local press and posted in the district. I do not know of any publication of the evidence except what was contained in the Press. Comments on the proposals were communicated to the Council in March, 1928, and further consideration and negotiations on a number of matters have since been proceeding.

The Skirlaugh Postmill, Holderness, near Hull, which has recently been "scheduled."

London Squares

Mr. Greenwood, Minister of Health, stated that he proposes to introduce a Bill on London Squares this session, but he could not yet indicate a date.

Slum Clearance Bill

Mr. Greenwood presented the Housing (No. 2) Bill, a measure to make further and better provision for the clearance or improvement of unhealthy areas; the repair or demolition of insanitary houses, and the housing of persons of the working classes; to amend the Housing Act, 1925, the Housing, etc., Act, 1923, the Housing (Financial Provisions) Act, 1924, and the other enactments relating to housing subsidies; and for purposes connected with the matters aforesaid.

Steel Industry Inquiry

Mr. MacDonald stated that he understood that the Committee which was examining the position of the steel industry in this country hoped to be in a position to submit their report to the Government shortly after Easter.

Announcements

Messrs. Braddell and Deane have removed their offices to Victor House, Portman Square, W.1 (entrance, No. 1 Baker Street). Telephone Number: Welbeck 7397.

The partnership between Messrs. Eric L. Bird, A.R.I.B.A., and Hubert Clist, A.R.I.B.A., has been dissolved. Mr. Bird has entered into partnership with Mr. H. G. Atkin-Berry, A.R.I.B.A., at 45 Bloomsbury Square, under the title of Bird and Atkin-Berry.

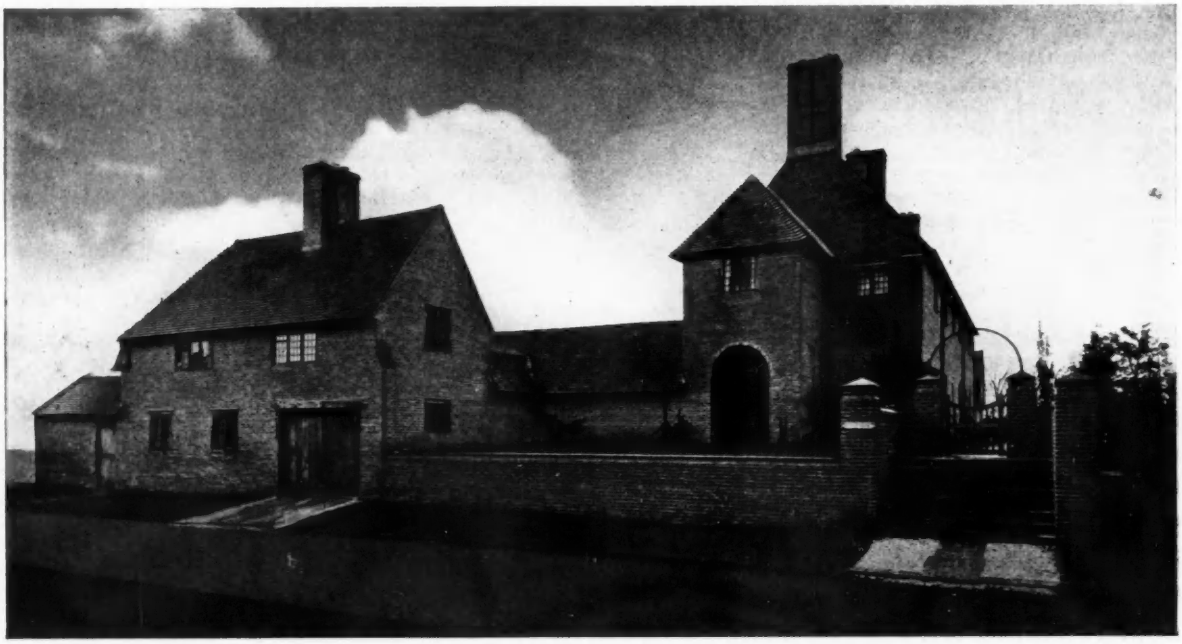
Mr. Aubrey Lane, L.R.I.B.A., architect and surveyor, late of Burton Chambers, Mansfield, Notts., has taken into partnership Messrs. Philip M. Lane, his son, and W. Richardson White, both of whom have been associated with him for a number of years. The practice will in future be carried on under the style of Aubrey Lane, Son and White. The firm have now moved to more convenient premises at Leeming Chambers, Leeming Street, Mansfield, Notts., at which address they would be pleased to receive catalogues.

SOCIETIES AND INSTITUTIONS

ARCHITECTURE OF TODAY AND TOMORROW

DURING the course of a lecture on "The Architecture of Today and Tomorrow," delivered before a meeting of the Royal Society of Arts on March 26, Mr. Howard Robertson, F.R.I.B.A., stressed the fact that into architectural design at all periods of history had entered three main governing factors: first, the programme of practical requirements, i.e. the function or purpose of the building; secondly, the structure, by means of which practical realization was given to the programme; thirdly, the relationship, through design and decoration, of the material building to the abstract human emotions.

The evolution of architecture was, he said, traced through the development of these three factors. Modern architecture was that which responded to the programme of the day, was built according to the methods of the day, and fulfilled the "pleasure" requirements of the day. There was, therefore, no modern style as such. All architecture which, in its period, had been called advanced, i.e. fulfilled its purpose up to the available limits of human achievement, was modern. Even a revival might be modern, provided it were in tune with the material and æsthetic needs of its day. Taste today, he thought, was improving. Design was valued for its own sake, regardless of period. But the level was still low, particularly in street architecture, where the legitimate demands of commerce in the way of shop fronts, advertising by illuminated signs, etc., were being met in a very mediocre way. The possibilities of light, for instance, were only dimly felt; and cinemas and theatres, on the façades of which signs must inevitably find a place, were still designed with an architectural cloak which took no account of this vital element. The architect was partly to blame, but more so the building owner, who lacked imagination and confidence. The vicious circle so created was, however, gradually being broken.



England, he pointed out, was terribly conservative in architectural design. One reason lay in the comparative stagnation of the past fifty years, and the lack of an evolutionary link between the past and the future, which made it difficult to create new forms alongside the old. Another cause was the reflection, in architecture, of the attitude which looked with satisfaction on past supremacy, and had neglected the progress made in other countries. It was likely, however, that the younger generation of architectural students, who were alive to the necessity for a changed outlook, would bring about a great development in which the spirit of modern design would be acclimatized to England.

The lecture was illustrated by over eighty lantern slides.

THE ARCHITECTURE OF SHOPS

Lecturing on the above subject at a meeting of the South-Eastern Society of Architects on March 27, Mr. H. V. Lanchester, F.R.I.B.A., said that success appeared a somewhat blatant theme for expression in design; but it need not take a vulgar form, since a confident dignity and assured efficiency were eminently suited to expression by means of building. If at times something more aggressive was demanded, a general recognition that this type of expression was relatively ephemeral might be hoped for, because the building that endeavoured to shout down its neighbour was repugnant to the idea of civic amenity, and it was, after all, as an element in civic life as a whole that they could best appreciate the value of the shop as an architectural asset. The large store was entitled to individual treatment by reason of its mass, but if the smaller shops attempted to compete with each other by over-accentuation, the appearance of our streets would become chaotic; such efforts ultimately neutralized each other and failed in achieving their aim.

The design of the shop, he said, should depend on the use to which it was to be put, and the faculty of realizing that there should be a harmony in this respect was of first importance to the designer, although in everyday practice there might be a certain amount of makeshift and compromise on the score of cost. In conflict with these efforts at special effects, they must have in the large stores a certain

Hillway, Ditchling, Sussex. Designed by A. J. Penty. This house forms the subject of photographic illustrations and working drawings in The Elements of Domestic Design, *a new book just issued by the Architectural Press.*

consistency and unity running through the whole.

Speaking from a designer's viewpoint, the shop, he said, offered many points of interest not afforded by the store; with the latter the general homogeneity, essential to a design as a whole, precluded too definite an adaptation of treatment to the peculiar needs of each department, whereas in the specialized shop one was free to adopt the exact type of design best suited to the goods to be displayed.

One could not picture a building equally appropriate to the accommodation of valuable articles bought and sold with circumspection and deliberation, or to those daily necessaries which were to be obtained with the least possible expenditure of time and trouble. In the one case the designer might fairly devote infinite pains to placing the transactions in an artistic environment; in the other a simple and business-like restraint, not inconsistent with good design, was the most that would be demanded.

We had, he pointed out, something to achieve in making the best use of natural light in a large block of buildings. In the one-story shop there was little opportunity in this direction, but now that entire buildings were being so utilized it was certainly open to question whether we were making the utmost use both of light from the roof or from the street fronts.

A matter that was too often neglected was the provision, in the design for the façade, of suitable areas for the display of the name and such other inscriptions and announcements as might be desired. The designer who neglected these had only himself to thank if he found his building afterwards disfigured by features conflicting with his intention.

Mr. Lanchester did not suggest that everything should be subordinated to such announcements, but the demands of most good businesses were not unreasonable in this respect, and were certainly legitimate requirements entitled to receive just as much consideration at the hands of the architect as those dealing with arrangement and other practical questions.

In conclusion, the lecturer said that what we most needed in our attitude towards the shop as fulfilling its initial purpose, and also as ministering to the dignity of the city, was a broader ideal, unhampered by restrictive traditions, but maintaining all those that were not out of harmony with actual progress. He had endeavoured to show that in design, at any rate, the utmost freedom was not incompatible with grace and charm, if the conception was based, as all architectural conceptions should be based, on the expression of the purpose of the building.

THE WELSH SCHOOL OF ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., was the principal guest at the annual dinner of the South Wales Institute of Architects held at Cardiff on Thursday last.

Principal Rees, in proposing the toast of the "R.I.B.A. and its Allied Societies," said he would like to see a more vivid sense of making a town or city as beautiful as possible. A city should be the expression of the spirit of the people. Architects should have a strong sense of their social responsibility—they were building the mould in which the people were framed.

Speaking of the Welsh School of Architecture, he said as far as he could see there was only one thing lacking about the Welsh School of Architecture, and that was that it had not got what was called university recognition. What one would like to see would be something of this kind: the Welsh School of Architecture given university recognition by the University of Wales; and one would like to see along with that the title of Professor of Architecture and the Applied Arts given to Mr. Purchon, the principal of the school.

Their arts students might also be given facilities to attend qualifying courses in architecture and the applied arts.

Sir Banister Fletcher, in responding, expressed the hope that Principal Rees's suggestion could be carried out in the near future.

Other speakers included Lieut.-Col. E. H. Fawckner, the Lord Mayor of Cardiff, and Messrs. T. Alwyn Lloyd, F.R.I.B.A., G. C. Lawrence, R.W.A., F.R.I.B.A., and T. E. Gough.

DEVON AND CORNWALL ARCHITECTURAL SOCIETY

The annual meeting of the Devon and Cornwall Architectural Society was held at Plymouth on March 22. The retiring president, Mr. W. A. Vercoe, A.R.I.B.A., occupied the chair.

The President referred to the healthy financial state of the Society, and pointed out that the annual subscriptions to kindred societies had been recently increased. He also mentioned that the value of the prizes offered in the competitions open to students had been increased, and that the results had more than justified this expenditure. Mr. Vercoe, in his address, said that the trend of architectural design in this country was an interesting study at the moment. The cost of post-war building meant the scrapping of everything that was not absolutely essential to the purpose of the building, and in itself a good thing. The dressing-up of modern buildings with a substantial skin of columns and entablature, mouldings and skulls of animals fabricated in stone, was no longer seen in the best designs.

The prizes offered for the annual competition of measured drawings were awarded to Messrs. J. G. Reid and E. C. Hicks, both of Plymouth.

The following officers and members of Council were elected for the ensuing year: President: Mr. John Bennett, L.R.I.B.A., Exeter; Vice-presidents: Messrs. A. S. Parker, F.R.I.B.A., Plymouth, and A. H. Ough, F.R.I.B.A., Dawlish; Hon. treasurer: Mr. S. Dobell, Exeter; Hon. auditor: Mr. L. F. Toner, L.R.I.B.A., Exeter; Hon. secretary: Mr. J. Challice, A.R.I.B.A., Exeter; Members of Council: Messrs. R. M. Challice, W. J. M. Thomasson, A.R.I.B.A., E. Kemeys Jenkin, F.R.I.B.A., W. F. R. Ham, H. Alban Peters, A.R.I.B.A., B. W. Oliver, A.R.I.B.A., B. Priestley Shires, F.R.I.B.A., C. Cheverton, F.R.I.B.A., H. Victor Prigg, A.M.I.C.E., A. V. Rooke, F.R.I.B.A., W. W. Wood, A.R.I.B.A.; Associated Members of Council: Messrs. D. W. Cooper and A. T. Martindale, L.R.I.B.A.

Following the business of the meeting, Mr. W. W. Wood gave an account of the encouraging progress of the architectural department of the Central School of Arts and Crafts, Plymouth.

ROMAN ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., in his lecture at the Central School of Arts and Crafts on Wednesday last, discussed the further development of architectural style which, he said, was consequent on the removal of the capital of the Roman Empire by Constantine in A.D. 324 from Rome to the old Greek city of Byzantium, which was renamed Constantinople. The change, he pointed out, was made from strategic and commercial considerations, and indicated the progressive commerce of those days.

ANNUAL MEETING OF THE N.A.H.V.D.E.E.

The twenty-sixth annual general meeting of the National Association of Heating, Ventilating and Domestic Engineering Employers was held on March 12. The president, Mr. F. A. Norris, was re-elected and the other officers were appointed as follows: vice-presidents, Messrs. R. C. Ching (London), Harry Walker (Newcastle-on-Tyne) and J. L. Musgrave (London); hon. treasurer, Mr. Stanley J. Benham (London); Council, Messrs. W. Mumford Bailey (London), W. Charles (Birmingham), Lewis Hill. (Liverpool), J. T. Leake (Newcastle-on-Tyne) and A. B. Potterton (Balham).

COMPETITION OF INDUSTRIAL DESIGNS

The public exhibition of works submitted in this year's open Competition of Industrial Designs, organized by the Royal Society of Arts, will be held

in the Exhibition Pavilion of the Imperial Institute, South Kensington, S.W., from August 2 to August 31 (Sundays included). Full particulars of the scholarships and prizes offered in connection with the competitions can be obtained from the Secretary of the Royal Society of Arts, Adelphi, London, W.C.2. Applications for forms of entry, labels, and instructions must be sent to the secretary of the society between May 1 and May 10, and the last day for receiving entries is May 26.

OBITUARY

DAVID RAESIDE

IT is with deep regret we record the death, on March 24, of Mr. David Raeside, a member of the firm of Sir John Burnet and Partners.

[It is hoped to publish an appreciation of Mr. Raeside in our next issue.]

WILLIAM J. MORLEY

We regret to record the death, after a short illness, of Mr. William James Morley, F.R.I.B.A., a well-known architect, of the firm of W. J. Morley and Son, Swan Arcade, Bradford. He was eighty-three years old.

Mr. Morley was responsible for the design of several large buildings, including the mills at Paisley, the Central Hall, Manchester, the Albert Hall, Manchester, and the Eastbrook Hall, Bradford, and also a large number of Nonconformist churches throughout England and Wales.

WALTER T. FALDO

We regret to record the death, on March 22, at his residence, Hillcrest, Purley, of Mr. Walter Thomas Faldo.

Mr. Faldo was the son of the founder of the firm of Thomas Faldo & Co., Ltd., and, on the death of his father, took control of the business. The firms of Thomas Faldo and Val de Travers were amalgamated in 1928, when he became joint managing director. He was fifty-six years of age.

Mr. William Lister Newcombe, F.R.I.B.A., of The Grove, Gosforth, Northumberland, left £83,266 (net personalty, £73,917).

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Surrey County Hall Extension (pages 529-533). General contractors, Leslie & Co., Ltd. Sub-contractors : Roberts, Adlard & Co., slating; Chubb and Son, safe; Elsley, Ltd., door furniture; W. H. Gaze and Sons, Ltd., tennis courts and bowling green; Grierson, Ltd., electric lighting; Guildford Glass Works, stained glass window; G. Jackson and Sons, Ltd., plasterwork; Jeffreys & Co., Ltd., heating and ventilating; Leeds Fireclay Co., Ltd., sanitary fittings; Luxfer Ltd., metal windows, staircase railing, lantern and skylights; Arthur Lyon & Co., electric clocks; Manu-Marble Co., marble paving and skirtings; Marryat and Scott, Ltd., passenger and service lifts; May Construction Co., Ltd., sound-deadening ; Merryweather & Co., fire hose and gear ; Norman and Underwood, internal and external plumbing; Roneo, Ltd., office partitions; Shipton Automatic Telephone Co., automatic telephones; J. P. White and Sons, Ltd., panelling; J. Wippell & Co., Ltd., staircase and balcony railing, main hall and wrought iron balconies; Nathaniel Hitch, carving of Royal Arms and entrance panels; George Alexander, stone and wood carving ; George K. Gray, heraldry.

Prince Edward Theatre (pages 534-538). General contractors, Griggs and Son, who were also responsible for the foundations, fireproof construction, plumbing and joinery. Clerk of works, F. Scruton. General foreman, E. Hollands. Sub-contractors : St. Mary's Wharf Cartage Co., Ltd., demolition and excavation; Ragusa Asphalte Paving Co., Ltd., dampcourses and asphalt; British Reinforced Concrete Engineering Co., Ltd., reinforced concrete; Wiggins - Sankey (Hammersmith), Ltd., bricks, tiles, and sanitary fittings; E. Young & Co., structural steel; Roberts, Adlard & Co., slates; A. Goldstein & Co., glass; The British Challenge Glazing Co., Ltd., patent glazing; Edward Evans and Sons, Ltd., patent flooring; Plastona Ltd., waterproofing materials; Carrier Engineering Co., Ltd., central heating, boilers and ventilation; Berkeley Electrical Engineering Co., Ltd., electric wiring, electric light fixtures, electric heating and bells; Brookes, Ltd., stairtreads and marble; F. Knight & Co., door furniture; Morris-Singer Co., casements and window furniture; A. Thornborough and Sons, Ltd., rolling shutters; F. A. Norris & Co., Ltd., iron staircases; H. E. Gaze, Ltd., plaster; Marc Henri and Laverdet, decorative plaster; J. Starkie Gardner, Ltd., and Garton and Thorne, Ltd., metalwork; Story & Co., textiles; Story & Co., and Jas. Shoolbred & Co., Ltd., furniture; Marryat and Scott, Ltd., passenger and service lifts; Frank Burkitt, signs.

House at Addington, Surrey (pages 546-547). General contractors, F. Ward and Sons. Sub-contractors : Geo. Withers, Ltd., oak floors and panelling; John Williams & Co., roof tiling; Wm. Edgar and Son, Ltd., heating; James Hooker, Ltd., casements and glazing; John Venning & Co., Ltd., sanitary fittings; Rust's Vitreous Mosaic Co., wall tiling; F. Wingfield, electric lighting; Benj. Ware and Sons, Ltd., bricks.

Shop Premises, Bristol (page 554). General contractors, A. Dowling and Son.

COMPETITION CALENDAR

April 28.—Messrs. Josiah Wedgwood and Sons, Ltd., invite designs in competition for a Wedgwood Vase, to be made in commemoration of the Bicentenary of the Birth of Josiah Wedgwood, which will be celebrated this year. Assessors : Philip Connard, R.A., W. Reid Dick, A.R.A., H. S. Goodhart-Rendel, F.R.I.B.A., and Frank H. Wedgwood. Premiums : £100, £50 and £25. Full particulars may be obtained on application to the Secretary, Messrs. Josiah Wedgwood and Sons, Ltd., Etruria, Stoke-on-Trent. Latest date for submission of designs : April 28.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit, £1 1s. Latest date for submission of designs : June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor : J. Ernest Franck, F.R.I.B.A. Premiums : £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs : June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor : Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor : Sir Brumwell Thomas. Premiums : £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs : July 31.

No date.—The Leicester Corporation invites local architects to submit designs for the erection of a library at West Humberstone. Assessor : Hugh Gold, F.R.I.B.A. Premiums : £75, £50, and £25.

Mr. Francis Jones, F.R.I.B.A., has been appointed assessor for the competition for the development of the old prison site, Carlisle. Particulars, etc., are not yet available.

The Incorporated Association of Architects and Surveyors has decided to arrange a competition to encourage the study and development of petrol stations planned to meet the commercial requirements of the distributors, but which may at the same time respect the beauty of natural surroundings. Various cash prizes, ranging from fifty guineas, will be offered by the association, and the competition, to be judged by independent assessors, is to be open to British architects and their assistants throughout the world. Particulars will be announced this month.

THE ARCHITECTS' DIARY

WEDNESDAY, APRIL 2

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Working Drawings. Until April 3. Also Students' Evening in connection with this Exhibition. **8 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Building Craftsmanship." By Nathaniel Lloyd, O.B.E., F.S.A. Professor Charles H. Reilly, O.B.E., M.A., F.R.I.B.A., will preside. **8 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "Regional Planning." By Raymond Unwin, F.R.I.B.A. Helen Ward (Miss) will occupy the chair. (Lantern Illustrations.) **8 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Tees-side Sub-Centre. At the Cleveland Technical Institute, Middlesbrough. Annual General Meeting, 7 p.m. "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch." 7.30 p.m. **7 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Meeting. "Some Notes on Electric Traction in England." By John L. L. North, STUD.M.INST.C.E. Sir Archibald Page, M.INST.C.E., will preside. **6.30 p.m.**

MAIDSTONE ASSOCIATION OF BUILDING AND ALLIED TRADES. At the Church Institute, Union Street, Maidstone. "The Causes and Prevention of Dry Rot." By E. H. B. Boulton. **7 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W. 1. Visit to Wellington Barracks and the Guards' Chapel, under the guidance of Sir Neville R. Wilkinson, K.C.V.O., F.S.A. **2.30 p.m.**

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Exhibition of Photographs of Continental Sculpture. 10 a.m. to 6 p.m. Until April 17. **10 a.m.**

MANSARD GALLERY, 196 Tottenham Court Road, W.1. Exhibition of Modern Glass and Colour Prints, Mansard Annexe. Exhibition of Landscape Painting. Open until April 17.

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields. W.C. 2. Open every Tuesday, Wednesday, Thursday, and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

IDEAL HOME EXHIBITION, Olympia, W. Organized by *The Daily Mail*. Open until April 17.

THURSDAY, APRIL 3

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. Students' Evening. **7 p.m.**

FRIDAY, APRIL 4

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "The Decentralization of Industry." By Captain R. L. Reiss. Dr. Sybil Plant will occupy the chair. **8 p.m.**

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION, The Castle, Winchester. Council Meeting, 3 p.m. General Meeting, 6.15 p.m. **3 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Indian Section. "The Maratha Nation." By Lieut.-Col. Sir Wolseley Haig, K.C.I.E., C.S.I., C.M.G., C.B.E. Sir E. Denison Ross, C.I.E., PH.D., will preside. **4.30 p.m.**

ROYAL SANITARY INSTITUTE. In the Council Chamber, Plymouth. Sessional Meeting. Discussion on "The Reconstruction and Reconditioning of Working Class Houses," to be opened by Councillor A. E. H. Webb. Edward Willis, M.INST.C.E., F.S.I., M.INST.T., will preside. **6 p.m.**

INSTITUTION OF MECHANICAL ENGINEERS, Storey's Gate, S.W.1. "Smoke." By A. Lennox Stanton. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. "Studies in Low-Power-Factor Measurements at High Voltages." By E. H. Rayner, D.SC., W. G. Standring, M.A., R. Davis, M.SC., and G. W. Bowdler, M.SC. **7 p.m.**

SATURDAY, APRIL 5

Sunrise, 5.29 a.m. Sunset, 6.38 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Visit to Marble Arch Flats, adjoining Regal Cinema. Meet main doorway in Great Cumberland Place at 2.30 p.m. **2.30 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. Conference on "Planning the England of the Future." Hon. Humphrey Pakington, A.R.I.B.A., and A. T. Pike. 2.30 till 4.15 p.m. Professor Percy Dearmer, D.D. 5 till 6.30 p.m. F. J. Hiorns will occupy the chair on both occasions. (Lantern illustrations.) **2.30 p.m.**

ROYAL SANITARY INSTITUTE. In the Council Chamber, Plymouth. Discussion on "Port Sanitation," to be opened by Dr. P. B. P. Mellows. 10.30 a.m. Lunch at 1 p.m. Meet at Guildhall Square at 2.30 p.m. for visits to (1) the Council Housing Estates; (2) the Co-operative Society's Pasteurising Plant: (3) the Hospital Ship "Flamingo" (weather permitting). **10.30 a.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' visit to the Works of the Ford Motor Company, under construction at Dagenham.

MONDAY, APRIL 7

R.I.B.A., 9 Conduit Street, W.1. General Meeting. "Antonio da San Gallo the Younger." By J. Hubert Worthington, O.B.E., M.A., A.R.I.B.A. **8 p.m.**

CARPENTERS' COMPANY, Carpenters' Hall, E.C.2. "The Rainbow." By Professor Wagstaff.

SURVEYORS' INSTITUTION, 12 Great George Street, Westminster, S.W.1. "The Future of British Agriculture." By Professor T. H. Wibberley. **8 p.m.**

TUESDAY, APRIL 8

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. "Textile Lighting." By S. Anderson, B.SC. **7 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Ordinary Meeting. "The Rebuilding of the Bassein Bridges on the Bombay, Baroda and Central India Railway." By Benjamin B. Haskew, M.INST.C.E., and "The Reconstruction of the Attock Bridge across the River Indus on the North-Western Railway, India." By William T. Everhall, O.B.E., M.INST.C.E. **6 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Scottish Centre. At the Royal Technical College, Glasgow. Annual General Meeting and Ordinary Meeting. **7.30 p.m.**

UNIVERSITY SETTLEMENT, Nile Street, Liverpool. At the David Lewis Club, Great George Place, Liverpool. Lectures on Housing and Town Planning subjects. Visits to new housing estates, tenements and slum districts. Papers will be given at 9.45 a.m. and 8 p.m. Applications for accommodation not later than March 28. Also lectures on April 9 and 10. **9.45 a.m.**

WEDNESDAY, APRIL 9

ARCHITECTURE CLUB, 229 Strand, W.C.2. At the Architectural Association, 34 Bedford Square, W.C. Supper discussion on "Relation of Sculpture to Architecture." Supper, 7.45 p.m. Discussion, 8.30 p.m. **7.45 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. "Preserving our Heritage." By Clough Williams-Ellis, F.R.I.B.A. Hon. Humphrey Pakington, A.R.I.B.A., will occupy the chair. **8 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Informal Meeting. "Recent Developments in Railway Permanent-way Practice, with particular reference to the Use of Metal Sleepers." By Samuel T. Dutton, M.INST.C.E. Sir Clement D. M. Hindley, K.C.I.E., will preside. **6 p.m.**

THURSDAY, APRIL 10

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. General Meeting. "Liverpool Cathedral." By Rev. Canon W. Thompson Elliott, M.A., Vicar of Leeds. (Lantern Illustrations.) **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. "Surge Investigations on Overhead Lines and Cable Systems." By S. W. Melsom, A. N. Arman, B.SC. (ENG.), and W. Bibby, B.SC. (ENG.). (Light Refreshments at 5.30 p.m.) **6 p.m.**

INSTITUTION OF WELDING ENGINEERS, 30 Red Lion Square, W.C.1. "Some Interesting Arc-Welded Jobs." By H. B. White and R. Tuddenham. (Lantern Illustrations.) **7.30 p.m.**

NORTHERN POLYTECHNIC, Holloway, N.7. Department of Architecture, Surveying and Building. Annual Speech Night. **7 p.m.**

FRIDAY, APRIL 11

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION, The Castle, Winchester. Excursion to Motor Vehicle and Engine Works of Messrs John I. Thornycroft, Basingstoke.

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W. 1. "Modern Civilisation in the Countryside." By J. M. Kennedy. Professor Percy Dearmer, D.D., will occupy the chair. **8 p.m.**

ROYAL SANITARY INSTITUTE. At the Town Hall, Chatham. Sessional Meetings. Tea 4 p.m. Discussion on "Modern Elementary School Construction," to be opened by R. L. Honey, F.S.I., M.INST.M. and CY.E.; and "Special Difficulties in Housing," to be opened by T. Topping, F.S.I.A. Edward Willis, M.INST.C.E., F.S.I., M.INST.T., will preside. 4.30 p.m. **4 p.m.**

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0
Screened ballast or gravel, add 10 per cent. per yd.			
Clinker, breeze, etc., prices according to locality.			
Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0

Exceeding 6 ft., but under 12 ft., add 30 per cent.

In stiff clay, add 30 per cent.

In underpinning, add 100 per cent.

In rock, including blasting, add 225 per cent.

If basketed out, add 80 per cent. to 150 per cent.

Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
If left in, add to above prices, per ft. cube	0	2	6
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½
STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft.	0	4	3
DO. 6 in., per ft.	0	5	0
DO. 9 in., per ft.	0	7	9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.

Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in. per roll*	0	4	9
DO. *14 in. per roll*	0	7	6
DO. *18 in. per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0
DO. in stocks, add 25 per cent. per rod.			
DO. in blues, add 100 per cent. per rod.			
DO. circular on plan, add 12½ per cent. per rod.			
DO. in backing to masonry, add 12½ per cent. per rod.			
DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super.	0	11	0
York templates sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0
Add to the foregoing prices, if in York stone, 35 per cent.			
DO. Mansfield, 12½ per cent.			
Deduct for Bath, 33⅓ per cent.			
DO. for Chilmark, 5 per cent.			
SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER, 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

Portmadoc Ladies	£14	0	0
Countess	23	0	0
Duchess	32	10	0

Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	£8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see "Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	Med. Green
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0
Green randoms	6	7 0
Grey-green do.	5	9 0
Green peggies, 12 in. to 8 in. long	4	13 6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6
Vertical Tiling, including pointing, add 18s. 0d. per square.			
FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour;* JOINER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):

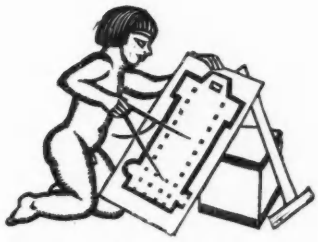
THE TOWER, WILLIAM BOOTH MEMORIAL BUILDINGS, DENMARK HILL, S.E.

By



GORDON & VINER, AND SIR GILES GILBERT SCOTT,
Associated Architects.

THIS tower rises to a height of 200 ft. It faces a railway embankment and stands on a site with a treacherous subsoil of clay, which made it necessary to sink the foundations to a depth of about 40 ft. On the following page is reproduced the architects' original half-inch detail drawing, now much the worse for wear, the entire work having been executed from it. Beneath the tower is an entrance hall designed virtually as a memorial hall.

Detail of upper part of Tower, William Booth Memorial Buildings, Denmark Hill, S.E. By Gordon and Viner and Sir Giles Gilbert Scott, associated architects.

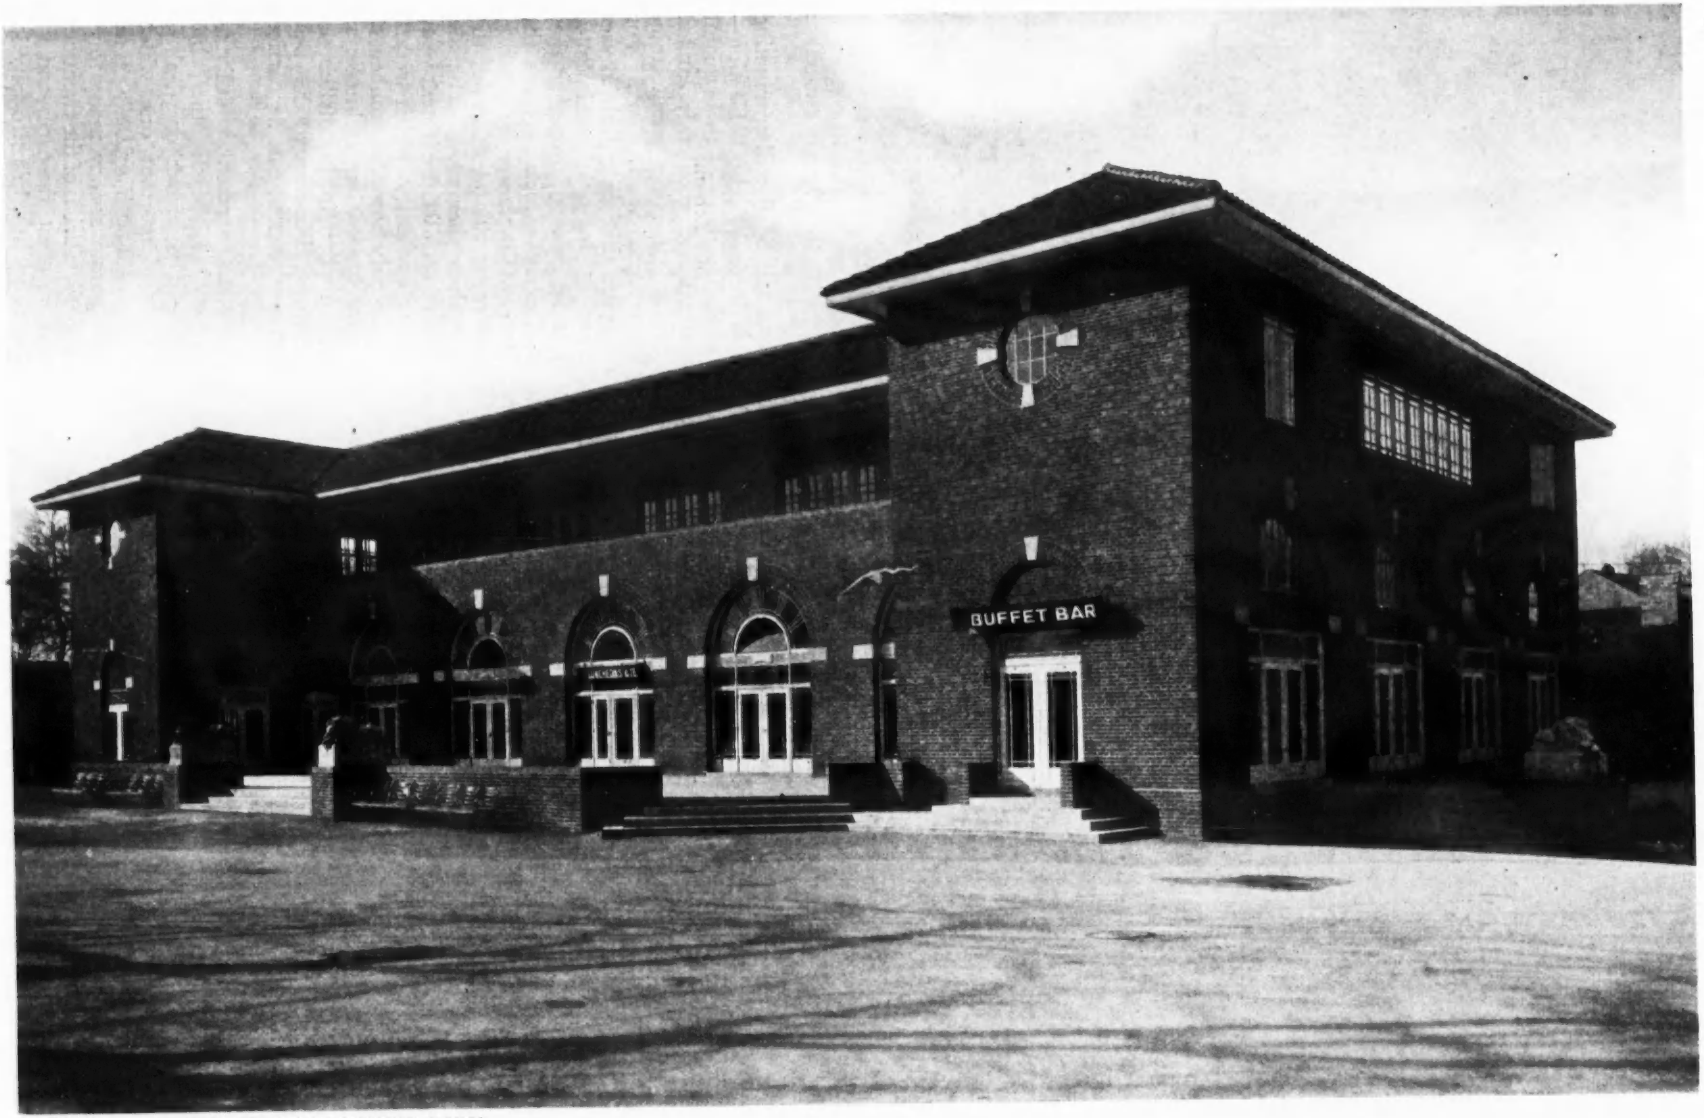
IDEAL HOME ARCHITECTURE

" *This is the house* The Mail *built.*"
. . . . . .
In fact :—
" *This is the man, not looking too worn,*
Who pets the missus, by no means forlorn,
Who pays the maid
That tends the gadgets that lighten the morn
In the rooms
Within the beams that adorn
The house The Mail *built.*"

—but what about a whole village of them?

FOR many years *The Daily Mail* Ideal Home Exhibition has attracted an enormous number of visitors whose architectural taste, in many instances, as far as housing is concerned, has actually been formed by the exhibits. One is paying no compliment to the organizers of the Exhibition in affirming the obvious truth that it is their desire to guide architectural taste. If the Ideal Home Exhibition were frankly a commercial venture and nothing more, it would be wrong to apply to it a strict æsthetic standard. As the organizers, however, are distinguished by the public spirit which causes them to approach their task in what might almost be described as a missionary zeal, the Exhibition must be regarded as possessing the same status as that of any other exhibition showing the products of the visual arts, and therefore deserves not only the type of encomium which may be read in the advertisements of the objects displayed, but respectful and serious criticism.

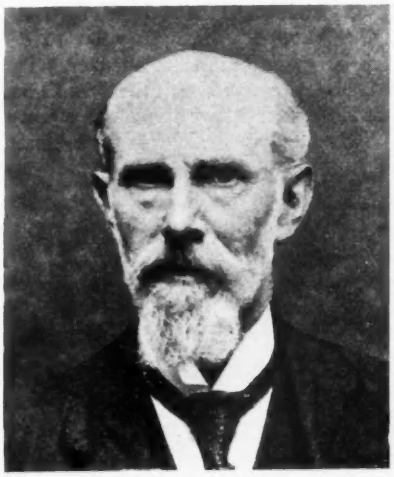


The domestic architect must welcome cordially the numerous labour-saving devices of which every year brings forth a new crop ; and even if at the present moment he is a little worried because, half-way through the jobs, clients are insisting upon the insertion of some artifice just seen at *The Daily Mail* Ideal Home Exhibition, he bears it no grudge on this account. But what will an architect say to a building owner who has invited him to lay out an estate and erect upon it thirty or more houses disposed in the manner which we see exemplified in some charming little models at Olympia—a number of semi-detached houses all exactly alike ? Or again, will he be pleased or, what is more, will the Council for the Protection of Rural England be pleased, if he is invited to build somewhere on the Sussex Downs or, in fact, in any part of England where the scenery is still unspoilt, a number of houses exhibiting such a variety of material, style and contour as we see in the Ideal Village at Olympia?

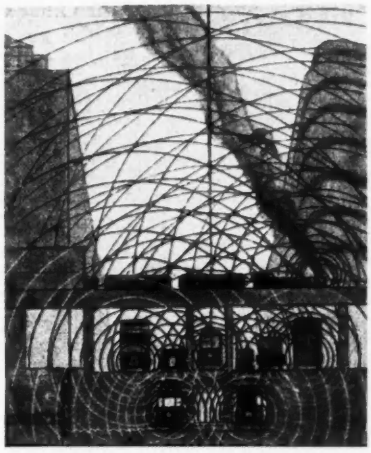
In asking these questions we do not wish to be misunderstood. The houses in question are admirably built, and their materials have all the good qualities which are claimed for them. We may even go further and say that they are also of attractive design, when considered individually. It is only their juxtaposition which causes us distress, dismay and other feelings of spiritual discomfort. Yet architects of today must learn how to design houses fit to be seen in congregation, unless it is to be said of us that we are altogether lacking in the civic sense.

It can scarcely be questioned by the discriminating observer that *The Daily Mail* Ideal Home Exhibition—which has shown the public so many of these quaint little houses, economical to construct, excellently planned and well built—has, while improving architectural tastes in some respects, corrupted it in others. For we have been led to suppose that these little houses represented the last word in domestic architecture, whereas, unfortunately, they ignored altogether that most important aspect of design which concerns the harmonious inter-relationship of houses on an estate.

May we suggest, therefore, to the organizers of the Exhibition that they may show themselves to be still more enlightened patrons of architecture if next year, in addition to the attractive features to which we are accustomed, they will not only show a number of full-sized cottages forming an harmonious architectural ensemble, but will also display to us models in miniature of housing groups, illustrating the best manner in which estate development can be carried out.



The problem of how to harmonize different architectural units not only with each other, but with their setting, whether it be urban or rural, is without exception the most important one which architects have to consider. Let *The Daily Mail*, then, a paper by whose vigorous agency many fresh amenities have been secured for citizens of the twentieth century, employ some of its great resources and its genius for propaganda in order to help us to solve it.



A NEW RENDEZVOUS AT REGENT'S PARK:
THE RESTAURANT IN THE ZOOLOGICAL GARDENS.

Designed by J. J. Joass, this building has been erected on one side of what is intended to be a vast octagonal place or terrace, with the Elephant Drive connecting it with the Lion House, etc. Accommodation is provided, separately, for Fellows of the Zoological Society and for the general public; 650 persons can be served, and facilities are provided for the serving of meals in the open, and upon the spacious first-floor balcony. A further photograph, plans and description, appear on pages 565–8.

NEWS & TOPICS

W. Reynolds-Stephens, elected President of the Royal Society of British Sculptors. This is the tenth term during which he has occupied the presidency.

Noise centres in a modern city.

J. Hubert Worthington, O.B.E., M.A., A.R.I.B.A., who delivered a lecture on "Antonio da San Gallo the Younger," at the R.I.B.A. on Monday.

SLUM CLEARANCE

THE Slum Clearance Bill, as was foreshadowed, delivers a frontal attack on the problem, and divides itself naturally to apply to three main categories—areas where conditions imply absolute clearance; improvement areas, which are semi-slum areas on the downward path; and individual houses in need of repair or demolition. Of the two methods of clearing an area, it is worth noting that one is new. It requires the *owner* to demolish the buildings. If the owner does not carry out the order to demolish, the authority may themselves do so and recover the cost from the owner. Furthermore, the provision of new houses for tenants displaced by demolition or improvement is to be considered essential. As to the demolition of individual houses, the Bill provides that appeals shall be made to the County Court instead of to the Minister of Health. Part 3 lays it down that every borough or urban district with a population of 20,000 shall submit a programme of housing work to the Minister in 1930 and every fifth year thereafter.

*

The financial provisions abolish the present 50 per cent. grant and replace it with an annual grant on the unit basis. This grant is based on the number of persons displaced for whom accommodation in new houses provided by the local authority is made available, and will be paid annually for forty years. The normal grant is 45 shillings a year, with 50 shillings in rural areas. It may be increased to 70 shillings in exceptional circumstances. The cost of this Bill has not been estimated, although it has been noted that if 100,000 persons are displaced each year, of whom 20,000 are rehoused in tenement buildings, the annual Exchequer grant would amount to a quarter of a million pounds. Let us hope that the results secured will be commensurate with the expenditure.

TOWARDS THE NOISELESS CITY

The German weekly, *Die Woche*, has recently published an article on the scientific study of the problem of street noises, reinforcing its arguments with the illustration shown above. The authors, Otto Kappelmayer and A. B. Henninger, state that the roar of great cities has already such a disastrous effect on the nervous systems of their inhabitants that its amelioration is bound to become as much a matter for public health authorities as sanitation and slum-clearance. As with most other evils, there are in theory two ways of dealing with this civic disorder: prevention and cure. Police regulations making a silencer a compulsory part of the equipment of every motor car and (more particularly) motor cycle are advocated by those who believe that the elimination of noise can be achieved by attacking it at source. Less optimistic reformers consider that the most hopeful remedy is to insist on road-engineers and town-planners constructing streets in such a manner and of such materials as will curtail the reverberative zones emanating from their surfaces and the yet more sensitive microphones of the hollow vaults beneath them. In this way the inevitable modicum of screeching and rattling could be made more approximate to that ideal "sinus line" of sound-convolutions which the study of acoustics has shown represents the sort of noise least unendurable to the human ear.

*

The perfect sounding-board for pandemonium, according to these experts, is a straight and busy city street, enclosed within continuous walls of lofty modern buildings of a uniform height. Should this street be laid with tram-lines, surfaced with asphalt and honeycombed by pipe subways and tube railways, its original tuning-fork potentialities will be magnified several hundredfold. If, however, the tram-rails are separated from the asphalt by a double row of wooden blocks, and this asphalt surfacing is interrupted every ten yards or so by strips of wood paving, or some other equally porous insulation, the reverberation can be very considerably reduced. The noiseless street, on the other hand, is typified by one of those wood-paved, canal-side streets of Amsterdam, which are flanked to landward by old, narrow-fronted, brick houses of very irregular elevation. The fact that so many modern city buildings are steel and concrete structures, faced with large slabs of smooth impermeable materials, enormously increases their resonance; whereas a rough and evenly divided

surface tends largely to diminish it. Yet every year more London streets—and London was till lately, except in Holborn, a predominantly wood-paved city—are being relaid with asphalt, which will vastly augment the already intolerable din, while offering hardly any better resistance to erosion.

FLAT ROOFS INSTEAD OF GARRETS

Sir Arbuthnot Lane in a recent interview stressed the need for flat roofs, sun porches, and any other means whereby the occupants of the buildings to be erected under the Slum Clearance Act may enjoy the health-giving properties of sunlight. He is surely right, for if we are to put any trust in the future we must count upon cleaner air and more good sunshine, which to waste by building houses with unusable roofs shows a lack of forethought and proper care for the health of the people.

★

Quite apart from this practical side, the prospect of flat-roofed tenements and flats opens up a vista of terraced architecture possessing unbounded possibilities when once the problem of the chimney is successfully solved.

★

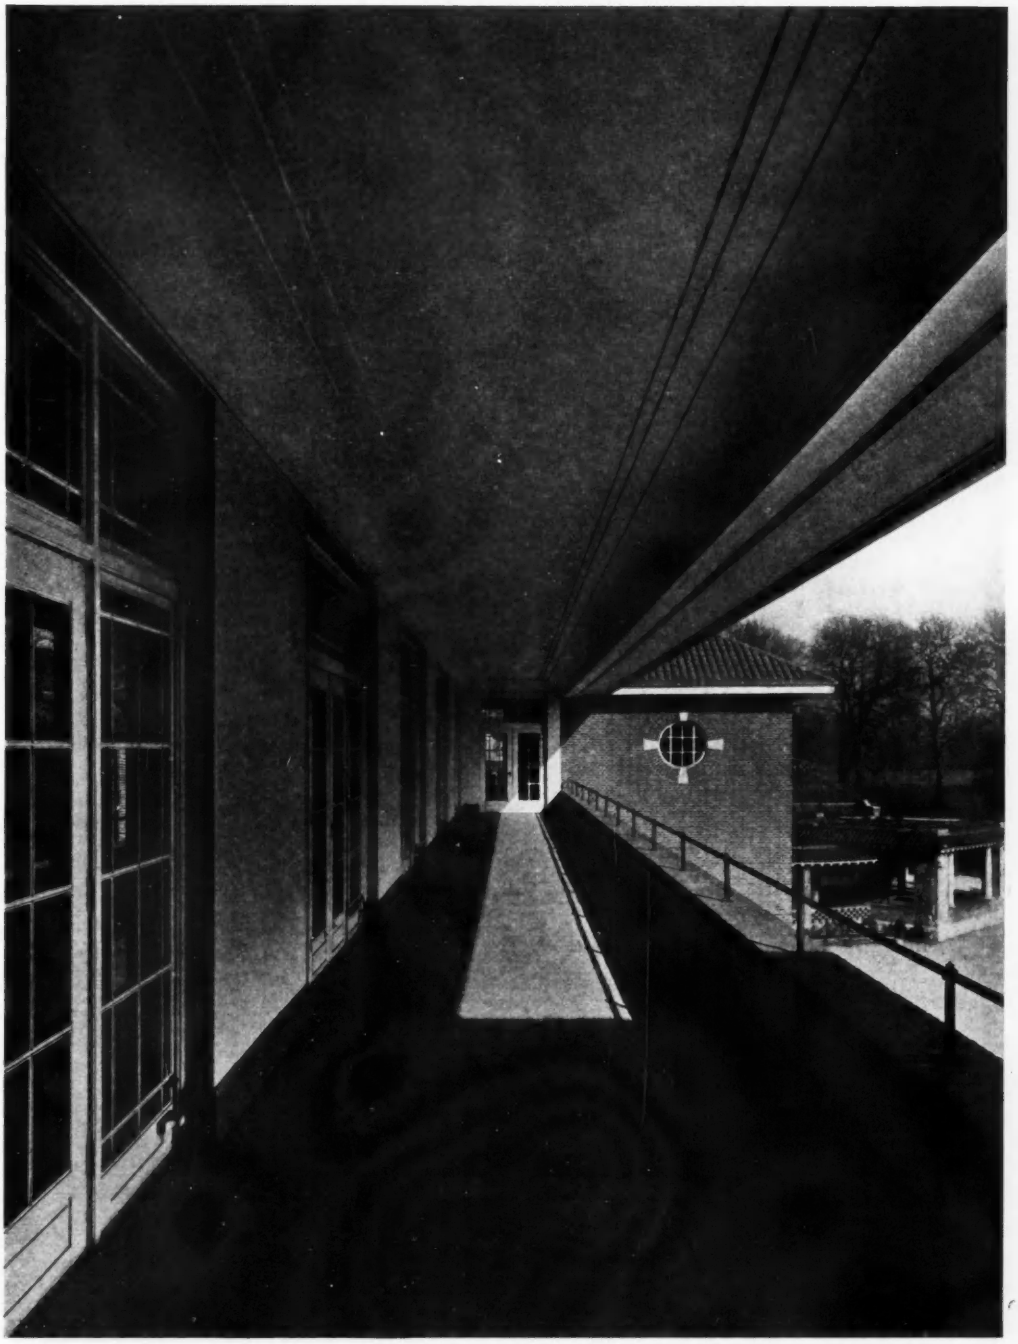
I think it should be realized that the roof, though considered by most architects to be an essential characteristic of any building bearing our national stamp, can be a serious hindrance to the flexibility of designing in large units. Also, the tenants of these buildings object to the height when it lands them near the traditionally despised roof, with all its associations of attics and garrets, whereas to be near the flat-roof playground and drying ground would provide a strong inducement to live high, and would make certain that the children of the upper floors got enough exercise and plenty of sun.

WHOSE SMOKE IS THAT ?

A rather amusing situation has arisen at Washington, U.S.A., where, in the course of a campaign against the smoke nuisance, a warrant has been served against the architect of the State Capitol, and through him to the Speaker of the House. Nobody knows quite what to do, because you can't serve warrants against the Speaker. The Health Officer, who has already had both the Post Office and the Office of Printing convicted for the same offence, is not the man to be troubled by little legal problems. Somebody will have to sit on the fire.

★

I wish we had a man like him in London, for I would take him to Whitehall on a fine frosty morning and show him the cloud of smoke that issues from the innumerable chimneys of Government offices, just as if there were no such thing as central heating.



THE ARTIST AND THE SHOP FITTER

The day when architect and painter will combine to find the right spaces for mural decoration is arriving. An instance is to be seen in the new red lacquer room at Austin Reed's premises in Regent Street, opened by Sir Alan Cobham on Wednesday last. This room, which is panelled in red and black lacquer, has been designed by P. J. Westwood and is intended for the sale of tropical outfits; the idea being to make the buyer feel hot as he examines the cool clothing and sun helmets. On entering the room at the opening ceremony I was impressed with the unique decorative scheme which captures so much of the charm of an Eastern setting. Much of this effect is due to the series of mural paintings, by Fred Taylor, forming a frieze around the room and representing scenes in many parts of our tropics—war canoes of the Solomon islanders, Maoris at a woodland shrine, a fruit market in one of the isles of the West Indies—brilliantly coloured, with scarlet predominant. The scenes I have mentioned can be seen, in their respective order, in the photograph reproduced on this page. The whole of the paintings are cleverly illuminated by lights recessed in the ceiling about two feet from the walls. These paintings are, I believe, a new departure for Mr. Taylor, and I feel they comprise his best effort in oil colours.

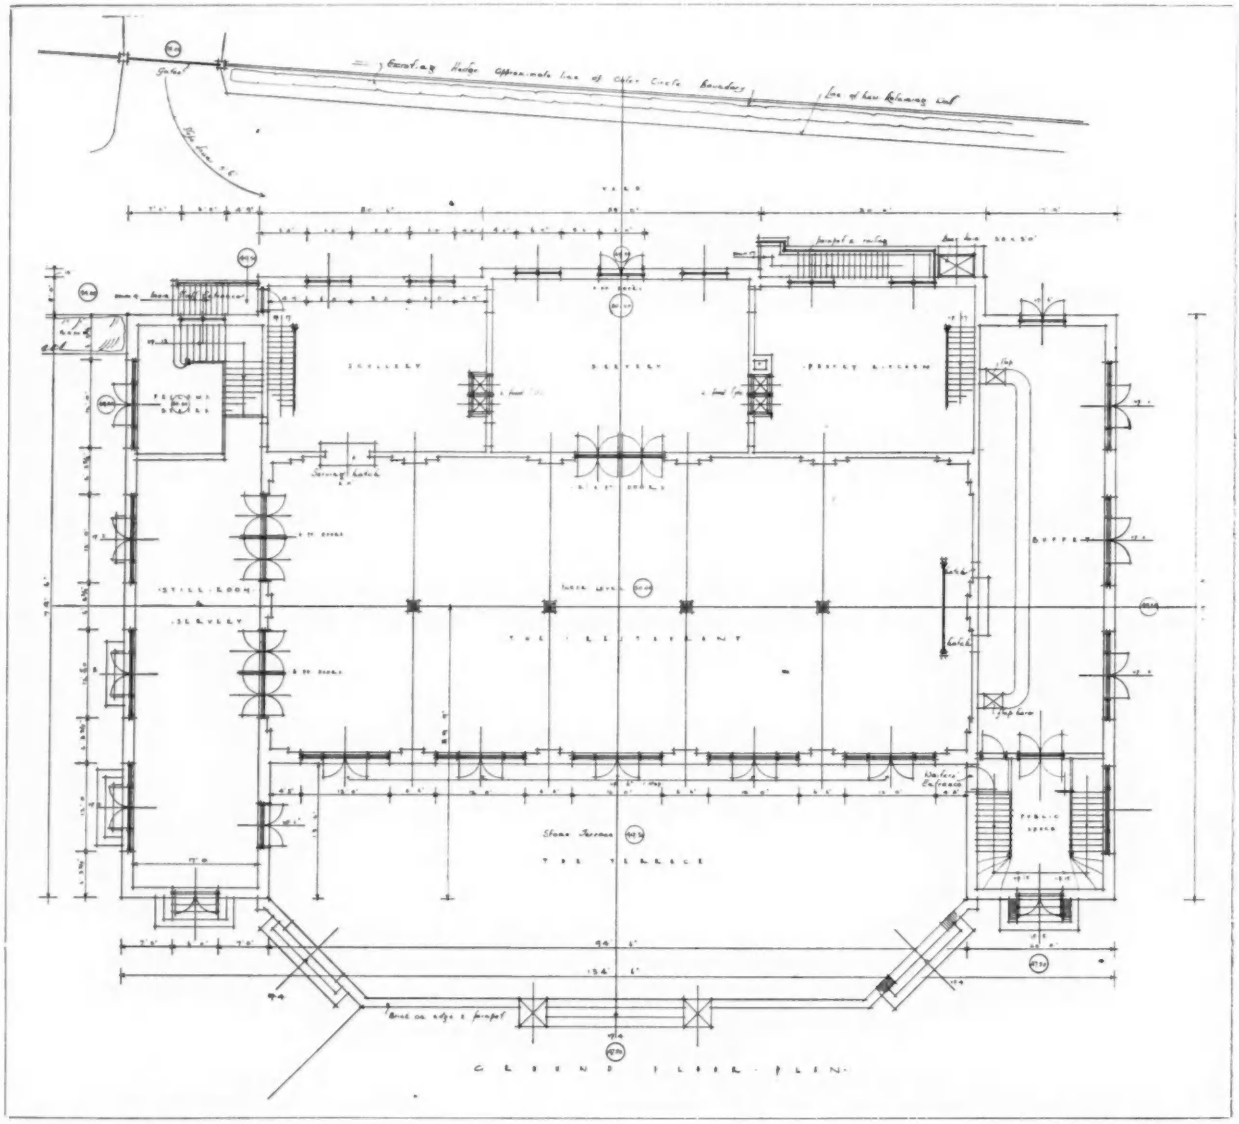
ASTRAGAL

Part of the red lacquer room at Austin Reed's, designed by P. J. Westwood. Mural paintings of tropical scenes, by Fred Taylor, form the frieze.

A view looking along the whole length of the first-floor balcony, which overlooks the terrace, gardens and bandstand. The near end is to be reserved for Fellows ; the further is to be for public use.

NEW RESTAURANT AT THE ZOO

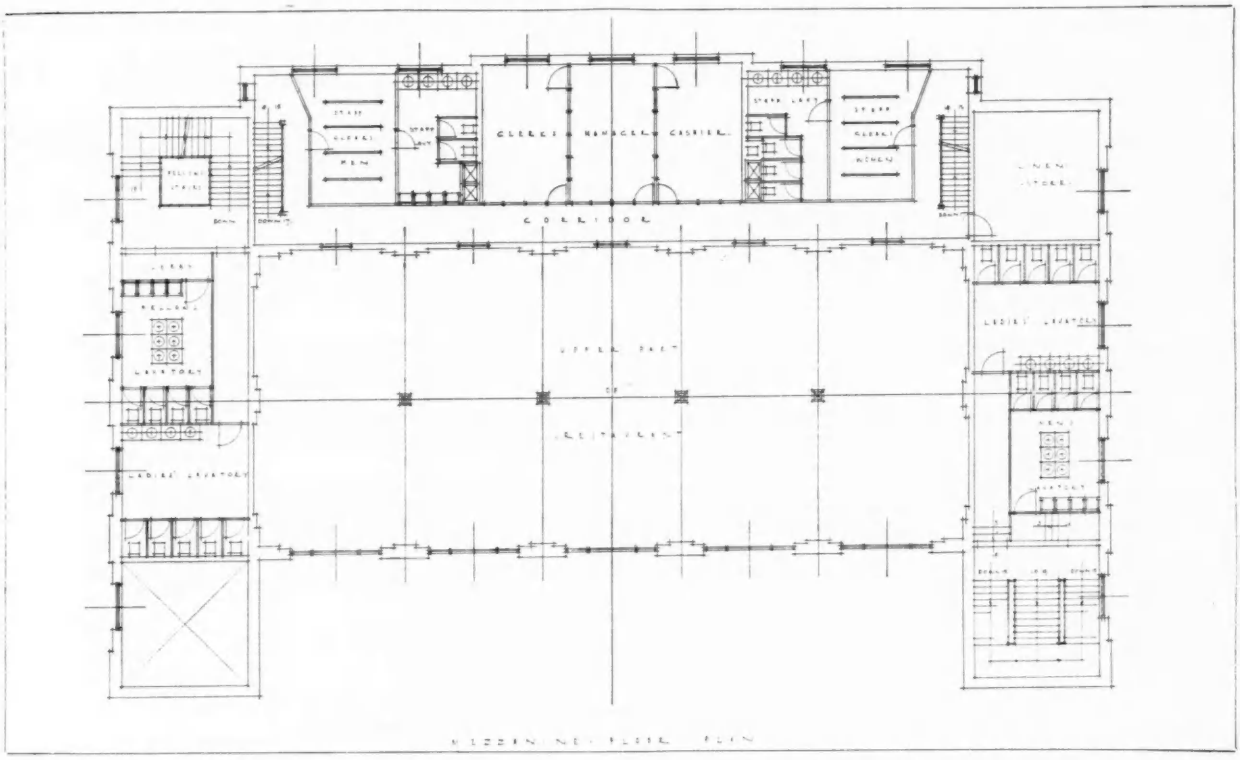
DESIGNED BY J. J. JOASS



EVIDENCE of the progressive spirit that animates the Zoological Society of London has been given on several occasions in this JOURNAL during the past few years. The policy that has resulted in the formation of the Mappin terraces, the new aquarium, new entrance buildings and reptile house is reflected in the attention given to the famous Gardens at Regent's Park as gardens, apart from their function of giving house-room to the animals. Few lawns and flower-beds in the metropolis present a more pleasant spectacle during the summer months.

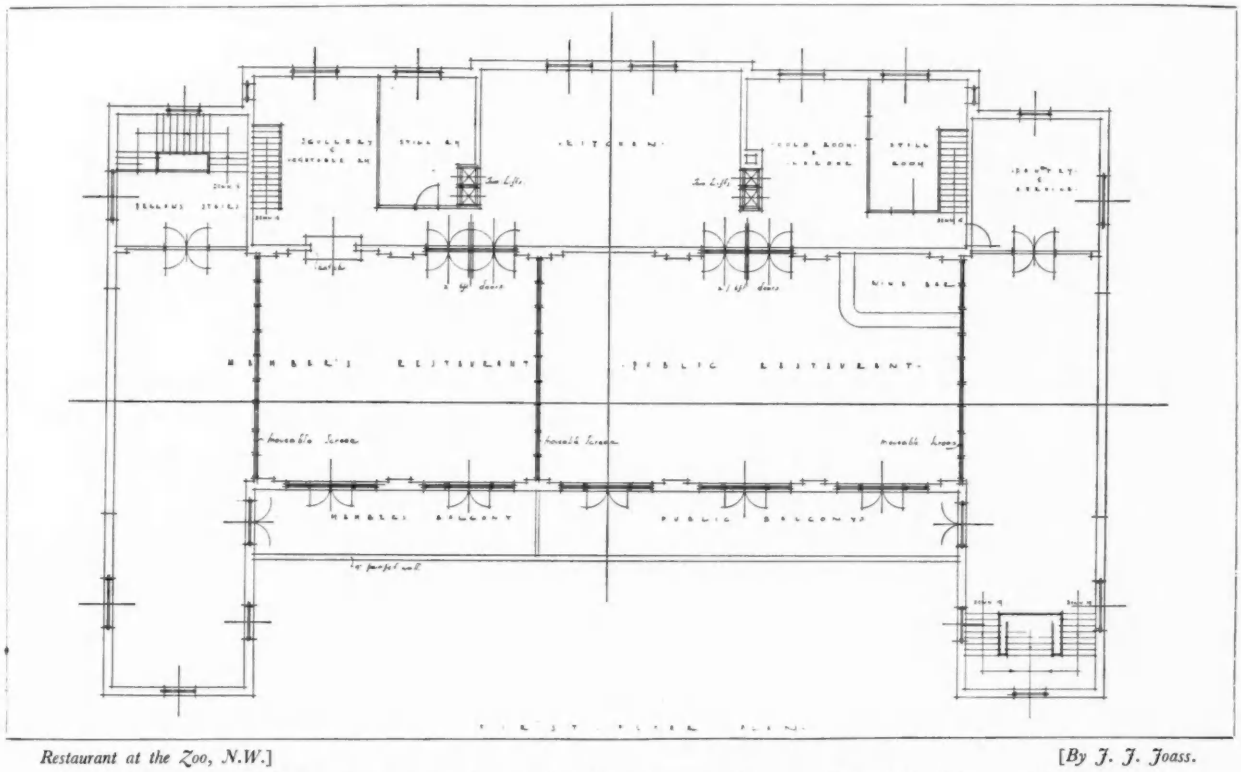
The building, of which photographs and plans are now reproduced, is the

latest to take its place in a scheme of layout that has in contemplation the creation of a vast octagonal place, from which the Elephant Drive leads to the Lion House, etc. In meeting the need for a modern first-class restaurant to cater both for the public and the Society's Fellows, the block expressly designed to supply these essential services has been placed at an angle of 45 degrees with the tea-room, on the other side of which a similar block is intended to form in due course another side of the octagon.



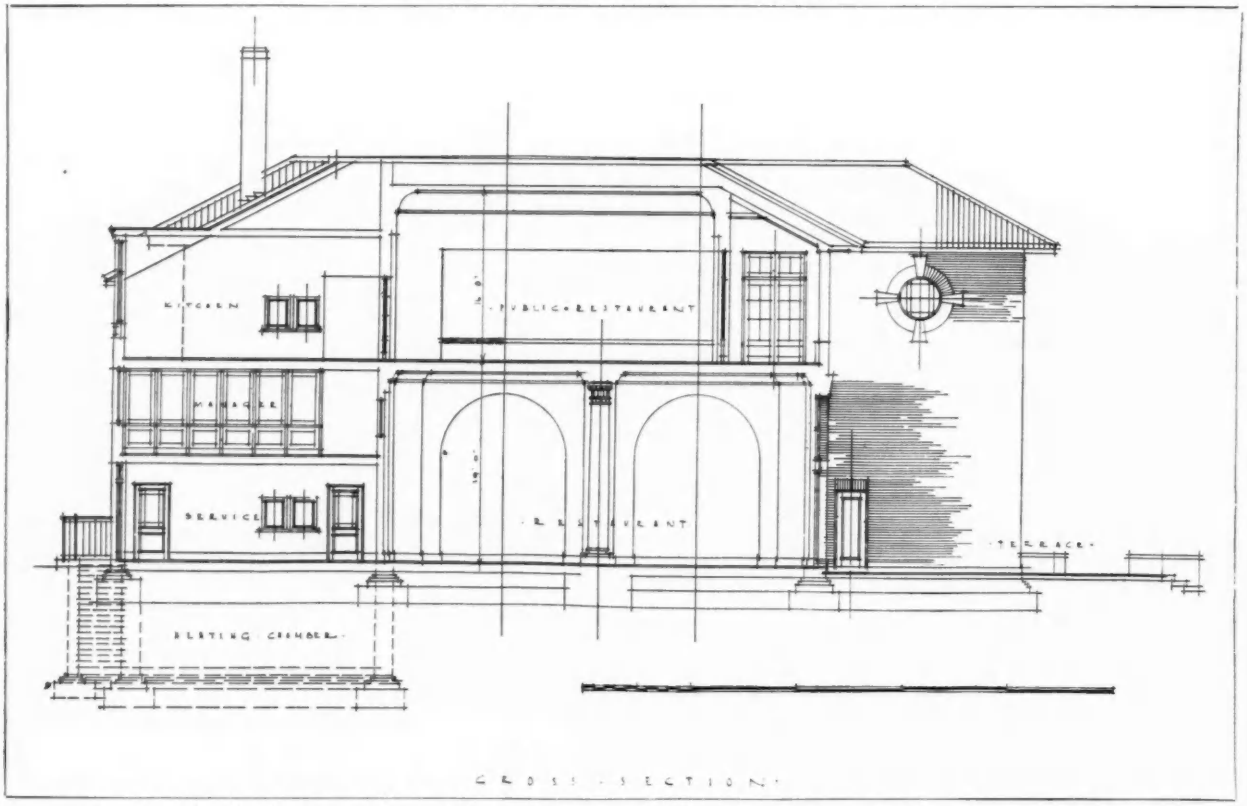
Erected upon a framework of steel, the new restaurant is faced with bricks, set off with keystones and voussoirs to the arched and circular window-openings of artificial stone, and has a deeply-eaved roof of special tiles; metal casements are employed. It is planned on two floors, with an intervening mezzanine, through which extends the large, and therefore lofty, public restaurant, some 96 ft. by 40 ft., occupying the central space on the ground floor. Its windows look out on to the extensive terrace that fronts the building, and the possibility of serving meals in the open air is aided by a service-room specially allocated to this purpose. The remainder of the frontage is occupied by a spacious entrance hall and a buffet bar. The kitchens, which are fitted in the most modern manner and are operated entirely by electricity, are behind and serve not only the ground floor but the first floor restaurants, special food lifts being provided.

A balcony overlooking the terrace, gardens and bandstand, and extending the length of the front between the paired end-blocks, is a feature of the first floor. A section of this is reserved for Fellows, as part of their separate accommodation, including lavatories, dressing-rooms, etc., with their own private staircase; the remainder is for public use. The same holds good of the restaurant within, which can be divided into three apartments by means of collapsible partitions; the public room here is about 56 ft. by 30 ft. In all, about 10,000 square feet are available for restaurant purposes, giving accommodation for 650 people.

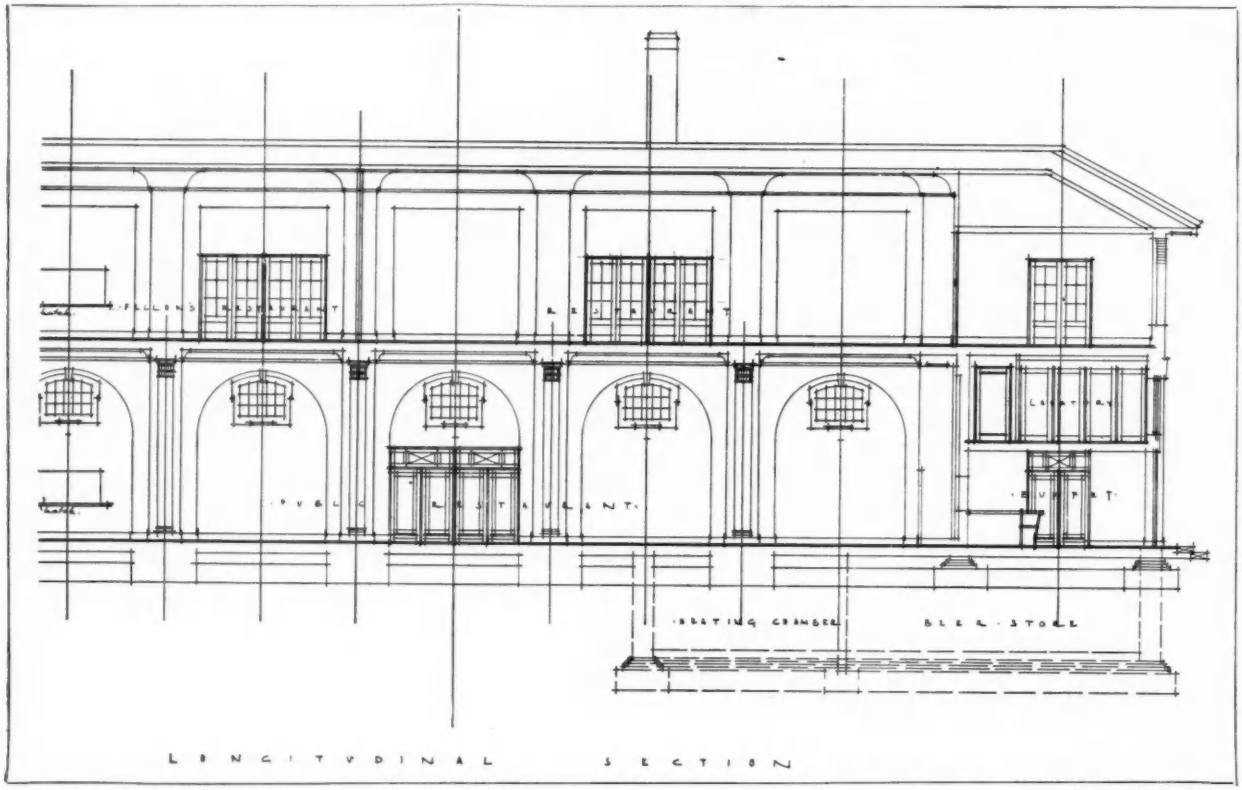


Restaurant at the Zoo, N.W.] [*By J. J. Joass.*

The architect's drawing of the ground-floor plan, showing the kitchens, immediately behind and adjoining the main public restaurant. On the right is the entrance hall and a spacious buffet bar. The building faces a stone-paved terrace.



The plan at mezzanine level shows the public restaurant carried up through it from the ground floor, and the remainder of the space devoted to various essential offices. The scale of the two drawings on this page is the same as that of the dimensioned ground plan.



Restaurant at the Zoo, N.W.] [*By J. J. Joass.*

On the first floor are the Fellows' restaurant and a second public restaurant, with removable partitions between. On this floor also is the balcony, similarly divided between Fellows and the public. The Fellows' quarters have their private stairs and retiring rooms.

C

This cross section, looking towards the end block containing the public entrance hall, indicates the loftiness of both the main restaurants, and the convenient planning of the service quarters adjacent to them on each floor.

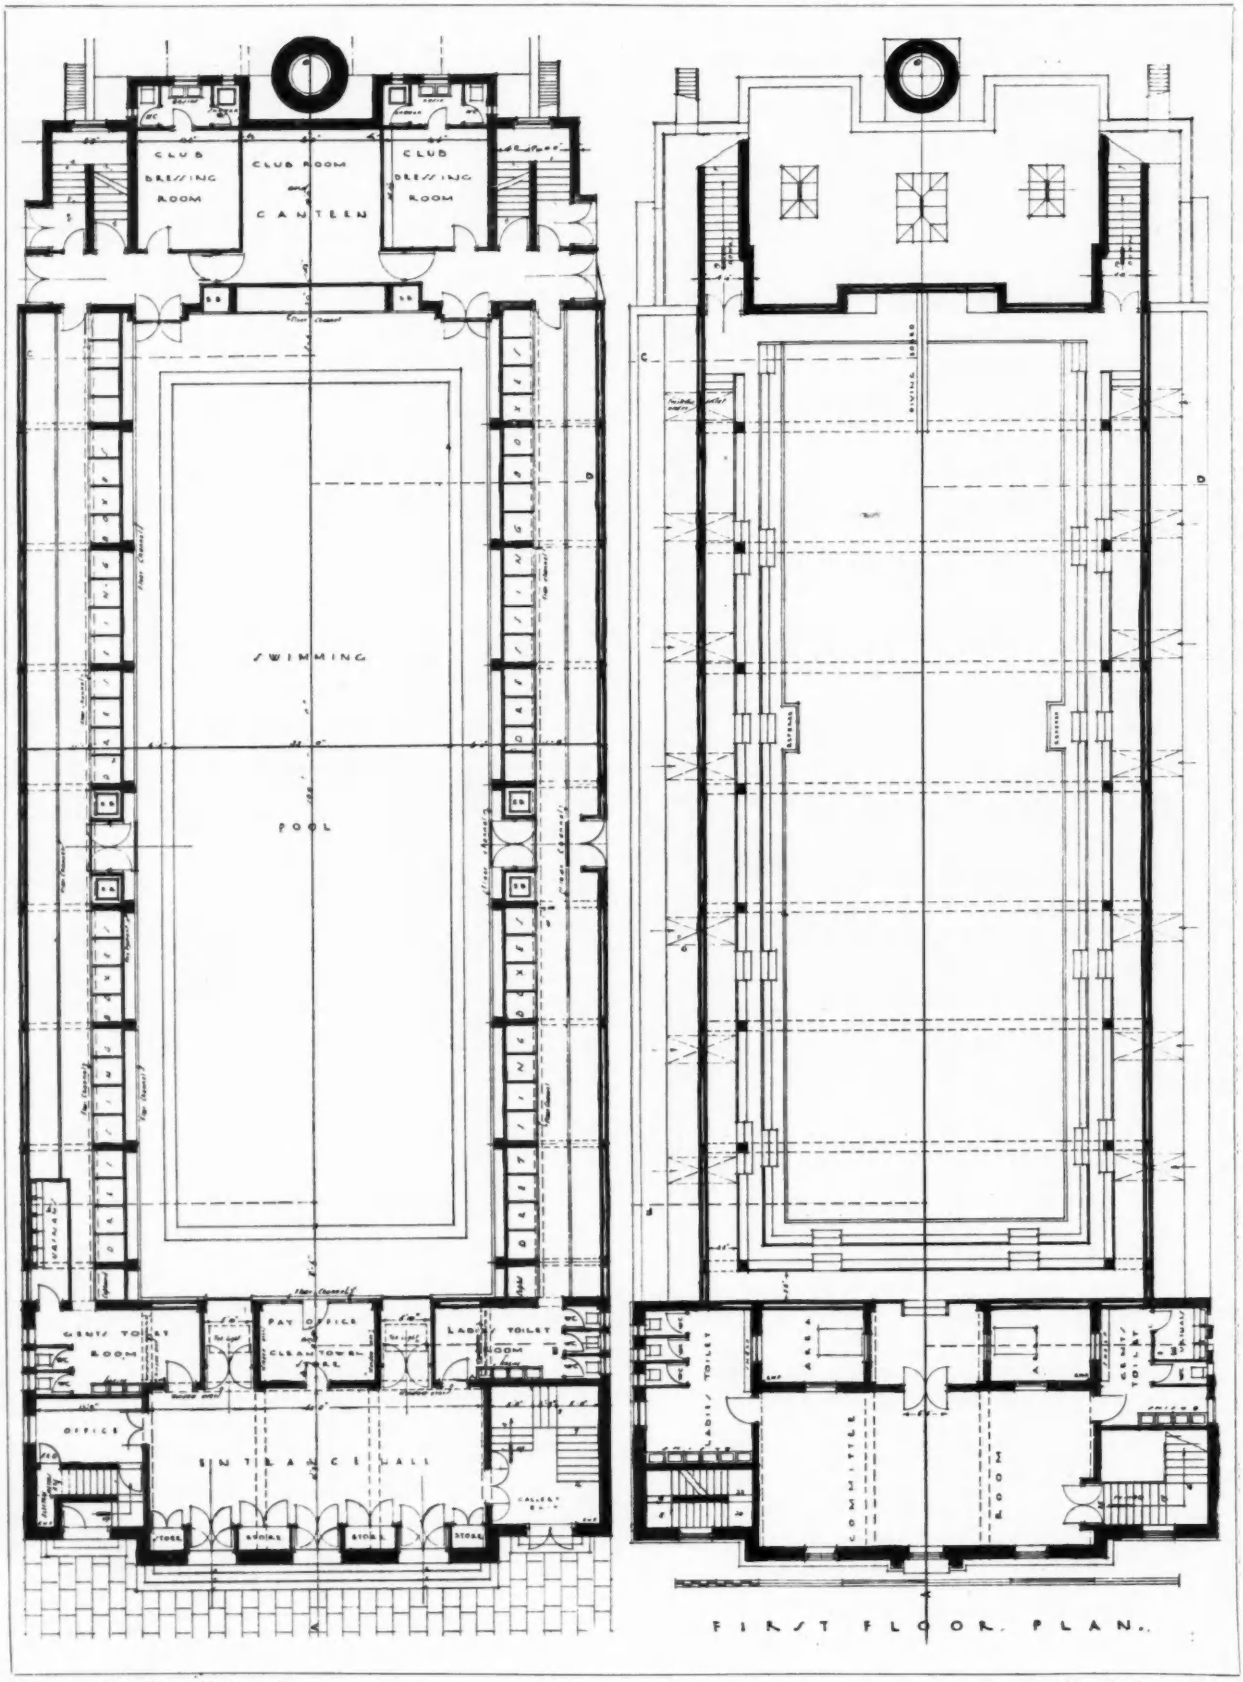
A portion of the longitudinal section taken through the restaurant halls and looking towards the kitchen and service quarters, with which communication is afforded through the doors shown on both the main floors.

SWIMMING BATH AT STOKE NEWINGTON

DESIGNED IN REINFORCED CONCRETE BY HOBDEN AND PORRI

The Clissold Road brick front of the new swimming bath, to be opened by H.R.H. Prince George tomorrow, April 10. The elevations have been specially designed to harmonize with the surrounding buildings, particularly the old houses in Church Street. Surmounting the main entrance is the borough coat-of-arms. The building will be floodlit from the lamp standards seen.

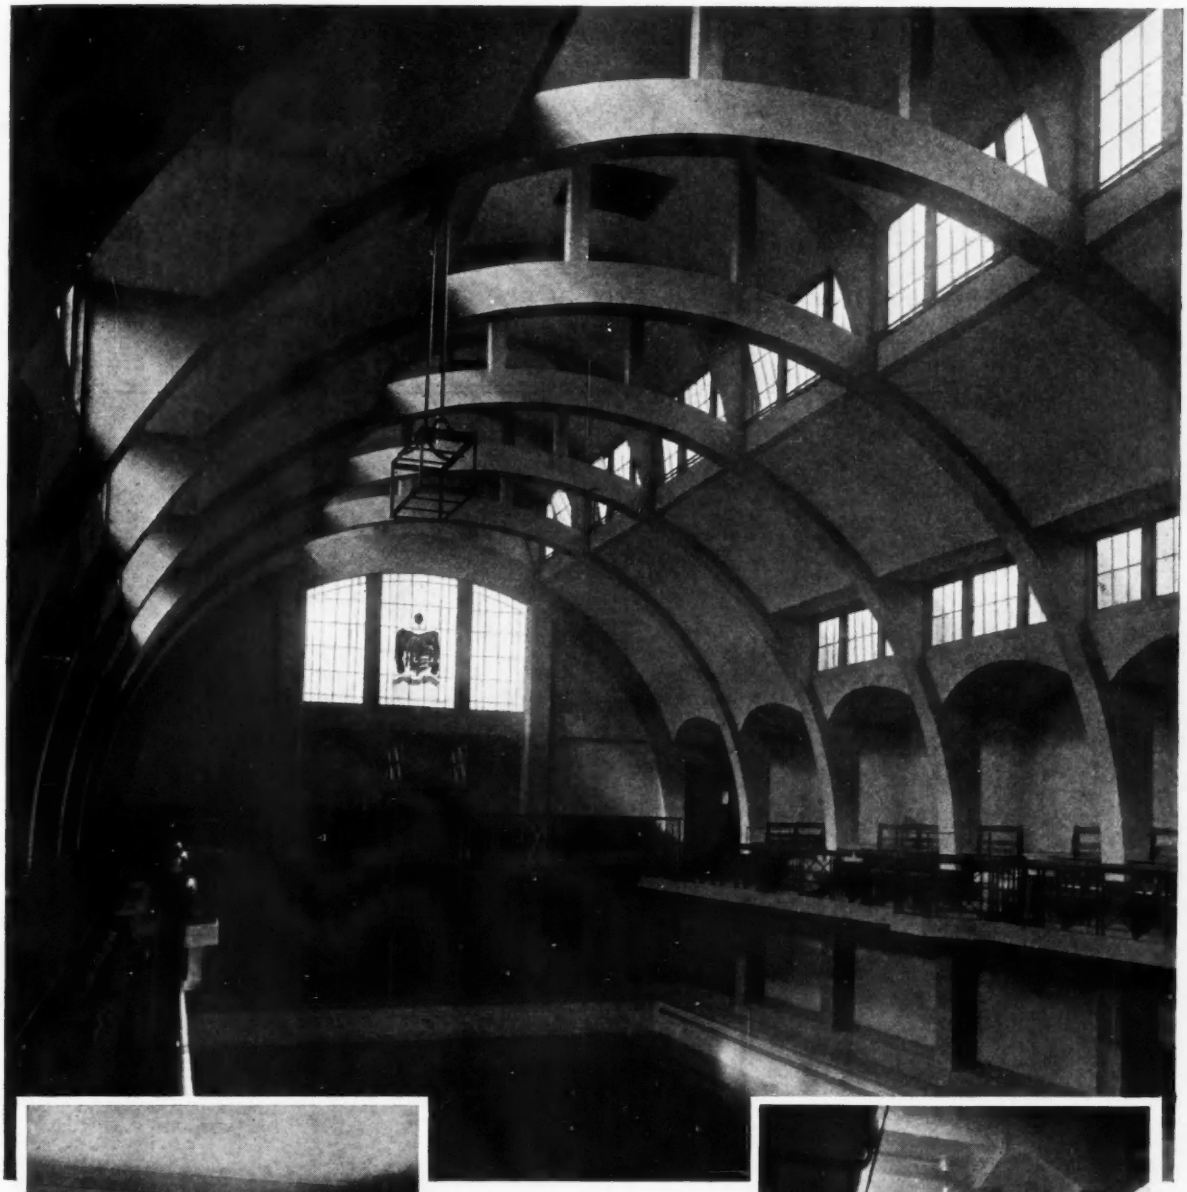
TOMORROW, April 10, H.R.H. Prince George will open the new swimming bath which has been erected in Clissold Road for the Stoke Newington Borough Council. The main front of the building is designed in a free interpretation of the Georgian style, and is faced with red bricks and Portland stone. Surmounting the main entrance is the Borough coat-of-arms.



Important features of the planning are the placing of the dressing boxes outside the bath hall and the position given to the shower baths. No bather will be allowed access to the bath hall until unrobed, thus eliminating the danger, from a medical point of view, of outside dirt being brought in. In other respects the building conforms with the latest expressed opinion of medical experts in relation to buildings of this kind.

The swimming bath contains 127,000 gallons of water, which is completely circulated through the purification plant once every four hours at the rate of 31,750 gallons per hour. This is equivalent to filling the bath with fresh pure water three times daily. The water is drawn from the deep end through an outlet box, covered with a brass grating, and is connected by piping to electrically driven centrifugal pumps, which circulate the water through the purification system.

The water on delivery from the pumps is treated with sulphate of alumina and soda ash and is delivered into three air-cleansed pressure filters having a total filtration area of 170 square feet, operating at the filtration speed of 186 gallons per square foot per hour.

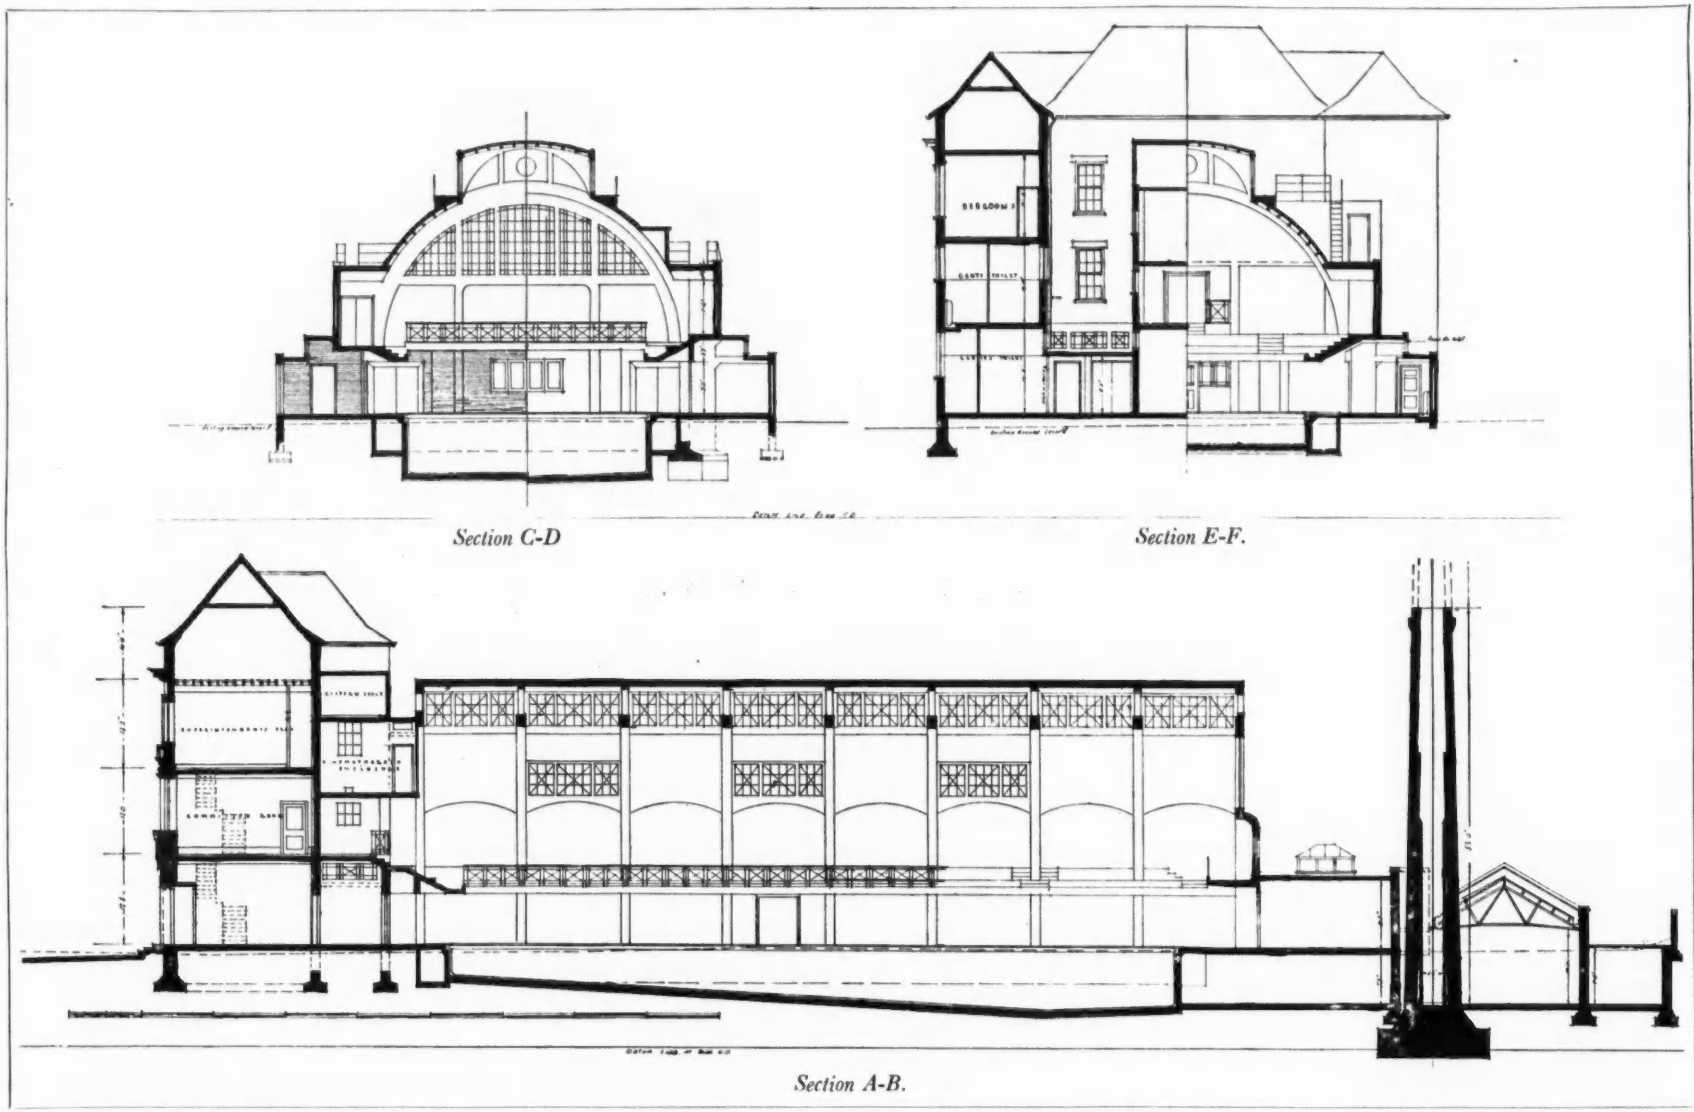


On leaving the filters the water is reheated to a temperature of about 74 degrees by passing through a tubular calorifier, and is then reoxygenated by contact with compressed air in an enclosed type aerator. Bacteriological purification is ensured by the application of a minute trace of chlorine gas, measured and continuously administered by a swimming-bath type chloronome.

The filtered and sterilized water is piped to the shallow end of the bath, where it is introduced at four points; and to ensure efficient distribution of water further inlets are provided on each side of the bath.

Swimming Bath, Stoke Newington.] [*By Hobden and Porri.*

Ground- and first-floor plans. The bath hall can seat 1,000 persons on the ground floor, and 250 in the gallery. When the building is being used as a swimming bath, the sole entry to the bath hall is by means of the toilet rooms and dressing-box corridors. Direct access from the entrance hall is provided for gala performances and when the hall is used for concerts, dances and cinema shows.



The bath hall is of reinforced concrete, rubbed, and coloured with distemper. The swimming pool is faced with white and blue glazed blocks, and the walls of the bath hall below the gallery with terrazzo. The promenade round the bath is of vitrified glass cubes.

SWIMMING BATH, STOKE NEWINGTON

By HOBDEN AND PORRI

Timbering and reinforcement of the main roof; and reinforcement of the east arch rib and suspended wall of the cinema operating enclosure.

THE "GEORGE," BURSLEM, STAFFS.

DESIGNED BY LONGDEN & VENABLES

THE George Hotel occupies an important site in Swan Square, Burslem, Stoke-on-Trent, and was opened in June, 1929. Many difficulties surrounded its erection, inasmuch as the whole of the town is subject to subsidence, due to mining operations, and a specially designed foundation to the building was essential. In consultation with steel construction experts it was finally decided to build cellars in the form of reinforced rafts underneath the building—one section below the three-story superstructure of the hotel, and a separate section below the lighter buildings of the public-house and hairdresser's shops in Nile Street. As far as can be ascertained to date the methods adopted have proved entirely successful.

The owners wished to erect a business and commercial hotel upon lines somewhat more attractive than those of the average provincial type, and although the bedrooms are comparatively few in number each has been given its own distinctive decorative quality. Moreover, the layout adopted has made it possible for certain adjoining rooms to be used for more than one purpose, either singly or as a suite.

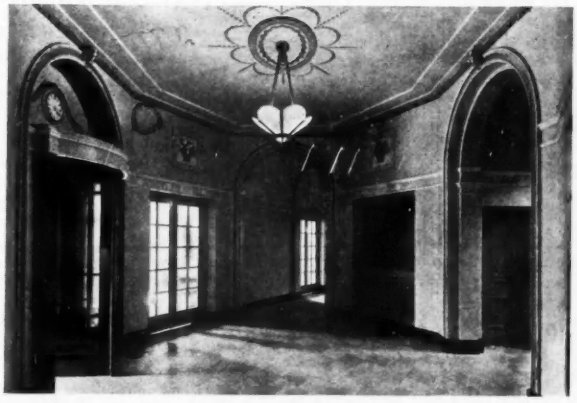
Common local bricks have been utilized in the fabric of the building, with facing bricks from the Reading district. The base is in Matlock stone, while the dressings are carried out in Hollington stone. Tiles of the Lombardic type cover the main roof, and though the chief windows are of the wooden sliding sash variety, a certain number of metal casements are also employed.

Within, terrazzo flooring and marble stair treads have been incorporated in the corridors and stairs.

The whole building is planned upon axes diverging from the hall of the corner main entrance, which takes an interesting irregular octagonal shape. The kitchens, still room, etc., form a connecting link at the rear.

Above, a similar hall occurs, this time of two stories in height, with a suite of reception rooms and bedroom corridors opening therefrom.

An admirable feature of the whole building is that no pipes of any description are visible.



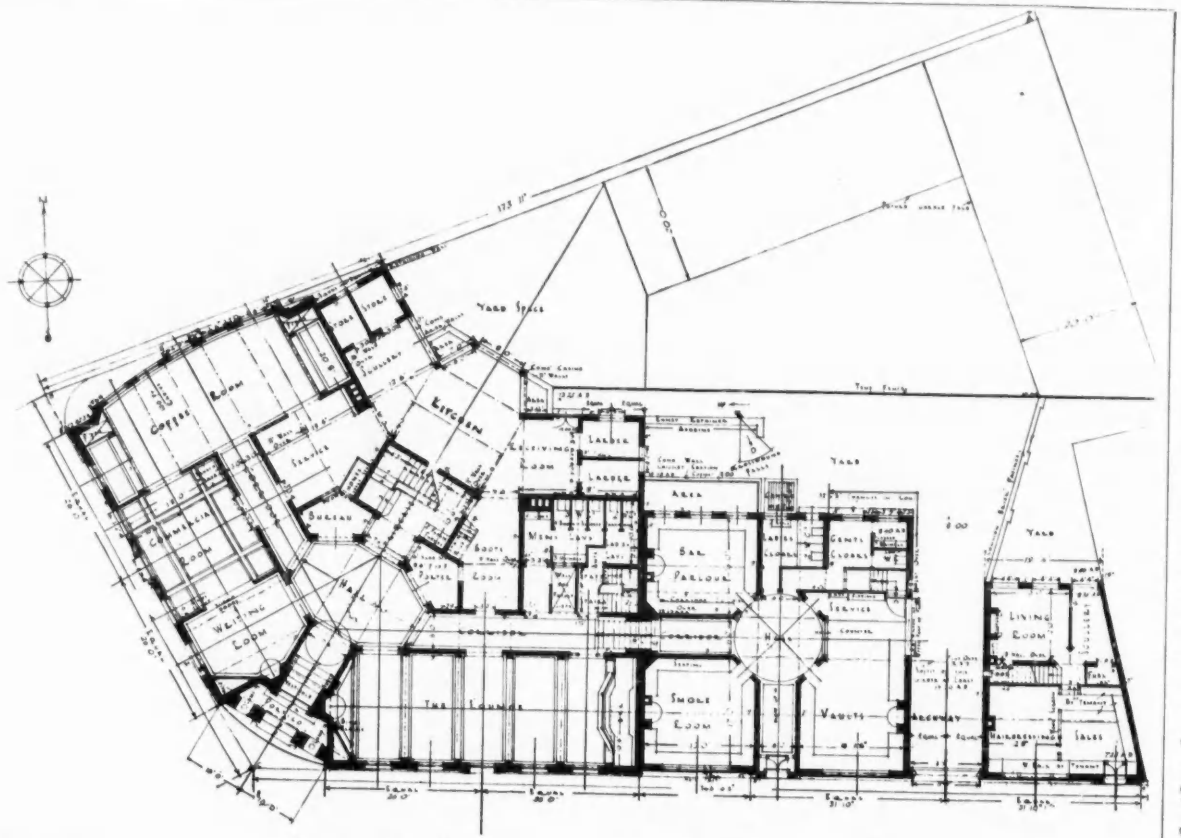
This slightly-bowed end, with windows to coffee-room on ground floor, and to four bedrooms immediately above, occurs round the corner to the left of the picture reproduced below.

The hotel occupies a peninsular site in Swan Square, of which this view shows the main façades, with a porticoed entrance on the corner. There is a subsidiary entrance farther down Nile Street, to the right.

The lounge, on the ground floor, has deep windows overlooking Nile Street, on the right. The bar servery is behind the screen at the far end of the room. In the left-hand wall are three doorways leading to the main entrance hall and corridor.

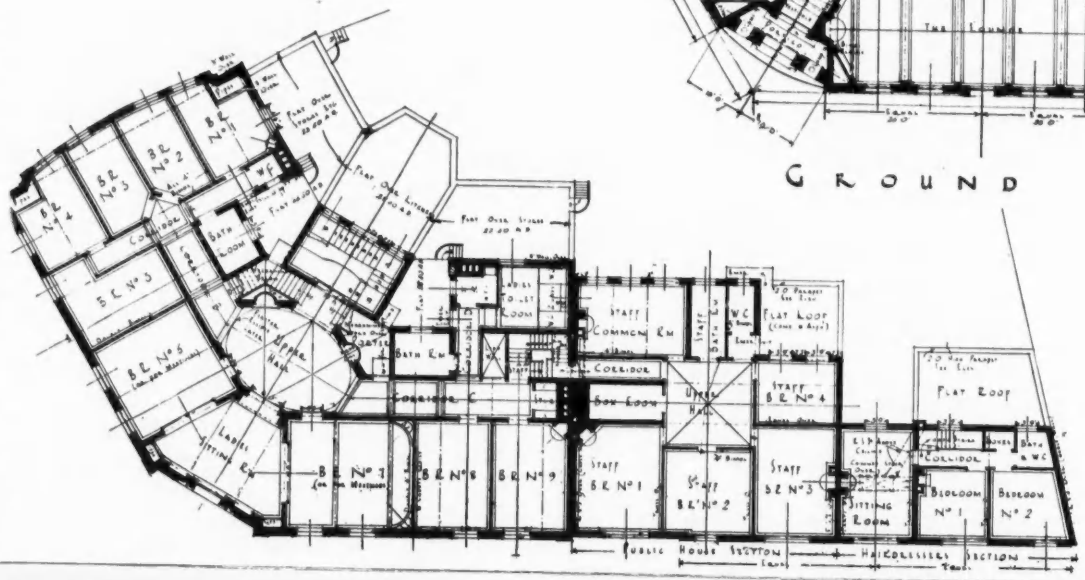
The two entrance halls on the ground floor. That on the left, entered from the main corner doorway, is eight-sided, symmetrical but not regular; that on the right, entered from Nile Street, is a true octagon, and serves the various bar rooms.

The George Hotel, Burslem, Staffs. [*By Longden and Venables.*



Furnished here as a private drawing-room, this apartment figures on the first-floor plan as "bedroom No. 7," and has been so arranged as to be adaptable to a variety of uses. It is entered from the eight-sided landing.

The George Hotel, Burslem, Staffs.

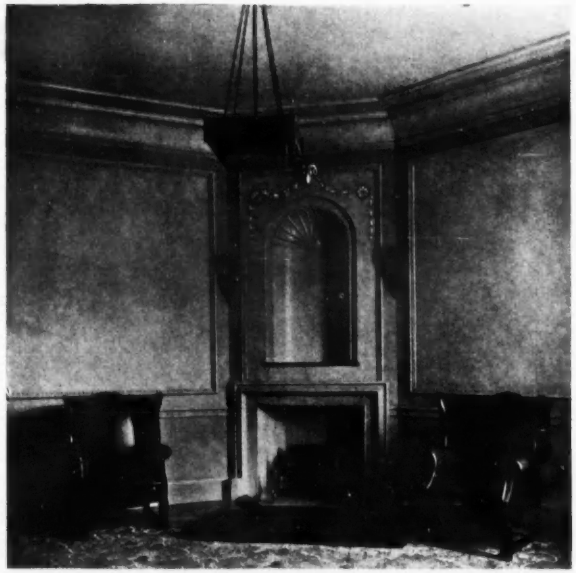


For Messrs. Parkers Burslem Brewery, Ltd.

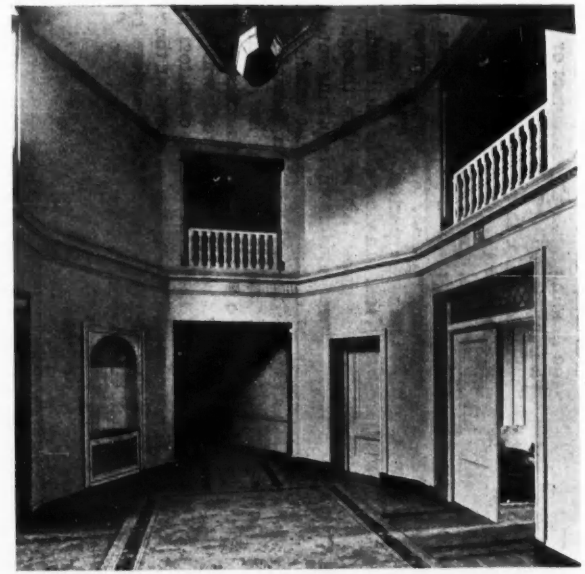
DESIGNED BY
LONGDEN AND VENABLES

These drawings are of the ground- and first-floor plans. There are, in addition, a basement and a second story. The site was a sloping one, and the problem of foundations was further complicated by the fact that it is in a mining area and consequently liable to subsidence. The whole of the weight of the buildings is taken by two reinforced concrete rafts, one under the hotel proper, the other under the lighter buildings to the right of the substantial party-wall here shown.

GROUND FLOOR PLAN.

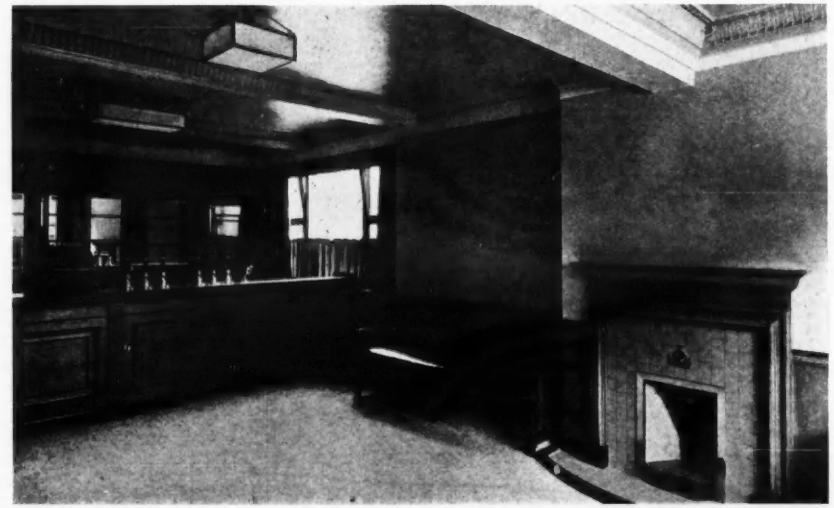


In the basement are cellars and stock-rooms, with a lower hall directly under the eight-sided one shown on the ground-floor plan, and space for a future billiards-room beneath the coffee-room. The planning on two intersecting axial corridors, with rooms opening off, allocated to the staff on one hand, and to the public use on the other, facilitates the hotel services, while giving the opportunity for intriguing vistas and rooms of unusual shape. The second story is devoted to bedroom accommodation except for the first-floor hall, which extends up through it, as seen in the view on the facing page.



The fireplace in the writing-room on the ground floor falls in the angle between splayed walls.

One of the corridors on the ground floor.



The eight-sided landing on the first floor extends upwards through the second floor.

The George Hotel, Burslem, Staffs.]

The ladies' sitting-room is placed between bedrooms Nos. 6 and 7 on the first floor, with folding doors communicating, to form a three-room suite.

[*By Longden and Venables.*

A corner of the bar or "vaults," showing the fireplace and service counter. The window looks on to the yard, which is approached through an arched way.

LAW REPORTS

ROAD CHARGES : LIABILITY OF OWNER

Warren v. *Bexley Urban District Council. King's Bench Division. Before the Lord Chief Justice and Justices Avory and Talbot.*

THIS was an appeal by Mr. Frank H. Warren, of Beaufort Avenue, Bexley Heath, from a decision of the Dartford Justices in favour of the Bexley Urban District Council, holding he was liable to pay £51 odd as the cost of making up the highway in front of his premises. The Justices determined the matter under section 8 (1) of the Private Street Works Act, 1892, and dealt with an objection by Mr. Warren under section 7 of the Act, that he was not liable for the provisional apportionment.

Mr. Elliott Gorst, who appeared for the appellant, said the question raised a point of interest to owners of small properties, who, under the Housing Acts, had purchased their houses on the system of deferred payments. The question was whether those people should be called upon to pay road charges when the roads were made up, or whether the local authority should make provision for those charges before paying the subsidy and fixing the price at which the builder had to sell. The appellant had purchased from a Mr. Middlemas, who had bought from the builder, who received the subsidy of £50 from the Bexley Heath local authority. Appellant was paying off the purchase price by instalments. Counsel argued that the road charges should have been allowed for in the price paid by his predecessor in title, and that it should have been settled by the Council before the selling price was fixed.

Without calling upon Mr. Frank Powell for the respondent Council, the Court dismissed the appeal with costs.

The Lord Chief Justice, in giving judgment, said if a man got a house cheaply he should be more able to pay the road charges. The Council had given the appellant proper notice, and had observed all the conditions precedent to create a liability by the owner of the house. The appellant being the owner, he was liable for the charges. The appeal therefore failed.

Justices Avory and Talbot concurred.

FORFEITURE OF LEASE CLAIM

Wood and another v. *Wood. King's Bench Division. Before Mr. Justice Swift.*

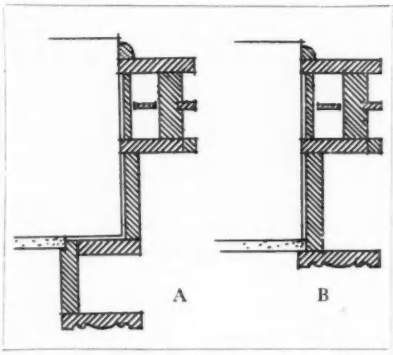
This was an executor's action against the son of the testator for possession of a shop and premises, 292 Stamford Hill, London, with arrears of rent from December, 1927, to March, 1929, and mesne profits.

Mr. Goff, for the plaintiffs, said the premises were let to the defendant on a twenty-one years' lease, at £120 a year, from January, 1909. During his father's lifetime defendant only paid £108 a year, with his father's consent, and the question was whether that concession was now binding on the executors. The widow was the tenant for life of the estate, and the extra £12 a year was an important consideration to her. The executors were now seeking to enforce the payment of £120 a year by forfeiture.

Mr. Critchley, for the defendant, said the original arrangement was that his client should pay £108 a year. The father, however, put £120 in the lease, but before it was signed it was arranged that the rent should be only £108 a year as long as the defendant remained in possession and did not become bankrupt. Counsel's submission was that this was a good collateral agreement, as it was not a question of varying a written agreement.

Mr. Goff contended that there was no evidence that that arrangement should be binding upon the executors or upon a purchaser.

His lordship, in giving judgment, said it was clear that from the making of the lease until the death of the testator a rent of £120 was never paid, but that was in pursuance of a verbal agreement between the parties. The sum paid was £108. In view of decided authority on the point, his lordship thought he was precluded from inquiring into the terms of any agreement made at or before the signing of a formal instrument, and therefore he could not inquire into what the agreement was under which the £108 was paid. When the testator died, executors were entitled to enforce payment at the rate of £120 a year. He therefore gave judgment for the plaintiffs for £15, which was the amount due at the date of the issue of the writ. As the defendant was claiming as a right a rebate of £3 a quarter, it was not a case in which the plaintiffs could ever have supposed that forfeiture of the lease would be granted.

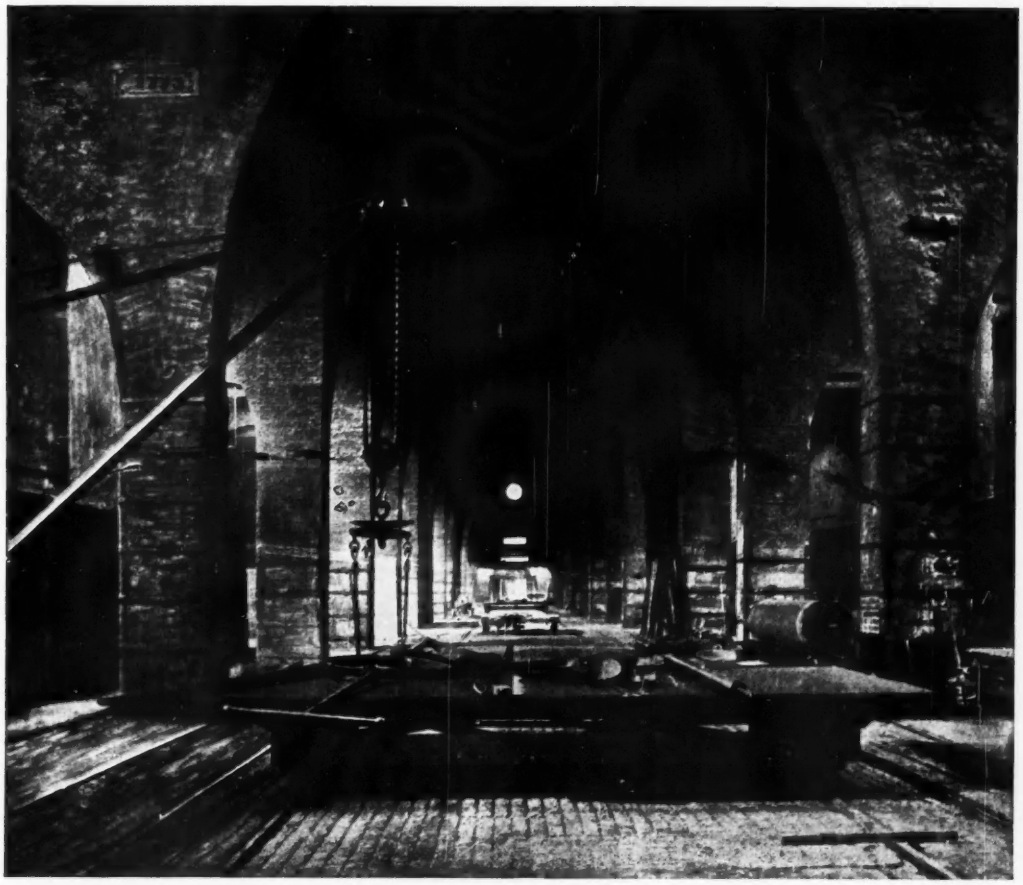


Judgment for plaintiffs for £15.

ARCHITRAVES AND CURTAINS

BY DELTA

IN the majority of houses one enters, on lifting the window curtains, there may be found architraves — some good, some bad, but still architraves— on which someone has expended time and trouble and someone else has expended money. Once a year, when the curtains are taken down for spring cleaning, the charwomen can gaze at these architraves and discuss the subtleties of their various mouldings; at other times they seem somewhat wasted, hidden, as they are, out of sight, and used generally as a fixing for curtain rods, valance boards, etc.



Architects are often accused of being too prone to design rooms without considering the furnished and inhabited whole; the window curtain question is, I think, a good point for the prosecution. The trouble comes probably from making half-inch details for the builder without having been obliged to make some sketch or scale drawing for the client.

(A) An ordinary curtain box, and (B) a suggested improvement by Delta, shown in plan

Directly a room becomes of sufficient importance for its design to be approved by the client, the architect draws in the curtains because they are of necessity a big feature in the room and they give a look of reality to the drawing. Immediately he draws in the curtains he changes the architraves to curtain boxes of some kind because the necessity is brought home to him.

The proper curtain box shown in figure "A" costs very little, but it is not always necessary even to go to this expense; for less important windows, where the curtains are not carried down to the ground, the architrave, instead of being fixed in its usual position, can be brought forward to project over the window reveal (and below the head), as in figure "B." This may appear to diminish the light, but in practice it reduces it very little, for no one draws curtains back clear of the reveal, and thin curtains of such materials as silk, taffeta, etc., suitable for such windows, will occupy very nearly the same position as they ordinarily would. The effect is tidier and more architectural in every way and the curtains are kept in their proper place.

ENGLISH PRECEDENT No. 110

THE OLD CASTING HALL, RAVENHEAD, LANCS.

Reminiscent of some ancient church, the original Casting Hall still stands in Messrs. Pilkington's works at Ravenhead, undisturbed by the ceaseless activity which surrounds it. Here it was in 1773 that the British Plate Glass Company produced their first cast plate. Her Majesty Queen Alexandra (as Princess of Wales) saw glass made here in 1865.

Since then the hand of progress has wrought but little change in the appearance of the Hall. Parts have been pulled down to make room for the Cathedral works, but the central aisle shown above has been preserved on account of its historical associations.

GREGORIES, BUCKS: THE HOUSE OF J. L. GARVIN

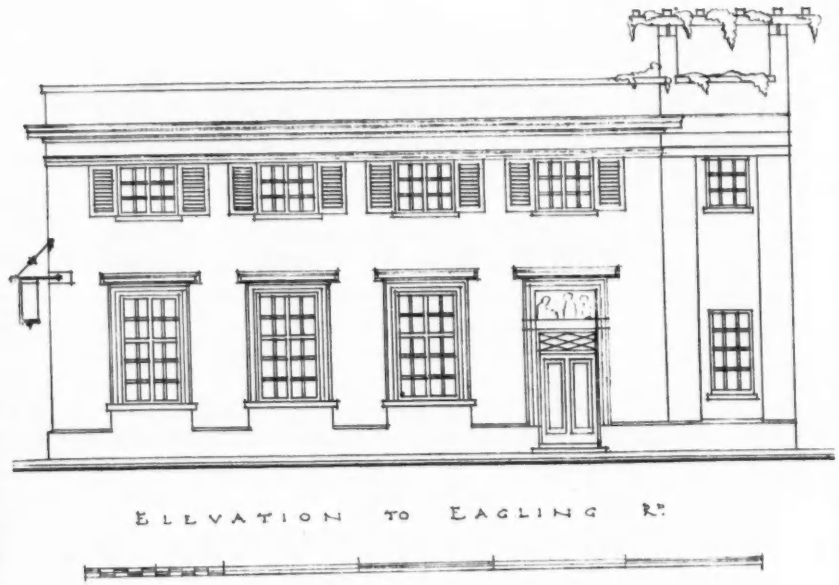
Gregories, Buckinghamshire, from the south. The large window on the right of the house belongs to "The Shepherd's Kitchen," now Mr. Garvin's study. The gabled porch was added by him

IN 1921 Mr. J. L. Garvin had occasion to look for a small country house. He searched every county within reasonable reach of London, and decided, eventually, upon Gregories, Beaconsfield, Bucks, the house associated with the memory of Edmund Burke. When he went to view the house, Mr. Garvin found it possessed an old staircase that led up from the kitchen to the bedroom above; a Cromwellian cupboard in the parlour; and crooked passages and ancient beams. Outside he was ravished to discover Burke's coach-house and the stables where the four black horses lived who drove Burke up to town for Parliament.

The first changes made by Mr. Garvin were the removal of pink marble mantelpieces that were desecrating the dining-room and the drawing-room, and the replacing of them by wide open brick hearths. The second alteration was structural, and was carried out under the direction of Mr. Paul Phipps. The house is L-shaped, and the kitchen wing towards its south-east end had seemed to continue into a tall, square, cell-like place called the "Shepherd's Kitchen."

To provide space for more books, Burke's coach-house has been converted into the library.

Opposite to Burke's coach-house, across a stretch of grass and at right angles to the barn, were the stables. These have been converted into a sort of record room with timbered gables, designed by Mr. Garvin himself. It is called "Piebalds," and is at some future date to have its iron sign swinging outside like the inns of the old town.



The alterations that have been carried out by Mr. Garvin are described in an article by Miss Viola Gerard Garvin, which appears in the current issue of *The Architectural Review*, and from which these brief particulars have been extracted.

[*From* The Architectural Review.

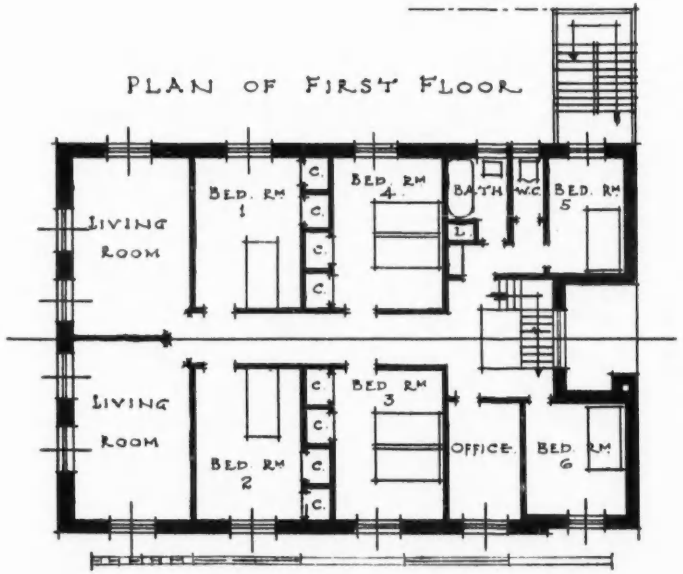
Burke's coach-house, now the library at Gregories, Buckinghamshire, as seen from Piebalds. The library is built of the original old red bricks. The door, chimneys, and windows have been added, but otherwise the shape of the building remains exactly as it was

NURSERY SCHOOL FOR THIRTY INFANTS

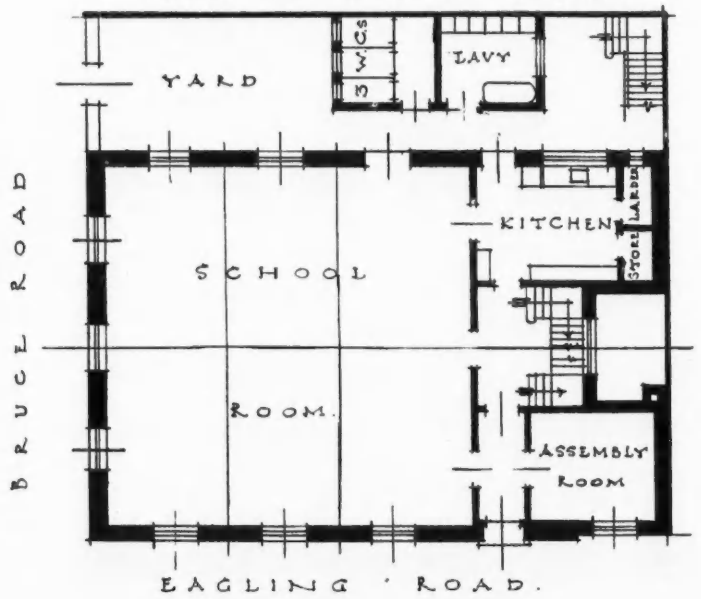
Built at Eagling Rd., Bow, E.

FROM DESIGNS BY

C. COWLES-VOYSEY



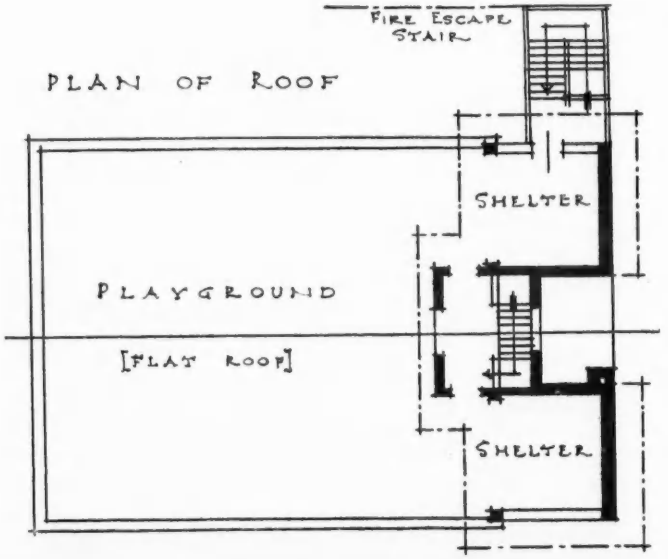
THIS nursery school provides accommodation for thirty children of the neighbourhood under school age. The children remain during the day, while mothers are at work, and play and rest and receive nursery, school and medical attention. On the ground floor there is a schoolroom some 35 ft. square, with cloakroom, lavatories and kitchen adjoining. The first floor is occupied by the living-rooms of the resident staff, and over these there is a flat roof which is used as a garden and playground. A portion of this has now been roofed in to form an "open-air" shelter, enclosed with folding doors and windows.



The walls are of brick, faced externally with 2-in. sand-faced, hand-made, multi-colour Dorking bricks, with artificial stone plinth, cornice and window dressings. The external louvre shutters are painted bright green. The over-door to the main entrance is in glazed stoneware and was modelled by Mr. Gilbert Bayes, the sculptor, who also carved and painted the signboard hung at the street corner.

The floors and staircases are of reinforced concrete, covered with battleship linoleum and quarry tiles in the entrance hall, kitchen and lavatories. The flat roof is covered with asphalt. The walls generally have composition dados with coved skirtings and enamelled plaster above. An acoustic ceiling of Cabot quilting was formed in the large schoolroom. An attempt was made to avoid dust-traps and to provide a permanent and hygienic finish.

The house is decorated in bright colours, with mural paintings of subjects interesting to small children. Lockers, clothes-hooks and personal belongings are identified by drawings of animals and flowers in place of numbers.



Plans of the school; and a photograph of the staircase at first-floor level.

NURSERY SCHOOL AT BOW, E.

By

C. Cowles-Voysey

CHARING CROSS BRIDGE BILL: COMMITTEE'S PROCEEDINGS

BY OUR SPECIAL REPRESENTATIVE

THE Chairman (Sir Henry Cautley) has announced that the Committee intend later to request that evidence should be given by an architect to be appointed by a representative body (presumably the R.I.B.A.) and that the Committee will be guided by his advice on the architectural treatment of the viaducts.

Sir Henry Maybury, giving evidence in support of the official scheme, said that while Waterloo Bridge might be the most convenient route for north and south traffic, it would not solve the problem of the Strand and east and west traffic generally. It might not be impossible to make a way from the bridge into Northumberland Avenue, but it would be very inadvisable. In order to make an approach to the bridge from the Embankment on that side of the river, it would be necessary to raise the Embankment 15 feet, so as to give the required head-room for navigation. Such a scheme would spoil the Embankment entirely. He did not consider that the viaducts on the south side of the river would impede traffic if they were properly lighted. The railway company proposed to construct shops in these viaducts and were expecting to make considerable revenue from them.

Mr. Frederick Palmer, joint consulting engineer for the project, was cross-examined by Mr. Tyldesley Jones, K.C., on behalf of users of the river.

After some discussion, witness stated that the L.C.C. were prepared to give an undertaking that the three northern arches of Waterloo Bridge would be kept open while the northern arches of Charing Cross Bridge were being constructed, and conversely.

The Chairman: This is surely an engineering matter that ought to be arranged between the two authorities.

Counsel: The real point is that the London County Council are being given a free hand to hold up the river, which is of the utmost importance to London.

After further discussion, Mr. Tyldesley Jones said that negotiations had been going on between the engineers for a fortnight. He agreed with the suggestion of the Chairman that these negotiations should be reopened.

Mr. F. J. Wrottesley, K.C. (for Lambeth Borough Council) questioned Sir Henry Maybury regarding the desire of the railway company to retain Charing Cross Station on the north side of the river, and asked whether the railway bridge was not approaching the end of its life. The witness said that he could not agree that that was so now. With a large part of the traffic electrified the station was much more advantageous than it had been for years.

The Chairman (to Counsel): What is the object of these questions? I thought Lambeth did not want the station removed.

Mr. Wrottesley: We do want it removed, but we object to the Lion Brewery site; we want it removed to the Waterloo Junction site.

Mr. Wrottesley then questioned the witness again regarding the "tunnels."

Sir Henry Maybury: They are not tunnels but covered roadways.

Counsel: I call them tunnels, but I will accept your description. Do you like the covered way at Vauxhall?—Speaking as an engineer, I do not like it.

And the covered ways in Lambeth are to have a 17-ft. headway as against 18 ft. 8 ins. at Vauxhall?—That is so, but we are now building bridges all over the country with a 16-ft. headway. That gives plenty of clearance for a covered-in omnibus, which is 14 ft. 3 ins. high.

In reply to further questions, Sir Henry Maybury said that this scheme provided a very good beginning for the development of Lambeth.

The Chairman: I quite agree, if you were not blocking it up with the station.

Sir Henry Maybury: I think it will be a big jumping-off ground for development in Lambeth. The rateable value will be enormously enhanced by the high standard of building set by this scheme.

Sir Edwin Lutyens was then called, and, replying to Mr. Charteris, K.C. (for the promoters), said that when in March, 1929, he was invited to advise on the possible layout of the scheme his hands were in no way tied. His business was to provide a solution of the difficulties, and at the same time present a scheme which would permit of architectural treatment. He was forced to the conclusion that the only practical site for the railway station was that now proposed in the scheme. He was satisfied from the architectural point of view that this would be a plan to the advantage of the area concerned. He had had regard to traffic, navigation, and engineering considerations. He considered that the balustrades and cornices of the bridge itself could be constructed in masonry. The buildings to be placed on the south side of the river would set a standard for the development of that area.

Mr. Charteris then referred to the question of the covered roadways, and Sir Edwin Lutyens produced two pictures showing how such roadways might appear by day and by night respectively. They were examined by members of the Committee, to whom Sir Edwin explained them in the course of conversation.

The Chairman: These are very beautiful pictures. Where is there such a covered roadway in reality?

Sir Edwin Lutyens (pointing to his forehead): Here. I have not seen it done anywhere, but I am quite sure that it can be done.

Mr. Charteris: They are indications not of work that will be carried out but of what can be done?—Yes.

In giving evidence, you only do so after having investigated all the possibilities and satisfied yourself that this is the best scheme?—Yes. I have had plenty of chance of getting out of this ordeal. (Laughter.)

The Chairman then stated that the Committee found themselves in a difficulty regarding the instruction from Parliament that designs for the bridge should be secured by competition or otherwise. Although Parliament had instructed the Committee, they had given the Committee no means of carrying out the instruction. It was an absurd position and they would like to know if learned counsel could assist them.

After discussion between counsel, it was decided that an agreed clause should be drafted endeavouring to give effect to the instruction.

Mr. F. D. Villiers Bayly (for Lambeth Borough Council) questioned Sir Edwin Lutyens about his pictures representing the arcades to be constructed in Lambeth. The witness agreed that there was nothing very dissimilar between the neighbourhood of Vauxhall Station arcade and the neighbourhood in Lambeth that would be affected by this Bill.

Counsel: Is there any reason why the arcade at Vauxhall Station has not developed on the lines suggested in your pictures?

Sir Edwin Lutyens: I suppose they had not the chance of employing me. (Laughter.)

Counsel: Then, it is having the ad-

vantage of your services that is going to convert people into building arcades like this. You will forgive us for being a little sceptical?—Well, look at the old third-class railway carriage compared with a modern first-class saloon.

I do not quite see the analogy. In any case, you are unable to give the Committee any instance of covered roadways like these having been constructed?—No; but think of the new underground approaches to Piccadilly Circus.

Do you compare them with these covered roadways? — No, but the method of lighting and so on at Piccadilly Circus was quite a new thing that had never been done before.

This picture of the arcade by night shows the people of Lambeth taking the air?—Yes.

Or shall we say breathing the carbon monoxide from motor traffic that has been held up?—I am assured that there will be no difficulty of that kind.

And they are listening to the music of the trains overhead?—Yes, a comforting rumble.

The Chairman : You think the sound will be deadened to that extent?—Yes.

Sir Edwin Lutyens was then questioned as to the lighting of the arcades, and said that the maximum amount of natural light would be obtained by having the roof sloping towards the centre from each end. There was enough space in the plans to provide for this. He also proposed that there should be flood-lighting, both day and night. The roof of the arcade could be kept clean by running a tramcar or other vehicle through it with a broom attached to the top.

Counsel later referred to the site, comprising the proposed buildings between the County Hall and the new station, and suggested that it was a difficult site to deal with.

Sir Edwin Lutyens : No; it is rather a nice site.

Counsel : Only so long as it can be dealt with as a whole?—No; that would not make it more difficult, but only more English.

What does that mean?—That it would be more haphazard.

Sir Herbert Walker, general manager of the Southern Railway, was then called. In reply to Mr. F. G. Thomas K.C. (for the promoters), he said that however good the present scheme were made and however much it were modified, it would still inconvenience a certain number of the Southern Railway passengers, and the only justification for the removal of the present station was the wider national interest. They considered that the site now proposed would put their passengers to the least possible inconvenience.

In reply to further questions, Sir Herbert Walker said that the railway company had abandoned the idea of ever amalgamating the south-eastern and the south-western services in one station at Waterloo. There were great engineering difficulties and it would involve rebuilding Waterloo Station, which had cost £2,300,000.

Sir Herbert Walker said it would be almost impossible from the engineering point of view to put the existing station underground at Charing Cross. An underground railway terminus was not really convenient, especially where, as at Charing Cross, there was a great deal of luggage. There were engineering difficulties in putting the station on any other site on the south side of the river.

Sir Felix Pole, a former general manager of the Great Western Railway, said he would like to see a Royal Commission appointed to consider the whole question of London's railway termini. All railway stations might be underground in the future. He looked forward to the time when Waterloo Station was covered all over with buildings and not merely with a roof. He saw no reason why our railway stations—even Waterloo Junction as it now stood—should not be dealt with in that way. Architectural beauty need not be confined to the station approach. If Charing Cross Station was to be moved to the south side of the river, the Lion Brewery was the only possible site.

Mr. Frank Pick, general manager of the Underground Group, said that a road bridge at Charing Cross would relieve the enormous pressure at Trafalgar Square; 1,746 omnibuses would use the bridge as soon as it was opened. As a result also, one fare stage would be eliminated from all fares on buses using that route, because the journey would be shortened.

Sir Lynden Macassey, K.C., for the promoters, announced that a clause had been agreed to by which the London County Council undertook not to stop up certain streets on the Adelphi estate until two new streets, one giving access to the Strand, and the other to Northumberland Avenue, had been constructed and opened.

The New Housing Bill

THE Housing Bill which the Government have introduced was expected to be debated on second reading on Monday and Tuesday last, and it will certainly give rise to lengthy proceedings in Committee.

The first part of the Bill deals with clearance areas and improvement areas, and the second part with individual insanitary houses. The definition of a clearance area is substantially the same as that of an unhealthy area under the present law.

The area can be cleared in two ways, by requiring the owners to demolish the buildings or by the local authority purchasing the area and then arranging for the demolition. The first method is new and is intended to enable the local authority to secure the removal of a bad slum without being obliged to incur the heavy capital expense of purchase and clearance.

The second method of dealing with a clearance area will be by purchase by the local authority, which would itself undertake the removal of buildings on the site. The procedure is intended to be simpler and more expeditious than that at present in operation, and does away with the necessity for a formal scheme. The local authority, having bought the land by agreement or by compulsion, must proceed to demolish the buildings and either appropriate the land for some purpose for which they have statutory powers, or dispose of it in some other way. In some cases they may have to re-house on the site or they may keep it as an open space.

In Part 2 of the Bill there is an alteration of the existing law with regard to the repair and demolition of individual insanitary houses. It is intended to simplify the procedure and provides that the appeal tribunal shall be the County Court instead of the Minister. Houses which are considered unfit for human habitation may be divided into those which can be made fit at a reasonable cost and those which cannot. In the case of houses in the first category, local authorities may require the owner to carry out the necessary work, or, if the owners default, may do it themselves and recover the cost. In suitable cases money may be lent to owners undertaking repairs. If the house cannot be made fit at a reasonable cost, then the local authority may enforce an order for its demolition.

A further attempt is to be made to deal with rural housing, and it is proposed to put a new responsibility upon the County Councils by enabling them to undertake building on behalf of a rural district, by empowering them to contribute to the expenses of ordinary rural housing, and by putting an obligation on them to contribute to houses provided by rural councils for agricultural workers or persons of a similar economic condition. It is proposed that the unit grant shall be reviewed every three years, and at the same time the period at which the Wheatley grants are reviewed will be increased from two to three years.

St. John's Lodge, Regent's Park

Major Edmondson asked the First Commissioner of Works what decision had been arrived at for dealing with the ground now occupied by the Botanical Gardens, Regent's Park, after

the expiration of the present lease, and for dealing with St. John's Lodge.

Mr. Lansbury, First Commissioner of Works: The question of the future use of the Botanic Gardens and of St. John's Lodge is under consideration at the present time, but no decisions have yet been taken.

New Labour Exchange

Mr. Remer asked the First Commissioner of Works what progress had been made in finding a site for the new Macclesfield labour exchange, as requested by the Minister of Labour.

Mr. Lansbury: A site has been found and my department's architects are considering whether it meets their requirements.

Art Galleries and Museums

Mr. Granville Gibson asked the First Commissioner of Works if, in view of the fact that Government property was not covered by insurance, he would carefully consider the desirability of installing with sprinklers Government art galleries and museums containing treasures impossible of replenishment in the event of loss by fire.

Mr. Lansbury: The installation of sprinkler systems in Government art galleries and museums generally involves the risk of serious damage by water to large sections of the collections in the event of the system being brought into operation. The policy at present followed of building in fire-resisting materials, eliminating potential fire-risks wherever possible, and maintaining systematic fire patrols, has been definitely adopted as providing adequate safeguards, but sprinkler systems have been installed in the basements and store-rooms of certain museums where there is no direct risk of damage by water to exhibits.

British Embassy at Moscow

Sir Frederick Hall asked the First Commissioner of Works what was the estimated cost of the work on the British Embassy at Moscow, and to whom it had been entrusted; how much of the estimate represented wages and how much was in respect of material and other items; whether the wages of the men employed for the purpose will be paid direct, and, if not, by whom; if he will say what classes of workers will be employed, and what wages they would receive expressed in terms of English currency.

Mr. Lansbury: Negotiations for the lease of the new Embassy at Moscow are still in progress, and although the necessary adaptations have been estimated roughly at £10,000, detailed plans for the work and method of execution have still to be settled. It is not possible, therefore, to give specific answers to the remaining points in the question.

CORRESPONDENCE

SEA SALT AS A CAUSE OF THE DECAY OF LIMESTONE

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—Referring to the important article by Messrs. A. R. Warnes and D. Northall-Laurie in your issue for March 19 on sea salt as a cause of the decay of limestone, we should like to point out that the Building Research Station has recently encountered several similar instances of serious and rapid decay resulting from the presence of sea salt in Portland stone. In all cases the buildings were comparatively new.

While agreeing in principle with the article in question, we venture to suggest that the fact that Portland stone may on occasion suffer contamination by direct contact with sea water is the important factor and one which requires more emphasis.

There is, as the authors point out, evidence that sea salt is carried inland by the wind, but were this an important cause of the contamination of Portland stone by sea salt, either in buildings or in the quarries, then decay from this cause would, we think, be much more common. It is well known, for instance, that the majority of the buildings in the Island itself are in a very good state of preservation; also, certain blocks of stone quarried at the time of the building of St. Paul's Cathedral, which had lain in the Island for nearly 200 years, were reported in 1861 to be still in good condition; indeed, a portion of one such block, which was presented to the Geological Museum as recently as last month, shows no signs of decay such as would be expected were wind-borne salt in itself a notable cause of decay.

The important factor seems to us to be that contamination of Portland stone by sea water may occur either accidentally, as, for instance, when an exceptionally high sea breaks into a railway-goods siding or when stone is taken from low-lying quarries which are subject to flooding by sea water.

Our observations have demonstrated that decay due to the presence of sea salt is localized; it has been observed to occur in and around particular blocks in several buildings. But the fact that the surrounding stonework is also affected seems to us to refute the suggestion made in the article in question that localized decay occurs because "the salt concentrates in those portions of the stone exhibiting a higher capillary head than contiguous portions." In our opinion, it is more probable that localized decay occurs because parts of one consignment of stone tend to find their way into more than one building. It is unlikely that more than a small proportion of sea-salt-contaminated stone finds its way on to the market.

Salt-contaminated Portland stone in isolated blocks decays at an alarmingly rapid rate, either from causes similar to those mentioned by the authors of the article, or, possibly, because sea salt is deliquescent and so causes the stone to be more readily attacked by acid sulphur gases in the atmosphere. This latter point is now under investigation at the Building Research Station.

It is suggested that, in their own interests and in the interests of their customers, the stone firms concerned would be well advised to take immediate steps to see that no stone is put on the market which has, from any cause, been in direct contact with sea water. Otherwise, occurrences such as that described by Messrs. Warnes and Northall-Laurie will continue to occur, to the detriment of the deservedly good reputation of Portland Stone.

P. W. BARNETT,
FOR THE DIRECTOR OF
BUILDING RESEARCH, WATFORD.

OBITUARY

DAVID RAESIDE: 1882–1930

DAVID RAESIDE, whose untimely death at the age of forty-eight years was briefly noted in last week's issue, was chiefly concerned with the business and practical side of the widespread activities of Sir John Burnet and Partners, with whom his association had been life-long. It is not the least formidable and arduous part of architectural practice, and Mr. Raeside's personality was a great asset in carrying it through: he had endeared himself to the whole legion of colleagues with whom it had been his lot to co-operate.

He started his career by apprenticeship with Mr. Anderson, of Ayr, in 1896. Three years later, when this office closed down, he entered that of Sir John Burnet in Glasgow. Twenty-one years ago, last November, he transferred to Sir John's London headquarters. During the war he saw service attached to the 2nd London Division of the Royal Engineers, in Egypt, in 1917–1919, and was also assistant architect to the War Graves Commission in Palestine. It was shortly after his return that he was taken into partnership by Sir John Burnet, in 1920.

He was buried at his native town of Prestwick, in Scotland, on March 28, and on the same day a memorial service was held in London at the Chapel of the Savoy.

JAMES H. CRAIGIE: 1870–1930

We regret to record the death, after a long illness, of James H. H. Craigie, F.R.I.B.A., of Glasgow.

He was articled to the late James

Hamilton and studied at the School of Art and Technical College, Glasgow, and also in France and Italy. Until 1915 Mr. Craigie was in partnership with the late George Bell, F.R.I.B.A., and thereafter with his son. He was joint architect to the Glasgow Courthouse Commissioners, and a J.P. for Glasgow and Lanarkshire in 1922-23.

SOCIETIES AND INSTITUTIONS

MODERN ART

The North Staffordshire Architectural Association held their final meeting at Hanley, when Mr. W. Aumonier delivered a lecture on "Modern Architectural Carving and Sculpture." Mr. Walton Stanley presided.

Mr. Aumonier referred to the modernist movement as a very vital force stretching from Scandinavia right across Europe. He stated that "the sculptor obtains his inspiration from the architect, and this modern phase of decorative sculpture largely arises from the opportunities afforded in modern architecture."

People, he said, were no longer surprised if a building was erected devoid of any mouldings or architectural embellishments, and with its sculpture hewn out of the rough stone, left with all the signs of its primitive origin. The desire for simplicity and directness in building had given a great opportunity to the individual sculptor and had brought to the front some very great craftsmen.

He was impressed with the idea that climate had some bearing on the grimness of much modern sculpture, for modernism in this direction had its origin largely in Scandinavia. Germany had fostered the new sculpture to a much more satisfactory conclusion than elsewhere, though here some specimens would be thought exaggerated and violent. It was curious that the Latin races had never quite capitulated to modernism. In England, he added, we were at the cross-roads, and there was a marked and strong tendency among the younger architects and sculptors to develop this modern phase.

In conclusion, he said that the fundamental principle of all good sculpture was the sympathetic collaboration of architect and sculptor, each striving to uphold the ideals they represented.[1]

The lecture was illustrated by lantern slides.

ARCHITECTURE OF THE COTSWOLDS

Mr. H. Stratton Davies, in a lecture to the Liverpool Architectural Society, described the struggle to preserve the beauties of the Cotswold domestic architecture. Major Duncan A. Campbell presided. The lecturer said, in these days of the jerry-builder they were very fortunate that so small a part of the Cotswolds had been spoilt. It was, he believed, the least spoilt part of England. A study of the extremely modest, restrained and dignified style of the old buildings there would have a good effect in these days of extravagant, ultra-modern ideas. The Cotswold builders, of course, were fortunate in their materials. He knew of no other buildings which so harmoniously engaged with the landscape round about them.

ROYAL SOCIETY OF BRITISH SCULPTORS

At the annual general meeting of the above society, Mr. W. Reynolds-Stephens was elected President for his tenth term of office. Mr. Gilbert Bayes was re-elected vice-president and Mr. C. L. Hartwell, R.A., treasurer. Mr. R. O. Gross and Miss Winifred Turner were elected Associates.

BYZANTINE ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., in his final lecture on ancient architecture, at the Central School of Arts and Crafts, traced the Byzantine style as it travelled from Constantinople in the East to Venice further West, and to other art centres in Western Europe, where, he said, it had survived sporadically down to the present day. He also referred to the chief monuments of Byzantine art in Greece, France and England.

THE LIGHTING OF TEXTILE MILLS

A lecture on the above subject was delivered before the Illuminating Engineering Society, by Mr. S. Anderson.

Mr. Anderson stated that about 90 per cent. of the textile mills in this country were lit by electricity, many generating their own supply by means of a dynamo driven from one of the main steam engines, and thus the cost of power to them was negligible. They had, however, in most cases, a considerable objection to increasing their lighting load owing to the fact that their generators were already fully loaded, and any extensive improvement in lighting would necessitate the installation of a new dynamo, probably accompanied by additions to the supply cables in order to cope with the increased load.

The provision for adequate daylight illumination was, he explained, very variable, but in general, spinning mills were poorly lighted during daylight, while weaving sheds were the entire reverse. The former were of the multi-story type, and rarely had sufficient ceiling height and window area to give good illumination in the middle of the floor, while the latter were invariably saw-tooth roof-lit buildings, which gave excellent lighting to the looms.

[1] The fruits of much research by Mr. Aumonier on the subject are to be published by the Architectural Press in June.

PRESENTATION TO MAJOR TASKER

Major R. I. Tasker, Chairman of the L.C.C. and last year's President of the Incorporated Association of Architects and Surveyors, was entertained at a dinner given by members of the Association on March 28. He was presented with black opal and diamond cuff links and studs, and a replica of the Presidential badge, and Mrs. Tasker with a diamond brooch and carriage clock.

COMPETITION CALENDAR

April 28.—Messrs. Josiah Wedgwood and Sons, Ltd., invite designs in competition for a Wedgwood Vase, to be made in commemoration of the Bicentenary of the Birth of Josiah Wedgwood, which will be celebrated this year. Assessors: Philip Connard, R.A., W. Reid Dick, A.R.A., H. S. Goodhart-Rendel, F.R.I.B.A., and Frank H. Wedgwood. Premiums: £100, £50 and £25. Full particulars may be obtained on application to the Secretary, Messrs. Josiah Wedgwood and Sons, Ltd., Etruria, Stoke-on-Trent. Latest date for submission of designs: April 28.

May 16.—Messrs. Ewart and Son, Ltd., in conjunction with the Association of Architects, Surveyors and Technical Assistants, invite designs for a lock-up hangar for an aeroplane. The competition is divided into two classes, for those over and under 25 years of age at midnight, May 15–16, 1930. Assessors: William H Hamblyn, A.R.I.B.A., and Chas. McLachan, A.R.I.B.A., with A. N. Cathgart as technical adviser with regard to roofing, ventilation and hot-water supply. Two prizes will be awarded in each class, namely, a free place in the A.A.S.T.A. party to Madrid in September, and includes second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. Messrs. Ewart and Son, Ltd., reserve the right to publish or make use of any of the designs for which a prize is awarded, but do not reserve the right to build in accordance with any of them. Particulars of the competition, etc., are obtainable from A. Seymour Reeves, Secretary, A.A.S.T.A., 26 Buckingham Gate, S.W.1. Latest date for submission of designs: May 16, 1930.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit, £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art,

and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

No date.—The Leicester Corporation invites local architects to submit designs for the erection of a library at West Humberstone. Assessor: Hugh Gold, F.R.I.B.A. Premiums: £75, £50, and £25.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATION

9266. Farmer, E. C., and Structural Steelcrete, Ltd. Reinforced-concrete structures. March 22.

SPECIFICATIONS PUBLISHED

326625. Josz, E. Process for the manufacture of plaster for building and like purposes, and the product thereof.

326678. Sorensen, H. Construction of fireproof buildings.

ARCHITECTS' WILLS

Sir Laurence Weaver, K.B.E., F.S.A., HON. A.R.I.B.A., of Dunedin, New Road, Ashtead, Surrey, left £28,263.

Mr. Frederick Arthur Howorth, of Thistleton, Hicks Road, Waterloo, near Liverpool, retired architect, left £21,208 (net personalty £21,128).

Mr. Allan Stevenson, of Largie, Castlehill Road, Ayr, architect, left £20,068.

Mr. Thomas Stokes, of Topcliffe Road, Sowerby, near Thirsk, architect and surveyor, left £7,142 (net personalty £3,635).

Mr. Edward Percy Thompson, A.R.I.B.A., of Bodimeades Cottages, Elstree, Herts, left £5,122 (net personalty £4,440). He bequeathed a copper washbowl from Newgate Prison which was pulled down in 1903, and iron stand belonging to it, to C. G. Lawson, with an explanation that it should be used as a rose bowl. To an old friend he left a ten-gallon cask of Scotch whisky, and expressed the wish that the cask should be filled from time to time to prevent tilting it when drawing off the contents.

TRADE NOTES

The lighting and heating section of the Ideal Home Exhibition should not be missed by architects visiting Olympia. It is evident that increasing provision must be made for accommodation and connections for electrical appliances in the modern home, and such displays and demonstrations as were given by Messrs. Ediswan in the "Hall of Ideals" (designed by Mr. T. S. Tait, F.R.I.B.A.) will do much to increase the demand, not only for electric cookers and fires, vacuum cleaners and fans, but for many other appliances. Refrigerators, washing machines, floor polishers, violet ray and artificial sunlight, vibrators, curling irons and hair driers were run by electricity from the house supply. This firm of electrical manufacturers of such a varied supply finds its engineering department more and more called upon by architects and builders.

Messrs. G. A. Harvey & Co. (London) Ltd., in an interesting booklet published under the title of *Steel Plate and Constructional Work*, describe and illustrate some of the many diverse types of riveted and electrically welded work carried out by the firm's steel plate constructional department. The firm specialize in hydraulically riveted or electrically welded steel plate work up to 1½ in. thick. In the foreword to the booklet the firm claim to have one of the most efficient and up-to-date plants for economical production, and that some of the special machinery is the only example of its kind in the United Kingdom. Among the many forms of industrial equipment the firm have produced are: Storage vessels, stills, condensers, cylinders, etc., for ammonia recovery, benzole, chemical and creosoting plants, water softening plant, bulk oil installations, storage tanks up to 116 ft. diameter, hydraulic pressings, structural steel work, bunkers and vulcanizing pans.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Swimming Bath, Stoke Newington (pages 569–573). General contractor, Albert Monk. Sub-contractors: Paterson Eng. Co., Ltd., aeration and filtration; Colley Meikle & Co., Ltd., heating and steam plant; Jacob, White & Co., Ltd., electrical work; Carter & Co., Ltd., wall linings and terrazzo; Farnley Iron Co., Ltd., glazed bricks and bath lining; Starkie Gardner, Ltd., ornamental balustrade to gallery; Adamsez, Ltd., sanitary goods; G. A. Harvey & Co. (London), Ltd., radiator guards in bath hall; W. and R. Leggott, Ltd., commemorative tablet in entrance hall; A. Jones Lock Co., dressing-box fittings and ironmongery; L. Bysouth and Sons, stonework; A. Thorpe, stone carving; Morris, Singer & Co., leaded light coat-of-arms; Henry Hope and Sons, Ltd., steel sashes and electrical sash-opening gear; David Rowell & Co., Ltd., ventilators; Considere Construction, Ltd., reinforced concrete designers.

The George Hotel, Burslem (pages 574–577). General contractors, T. Godwin and Sons. Sub-contractors: Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, reinforced concrete and fireproof construction; Colliers (Reading), facing bricks; A. D. Dawnay and Sons, Ltd., structural steel; Ames and Finnis, tiles; Pilkington Bros., Ltd., glass; Mellowes & Co., Ltd., patent glazing; Hollis Bros. & Co., wood-block flooring; White's Hygeian Rock Co., waterproofing materials; Saunders and Taylor, central heating; Bratt Colbran & Co., stoves, grates and electric heating; Saunders and Taylor, Ltd., boilers; Bagues, Ltd., Best and Lloyd, Ltd., and Woodfyt Sales, electric light fixtures; A. Wood & Co., and Twyfords, Ltd., sanitary fittings; J. and H. Patteson, Ltd., stairtreads, window furniture and marble; N. F. Ramsay & Co., door furniture; Mellowes & Co., Ltd., casements; Colman & Co., revolving doors; G. Jackson and Sons, Ltd., decorative plaster; Durose and Son, metalwork; A. Wood, tiling; Merchant Trading Co., Ltd., Salubra wallpapers.

Children's Nursery School, Eagling Road, Bow, E.3 (pages 582–583). General contractors, Griggs and Sons. Sub-contractors, Messrs. Stuarts Granolithic Co., Ltd., artificial stone; Broadhurst Craig, heating; Beaven and Sons, Ltd., lighting; Doulton & Co., Ltd., glazed stoneware; H. Pontifex and Sons, Ltd., sanitary fittings; Art Pavements and Decorations, Ltd., and Van Straaten & Co., floor and wall linings; Bloxam and Scuffell and Haywards, Ltd., fire-escape stairs, gates and staircase balustrade; Mander Bros., paint; Lawford and Sons, Ltd., asphalt; Hammond and Champness, lift.

House at Neston (pages 590–591). General contractors, Henry Norman and Son.

ANNOUNCEMENTS

The partnership between Messrs. George Anag, F.R.I.B.A., and George Hornblower, F.R.I.B.A., has been dissolved. Mr. Anag will practise on his own account at 7 Great James Street, Bedford Row, W.C.1.

Mr. E. Stone Collins, F.R.I.B.A., has taken into partnership Mr. Brian S. Roberts, nephew of the late Mr. Ralph Knott. The practice will be carried on as before, under the name of Knott and Collins, at 14 John Street, Adelphi, W.C.2.

By virtue of the Merchandise Marks (Imported Goods) No. 1 Order, 1930, all imported roofing slates sold or exposed for sale on or after June 28, 1930, must bear an indication of origin, applied to each slate by stamping, stencilling, or otherwise painting.

THE ARCHITECTS' DIARY

WEDNESDAY, APRIL 9

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Architectural Examinations Committee. Annual General Meeting of the South-Eastern Society of Architects. 4.30 p.m. **5 p.m.**

ARCHITECTURE CLUB, 229 Strand, W.C.2. At the Architectural Association, 34 Bedford Square, W.C. Supper discussion on "Relation of Sculpture to Architecture." Supper, 7.45 p.m. Discussion, 8.3 p.m. **7.45 p.m.**

GUILDHOUSE FELLOWSHIP, Guildhouse, Eccleston Square, S.W.1. "Preserving our Heritage." By Clough Williams-Ellis, F.R.I.B.A. Hon. Humphrey Pakington, A.R.I.B.A., will occupy the chair. **8 p.m.**

Jackson; conversion of house into five flats, 16 St. Saviourgate, for York House Improvement Society; two houses, Shipton Road, for Clifton Estates, Ltd.; four houses, Muncaster Estate, for Mr. Denby Collins; two houses, Stockton Lane, for Messrs. F. Addison and H. C. De Burgh.

SCOTLAND

Messrs. W. and G. Taylor are to erect twenty terrace houses in Paisley Road West, between Walkerburn Road and Forfar Avenue, GLASGOW.

The GLASGOW Corporation Housing Committee has passed plans of the housing director for the layout of land for the erection of thirty-six houses, at Amulree Street, Tollcross.

The GLASGOW Corporation Housing Committee has adopted the layout plan of the Netherton housing scheme, showing 222 houses.

The GLASGOW Corporation is being asked by the Western Heritable Investment Co., Ltd., for a subsidy of £12 10s. for, and a loan of 75 per cent. of the value of each of, 1,364 houses proposed to be erected at King's Park.

The GLASGOW Corporation is obtaining a report as to a site for a proposed new infectious diseases hospital.

The GLASGOW Corporation has granted the Hermon Baptist Church a site at Govanhill, for the erection of a church.

The GLASGOW Corporation Water Committee recommends the construction of an additional syphon pipe line from Loch Katrine across the Endrick and Blane Valleys, at a cost of £85,000.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

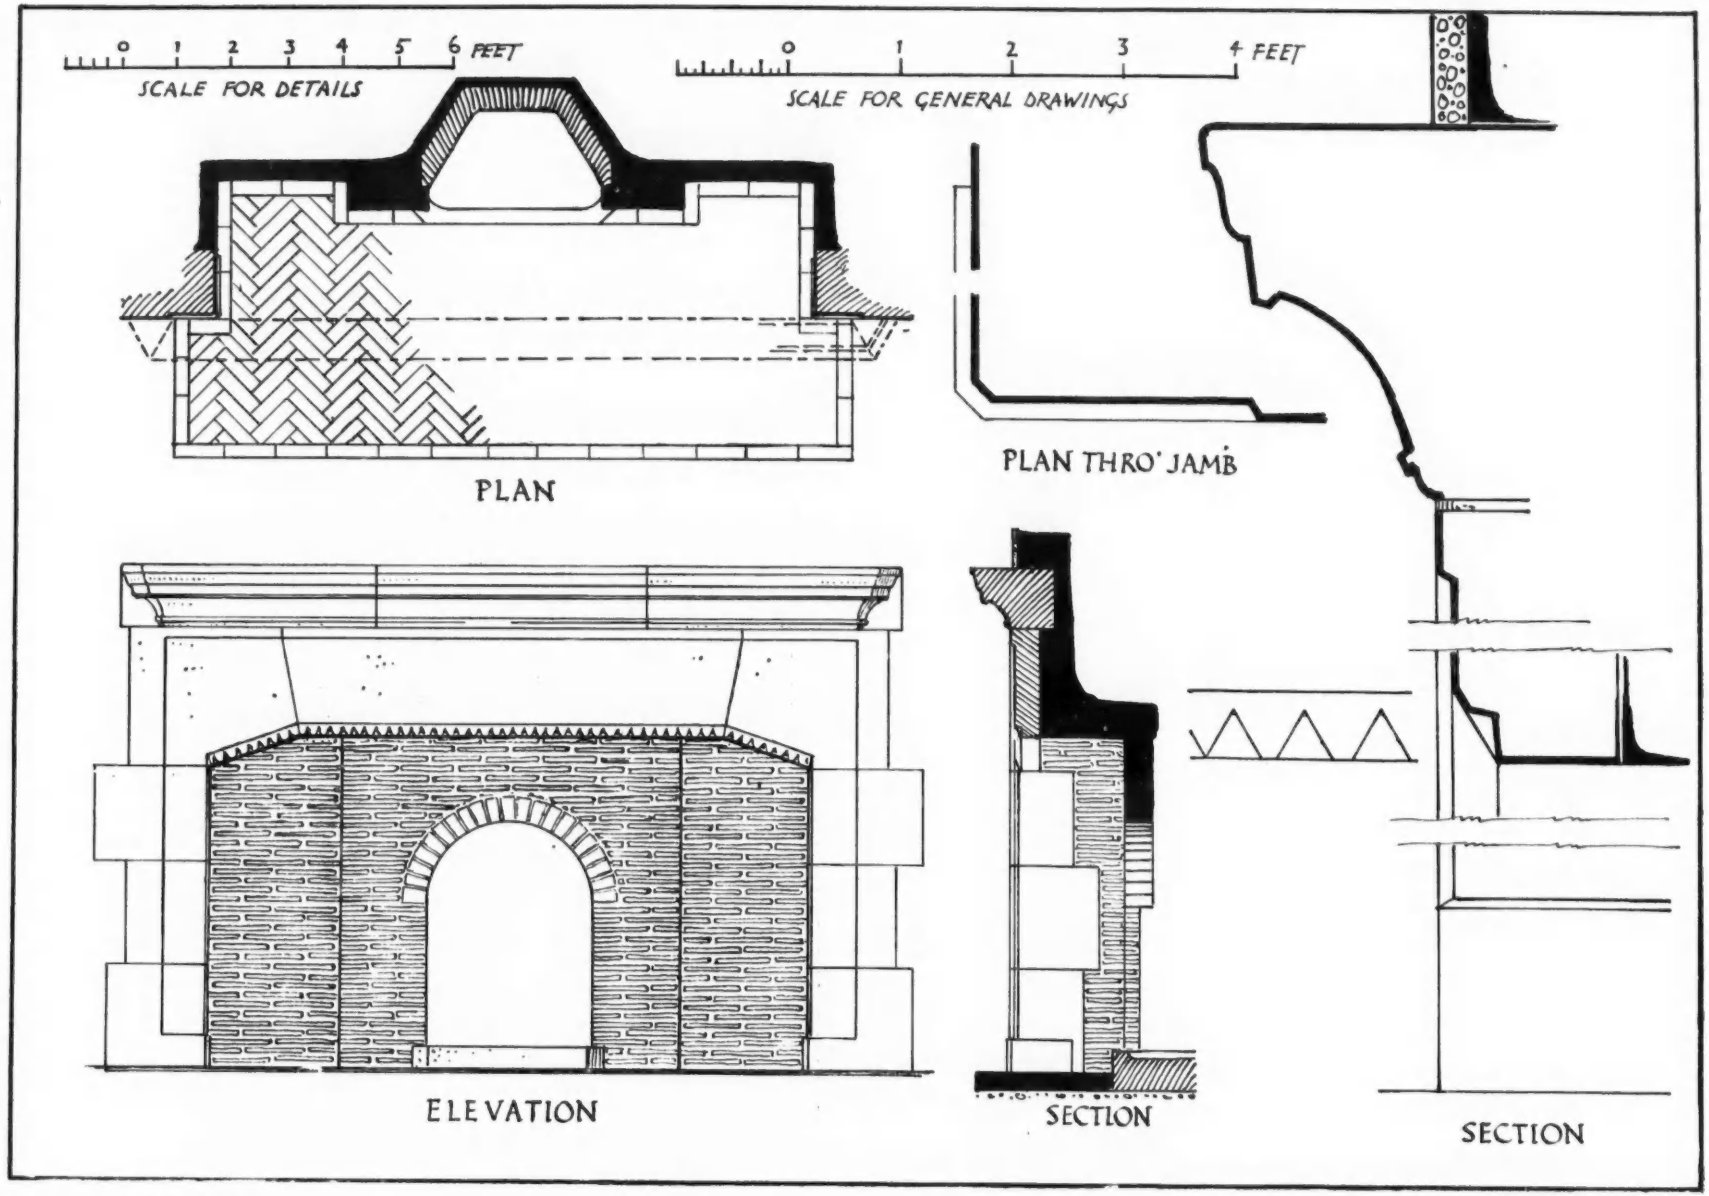
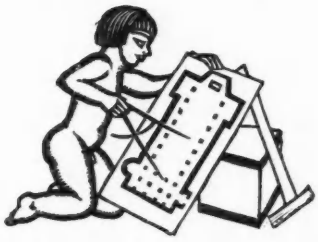
A STONE FIREPLACE, WITH RECESS IN TILES, AND ARCH AND HEARTH IN BRICK: HOUSE AT DITCHLING, SUSSEX



By

ARTHUR J. PENTY

IN order to combine the architectural advantages of a large open fire with the practical ones of the well type, the depth of the recess has been reduced, while the hearth is kept level with the floor.



The Portland stone used for the surround is left with a boasted finish, and its face is set flush with the plaster. In building the recess, of roof tiles, the mortar used was given a desirable dark colour by mixing the lime with a dark sand, the proportion of this being determined experimentally. Moreover, the joints were kept thinner than is customary. Those of the brick arch were kept as thin as possible and, to aid this, the bricks themselves were individually cut.

Large and small scale drawings of this subject are reproduced on the following page.

For photograph, see previous page.

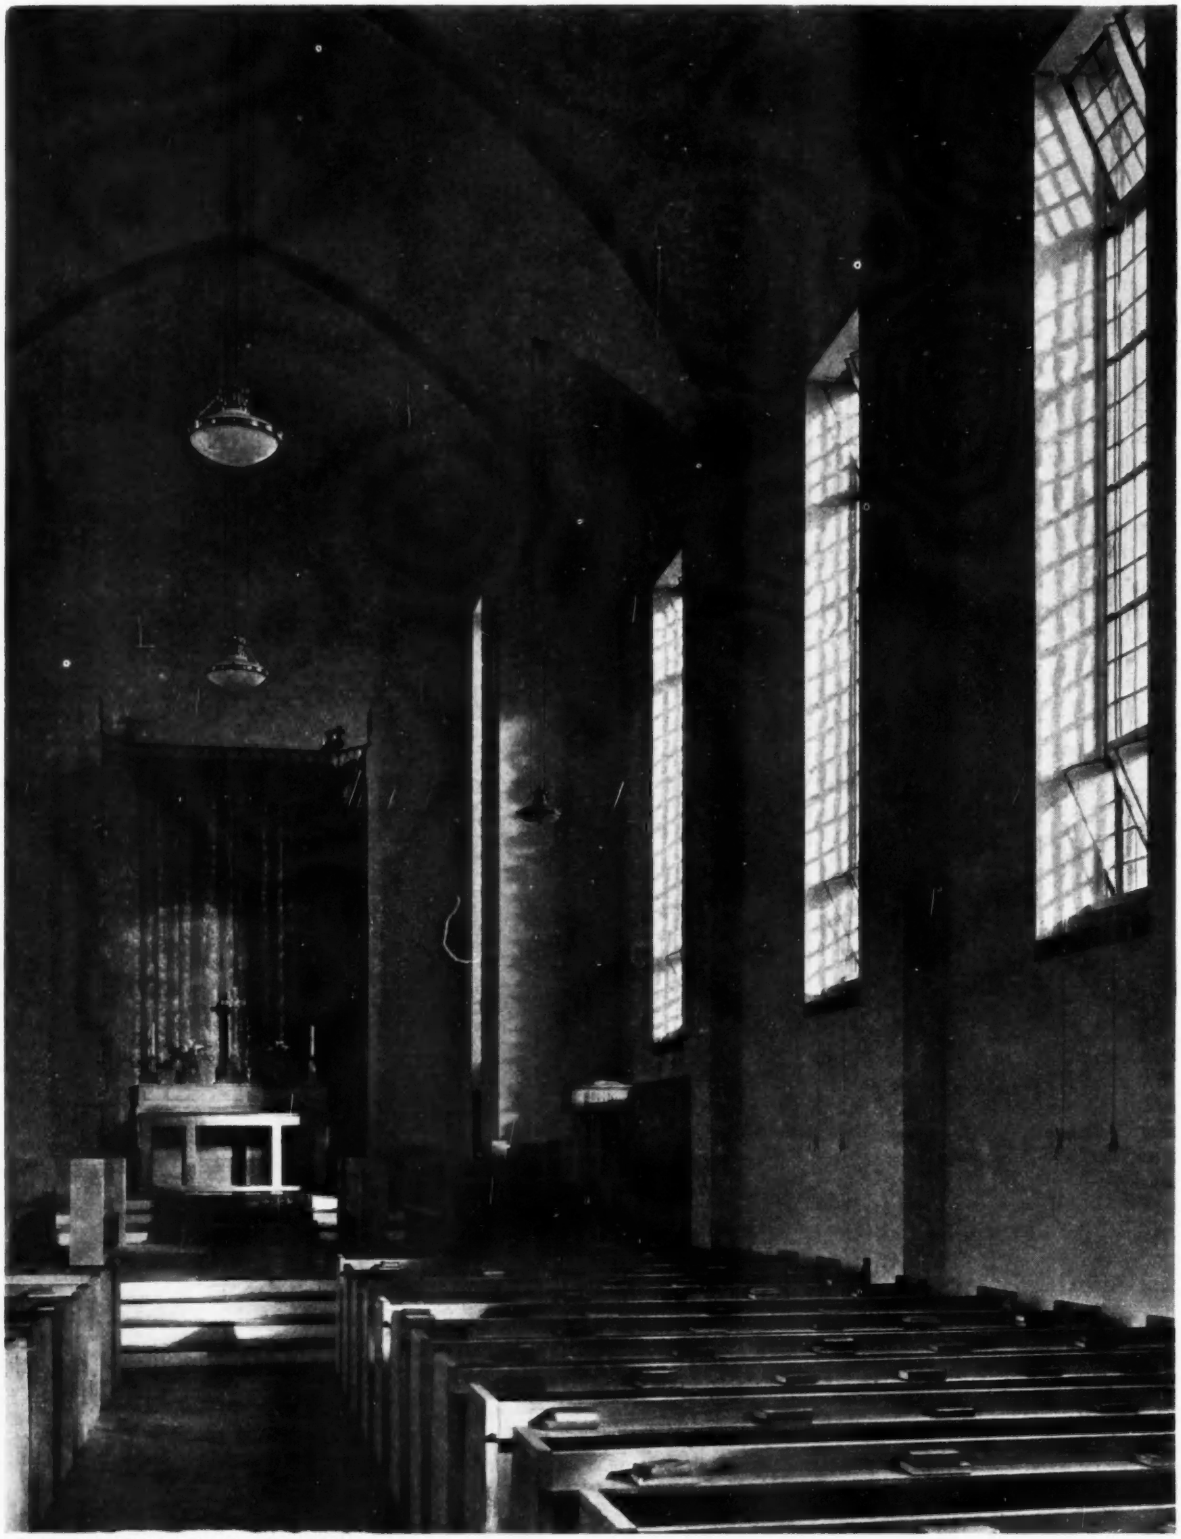
THE ARCHITECTURAL ASSISTANTS' PROBLEM

A Move towards its Solution

"This JOURNAL places its columns at the free disposal of architectural assistants . . . with the hope that it will be the first step in the reorganization of a very poor service to a highly skilled class of men."

IT is typical of this century that we should be prodigal of the classes of well-educated, finely-bred men and women, and fanatically fastidious of the welfare of the masses. This remark is not so much a statement of fact as an enlarged comparison between the means of livelihood of, say, a bricklayer and an architectural assistant. The first has sick benefit and unemployment pay, while the second relies upon his own resources if he should fall ill, and looks for employment in a market nearly entirely unorganized in so far as the best use of his valuable training and talents are concerned.

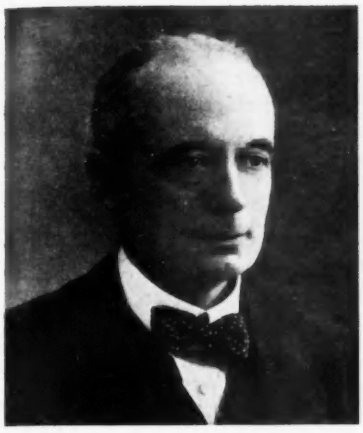


Time was when architectural offices were small half-family affairs, with one or two pupils under the principal, and one or two poorly-paid tracers. Things are very different today. In the first case the pupilage system, for better or worse, is hardly existent, and the schools train most of the young architects and the mass of architectural assistants. The training is good and turns out a great quantity of keen, inquiring minds. But when one considers how the trained men find employment it is seen how suddenly inadequate is the organization for placing them in positions, for finding them new situations, and for advancing the fortunes of those among them who are not content to become moss-bound upon one office's stool.

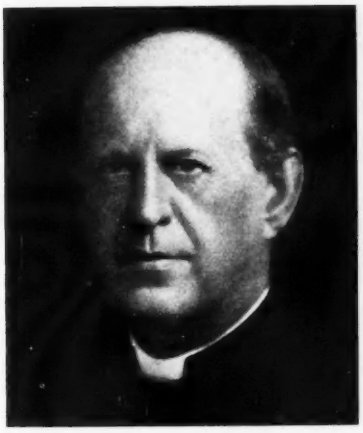
No one can doubt that the whole thing is precarious and uneconomical. Salaries are, of course, low; and low to men whose abilities are worth more, just because it is difficult to change from one position to another in the knowledge that the change is to be for the better. We must recognize the existence of a class of responsible assistants and cater for them as responsible men whose services are worth bidding for, and whose position as subordinates to practising architects shall not deny them salaries commensurate with their talent and abilities. It is all the more necessary that the employment organization should be good when we remember how seasonal and desultory architectural practice is liable to be. There is furious work for six months, perhaps, and then a sudden falling away. The job is done, and *ergo*—the assistants must go, so that overhead expenses may shrink again to normal.

Now, even with foreknowledge of this impending shrinkage, a draughtsman has only two or three inadequate means of finding a new job. He may place himself upon R.I.B.A. or other lists; he may write letters to or call upon busy architects; or he may pay for the insertion of an advertisement in a professional journal or in the public press.

All these methods are either slow or expensive, and impossible to many men, and it is with the object of bettering the situation which we have described that this JOURNAL places its columns at the free disposal of architectural assistants. We expect that the circulation of a list of names, with qualifications and experience clearly set down, will accelerate the healthy movement within the profession, and direct some light upon the inadequate systems at present obtaining. We are, at least, prepared to make the experiment in as generous a manner as possible, with the hope that it will be the first step in the reorganization of a very poor service to a highly skilled class of men.



For details of THE ARCHITECTS' JOURNAL *free service, now available to architectural assistants desiring appointments, and to architects requiring to engage assistants, the reader is referred to advertisement page* xxxviii *of this issue.*



LIT BY THE LAMP OF DAY:
THE NEW CHAPEL AT SUTTON VALENCE SCHOOL

This photographic study of a recent addition to the school buildings, from the designs of Adams, Holden and Pearson, gives value to the impression of loftiness characteristic of this chapel, both within and without. The walls are washed a warm cream colour, and the finish of the oak furniture is left natural. Other illustrations, and drawings, appear on pages 601–6.

NEWS & TOPICS

Sir Henry Cautley, K.C., M.P., Chairman of the Parliamentary Committee, whose findings on the Charing Cross Bridge Bill, announced last week, were against the official scheme on the South side. A new scheme is to be found by May 6.

The Rev. Canon S. A. Alexander, Treasurer of St. Paul's Cathedral Preservation Fund, organizer of the restoration work, now approaching completion. His election as Hon. A.R.I.B.A. has just been announced.

THE VILLAIN OF THE CHARING CROSS PIECE

I VENTURE to think that never has there been a problem that required the sane outlook of architectural opinion more than has the Charing Cross Bridge scheme. When the Chairman of the Select Committee that has been examining the L.C.C. Bill regretted that he was not allowed to call more evidence from independent architects, I feel that he had reached an advanced state of irritation at the ridiculous complications which the L.C.C. advisers had landed themselves into in an endeavour to find something that pleased the Southern Railway and yet looked like a job of work. As we all know, they have been sent back to do it again, and the Chairman, a very wise man, having recognized the Southern Railway to be the villain of the piece, has said so boldly.

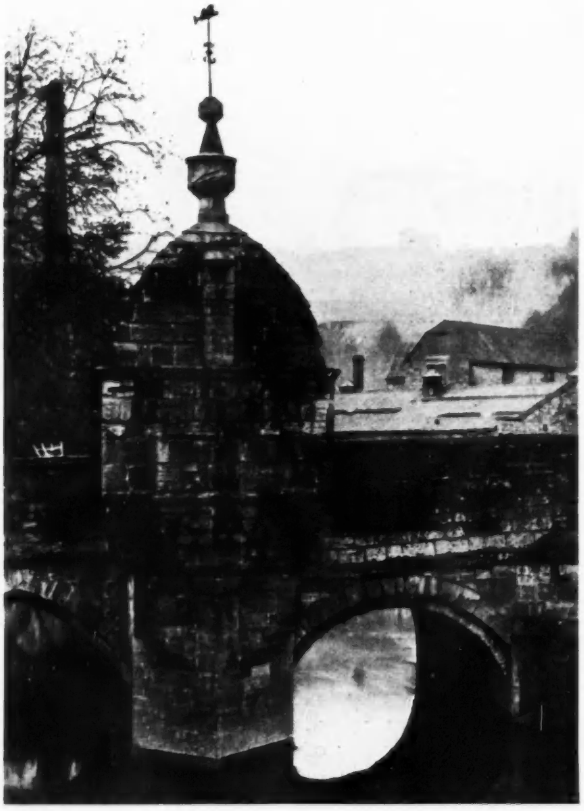
★

This infiltration of common sense will do some good. It has done so much good that the scheme to be will not have tunnels, will not destroy the South bank, and cannot help being less of an abortion than the scheme put forward. I wondered, as I looked at the model, how responsible men dared to advance that scheme as a solution at all. It was as full of blemishes as a sieve of holes, and Sir Edwin Lutyens could not have made architecture of it, however wisely he may have tapped his forehead in committee. He was lucky to have escaped the test.

★

It was made abundantly clear during the final stages of the Committee's proceedings that it was the conditions attaching to a financial grant from the Road Fund that had in fact carried weight with the L.C.C. in standing sponsor to the riverside site for the new station. And this, of course, was the pivot on which swung the whole clumsy contraption of roads and tunnels. A subsidy from a fund that supposedly exists for the amelioration of traffic facilities could, in fact, be invoked only for a road-system calculated to give the very negation of facility. Could anything be more crass?

WHAT WILL CHARING CROSS BRIDGE COST LONDON?



Incidentally, about one important phase of the projected scheme but meagre information was vouchsafed to the public—the cost. We have learnt to talk glibly in millions in considering a project of this magnitude, yet Sir Percy Simmons has been reported as saying that the cost to L.C.C. ratepayers would average nearly a half-penny in the £ over a term of sixty years. It will be interesting to see the calculations on which the final estimate is based.

THE DINNER TO ROBERT ATKINSON

The very large and distinguished gathering of architects at the dinner given at the Criterion on Thursday evening by the Architectural Association, in honour of Robert Atkinson, was testimony indeed, if such was needed, to the universal esteem in which the sometime Principal, and until lately Director of Education of the A.A., is held by one and all in the profession. The President of the Architectural Association, Mr. F. Winton Newman, who was in the chair, read letters of regret for absence from Sir Banister Fletcher and others, and telegrams of appreciation and good wishes from architects in all parts of the world. He then briefly sketched the varied life of Robert Atkinson, paying tribute to him as a man of many parts—architect, artist, scholar, connoisseur, and, not least, great teacher. He spoke of the unstinted service which he had given to architectural education over a period of nearly twenty years—services rendered with undoubted personal sacrifice, and given not only to the Architectural Association, but through that Association and its influence on schools throughout the country to the profession as a whole. The Chairman was supported by E. Stanley Hall, Maurice Webb, Howard Robertson and Sir Archibald Flower, who one and all testified to Robert Atkinson's great work for architectural education in this country and throughout the Empire. There followed a most amusing diversion by some old students of the A.A.

SHOULD SALARIED SURVEYORS DRAW PRIVATE PLANS?

The reply to the question of whether salaried surveyors to local authorities should be allowed to carry on private practice in their working hours seems to me to be so obvious that the subject needs no discussion. The nature of a surveyor's work is such that either he is a surveyor, whose authority over the field of activity limited by his position is absolute, or else he is a jobbing half-and-halfer, picking up work here and there, being easy with someone from whom he wants a job, and severe with someone who employs another; and generally so dividing his interests and his loyalties that his authority is enforced by means other than those due to a straightforward performance of definite duties.

A jail on a bridge: this quaint excrescence at Bradford-on-Avon was originally a chapel.

In other words, what work he gets is usually due to influence which arises out of his position as surveyor, and not out of his capabilities as a designer. It is surprising to read in a report of a discussion which took place over this question in a particular rural council, of which some account is to be given elsewhere in this issue, that the duality of practice was regarded as so usual that it was actually defended by the members of the council employing the surveyor.

ARCHITECTURE AND SCULPTURE DISCUSSED

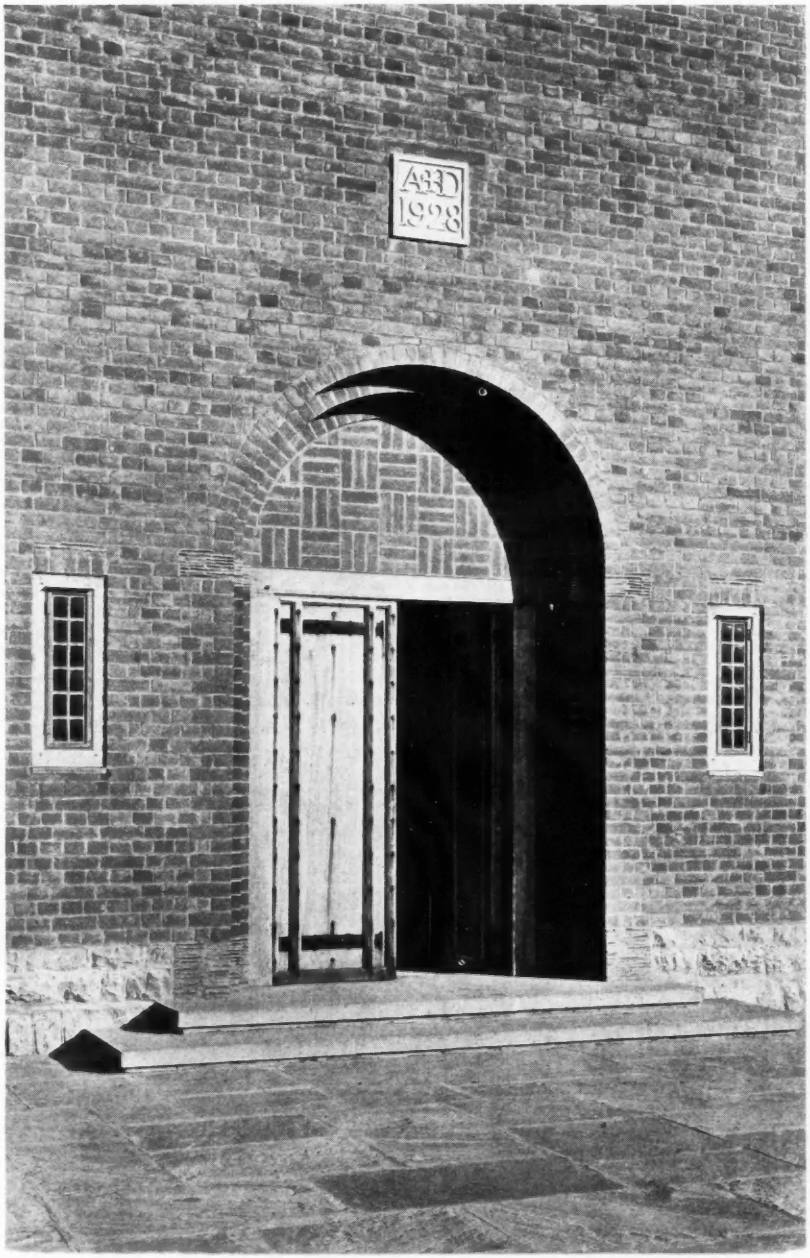
The range of discussion was unusually wide when on Wednesday evening the Architecture Club debated the relation of sculpture to architecture for over two hours. Broadly speaking, it is the sculptor who finds the relationship sometimes strained, whilst the architect happily experiences no similar effect, since he finds it impossible to dissociate architecture from sculpture. If he conceives a building of monumental value he himself becomes a sculptor. As Darcy Braddell said, the New York skyscraper is itself a piece of sculpture, and there is no point in adding to it. As might have been expected, No. 55 Broadway was the focal point of the discussion, and lantern slides of its various sculptures were shown at the commencement of the debate. In the absence of both Mr. Pearson and Mr. Holden (owing to the recent death of their senior partner, Mr. Adams), Mr. Frank Pick found himself sole counsel for the defence, and in his most disarming manner proceeded to justify both his company and the architects, explaining the particular function of the figures, and their essential fitness, to his mind, as an outlet for the creative fancy lying concealed in this otherwise robot building. Charles Marriott summed up by likening architecture to a choral symphony, with its abstract themes which suddenly at some point or other became articulate. He considered the true function of sculpture was to make architecture more articulate.

BRADFORD-ON-AVON'S BRIDGE JAIL

A strongly-built piece of masonry has as many lives as a cat. The little jail at Bradford-on-Avon—the only jail built upon a bridge—was originally a chapel. Since then it has been a lock-up, then a toll-house, and finally, before it became a relic, it was an ammunition store—and might yet become a petrol-filling station if things were different. It is an uncouth piece of work, with its oven-like dome surmounted by a fish weather-vane of copper gilt. It used to be said of a man who spent the night in one of the two cells, that he was "under the fish and over the water"—a delicate circumlocution. ASTRAGAL

THE LATE H. PERCY ADAMS: AN APPRECIATION

H. Percy Adams was born near Ipswich sixty-four years ago. The son of a doctor, he was familiar with medical life from the beginning; this knowledge was invaluable, and accounts for his sympathetic understanding of the practical side of his work. He was articled to Binyon, an Ipswich architect, himself a pupil of Alfred Waterhouse.



Always a hard worker, as a student he made complete measured drawings of a Suffolk church, was a prizeman at the R.A., won the Godwin Bursary, and made an exhaustive study of a large German hospital. After coming to London he entered into partnership with Stephen Salter, an architect with an old-fashioned practice. Mr. Adams very soon showed his ability by winning a competition for the Bedford Hospital, which showed his lucidity in planning and skill in the layout of the various buildings.

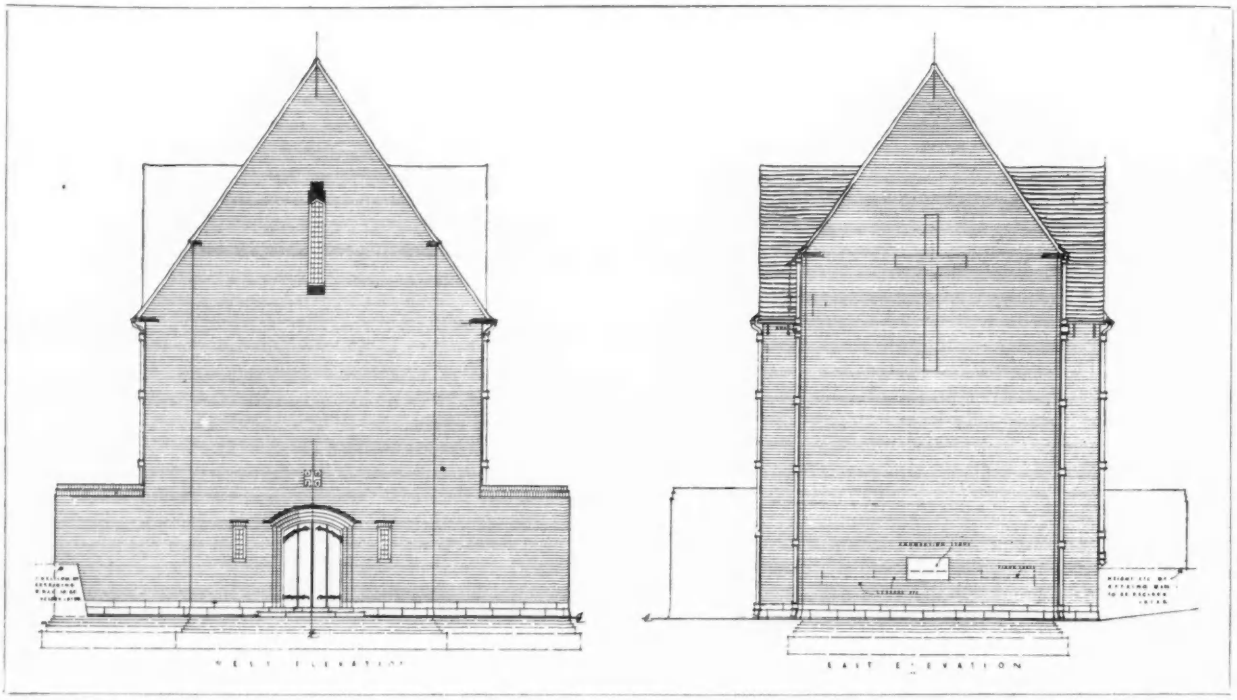
The Newcastle Royal Infirmary showed the same fine qualities on a larger scale. The Belgrave Hospital for Children, the Bristol Royal Infirmary, the Seamen's Hospital at Constantinople, the King Edward VII Sanatorium at Midhurst, were among the most important of his works before the war. In the case of the last, he made a tour of German sanatoria before doing the drawings.

After the war he continued his hospital practice. Among the most successful of the smaller hospitals was the Deal and Walmer War Memorial Hospital, which shows how an architectural arrangement of the wards can be combined with first-rate practical efficiency and economy, a point he always studied. At Southend he invented a type of ward which is likely to mark a step forward in planning.

In addition to hospital work, he also carried out the new buildings of the Law Society, the Institution of Electrical Engineers, the British Medical Association and many other buildings, but it is principally as a designer of hospitals that he will be remembered. His paper on English Hospital Planning, read before the Institute on May 27 last year, is likely to remain the standard work on the subject for a long time to come.

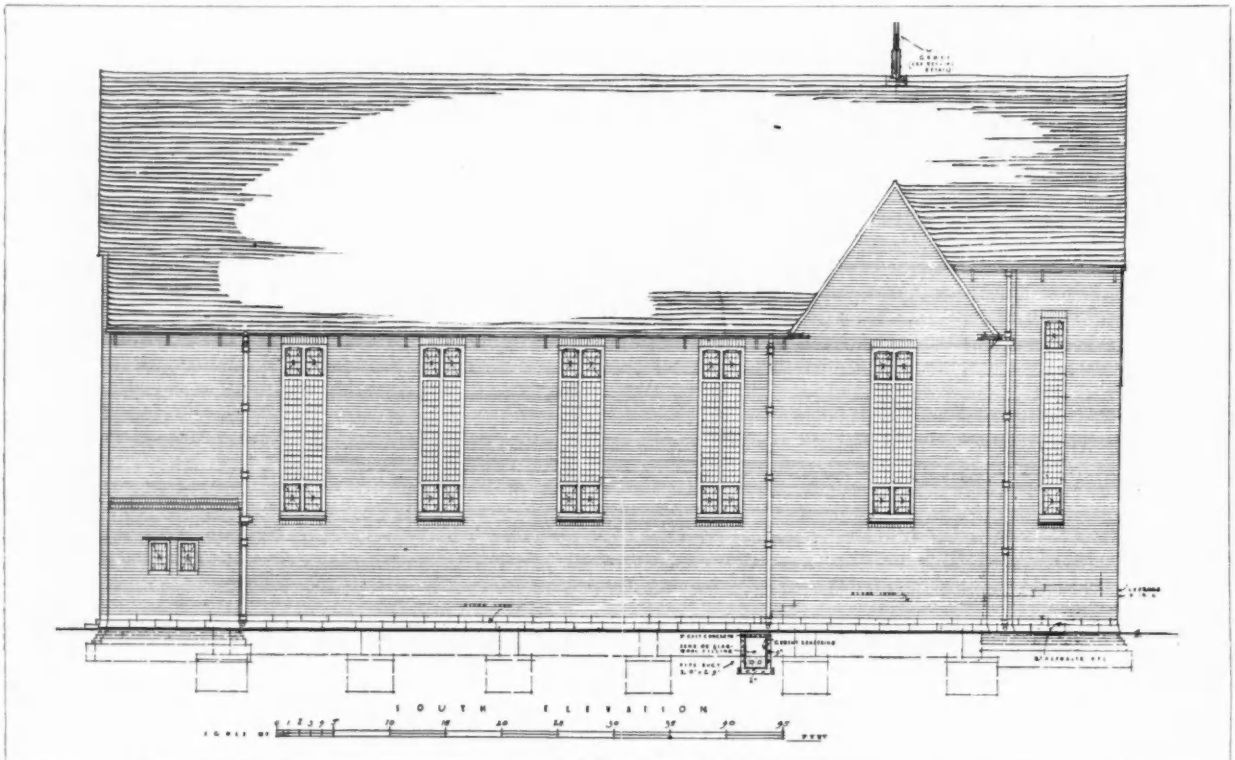
As a personality it is difficult to describe the secret of the hold he had over his staff and all connected with his work. His own enthusiasm and love of hard work was infectious, but quite apart from this, he was the most human of men and had a gift for inspiring affection in all and sundry. L. P.

The plain simplicity of the design of the arched western doorway allows the textures of the various materials to tell to the utmost. The creamy sharpness of the worked stone of the date tablet ; the velvet of the bricks, cut by the keen edges of the tile-courses at the springing of the arch, over the windows, and at the base ; the ruggedness of the coursed stone plinth—all form the ideal setting for the damask of the oak doors.



NEW CHAPEL AT SUTTON VALENCE SCHOOL, KENT

DESIGNED BY ADAMS, HOLDEN AND PEARSON

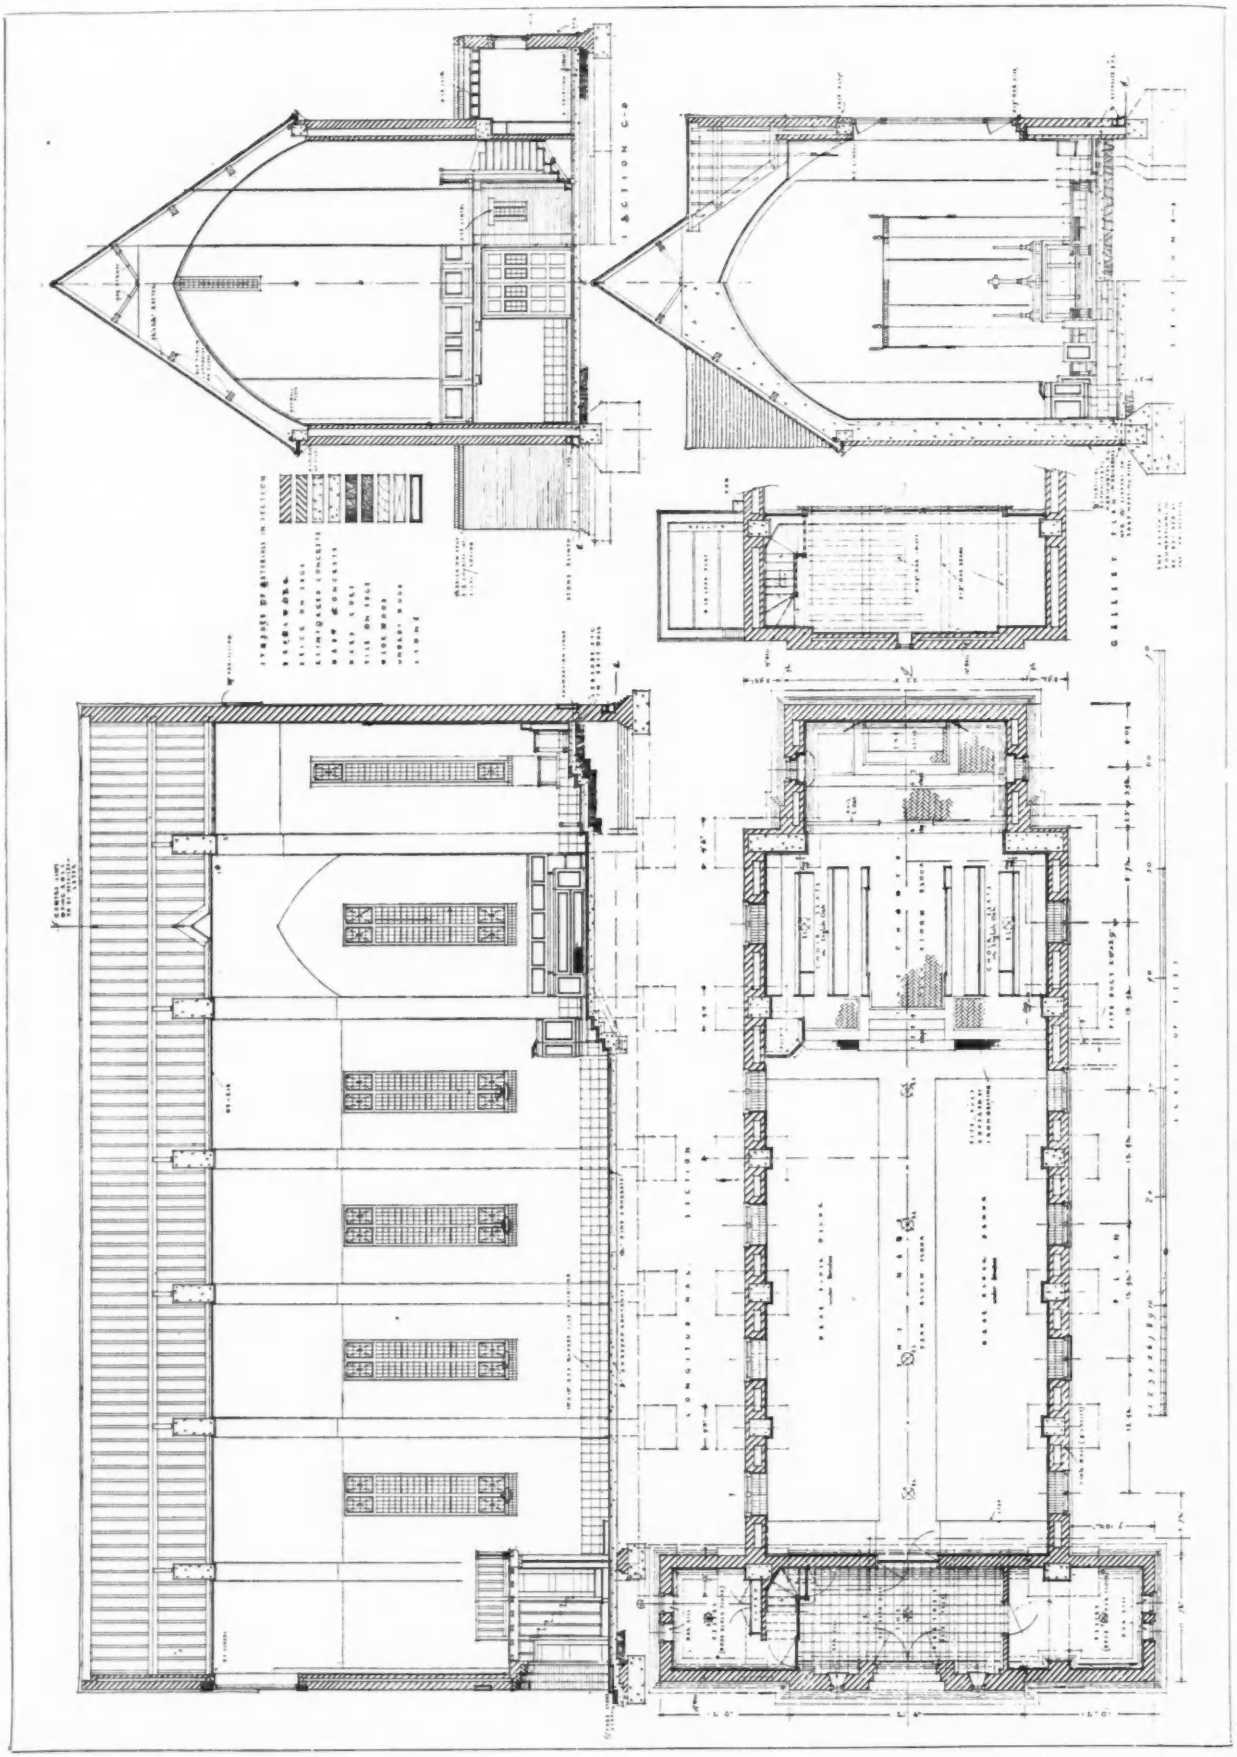


THE main buildings of the school, comprising school hall, class-rooms, two boarding-houses and masters' houses, were erected in 1910 on a beautiful site on the south edge of the plateau, forming almost a cliff above the village of Sutton Valence, and commanding a fine view over the Weald of Kent.

The approach to the school was originally along the south front of the school group, but it was found subsequently that the back entrance was more conveniently placed for general use. When, therefore, it was proposed to add a chapel, tuck shop and day boys' changing room, the first of which is the subject of the accompanying

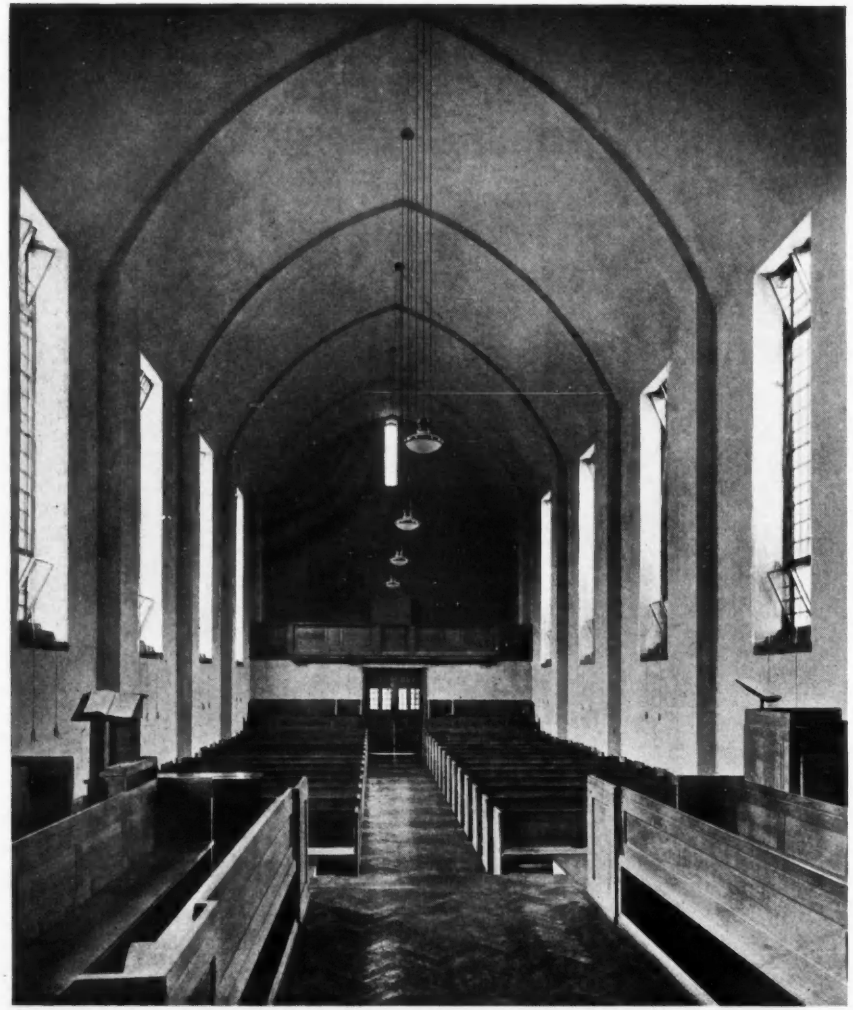
(*Concluded on page* 606)

The architects' drawings of the west and east elevations. The only doorway occurs on the west, and on this front there are also two short transverse wings containing the vestry accommodation and stairs to gallery. The cross on the eastern end is formed in brickwork; below, near the base, is the foundation stone.

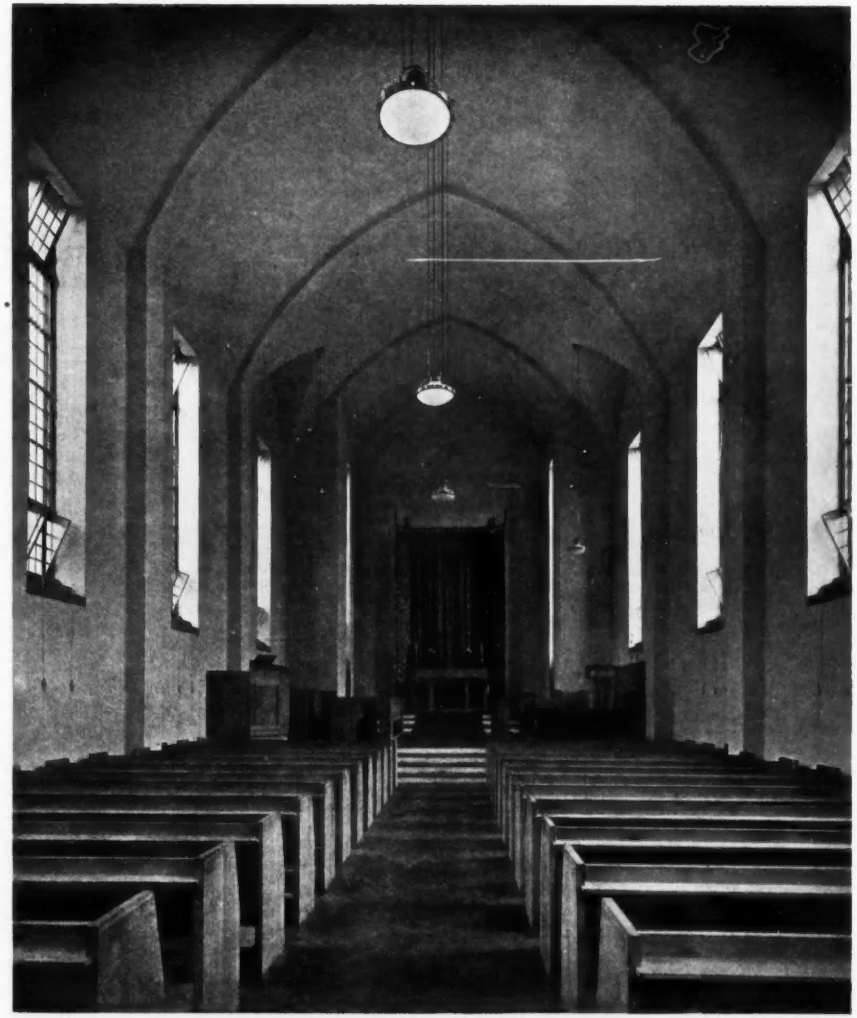


New Chapel, Sutton Valence School, Kent. [*By Adams, Holden and Pearson.*

The drawing of the south elevation shows the punctuation obtained by the deep vertical fenestration. The larger window openings have brick-on-edge heads and cills; the frames themselves are in oak, fitted with slab glass and metal casements. The external cross, severely plain, is in wrought iron.



New Chapel, Sutton Valence School, Kent.] [*By Adams, Holden and Pearson.*



A general exterior view of the west end and north side, giving a hint, on the right, of how the new addition groups with the older school buildings ; their relative positions are indicated on the block plan, reproduced on page 606. Practically the entire building is carried out in red bricks and tiles, and is set upon a plinth built of the stone that had to be extensively excavated to afford a level site.

The architects' drawings of the ground floor and gallery plans, longitudinal section, looking north, and cross sections, looking in either direction. The constructional materials are clearly indicated by the key, from which it will be seen that the main supporting members are of reinforced concrete.

The architects' drawings of the ground floor and gallery plans, longitudinal section, looking north, and cross sections, looking in either direction. The constructional materials are clearly indicated by the key, from which it will be seen that the main supporting members are of reinforced concrete.

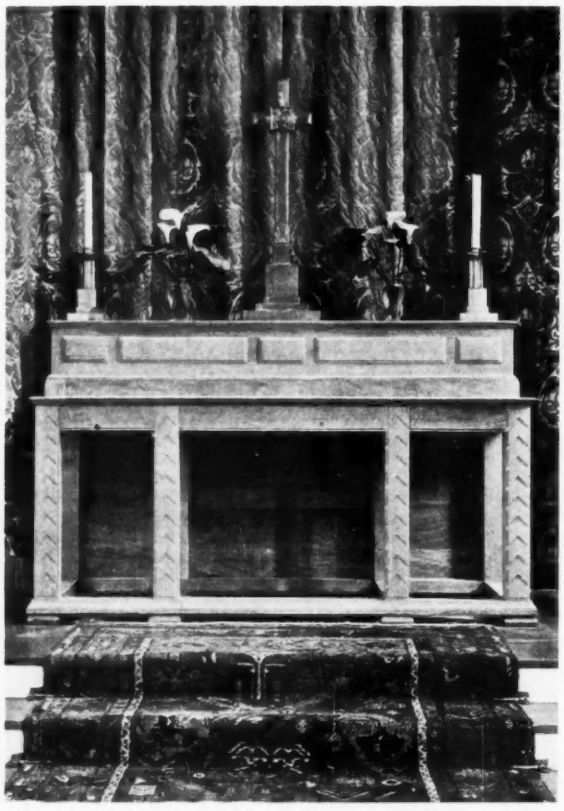
New Chapel, Sutton Valence School, Kent.] [*By Adams, Holden and Pearson.*

Two views of the interior, looking towards the west and east, respectively. All the furniture is in English oak, including the panelling of the small western gallery. The flooring is of deal blocks under the benches, and teak in the central aisle, chancel and sanctuary. A closer photograph of the altar is reproduced on the following page.

illustrations, advantage was taken of this opportunity to improve the entrance and to group the new buildings around a large forecourt. In forming the forecourt a large amount of rock was excavated, which was utilized in building retaining walls and steps, and in forming the plinth course to the chapel.

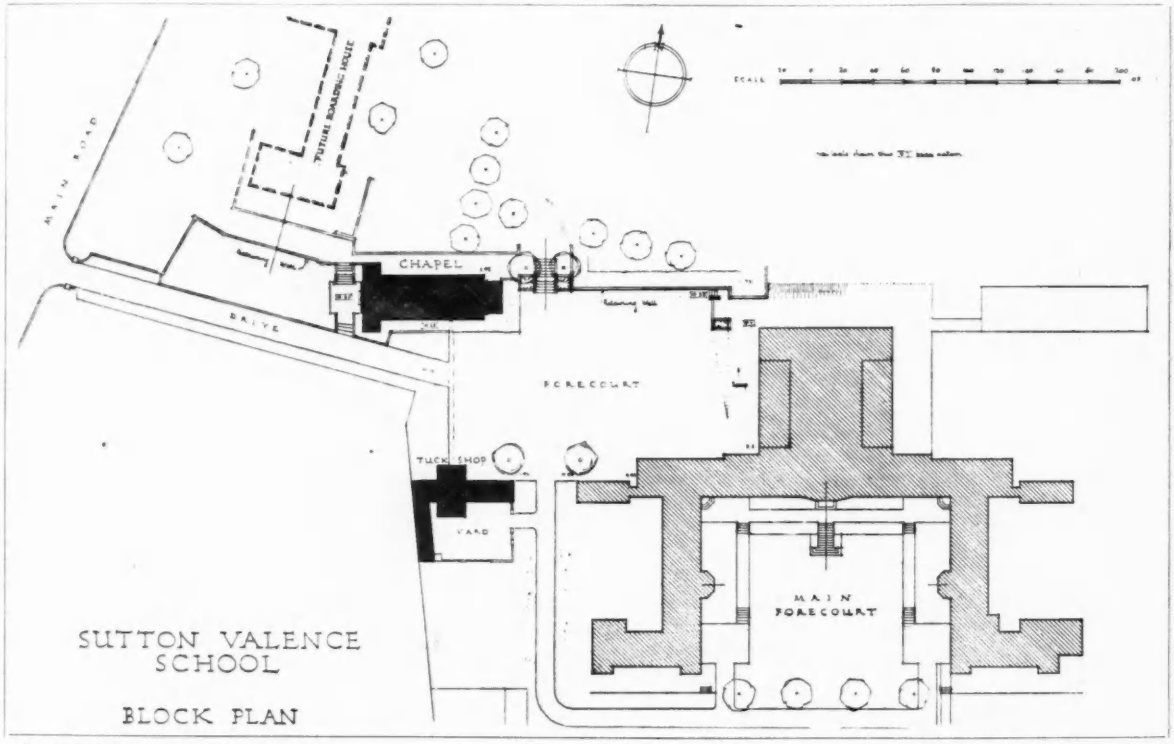
As will be clear from the block plan reproduced on this page, the tuck shop was designed to balance an existing lavatory block, the two buildings framing a striking vista of the Weald beyond, to the southward.

The chapel, which will accommodate upwards of 250 boys, is designed in harmony with the school buildings and, like the schools, is severely plain, in red brick, relieved by the use of English oak for the window and door frames, and slab glass for the windows.



Internally, the fittings are of English oak, the floor of the central aisle and chancel being of teak blocks.

Owing to the great height, and the very exposed position of the chapel, it was necessary to take special precautions to ensure stability. It was therefore decided to construct the main frame of the building in reinforced concrete, the stancheons and arched trusses being carried on broad, splayed feet, tied together at the ground and plate levels by reinforced concrete beams. The beams at the ground level were used to carry the walls of the brick superstructure.



Internally, the walls are plastered, finished with the wood float, and distempered a warm cream colour. The oak fittings are left the natural colour of the wood.

Most of the internal fittings, benches, etc., were carried out by the general contractors, but the altar was the work of Mr. Richards, manual instructor, and the boys of the school.

For the wood carving and the stone carving, Mr. Joseph Armitage, and Mr. H. J. Cribb, respectively, were responsible. The building is electrically lit and centrally heated.

The altar table, in English oak, was made by boys of the school under the supervision of their manual instructor.

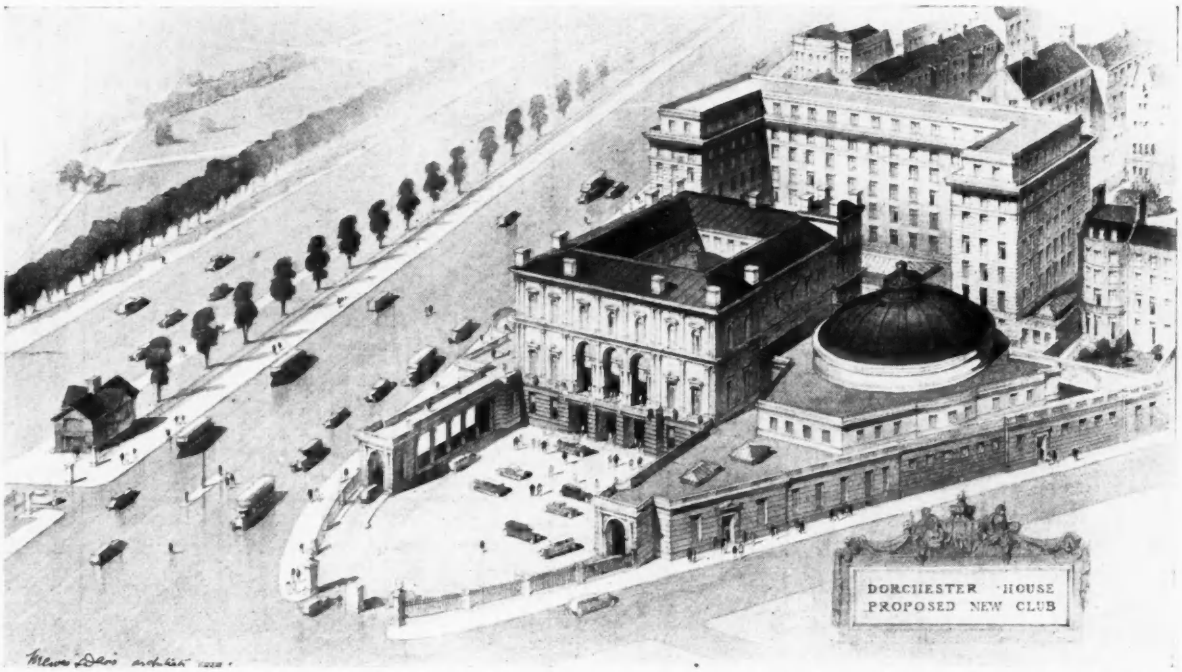
New Chapel, Sutton Valence School, Kent.] [*By Adams, Holden and Pearson.*

This site plan illustrates the change that has been made in the approach to the school buildings. Originally this was from the south, to the main forecourt, but that here indicated, by means of a drive, leading in on the west, from the main road, was always found more convenient, and the new buildings have been sited accordingly. The buildings stand on the south edge of a plateau with extensive views over the Weald of Kent.

The architects' perspective sketch showing the effect of the proposed treatment, visualized from Park Lane. The old Dorchester House is seen in the centre, with a new winged block behind. Park Street, on the left, was to be continued into Park Lane and, facing the angle at which they met, a new members' dining-room, with bowed front and members' terrace above, was to be erected.

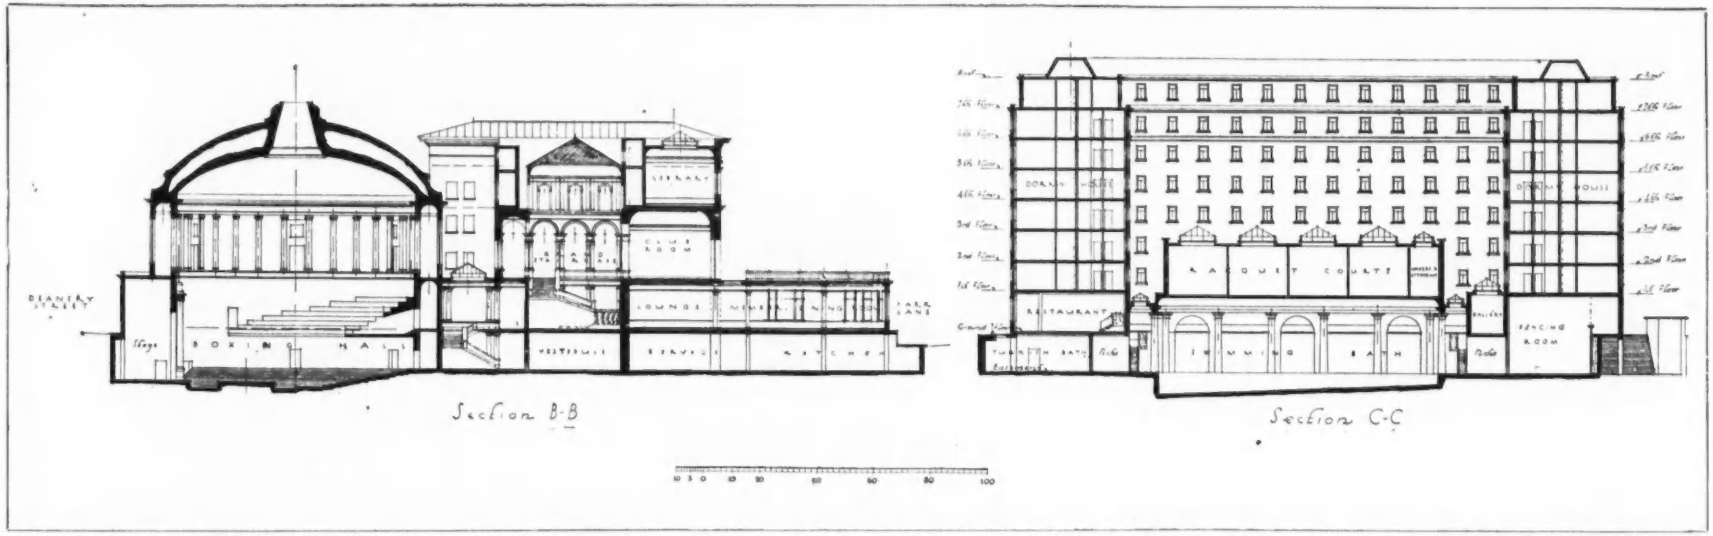
A DORCHESTER HOUSE CONVERSION SCHEME

To Accommodate a Club with Large Sporting Membership



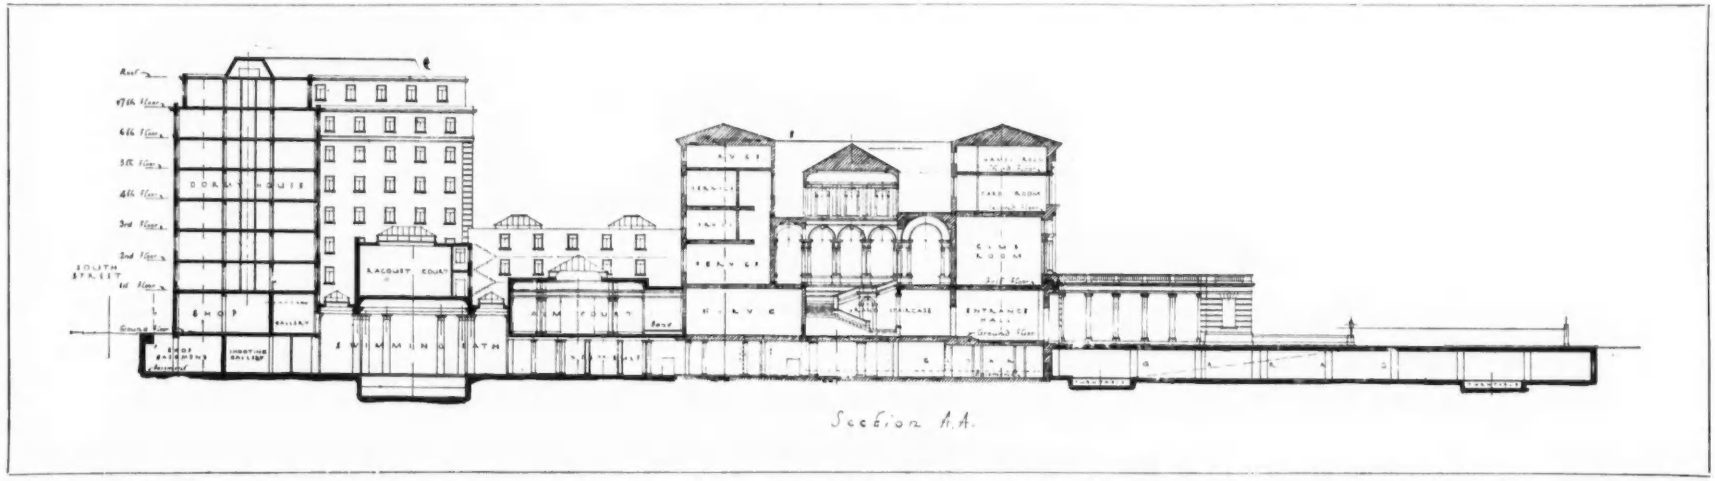
DESIGNED BY MEWÈS AND DAVIS

AT the time when the fate of Dorchester House hung in the balance this very interesting scheme was evolved for its transformation into luxurious club quarters for a large sporting membership.

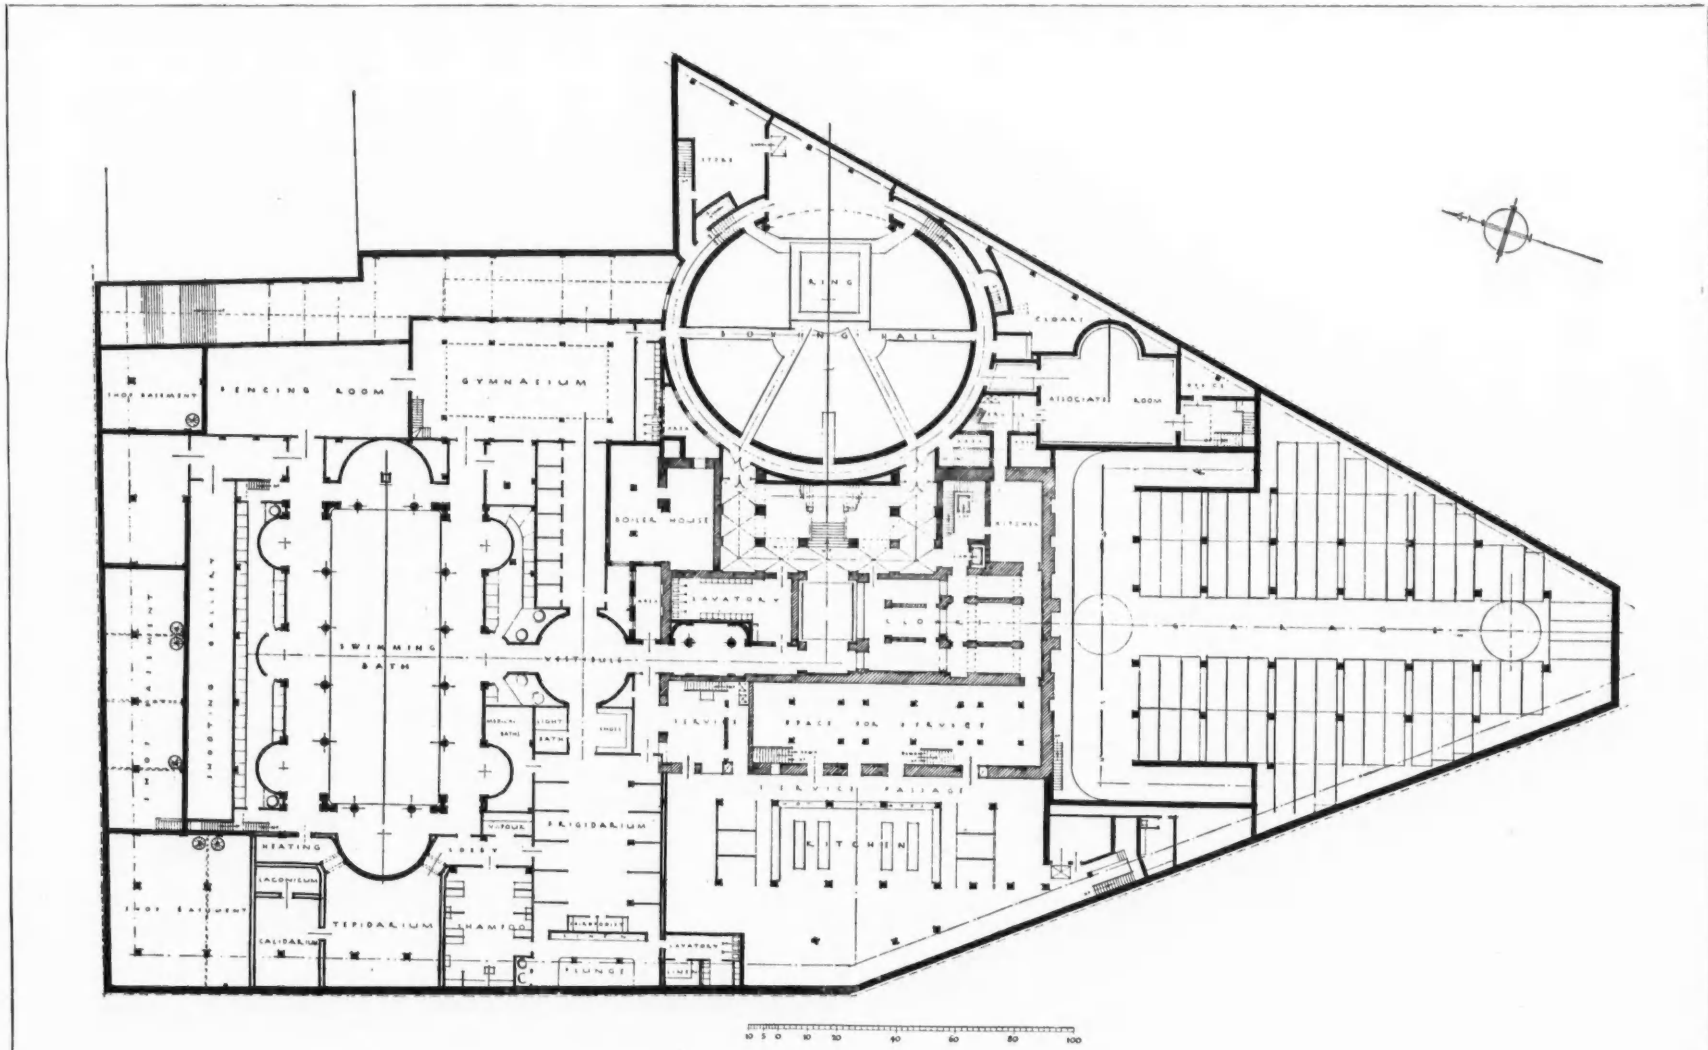


It was proposed to retain Dorchester House, adding wings to the centre block and erecting at the rear a large building to contain bedrooms, and with shops underneath on the South Street front; also to continue Park Street, which now terminates in a dead end, into Park Lane.

A garage to contain seventy-five cars was to be introduced under the forecourt and, above the old stables, a large oval hall.

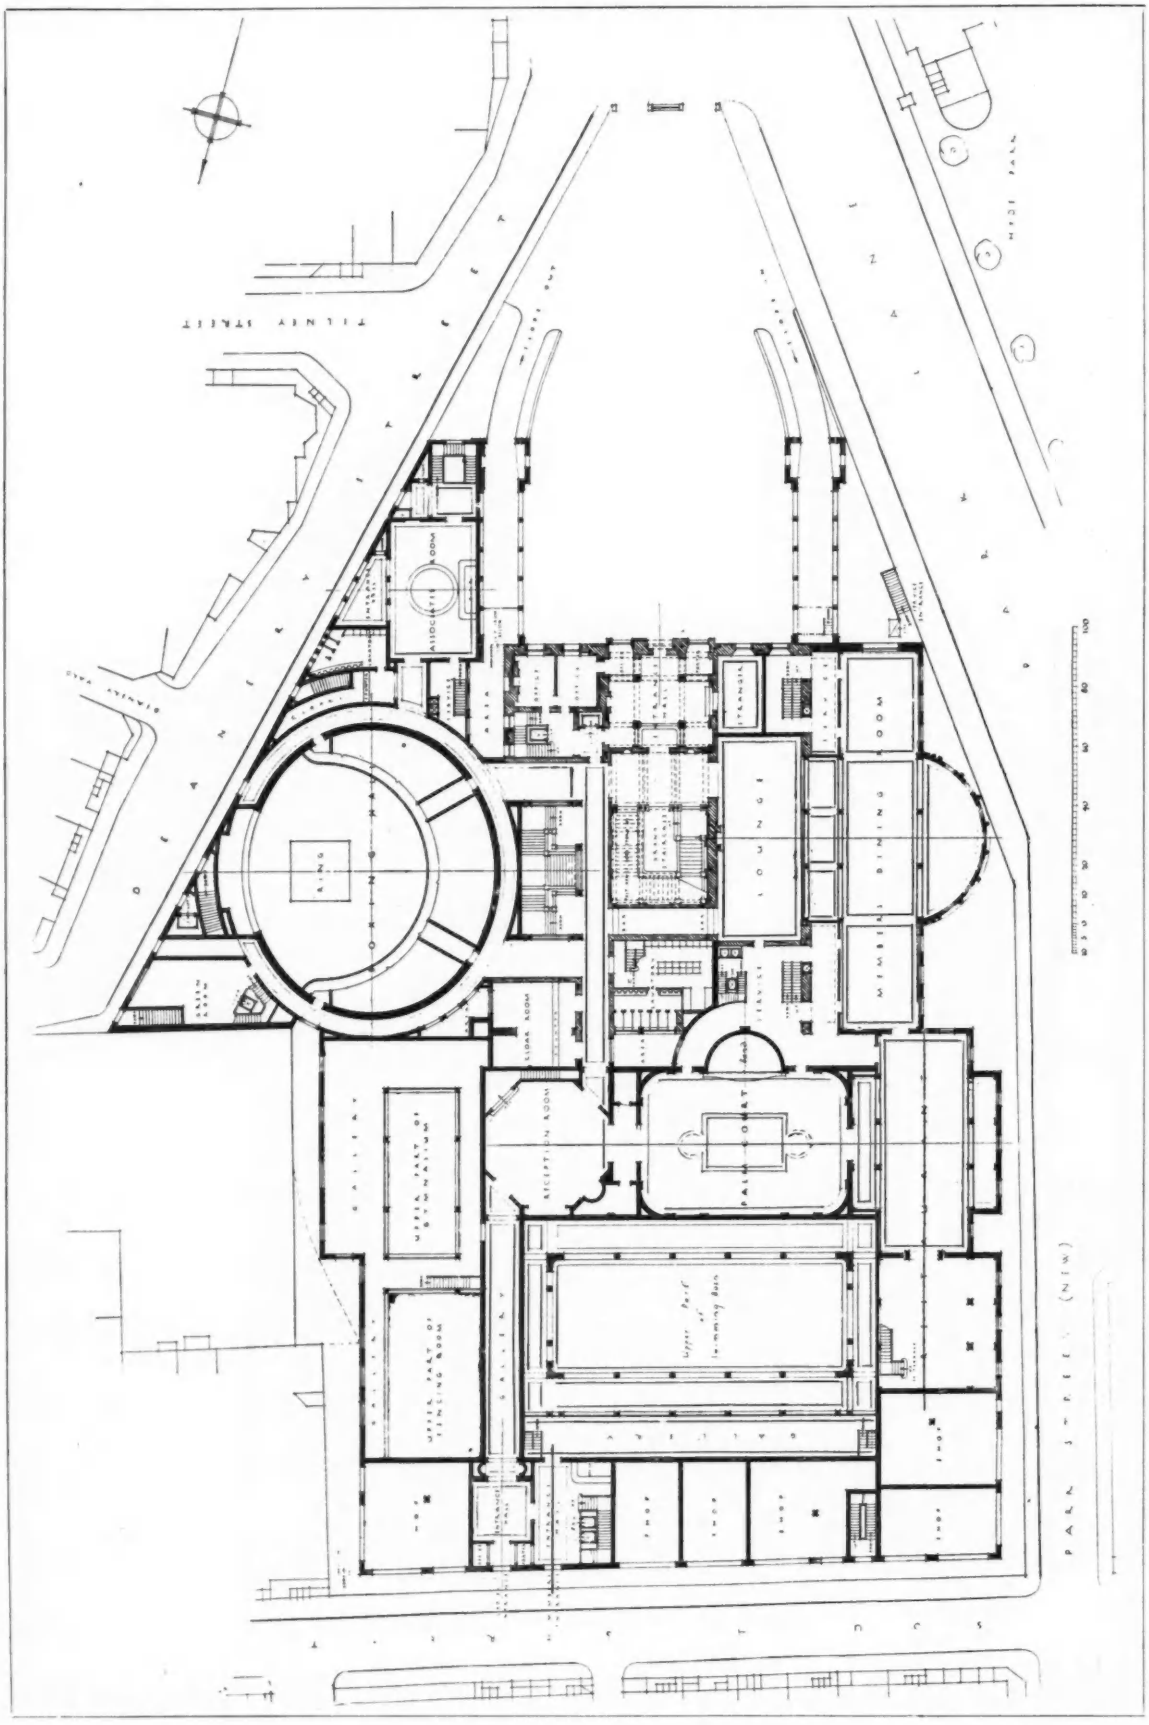


On the Hyde Park side a new kitchen and service quarters were designed, with dining-rooms and terraces above.

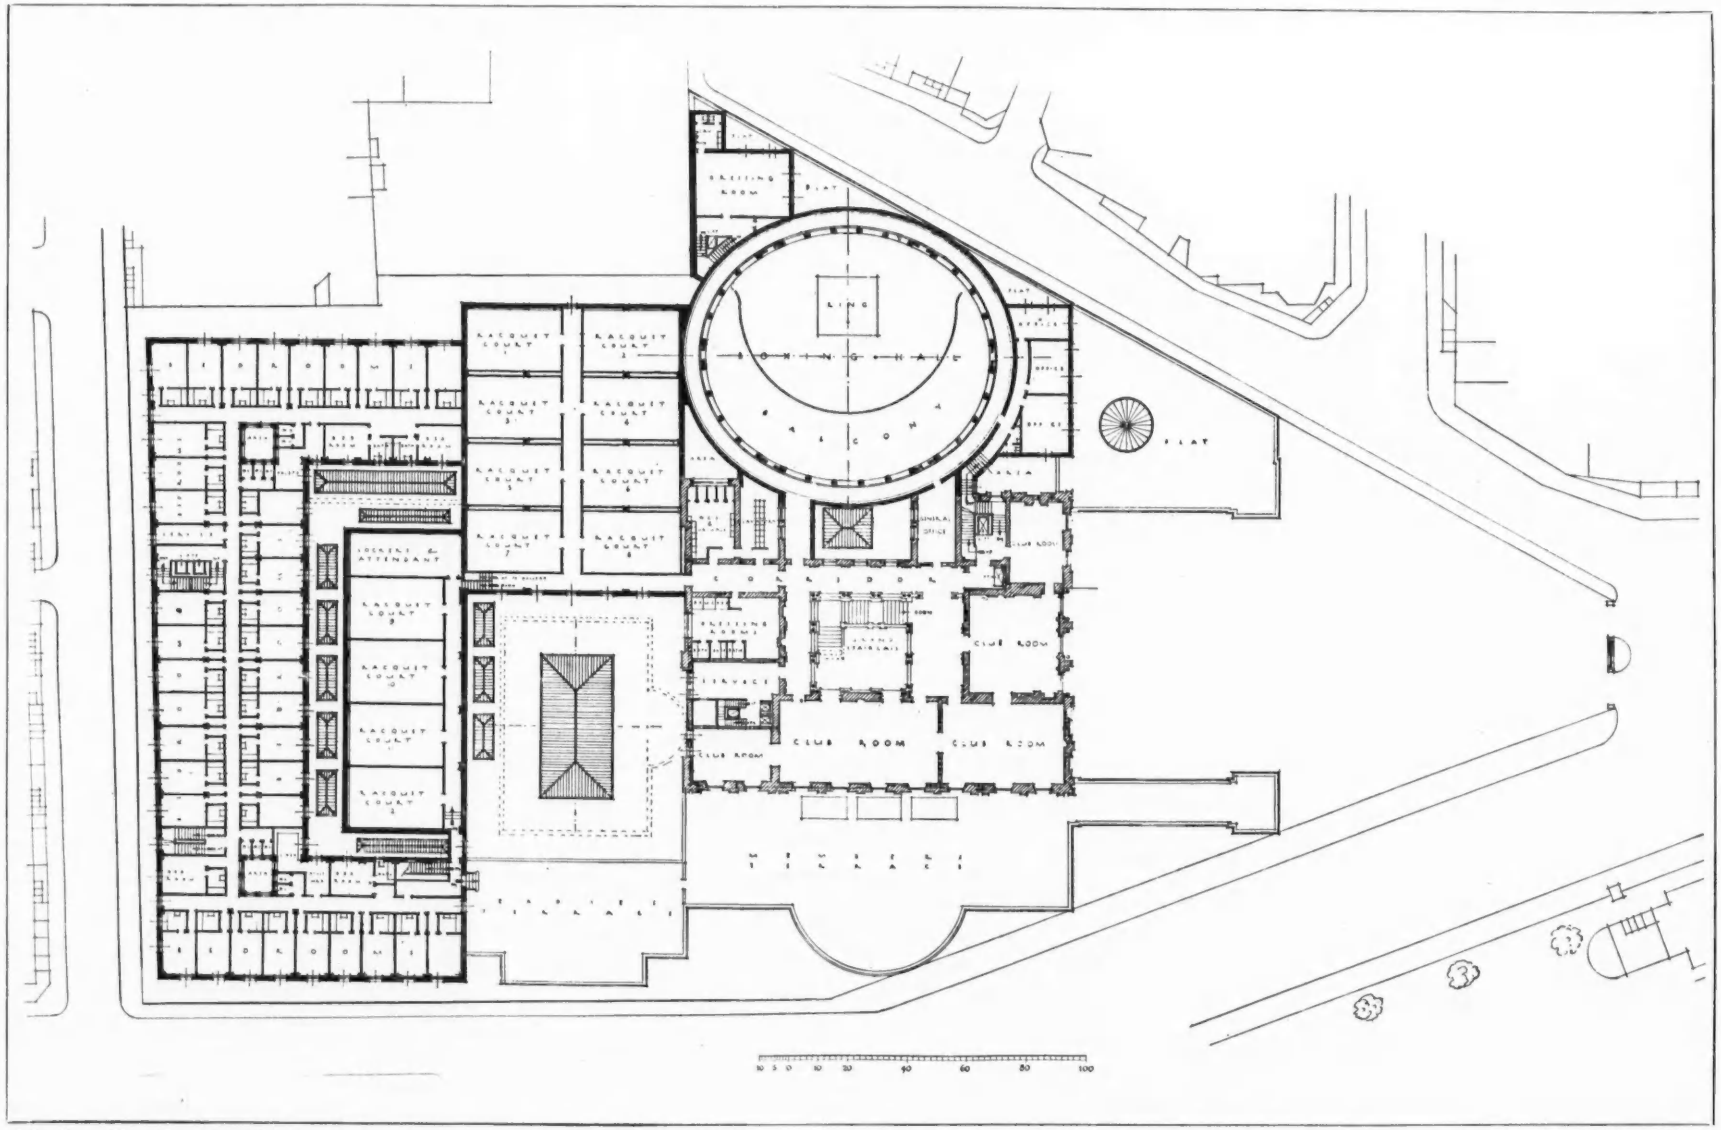


A general view of the proposals as seen from aloft. Park Lane and the Park lie on the left, and Deanery Street cuts across the foreground. The oval cupola is above the suggested boxing hall, and a garage was to be formed underground, beneath the forecourt, with entrance and exit slopes to left and right, respectively. Bedrooms were to be provided in the new building at the back.

Of these two cross-sections, that marked B-B is taken on the centre-line (short axis) of the boxing hall, looking in a southerly direction. The central portion shows Dorchester House proper, with its grand staircase, retained, but partly reconstructed, as necessary. Section C-C is on a line parallel to that of B-B, through the proposed bedroom block, but looking in a northerly direction, and shows swimming and Turkish baths and a fencing-room below ground level, and racquets courts on the first floor.



The longitudinal section on the north (left) and south centre-line of the scheme. Again, Dorchester House occupies the central position. A certain number of shops were contemplated for the ground floor and basement of the South Street front, the remainder of this new building to be given over to the Dormy House quarters. The positions of racquets courts and swimming bath are clearly shown. A top-lit palm court, with band alcove, occupies an intermediate position between new and old buildings. Ramps leading to the southerly underground garage, with turntables, are indicated.



A Dorchester House Conversion Scheme.] [*By Mewès and Davis.*

This plan of the basement, in common with the other drawings, indicates the Dorchester House structure hatched, while the walls, etc., of the contemplated additions are in black. Alongside the spacious swimming bath, in the new northern block, is shown a shooting gallery, over 110 ft. long and, flanking it, suites of rooms for Turkish and medical baths. On the easterly side is a salient feature—the boxing hall; placed in opposition, on the west, are the ample kitchens and service quarters.

The ground-floor plan shows very clearly the road improvement that was part and parcel of the scheme: the extension of the Park Street cul-de-sac into Park Lane. The attractive proportions of the palm court, with its band recess, semi-circular on plan, can be appreciated. At this level it can be seen that tiers of seats and a stage are visualized as part of the equipment of the oval boxing hall, which extends also through the next floor above. To this hall and the associates' department there would have been separate entrances from Deanery Street.

A Dorchester House Conversion Scheme.] [*By Mewès and Davis.*

As this plan at first-floor level shows, some of the new work was intended to be only one story high. Upon the flat roofs of the members' dining-room and the restaurant, for example, are promenade terraces. No fewer than twelve racquets courts figure in the area of the new northerly wing and the annexe adjoining. Every bedroom shown on this floor has its own bathroom. The large lantern light is over the palm court, and the series of small ones illuminate the swimming bath. At this level, a balcony occurs in the boxing hall.

IBSLEY ELMS, HAMPSHIRE

[FROM A CORRESPONDENT]

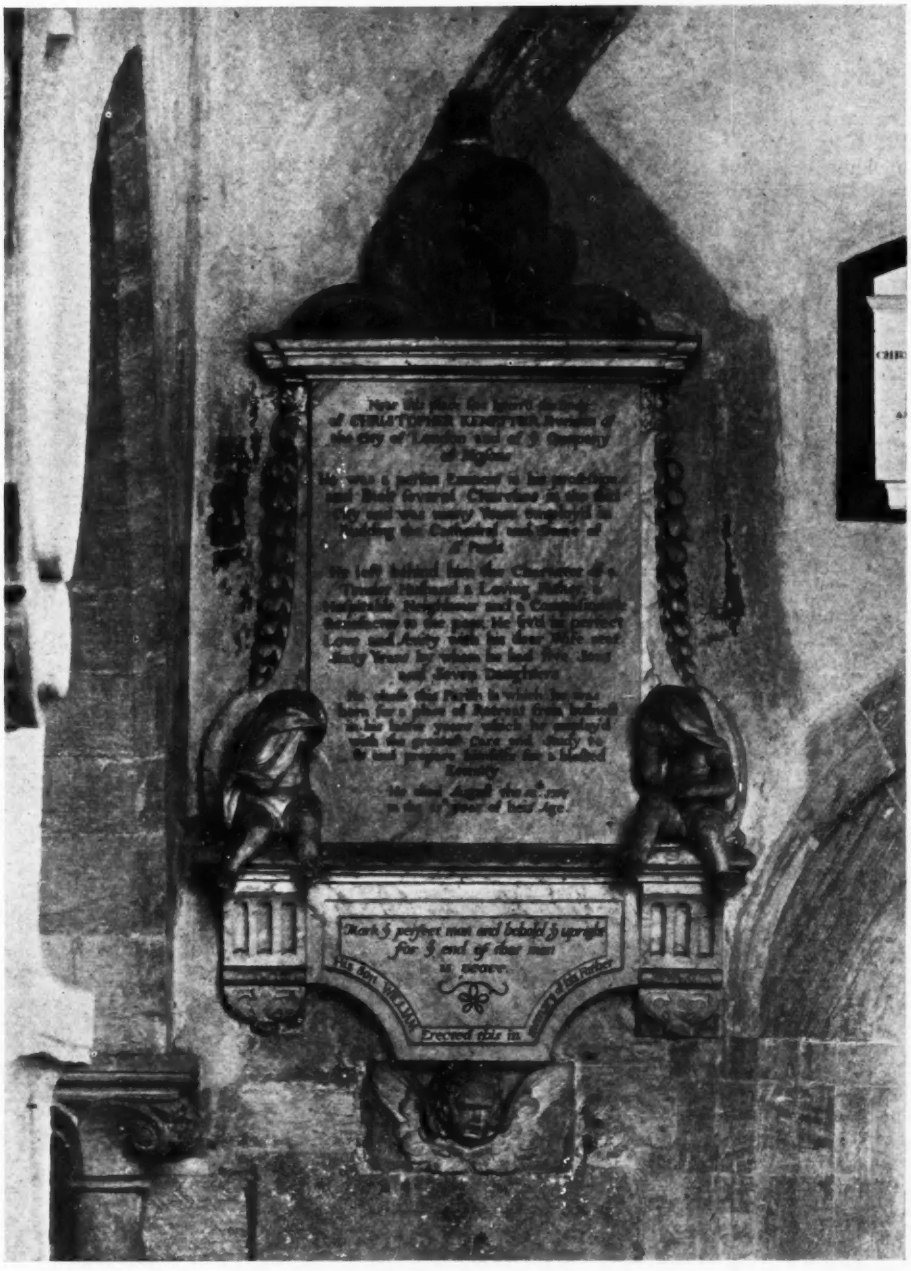
"IT is tragic to know that those beautiful trees which formed one of the most lovely features of the whole road between Bournemouth and Salisbury have been cut down."

In these words reference has been made to the total destruction of the magnificent elm avenue between Ellingham and Ibsley. It was situated on the left bank of the River Avon, between the second and third milestones on the road from Ringwood to Fordingbridge, commencing from the crossing of the road leading from Moyles Court (associated with the Lady Alice Lisle) to Somerley Park (Lord Normanton's seat).

At the other end of the avenue was Ibsley Church, and the old bridge over the Avon to Harbridge, which is in course of reconstruction. It formed, in summer, a continual arch of living green for a distance of about three-quarters of a mile along a gradual curve in the road.

There were over 300 trees, of which nearly all were elms. Unfortunately, last winter's gales dealt severely with elm trees in particular (over 95 per cent. of the trees that came down were elms), and the destruction of these glories of the landscape, already premeditated for road improvement [*sic*], was precipitated.

The Council for the Preservation of Rural England had made strenuous efforts to prevent the felling. They offered to provide an independent expert to pronounce on the soundness of the trees; but unfortunately when it seemed likely that their efforts might prove to some extent successful the two extraordinary gales came which wrecked so many trees all over the country, and the owner would not take the risk of allowing the trees to stand. Every one was felled; and it is understood that only about six of them turned out to be rotten, although a number of others were insecure.



To emphasize the tragedy of this destruction, it should be repeated that the road takes the form of a curve, the length of which was occupied by the avenue; and the obvious treatment would have been to cut the new road in a straight direction, as a chord of the arc. The avenue could have been left (after removal of any trees pronounced unsound by an expert) as a resort for pedestrians and beauty lovers. An insurance policy could have been taken out to cover the owner against loss.

Let it be added, however, in mitigation, that the local authority have agreed to replant when the road widening is finished. Nevertheless, the felling was a disgrace to all concerned; and all the more to be regretted because instructions were issued on November 1, 1929, by the Minister of Transport to its Divisional Road Engineers that special care was to be taken, in road widening and similar works, to preserve existing trees as far as possible. It is to be hoped that it may be possible to include in the Rural Amenities Bill further provisions for the protection of timber alongside roads, and in particular that some of the oak trees may be saved in the avenue which leads from Christchurch to Bournemouth, at the approach to Iford Bridge, now being widened.

Two photographs of the elm avenue on the left bank of the River Avon, between Ellingham and Ibsley, Hampshire, before and after the demolition of the trees to make way for road widening. There were nearly three hundred trees, most of them elms.

ENGLISH PRECEDENT No. 111

MEMORIAL TABLET, BURFORD CHURCH, OXFORDSHIRE

This photograph of Christopher Kempster's memorial tablet reminds us that much of the stone used in the building of St. Paul's Cathedral came from quarries close to Burford. These are still known as Christopher's or Kitt's quarries. Near them is a house bearing the inscription, "Christopher Kempster built this in 1698." —[THOMAS FALCONER.]

CHARING CROSS BRIDGE BILL: COMMITTEE'S DECISION

BY OUR SPECIAL REPRESENTATIVE

THE Chairman (Sir Henry Cautley) having announced that the Committee were not satisfied with the proposed position of the Southern Railway station on the south side of the Thames, nor with the proposal that there should be a series of tunnels over streets in that area, later in the sittings, Mr. Frederick Palmer, consulting engineer, who considered the scheme jointly with Sir George Humphreys for the London County Council, was recalled and laid before the Committee plans for a scheme by which the new station would be placed on the south side of the present Waterloo station.

After the plans had been discussed in conversation between the Committee, counsel, and the witness, around the table, Sir Lynden Macassey, K.C. (for the L.C.C.) said that the general principle governing the application of the Road Fund was such that under the scheme for a station on the south side of Waterloo, the L.C.C. would receive no grant for the embankment improvements on the Surrey side. They could not be expected to carry out those improvements without assistance.

The Chairman: You cannot make this bridge, which is 95 feet wide and a great artery to the south, without having an embankment. You cannot say that that is not part of the scheme.

Sir Lynden Macassey: We should get no contribution for the extent to which it exceeds what is incidental to a road scheme.

The Chairman: We do not like the present scheme, with a road twisting about and all these viaducts.

Sir Lynden Macassey: If you could get us the money for an alternative scheme we would consider it.

The Chairman: From the very first day we have understood the potency of the three pounds for one.

Sir Lynden Macassey: It is the contribution of the Ministry of Transport that has made the scheme in the Bill possible. Take that away, and it becomes impossible.

Sir Herbert Walker, subsequently recalled, said that Mr. Palmer's plan had many more disadvantages than even the Waterloo Junction site, and certainly none of the advantages of the Lion Brewery site. The means of access would be very inferior compared with the Lion Brewery site, and, as in the case of the Waterloo Junction site, entrances to the station would have to be from the road level, which meant that luggage would have to go up to the platforms by lift. The distance from the centre of the station to the underground railway would be 450 yards, as compared with 192 yards at the Lion Brewery site. There would be two distinct stations because the road access to Waterloo must remain where it was, in between the side of the two stations. The cost of working the station would in all probability be greater than at the Lion Brewery site. The site did not lend itself to the building of a hotel.

The Chairman: Have you considered the possibility of making Waterloo a through station and running trains to Cannon Street or London Bridge? Surely that would be a great advantage?

Sir Herbert Walker: Not so much as it seems at first sight. There might be an advantage in running some of the electric services through, but not the long-distance steam trains.

Asked by the Chairman whether he had ever considered putting another station on top of Waterloo, Sir Herbert Walker said that the Air Ministry had inquired whether it would be possible to put an aerodrome there, and it was then found that the cost would be £5,000,000 for an aerodrome alone. He would not like to say what a station would cost. The whole of the foundations would have to be underpinned, as they had only been built to carry platforms and the roofs. They could rule the proposal out as quite impracticable on account of the cost.

The Chairman: Mr. Palmer's plan does get rid of long blank walls, and a bend in the street, and it does make the traffic go direct to the new bridge and to Waterloo Bridge without all these tunnels.

Sir Herbert Walker: I think you would have very great difficulty in getting the traffic to Waterloo Road. The only advantage of the scheme is that at some time or other we might connect up the two systems. We should certainly oppose most strongly this scheme or the Waterloo Junction site.

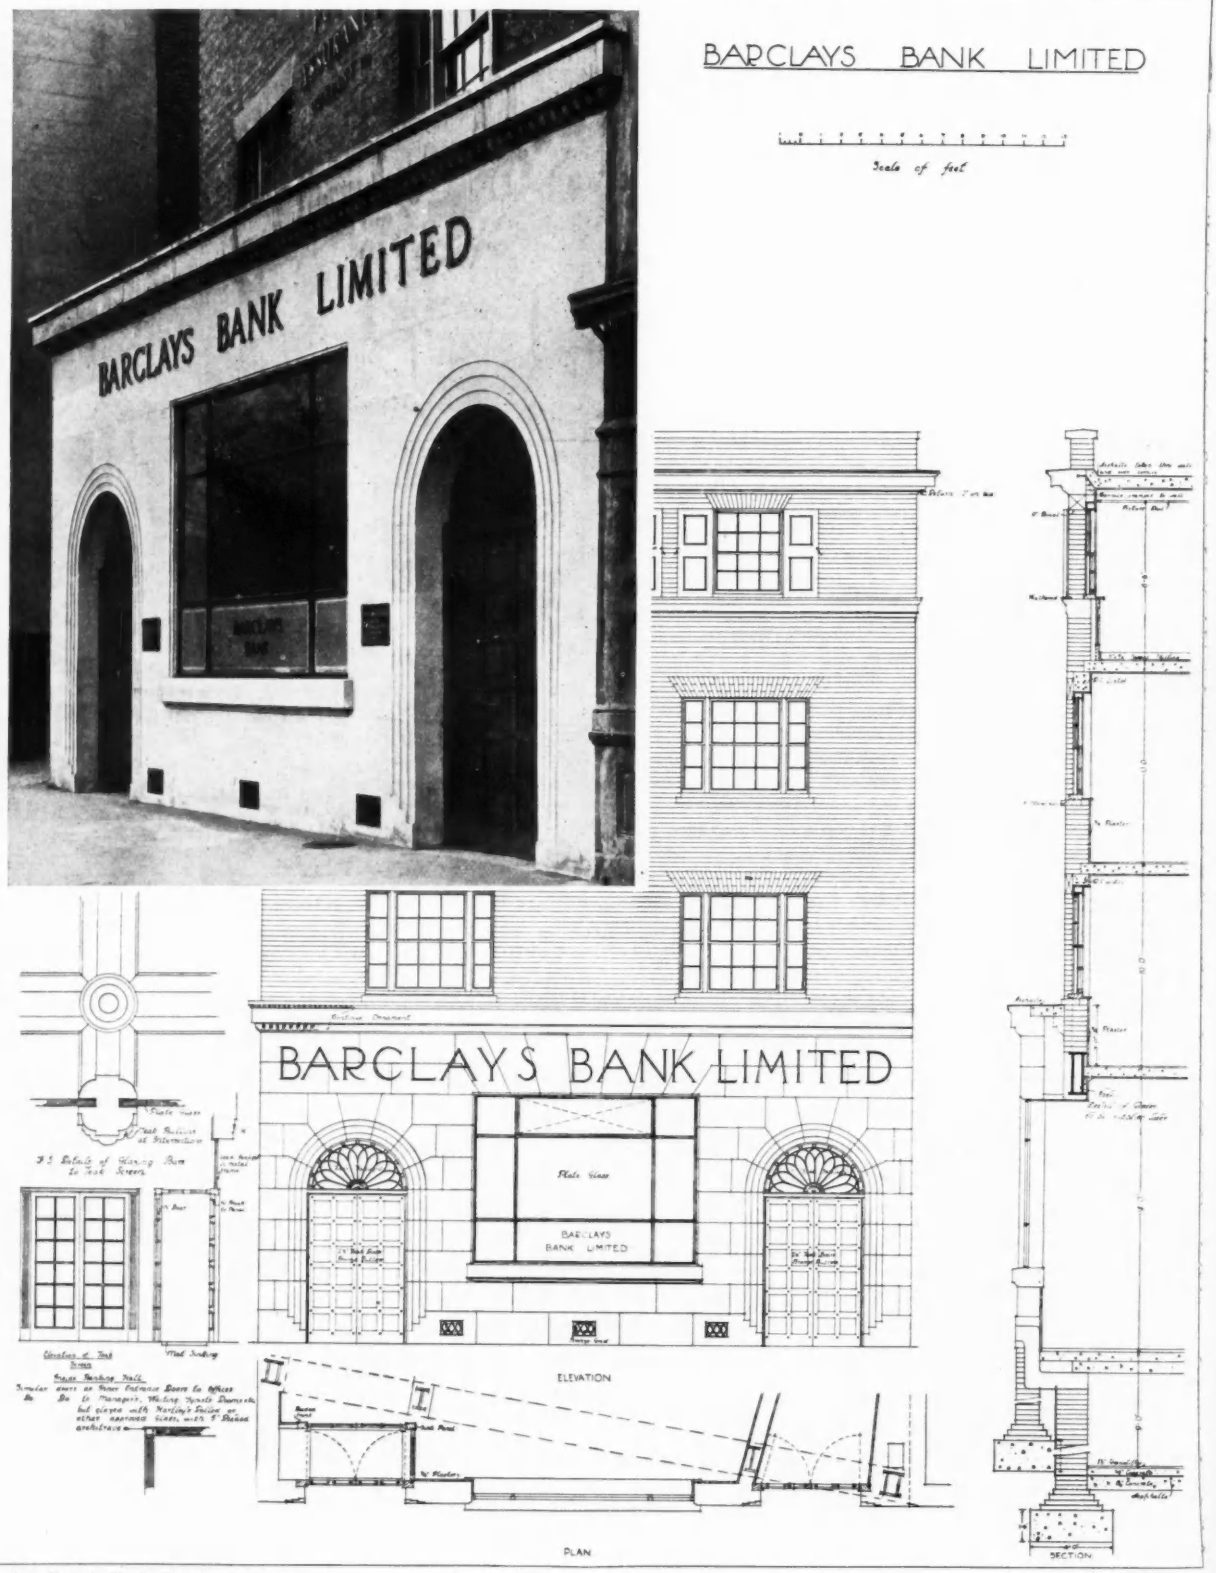
The Chairman: In other words, you oppose being put anywhere except on the Lion Brewery site? — No, we prefer to be left alone where we are now.

Sir Henry Maybury was also recalled and said that Mr. Palmer's plan would not be so advantageous from a traffic point of view as the scheme in the Bill.

The Chairman: But it would permit of a very fine development of York Road and Stamford Street as a through road?—Yes, very much better.

And it would do away with half a mile, or perhaps more, of existing viaduct?—Yes.

Committee's Decision



On Thursday, when the Committee assembled, the Chairman announced that so far as traffic was concerned, he believed that if the original L.C.C. plan of widening Waterloo Bridge had been adopted, it would have dealt with traffic problems for many years to come. At any rate, having seen the model and heard the evidence, the Committee were satisfied that the three bridges—Westminster Bridge, the new Charing Cross Bridge and Waterloo Bridge—as portrayed before them, would make an immense improvement to London and make the river worthy of the city.

There was one comment as far as the northern part of the scheme was concerned. The scheme of development of the new road bridge at Charing Cross would pour a large amount of through traffic into the Strand. The Committee accepted the evidence of Sir Henry Maybury that it would improve traffic arrangements and present no insuperable difficulty, provided that before that traffic poured down from the bridge St. Martin's Lane was widened.

Coming to the southern side, the Committee were of opinion that a 95-ft. bridge would create a great opening for the development of Lambeth. They were not prepared to accept the evidence of Mr. Hunt (valuer to the L.C.C.) that such development in the future was not likely. Business was quite likely, the Committee believed, in the future with these facilities to extend into Lambeth.

The great blot on the scheme, the Committee were agreed—and they were not prepared to accept it—was the putting of the railway station at the bridge head, and causing one road to go over the other in the way shown in the model. The Southern Railway had, on the ground of national necessity, agreed to move, provided they went to one particular site. The Committee thought that only the railway point of view in the selection of the site had been considered. They could not believe that the Southern Railway could not agree to having the station put in a different position if such a site could be found.

The best course would be to adjourn the Committee for, say, a month—to May 6, the first Tuesday after Parliament met—the L.C.C. to consider with the Southern Railway whether they could not meet the views expressed by the Committee and find some different site for the railway. "We do not like to go down to posterity as the people who held up the whole development of this place by putting these thirty-three acres of railway station in this position."

Barclays Branch Bank, Kennington, S.E.] *[By Adshead and Ramsey.*

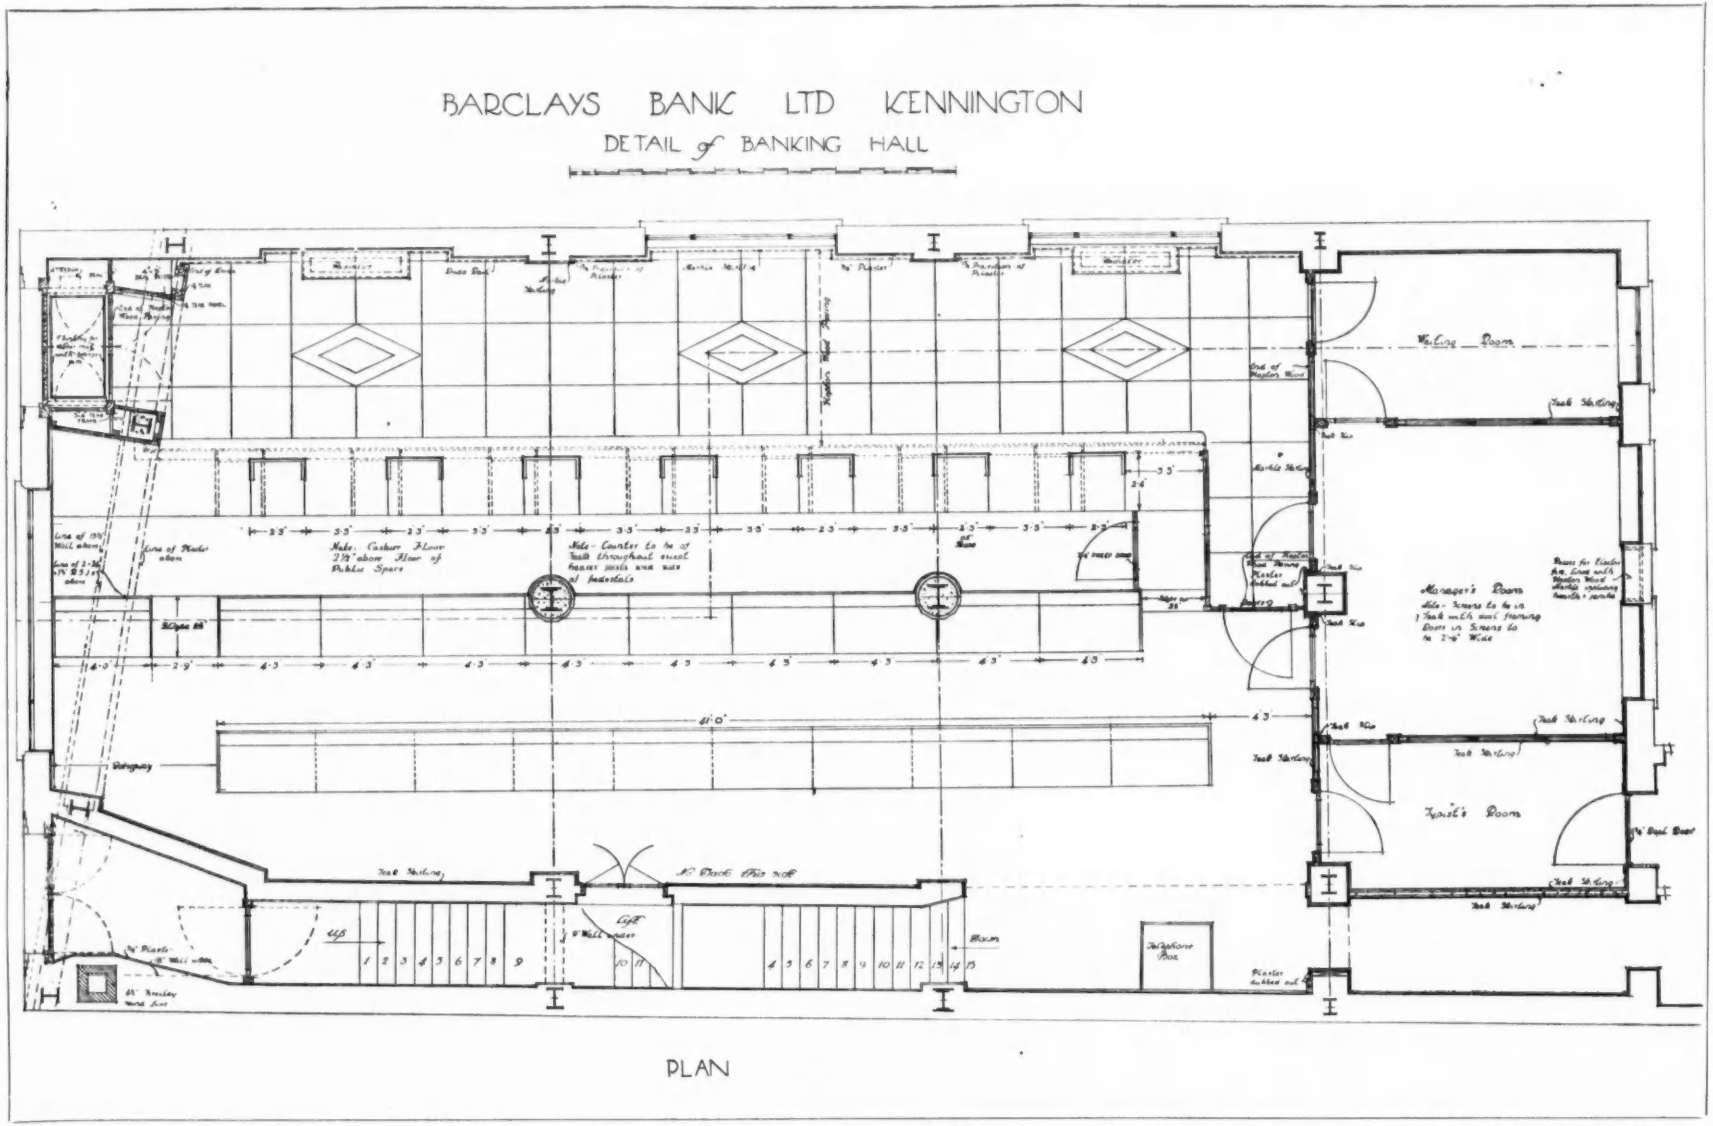
A photograph and the architects' working drawing of the entrance front to Kennington Road. When the needed rectification of the corner of Kennington Park Road and Kennington Road is made, the Portland stone front will be set back in line with the brickwork over, as shown in dotted lines on the plans reproduced on this and page 618.

BRANCH BANK AT KENNINGTON, S.E.

DESIGNED BY ADSHEAD AND RAMSEY

THIS bank is a branch of Messrs. Barclays and is built on the Duchy of Cornwall Estate, Kennington, at the corner of Kennington Park Road and Kennington Road, immediately opposite the Horns Tavern. The upper part is of Redhill bricks, with patent stone dressings; the lower is faced with Portland stone, and the entrance doors are of teak, studded with bronze nail-heads and with wrought-iron grilles over. There is a banking hall on the ground floor and sets of offices over.

As at present erected there is a rather awkward junction between the Portland stone front and the brick upper portion of the building. This will be overcome when the needed rectification of the corner of Kennington Park Road and Kennington Road is carried out, and the stone front set back in line with the upper portion.



The design for the front elevation, as well as for the interior, is on somewhat severe lines, but shows the influence of tradition.

In the interior are plain plastered walls and ceiling, distempered to an ivory cream; and mouldings are very few and simple. Generally speaking, the effect is one of quiet and almost Quaker-like simplicity: at the same time, there is an air of dignity and security about the building which indicates its purpose as a bank. The floors are of reinforced concrete, and the construction generally fireproof.

In design the elevation follows on the lines of the late-eighteenth-century work which is peculiar to the neighbourhood. Most of the older buildings in Kennington which have any architectural significance date from this time, and the architects to the Duchy, Messrs. Adshead and Ramsey, who are also the architects of the bank, relied for their inspiration on these older buildings when they rebuilt the Prince of Wales's estate. The new bank makes an harmonious unit with the whole.

The public space, looking from the entrance, towards the waiting, manager's and typists' rooms. The walls and ceiling are of plaster, distempered ivory cream, and the fittings of wax-polished teak, with grilles of bronze. The floor is of Bianco-del-Mare marble.

Barclays Branch Bank, Kennington, S.E.] [*By Adshead and Ramsey.*

Plan of banking hall. The entrance on the left of the main front leads to the public space; that on the right, to the suites of offices on the upper floors. The manager's room is planned between the waiting room and the typists' room. It has direct access to these apartments as well as to the public space and the general office. The cashier's department, the floor of which is 2½ inches above that of the public space, is entered from the general office by a dwarf door.

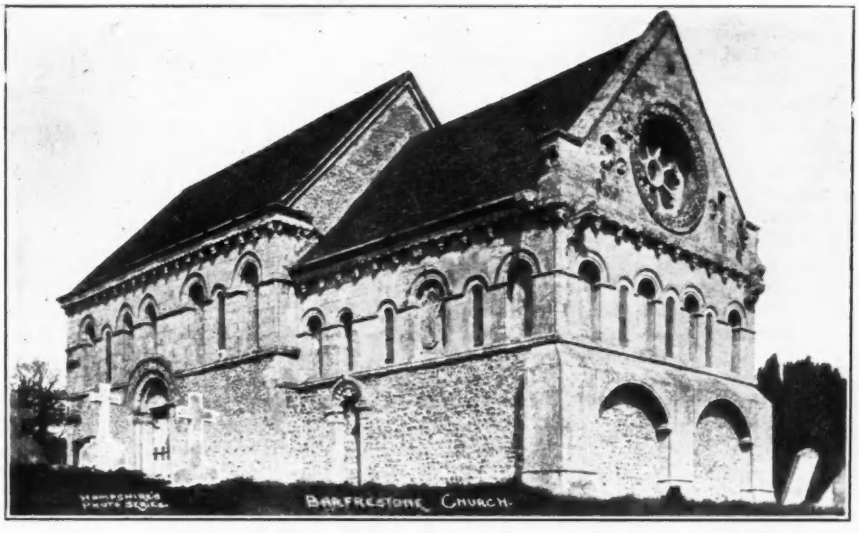
LITERATURE

MR. PENTY'S NEW BOOK

MR. ARTHUR J. PENTY is known, outside the pages of this JOURNAL and the world of architecture, as the author of numerous books on the Medieval Guild System and Social and Industrial Growth, and as the possessor of a powerful intellect, wide scholarship and high accomplishment in the craft of letters; and in his new book he brings his versatile resources to bear on the technical aspects of everyday house-design as they present themselves to the practising architect.

Much of the work has appeared serially in these pages, but it was, clearly, planned as a book, and it is only as a book that the central idea which gives identity to the work and marks its achievement can be appreciated. The idea of *The Elements of Domestic Design* is new, and the ground it covers is new; but the need for such a book is very far from new, and it is remarkable that no attempt has before been made to satisfy that need. The book is concerned with those details of building construction which involve design, and in this it avoids the irrelevancies and superfluities of the building construction textbook. It represents the vernacular of building detail as spoken by architect-designers, and is planned to answer their questions, relieve their doubts and guide their judgment while at work. So far as such a thing may be possible, the book makes good to the architect what he lacks in experience. Take, for instance, the feature, eaves, the design of which calls for subtle imaginative discernment. The designer has to determine the form, dimensions and embellishments of his eaves necessary to give that expressiveness to his elevations which is his aim. A textbook on building construction will merely chill the faculties he wishes to stimulate, by the arid poverty of the matter it deals in; but Mr. Penty provides a round score of scale sections of eave-forms, so rendered as to satisfy the requirements of a book-illustration, showing many varieties of "shoots" fixings, and so forth, all of which will be recognized as belonging to the right substance of expressive architectural design. He supplements these with concise descriptions, elucidating the practical and æsthetic merits and traditional associations of each example, so that the designer is informed in exactly the way he needs, and his imaginative reason is quickened and his confidence enforced.

The writer who expounds the *practice* of design has to face the particular difficulty that whatever examples of the application of his principles he adduces, he cannot expect to carry everyone with him. Tastes differ, and the challenge "Is this all we are arriving at?" cannot be avoided. Mr. Penty has, however, managed to get off lightly, partly because he gives a large number of examples, and partly because he chiefly concerns himself with the design of details rather than with their application. His sash and casement windows, for instance, are excellent; they are fundamentals, but they are, so to speak, units which all designers have common need of. On the other hand, when Mr. Penty's examples involve composition and æsthetic taste, it must unavoidably happen that some Jones or other, looking at the book, will find that he prefers Jones to Penty. A case in point is the set of plates illustrating a simple staircase. The baluster design, of which a number of examples are given, is unusual, and will not appeal to everyone, because they are unusual. What the author has to say on the subject, however, will be found to be true in the experience of all who have experimented in the design of balusters, and the force with which the principle is presented is likely to change disfavour into definite admiration.



Mr. Penty's book is, therefore, an ideal reference book for the drawing table: so far as it goes, it is adequate, and I know of no other book of which that can be said; but it is more particularly a book to study or—for those who are well-informed—to read with delight. The subject-matter has been broken up into sections for convenience of reference. Where these are explanatory of the examples illustrated they are full of discerning comment and curious information; and where they have a more general application they are masterly little essays which display the author's erudition and wide experience through the medium of a crisp, lucid, direct style which any writer might envy and only a skilled writer adequately admire, for Mr. Penty does this most difficult thing with beguiling ease. In all this writing the author uses a well-balanced discretion. In a quiet way he inculcates a principle of address to the subject of design which in my opinion is admirable, and if I had pupils in my office or were otherwise guardian of the young in my vocation, I should press this book upon their attention.

EAST KENT REGIONAL PLANNING SCHEME

TO fully appreciate this report, the preliminary survey, published in 1925, should be on the table by its

A General View of Barfrestone Church.

[*From* East Kent Regional Town Planning Scheme —Final Report.

From East Kent Regional Town Planning Scheme : Final Report.]

Chemist's Shop, Wingham.

side. The two together are most instructive as showing how a thorough study of conditions is needed to justify and give validity to a scheme of this character.

The preliminary survey covered more than its title suggested, and included a general outline of a scheme, but since the date at which it was issued many of the developments, then in an embryonic stage, have taken a more definite form and thus not only has progress to be recorded, but the proposals for the future can be made with a greater measure of confidence. While the general lines of the scheme still stand, every aspect of the problem has received further consideration, and there are, consequently, many changes of detail. The road alignments have received very close attention with a view to efficiency and economy, no fewer than fifty-five roads of varying importance being laid down and their purpose explained, while railways and air transport are not overlooked. The influence of water and other supplies, together with drainage, has been considered in deciding the allocation of areas for various purposes.

The fine map that accompanies the report indicates the following allocations : (1) Areas at present built on ; (2) Areas defined as residential ; (3) Areas proposed as residential ; (4) Areas for factories around coal pits; (5) Areas for factories elsewhere ; (6) Public open spaces now existing ; (6a) Public open spaces proposed ; (7) Private open spaces ; (8) Agricultural land transferable to other purposes ; (9) Agricultural land permanent ; (10) Low-lying land ; (11) Government property.

Allocations Nos. 2 and 3 are mainly around existing towns, but the new mining town of Aylesham is in course of construction on a carefully chosen site about midway between Canterbury and Dover. It is planned for a population of 15,000, and four hundred houses have already been built while a further hundred are in course of construction.

At Chislet the scheme provides for 1,000 houses, and a smaller group has been built near the Tilmanstone Pit.

The land reserved under No. 4 extends for a radius of half a mile around each pithead, while the main reservation under No. 5 is an area about a mile square to the N.E. of Dover, where an existing rail track connects with the harbour.

It is suggested that the fine woodlands to be found in some parts of the area should be preserved as open spaces, with public access to defined paths and rides only so that their economic exploitation would not be interfered with.

The suggestion is also made that owners of private parks should be invited to declare these as permanent open spaces, and thus free themselves from taxation on prospective building values, which might eventually compel realization even when not desired.

Other proposed open spaces aim at securing the coast line where this is still accessible.

The division of the agricultural land into two classes is to separate that which might reasonably be used for building if the demand arose, from that where any other form of development would be undesirable.

It is proposed that local features should be dealt with by the respective town-planning authorities, but that if these did not wish to be burdened with the responsibility they could have their part done at a central office. A great economy of staff could be effected by the general adoption of this method.

H. V. LANCHESTER

East Kent Regional Town Planning Scheme : Final Report. By Patrick Abercrombie in collaboration with John Archibald. Publishers : Austens, Canterbury.

THE ROMANCE OF ARCHITECTURE

THIS little paper pamphlet is more than meets the eye. It is a shillingsworth of magic carpet, or some marvellous lamp of Aladdin, holding within its fifteen pages the means of carrying the willing reader over a thousand miles of space and across some thirty centuries in as many minutes. Great though the distance may seem between the Pyramids and St. Paul's Cathedral, the prehistoric hut and "England's mansions," the word of the genie transports thought and imagination back and forth with easy transition and with the exhilaration of smooth, effortless speed. This is how the ordinary non-technical reader of today likes to take his tabloid information.

Yet in reading this leaflet he will acquire not merely a sketchy knowledge of the great monuments of the past, and of their origins and consequences, but he will inevitably breathe deeply of the subtle aroma of romance—the romance which lurks in all architecture of all ages. It will not be the fault of Sir Banister Fletcher if those who inhale his skilfully distilled concentrated essence of magic and romance do not turn ere long to larger histories or to more careful personal observation of the buildings around them. That is the evident aim of this useful little leaflet in which are reproduced eight photographs and "The Tree of Architecture" from the author's *History of Architecture on the Comparative Method.*

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

The Housing Bill

THE House was sympathetic to the Government's Housing Bill, and gave it a second reading without a division; but there were several criticisms of certain of its provisions and of its omissions. The most detailed criticism came from Mr. Chamberlain, who was Minister of Health in the late Unionist Government.

He pointed out that the most important provision in the Bill was the alteration of the subsidy, and he approved the method of getting away from the percentage contribution. Experience of the Housing Acts of 1923 and 1924 showed that the plan of making definite contributions from the Exchequer conduced to efficiency and economy. So far as the increase of subsidy was calculated to reduce the liabilities of the local authorities, he approved of it. In so far as the new subsidy was to make differential rents, he foresaw considerable difficulties. He regretted also that there was no provision for the town-planning of built-up areas, which had been long called for and was understood to be associated with a Bill of that kind. There was also the exceptionally harsh and unjust provision dealing with compensation to owners whose property was to be demolished. No distinction was to be made, apparently, between any buildings in slum areas. In many cases owners had been compelled to spend money in putting houses in good condition; but, once an area had been declared a clearance area, those houses would have to be pulled down by the owner at his own expense. He did not think that that proposal, if he understood it rightly, could be allowed to stand in the Bill. In the case of local authorities purchasing an area, there again all houses in the area were to be purchased by the local authority at site value.

The Minister of Health, in Mr. Chamberlain's opinion, had missed a great opportunity with respect to the treatment of improvement areas. Reconditioning might be a very valuable adjunct to other provisions dealing with housing, as it was capable of being put into operation rapidly over wide areas and would make a desirable improvement until a more permanent remedy could be applied. But he had always insisted that reconditioning should be accompanied by the provision of a proper system of management. As the reconditioning was to be done by the individual owners of individual houses, he saw no hope under the scheme of getting anything like standardization of management. He would like to see some non-elected body, something in the nature of a Commission, made responsible for the management of those small houses. Apparently, the Minister did not think it a matter of serious consideration.

The local authority would have a very difficult and thankless task when it attempted to fix differential rents for similar classes of houses.

Town Planning

Mr. Chamberlain, in common with other members, regretted that the Bill contained no town-planning provisions; but Mr. Greenwood, the Minister of Health, has since explained that he intends to introduce a Town Planning Bill as soon as opportunity is offered.

Smoke Abatement

Sir Samuel Hoare asked the First Commissioner of Works whether, in the interests of smoke abatement, it was the policy of the Government to substitute central heating for open fires in Government offices; and, if so, what progress was being made with the substitution.

Mr. Lansbury replied: It is the policy to instal central heating in all new Government buildings and gradually to substitute central heating for open fires in existing buildings in cases where, after taking into account interest and sinking fund charges in respect of the capital expenditure involved, some considerable economy would result. Provision had been made in the Estimates (Class VII) for 1931 for several cases of the latter type.

Marlborough House

Mr. Neil Maclean asked the First Commissioner of Works whether he could state the total cost of the alterations to Marlborough House.

Mr. Lansbury: The total expenditure on reconditioning Marlborough House, including the garages and other outhouses, was approximately £20,500. Of this, approximately £8,000 might be ascribed to alterations and improvements, the balance being for general re-decoration, external and internal repairs, re-wiring, etc.

Mr. Brangwyn's Panels

Mr. Horrabin asked the First Commissioner of Works whether, now that it had been decided that the paintings by Mr. Frank Brangwyn, R.A., executed under the bequest of the late Earl of Iveagh, should not be accepted for the Royal Gallery, he proposed to find some other position for these paintings in the Palace of Westminster.

Mr. Lansbury: The offer made by the late Earl of Iveagh was to fill the vacant panels in the Royal Gallery of the House of Lords with paintings. No offer has been received to decorate any other portion of the Palace of Westminster.

SOCIETIES AND INSTITUTIONS

HOSPITAL PLANNING

An account of recent developments in the planning and construction of a large variety of remedial institutions, including mental hospitals, buildings for the treatment of medical and surgical cases, cottage hospitals, etc., was given by Mr. C. Ernest Elcock, F.R.I.B.A., under the auspices of the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch), at the Engineers' Institute, Cardiff.

Many of these schemes, he said, were on a very large scale and, particularly in the case of extensive out-patient departments, extremely elaborate in plan. He explained how recent developments in medical science had given the architect many new problems to solve, and he indicated directions in which the older type of hospital ward could be modified with advantage, and how, as a result of treating the forms which were arising out of the new requirements in a simple rational manner, many of the new hospitals were reaching a higher standard, aesthetically, than did the earlier buildings of this class.

BERKSHIRE SOCIETY OF ARCHITECTS

At the tenth annual general meeting of the Berkshire Society of Architects, the following officers were elected: Chairman, Mr. T. T. Cumming; vice-chairman, Mr. C. B. Willcocks; hon. librarian, Mr. H. Whiteman Rising; hon. treasurer, Mr. W. R. Morris; hon. secretary, Mr. W. J. Freeman; hon. auditors, Messrs. A. S. Cox and E. P. Morgan. Messrs. W. Roland Howell, J. T. Saunders, E. S. Smith and A. H. Powell were elected members of the society. Mr. T. T. Cumming was elected vice-president, and the following representatives of the society on the Council of the Berks, Bucks and District Architectural Association: Messrs. J. T. Saunders, J. R. Greenaway, A. Saxon Snell, S. E. Burrett, W. J. Freeman and W. R. Morris (Reading), A. B. West (Abingdon) and F. E. Wapshott (Maidenhead).

DRY ROT IN TIMBER

Mr. E. H. Boulton, M.A., M.C., of the Cambridge School of Forestry, lecturing at Maidstone on dry rot in wood, said that timber could become attacked by dry rot, which was a plant belonging to one of the lowest orders of the vegetable kingdom, from any period between the cutting of the tree to the time of its use for building, and even afterwards. He showed how the different fungi germinated, and said that in theory all timber should be treated with

some preservative if they wanted completely to keep away dry rot. To germinate, dry rot needed oxygen, water, temperature and food. The spores could remain dormant in timber for fourteen years, when perhaps a roof tile would come off, water would get in, and the spores would germinate. Over 50 per cent. of the timber used in this country today had fungus of some sort in it, but, fortunately, conditions were such that it rarely had a chance to develop. If they put in a damp course, had good ventilation and kept the timber dry, it had not an opportunity to develop.

Blueing fungus, he pointed out, was not detrimental as far as the strength of the timber was concerned, but red stripe was definitely a forerunner of dry rot.

R.I.B.A. ELECTION OF MEMBERS

At the last general meeting of the R.I.B.A. the following members were elected :

As Hon. Associates (2)

Alexander, S. A. — Goetze, S. C. H.

As Hon. Corresponding Members (2).

Pontremoli, E. — Sano, Dr. R.

As Fellows (18)

Benslyn, W. T. — Surman, J. B.
Brown, Col. J. — Wood, W. W.
Butler, C. G. — Worthington, J. H.
Cobb, R. S. — Currey, H. W.
Cullen, A. — Holmes, A. H.
Hughes, H. C. — Kesteven, L.
Owen, R. W. — Roberts, F. A.
Rollo, R. L. — Campbell, W.
Somerville, W. L. — Snowden, T

As Associates (43)

Boon, G. M. — Maynard, F. J.
Bradbury, R. — Murray, J. M.
Brenchley, A. R. — Neil, C. W.
Brentnall, R. H. — Nisbet, J. A. V.
Bright, G. E. — Patker, V. M.
Brown, C. W. — Phillipson, B. J. (Miss)
Butler, R. McC. — Price, G. L.
Carter, E. J. — Randall, G. F.
Cassells, G. A. — Rea, H. F.
Chaplin, J. P. — Segar-Owen, G. J. S.
Dower, J. G. — Shaw, R.
Duffy, T. — Shepherd, G. H.
Fletcher, J. (Miss) — Smeed, C. W. J.
Grayson, A. B. — Somake, E. E.
Haskins, A. D. A. — Stanley, L. S.
Hughes, J. L. — Steele, F. R.
Johnson, A. — Tassell, G. E.
Kemp, S. J. — Taylor, G. S.
Kininmonth, W. H. — Westerman, A. E.
MacDonald, H. S. — Wheeler-Carmichael, S. D.
McMullen, A. L. —
Martin, J. L. — Young, W. E.

VICTORY SCHOLARSHIP AND THE TITE PRIZE COMPETITIONS

The R.I.B.A. announce that in the United Kingdom forty-five students took part in the preliminary competition for the Victory Scholarship, and 198 students took part in the preliminary competition for the Tite Prize. The following students have been selected to take part in the final competitions :

The Victory Scholarship

Hilary Archer (Miss) (Liverpool School of Architecture, University of Liverpool).
C. L. Fairless (Liverpool School of Architecture, University of Liverpool).
William Holford (Liverpool School of Architecture, University of Liverpool).
George Kenyon (Liverpool School of Architecture, University of Liverpool).
Brian B. Lewis (Liverpool School of Architecture, University of Liverpool).
E. F. Massey (School of Architecture, University of Manchester).
R. H. Matthew (School of Architecture, Edinburgh College of Art).
J. V. Nisbet (School of Architecture, the Architectural Association).
Stanley H. J. Roth (School of Architecture, the Architectural Association).
E. F. Starling (Bartlett School of Architecture, University of London).
Gordon Stephenson (Liverpool School of Architecture, University of Liverpool).
C. A. E. Thatcher (Welsh School of Architecture, the Technical College, Cardiff).

The Tite Prize

A. M. Best (Liverpool School of Architecture, University of Liverpool).
John Brandon-Jones (School of Architecture, the Architectural Association).
John Campbell (School of Architecture, Glasgow).
Dudley G. Cutler (School of Architecture, the Architectural Association).
Reginald Edmonds (School of Architecture, Birmingham).
Alwyn G. S. Fidler (Liverpool School of Architecture, University of Liverpool).
H. J. Forbes (Liverpool School of Architecture, University of Liverpool).
Rolf Hellberg (School of Architecture, Birmingham).
R. Pearce S. Hubbard (Liverpool School of Architecture, University of Liverpool).
Albert E. Jones (Department of Architecture, Building and Surveying, the Northern Polytechnic, London).
Kenneth W. Judd (Department of Architecture, Building and Surveying, the Northern Polytechnic, London).
John Needham (School of Architecture, Leeds College of Art).
David S. Paterson (School of Architecture, Glasgow).
Myerscough Walker (School of Architecture, the Architectural Association).
R. H. Whistler (School of Architecture, the Architectural Association).
J. D. Wylson (School of Architecture, the Architectural Association).

READERS' QUERIES

TREATMENT OF OAK

W. T. writes : "*I have some new solid half-timber work in English oak, which I wish treated in such a way that I can obtain a permanent dark brown colour. Can you advise me as to the best method to obtain this effect ?*"

The oak half timber will be best stained with dark brown Solignum to give the effect desired by W. T. Permanency, however, is hardly possible, as may be observed on oak fencing, where the action of sun, rain, etc., usually bleaches the oak of its stain. It is always possible of course to apply further coats of Solignum, which is the usual course.

I, personally, would prefer another treatment which avoids this very dark, and as I think, unnatural appearance of the oak.

Whether the spaces between the framing be filled with brick or plaster, I always prefer the appearance of oak that has first had an application of caustic soda solution, followed, after a few days, by a coat of slaked lime; this latter being brushed off when dry. This will give a weathered grey-brown tone which the action of the elements will enhance.

J. C. R.

PRESERVING AND CLEANING A PITCH-PINE FLOOR

F. J. R. writes : "*I have, in my living-room, a pitch-pine floor which, probably from over-waxing, has become rather dirty. Could you inform me how to clean it properly and mention something about its care ?*"

From the wording of the inquiry I gather that the pitch-pine floor is unstained, and waxed natural colour. If this is so, and it is desired to clean the surface entirely, a wash and scrub with hot soda-water and soap will do it; but I rather gather that the effect of the wax polish is to be retained and that dirt, etc., trodden into the wax is to be cleaned off. This can be done by sprinkling pumice powder on the wood and rubbing with a pad soaked in turps, followed by a rub over by a clean rag dipped in turps to wipe off all powder, etc. Leave to dry, then brush over with a soft broom, and wax polish with Ronuk or some other light-coloured wax.

In the course of time it is impossible to avoid a certain darkening of the surface due to dirt working into the polish. This is seldom objected to, but a cleaning off as described may be done once a year or so ; though it inevitably destroys for the time being the gloss obtained by previous polishing.

J. C. R.

CUBIC COST OF BUILDINGS

"Cost" writes : "*Can you give provincial prices per cube foot for : Technical secondary schools in brick and stone design ; municipal offices, all stone ; fire brigade stations, brick with stone dressings ; police station (if any post-war) ?*"

Locality and design play an important part in the cost of buildings, and even when in possession of drawings and specification of a proposed building it is still extremely difficult to judge within reason the price per foot cube of the ultimate cost.

However, as a rough indication, the following figures may be a guide :

Technical and secondary schools in brick with stone dressing, 1s. 3d. per foot cube.

Municipal offices in stone in stone localities, 2s. 6d. per foot cube.

Fire brigade stations in brick with stone dressings, 1s. 6d. per foot cube.

Police stations in brick with stone dressings, 1s. 6d. per foot cube.

B. O. F.

Should District Surveyors Draw Plans?

AT a recent meeting of the Urban District Council of Bentley, near Doncaster, the question whether the district surveyor, Mr. P. C. Woodhall, was in order in drawing plans of private work was keenly debated. The subject—one of interest both to architects and surveyors—was brought up at the instance of Mr. Oliver Straw, representative of one of the wards. The following is a condensed account of the proceedings :

Mr. Straw was given permission to ask questions on the minutes and referred to a recommendation prohibiting the drawing of private plans being done on Council premises and during Council hours. He asked if the chairman knew whether an official had received payment.

The Chairman replied that he heard of a case some years ago.

Mr. Straw asked if he would be right in drawing a conclusion that there had been a breach of faith.

The Chairman said there would be a breach of faith if such a thing had taken place since the committee decided on prohibition during Council time and on Council premises. Later, he said he had no reason to believe that there had been a breach of the recommendation.

Mr. Straw said it would be interesting to know the proportion of private plans drawn in the Council office. He alleged that the cost of the surveyor's department was too heavy and there were too many assistants. When he first raised this matter he was not satisfied with the answer. He asked whether the surveyor had received payment for plans for people who built privately.

The Surveyor said the plans referred to at the previous meeting were for two cottages, and were not drawings but photographs taken by a Doncaster photographer. All that was done was that his pupil put a wash of colour on them.

Mr. Straw said that when the Council appointed the surveyor they laid it down definitely that such work should not be done. He asked the surveyor if, at any time, as an official of the Bentley Council, he had received remuneration for the drawing of plans for residents in that area.

The Surveyor : As I told the sub-committee, the answer is definitely in the affirmative.

Mr. Straw said he was astounded and disgusted, knowing what wages Bentley Council paid for the services of a chief official.

The Surveyor : I strongly object to that. I consider that is taking advantage of my position.

Mr. Straw said for a man to receive a salary second to none as a surveyor to an urban authority, and to receive payment for drawing plans, was hitting below the belt in the profession, and depriving other men of an honest pound or two.

Mrs. Ringrose asked the sanitary inspector if he had drawn plans.

The Sanitary Inspector (Mr. W. B. Jepson) admitted he had, and received payment. He said his action had been to the advantage of the people for whom the work was done.

Mr. W. E. Shelton said that after the recommendation of the committee on this matter he had hoped the matter would be allowed to drop. He had hoped that they would continue in harmony. He alleged that Mr. Straw was seeking self-aggrandisement and seeking to lower the officials of the Council in the eyes of the public, and asked why the honour of officials should be dragged out at a public meeting?

The Chairman (Mr. W. J. Ballam) said it appeared that Mr. Straw was disappointed because the committee did not take up a lot of disagreeable things and hurl threats instead of trying to improve the position in the Council. He condemned the continuation of this vendetta, and said the drawing of plans was a custom in existence in the profession all over the country, and he questioned whether they could find a surveyor who did not carry on such work. He doubted whether another authority in the county had told their surveyor that he must not do so.

Mr. Straw sought to reply, but the Chairman told him there was no resolution before the meeting.

Mr. Straw then moved a vote of censure upon the surveyor and sanitary inspector for drawing the plans.

There was no seconder to the resolution and the Surveyor said if the matter was to continue in mud-slinging he would retain his dignity and say no more.

COMPETITION CALENDAR

April 28.—Messrs. Josiah Wedgwood and Sons, Ltd., invite designs in competition for a Wedgwood Vase, to be made in commemoration of the Bicentenary of the Birth of Josiah Wedgwood, which will be celebrated this year. Assessors : Philip Connard, R.A., W. Reid Dick, A.R.A., H. S. Goodhart-Rendel, F.R.I.B.A., and Frank H. Wedgwood. Premiums : £100, £50 and £25. Full particulars may be obtained on application to the Secretary, Messrs. Josiah Wedgwood and Sons, Ltd., Etruria, Stoke-on-Trent. Latest date for submission of designs : April 28.

May 16.—Messrs. Ewart and Son, Ltd., in conjunction with the Association of Architects, Surveyors and Technical Assistants, invite designs for a lock-up hangar for an aeroplane. The competition is divided into two classes, for those over and under 25 years of age at midnight, May 15–16, 1930. Assessors : William H Hamlyn, A.R.I.B.A., and Chas. McLachlan, A.R.I.B.A., with A. N. Cathcart as technical adviser with regard to roofing, ventilation and hot-water supply. Two prizes will be awarded in each class, namely, free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. Messrs. Ewart and Son, Ltd., reserve the right to publish or make use of any of the designs for which a prize is awarded, but do not reserve the right to build in accordance with any of them. Particulars of the competition, etc., are obtainable from A. Seymour Reeves, Secretary, A.A.S.T.A., 26 Buckingham Gate, S.W.1. Latest date for submission of designs : May 16, 1930.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs : June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor : J. Ernest Franck, F.R.I.B.A. Premiums : £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs : June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor : Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor : H. V. Ashley, F.R.I.B.A. Premiums : £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs : July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor : Sir Brumwell Thomas. Premiums : £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs : July 31.

No date.—The Leicester Corporation invites local architects to submit designs for the erection of a library at West Humberstone. Assessor : Hugh Gold, F.R.I.B.A. Premiums : £75, £50, and £25.

TRADE NOTES

The Egyptian Government Ministry of Public Works have accepted the tender of Dorman Long & Co., Ltd., for the erection of a steel-framed power station at Atf, in Lower Egypt, about 70 miles from Alexandria, along the Mahmudieh Canal. The building will contain approximately 770 tons of steel.

Mr. T. P. Sturdee has been appointed London Manager for Messrs. Banister, Walton & Co., Ltd., constructional engineers and stock holders, 82 Victoria St., Westminster, and of Trafford Park, Manchester. The firm have also inaugurated a London designing and drawing office.

At a board meeting of Messrs. Dorman Long & Co., Ltd., held recently, Mr. Charles Mitchell was appointed joint managing director. He will, however, continue in charge of the bridge and constructional departments, at 55 Broadway, Westminster, S.W.1, the company's London office.

Spraying is being used to a considerable extent today by the modern decorator. It is speedy compared with older methods of painting, and effects can be obtained in shading and in blending one colour into another. In the latter case it is often difficult to say where one colour ends and the other begins. Not only is cellulose sprayed today by Messrs. Goodworks, Ltd., but paint, distemper and bronze, gold and silver powders. Small surfaces, such as window frames, etc., can be sprayed as well as large ones. Paint, distemper, etc., when applied correctly by means of a spray is claimed to have not only an even coat but better covering power, two sprayed coats, it is stated, being generally recognized to equal three brushed coats. On large contracts, it is claimed, the price for spraying is very keen, and often cheaper than the old method, and even on small contracts it is said to be very favourable.

On this page is illustrated the Alpine scenic wall at the new Ice-Drome, Hammersmith. Instead of being a smooth-painted representation of the Alpine skyline, it has been given a third-dimension treatment, which is so valuable in scenic effects. This is achieved by treatment with Berger Surfex, a plastic paint which gives a rugged texture. The work was carried out by Messrs. G. F. Holding, Ltd., of Brooks's Bar, Manchester.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors, specialists, and some of the sub-contractors for the buildings illustrated in this issue :

New Chapel, Sutton Valence School, Kent (pages 598, 601-606). General contractors, R. Corben and Sons, who were also responsible for most of the internal fittings. Sub-contractors : The Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, reinforced concrete; Henry Hope and Sons, Ltd., casements and leaded lights; Clubb and Sons, and Frederick Jukes, wrought-iron work; Thomas Elsley, Ltd., rain-water heads; A. E. Davis, ironmongery; Berkeley Electrical Engineering Co., Ltd., electric lighting; General Electric Co., Ltd., and Osler and Faraday, Ltd., electric fittings; W. Stainton, heating; Oetzmann & Co., Ltd., hanging to altar; Joseph Armitage, wood carving; H. J. Cribb, stone carving; the altar was the work of Mr. Richards, manual instructor, and the boys of the school.

Barclays Bank, 414-416 Kennington Road, S.E.11 (pages 616-618). General contractors, Hall, Beddall & Co., Ltd., who were also responsible for most of the internal fittings, counters, etc. Sub-contractors: G. M. Callender & Co., dampcourses ; Limmer and Trinidad Lake Asphalte Co., Ltd., asphalt; Wm. Brown and Son, bricks; Empire Stone Co., Ltd., artificial stone and stairtreads; South Western Stone Co., Ltd., stone; Aston Construction Co., Ltd., structural steel; Morris and Son, Ltd., glass; Stevens and Adams, Ltd., woodblock flooring; Siegwart Fireproof Floor Co., Ltd., patent flooring; Colley, Meikle & Co., Ltd., central heating; Grierson, Ltd., electric wiring and electric heating; Holophane, Ltd., electric light fixtures; Tylors, Ltd., sanitary fittings; Buckley, door furniture; R. E. Pearse & Co., Ltd., casements; Plaster Decoration Co., Ltd., plaster; Galsworthy, Ltd., metalwork; Fenning & Co., Ltd., marble; Waygood-Otis, Ltd., lifts.

NEW INVENTIONS

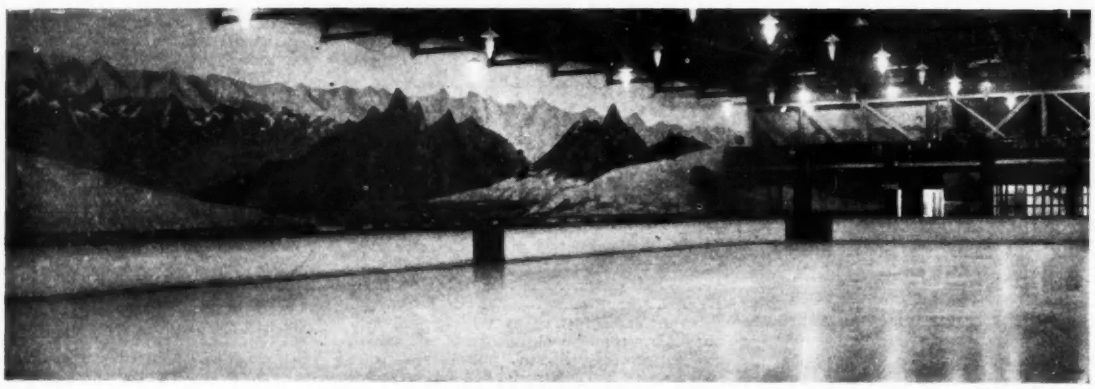
[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

9838. Black, W. J., and Chisholm, W. D., and Dickins, A. S. Manufacture of floorings, pavings, etc. March 27.

9541, 9543. Concrete Greenhouses, Ltd. and Rawson, C. H. Concrete building construction. March 25.

9540. Concrete Greenhouses, Ltd., and Rawson, C. H. Sills for building construction. March 25.



9897. Doughty, H. E. Treatment of brick, concrete, etc., surfaces. March 28.

ANNOUNCEMENTS

The Order-in-Council made on December 17 last requiring any container in which imported Portland cement is sold or exposed for sale to bear an indication of the country of origin, came into operation on March 17.

For the convenience of motorists wishing to avoid touring from town to town for the Easter holidays, the Automobile Association has prepared special descriptive drives giving six day tours from each of 200 centres. These booklets are supplied free to members on application to the A.A., Fanum House, New Coventry Street, W.1. The number of A.A. badges issued to members has now passed the one million mark.

The Fireplace in a House at Ditchling, Sussex (pages 595–6), is reproduced from *The Elements of Domestic Design.* The illustration of an elm avenue in Hampshire (page 612) is reproduced from *The Face of the Land : The D.I.A. Year Book.*

The Alpine scene in the Hammersmith Ice-Drome, W.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual General Meeting, 6 p.m. Irish Centre (Dublin). At the Physical Laboratory, Trinity College, Dublin. Annual General Meeting, 7.45 p.m. Hampshire Sub-Centre. At Southampton, Summer Meeting. **6 p.m.**

FRIDAY, MAY 16

INSTITUTION OF ELECTRICAL ENGINEERS. Scottish Centre. At the Technical College, Dundee. The twenty-first Kelvin Lecture. "Some Recent Advances in the Electron Theory of Metals." By R. H. Fowler, F.R.S. **7.30 p.m.**

SATURDAY, MAY 17

Sunrise, 5.6 a.m. Sunset, 8.47 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Second visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. **2.30 p.m.**

THE SKETCH CLUB

SUCH is the title of a supplement which will adorn every other issue of THE ARCHITECTS' JOURNAL from next week's onwards. As this title is meant to indicate, the new supplement will be a club and will contain sketches. It will, therefore, be the natural meeting-place of those architects who sketch and find pleasure therein. The holiday sketcher and the office sketcher, the heavy sketcher and the occasional one, the convivial and the secret sketcher, the professional and the stickler for amateur status—all without exception will here come together to praise and practice the noble sport of sketching.

It is too true that the camera, like war-debts and the motor-car, has come to stay. Moreover, it would be idle for the lovers of sketching to try and dislodge it. It would also be dangerous. Imagine modern architecture without the camera! Imagine THE ARCHITECTS' JOURNAL without its photographs! But in a thousand architectural workshops throughout the country the japanned colour-box still reposes on the little pile of canvas-bound books. These things have remained to testify that old loyalties are not forgotten, and that the photograph and blue-print have not yet obtained a traffic monopoly for architectural ideas.

There may be a great deal to be said against sketching; there is also a great deal to be said for it. We ask the scornful ones to suspend judgment till *THE SKETCH CLUB* has been busy for three months or so. We promise them that at the end of that period they shall have a proper hearing.

Meanwhile, the first meeting will take place in THE ARCHITECTS' JOURNAL on

WEDNESDAY, APRIL 23.

All who have ever sketched, tried to sketch or contemplated sketching, whether for business or pleasure, are cordially invited to attend.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed by the BARKING U.D.C.: Eleven shops with dwelling accommodation, Becontree Estate, for the London County Council; factory, River Road, for Invictus Flooring Co., Ltd.; twenty garages, rear of Norfolk Road, for Mr. C. B. Lovell; temporary church, Urswick Road, Becontree Estate, for the Church of England Authorities; lay-out, Lodge Road, Porter's Avenue and Goresbrook Road, for the L.C.C.

The L.C.C. has revised its scheme for the development of the Barking section of the BECONTREE Estate. The scheme will comprise the erection of 1,497 dwellings and 39 shops.

For the erection of further tenements on the Collingwood estate, BETHNAL GREEN, the L.C.C. has voted an expenditure of £150,000. The dwellings will be of the normal type, five stories in height.

Plans passed by the COULSDON U.D.C.: Four houses, Bradmore Way, for Mr. F. Everitt; house, Caterham Drive, for Mr. R. C. Older; twenty-five houses, Portnalls Road, for Messrs. Gresswells, Ltd.; five houses, New Barn Lane, Beverley Road, and Hilltop Road, for Messrs. E. O'Sullivan, Ltd.; house, Coulsdon Road, for Mr. F. A. Freeman; house, Winifred Road, for Mr. D. M. G. Yuille; house, Coulsdon Common, for Miss V. O. Dent.

The CROYDON Corporation has obtained sanction for a loan of £20,000, for the erection of baths in Mitcham Road.

Plans passed by the EAST HAM Corporation: Office, rear of 203 High Street North, for Mr. A. Webb; two houses, Michigan Avenue, for Mr. T. W. Bedford (architect); house, Mountfield Road, for Mr. W. F. Blake (architect); four houses and workshop, Kennard Street, for Messrs. W. Harris, Ltd.; shop and timber store, 772/4 Romford Road, for Mr. F. Amott (architect); mission hall, corner Flanders Road and Bonny Downs Road, for Mr. W. J. Cearns; house, Ranelagh Road, for Mr. T. W. Ebdell; builders' store and workshop, 3 Boleyn Road, for Messrs. W. Beattie, Ltd.; alterations, 165 High Street North, for Messrs. Hammond and Miles, Ltd.; shop, Green Street, Upton Park Station Bridge, for Messrs. Lee, Dickens & Co.

Plans passed by the HACKNEY B.C.: Shop, Mare Street, for Mr. F. T. Ford; twelve houses, Warwick Road, and five houses, Knightland Road, for Mr. G. G. Winbourne; pavilion, ground rear of Holmleigh Road, for Ea Tout Cas (Syston), Ltd.; weir-keeper's cottage, Strong's Bridge, South Millfields, for Mr. B. Howarth; motor coach station, Stamford Hill, for Messrs. Pite, Son and Fairweather.

Plans passed by the LEWISHAM B.C.: Eight houses, Chudleigh Road, and three houses, Ladywell Road, for Mr. J. H. Bolton; thirty-two houses, Perry Hill, for Mr. B. G. Utting; rebuilding, 175 Rushey Green, for Mr. J. H. Willis; four houses, Collingtree Road, for Mr. G. A. Clothier; reconstructing Bridge Mill, Mill Road, for The Power Construction Co., Ltd.; church hall, Downham Way, for Mr. W. E. Ismay; additions, "Tiger's Head," public house, Bromley Road, for Mr. A. R. Mayston; garages, rear of Sunderland Road, for Messrs. Gledhill Bros.

The L.C.C. has passed plans, submitted by Messrs. L. G. Mouchel and Partners, for the erection of buildings in Rathbone Place and Cresse Street, MARYLEBONE.

Plans passed by the MARYLEBONE B.C.: Vaults, 104/108 Oxford Street, for Messrs. Slater and Moberly; reconstruction of vaults, 12 Ogle Mews, for Messrs. Weir, Borrows and Weir; building, Hall Road, for Mr. D. W. Beck; alterations and additions, 69/71 Margaret Street, for Mr. M. Seth-Ward.

The L.C.C. has passed revised plans for the erection of premises, for Messrs. A. W. Gamage, Ltd., in OXFORD STREET, Park Street and North Row.

Plans have been passed at SANDERSTEAD for new streets on the Borough Farm Estate, for Mr. D. A. Bowerman.

Plans passed at SELSDON: Twelve houses, Dulverton Road, for Mr. E. D. Astington; thirty-seven houses, Sylvan Close, Selsdon Road and Addington Road, for Messrs. Steel and Howes.

The STEPNEY B.C. has obtained land in Brightlingsea Street, for the erection of tenements.

The L.C.C. has prepared a scheme for culverting part of the River Graveney, in the vicinity of WANDSWORTH, at a cost of £60,000.

Messrs. Grace and Farmer are to erect new buildings on a site with frontages to Approach Road, Milford Lane, Tweezers Alley and Water Street, WESTMINSTER.

Plans passed by the WESTMINSTER City Council: Shelters, Leicester Square Theatre, St. Martin's Street, for Mr. A. Mather; building, 107 Piccadilly, for Messrs. Henry Tanner; fascia and pilasters, 27-29 Berwick Street, for Messrs. A. Davis & Co., Ltd.; balconies, 38–40 Piccadilly and 1–5 Sackville Street, for Mr. A. Mather; shop addition, 4 Tilney Street, for Messrs. Bomer and Gibbs; balcony, 43 Conduit Street, for Messrs. White, Druce and Brown.

SOUTHERN COUNTIES

The BIRKENHEAD Corporation has asked the Libraries Committee to consider the provision of a branch library in the Preston district.

The Board of Education Committee has approved the plans of the trustees for the erection of a Roman Catholic elementary school, in Challis Street, BIRKENHEAD.

The West Riding Education Committee has decided to erect a senior school for 1,200 children at BOLTON-ON-DEARNE, at a cost of £44,000.

The West Riding C.C. is to widen the bridge over the River Calder at CALDERSIDE, at a cost of £4,500.

The West Riding Education Committee has prepared a revised scheme for the erection of a middle school at CASTLEWOOD, with accommodation for 800 instead of 600 children, at a cost of £26,000.

The West Riding Education Committee is to erect an elementary school for 280 children at FLOCKTON, at an estimated cost of £8,500.

The West Riding Education Committee has prepared a revised scheme for the erection of a senior school at GOOLE, for 1,200 children, at a cost of £42,000.

The West Riding C.C. is to reconstruct the canal bridge at GOOLE, at a cost of £4,000.

The Rotherham Corporation is to sell a site in Wickersley Road, HERRINGTHORPE, to the Vicar of Whiston for the erection of a church and vicarage.

The HULL Corporation Libraries Committee is considering three sites in Cottingham Road, suggested for the erection of a branch library.

The West Riding Education Committee is to enlarge the council school at INGLETON, at a cost of £3,500.

The MANCHESTER city architect estimates that the cost of the erection of the proposed branch library at East Gorton will be £3,000.

The West Riding Education Committee is to erect a new primary school, for 400 pupils, at MEXBOROUGH, the estimated cost being £12,000.

The West Riding Education Committee is to erect a practical instruction centre at Dolcliffe Street school, MEXBOROUGH, at a cost of £5,400.

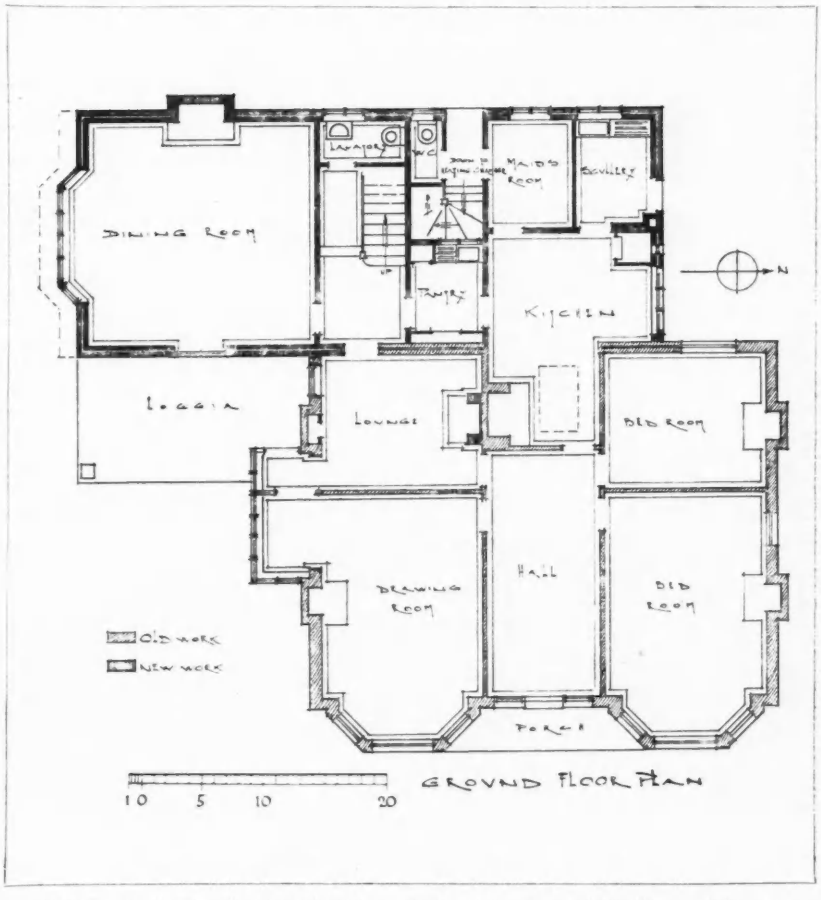
The West Riding Education Committee is to extend the Adwick Road school, MEXBOROUGH, to accommodate a further 240 scholars, at an estimated cost of £5,000.

The West Riding C.C. is to widen the Knoll Beck Canal bridge in the ROTHERHAM rural district, at a cost of £9,000.

The ROTHERHAM Corporation Markets Committee has approved plans, prepared by the borough engineer, for alterations and extensions at the public slaughterhouses, at a cost of £8,000.

Plans passed by the ROTHERHAM Corporation: House, Broom Lane, for Mr. S. A. Telling; two houses, Old Wortley Road, for Mr. R. Harrington; warehouse and shop, Westgate, for Messrs. S. Waterhouse, Ltd.; wagon repair shop, Fullerton Road, for Wagon Repairs, Ltd.; amended plans, Bridge Inn, for Mappin's Masbro' Old Brewery, Ltd.

The West Riding Education Committee is to erect an elementary school for 500 children at RYHILL, at an estimated cost of £15,000.



The STRETFORD U.D.C. is to include in the estimates for the year a sum to cover the cost of the erection of an additional 200 houses, and has asked the chairman to continue negotiations for the acquisition of suitable sites.

MISCELLANEOUS

Plans passed by the DOUGLAS (I.O.M.) Corporation: Alterations and additions, "Imperial," Central Promenade, for Miss Cowbourne; six houses, Somerset Road, for Messrs. Creer Bros.; battery room, Royalty Cinema, for the Palace and Derby Castle, Ltd.; alterations, 31 Lancaster Road, for Mr. Cochran; alterations to shop, Little Switzerland, for Miss Brew; alterations, 25 Castle Mona Avenue, for Mr. J. H. Kelly; alterations, 24 Buck's Road, for the Co-operative Society; building, St. George's Street, for Messrs. Crosbie and Cowley.

The ISLE OF WIGHT Education Committee is to extend the Grange Road council school, East Cowes, at a cost of £6,000.

At the last meeting of the WHITEHEAD U.D.C., it was stated that approval had been obtained for a loan of £7,000 for the construction of a swimming pond and shelters for the foreshore.

Additions to "The Knoll," Shiplake. Designed by Leonard V. Hunt. The new portion of the bungalow is two stories high, and comprises, in addition to the accommodation shown on the ground floor plan, three bedrooms, dressing room, hot closet, bathroom and closet, and boxroom, on the upper floor.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5 ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9

CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in. per roll*	0	4	9
DO. *14 in. per roll*	0	7	6
DO. *18 in. per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1-3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ⅜ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super.	0	11	0
York templates sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			

HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER, 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:			
Portmadoc Ladies	£14	0	0
Countess	23	0	0
Duchess	32	10	0

Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see "Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	Med. Green
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0

Green randoms	6	7	0
Grey-green do.	5	9	0
Green peggies, 12 in. to 8 in. long	4	13	6
TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6
Vertical Tiling, including pointing, add per square	18s.	0d.	
FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour;* JOINER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):			
7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1½ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded 1½ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring standard blocks laid herringbone in mastic :			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in. with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra each	0	0	3
DOORS, 4-panel square both sides, 1¼ in thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup..	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup..	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labours, per ft. run	0	0	1
STAIRCASE work :			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS :			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick and bedding per ft. sup.	0	4	6
IRONMONGERY :			
Fixing only (including providing screws) :			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

SMITH, *weekly rate equals* 1*s.* 8½*d. per hour*; MATE, *do.* 1*s.* 3½*d. per hour*; ERECTOR, 1*s.* 8½*d. per hour*; FITTER, 1*s.* 8½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Mild Steel in British standard sections, per ton	£12	10	0

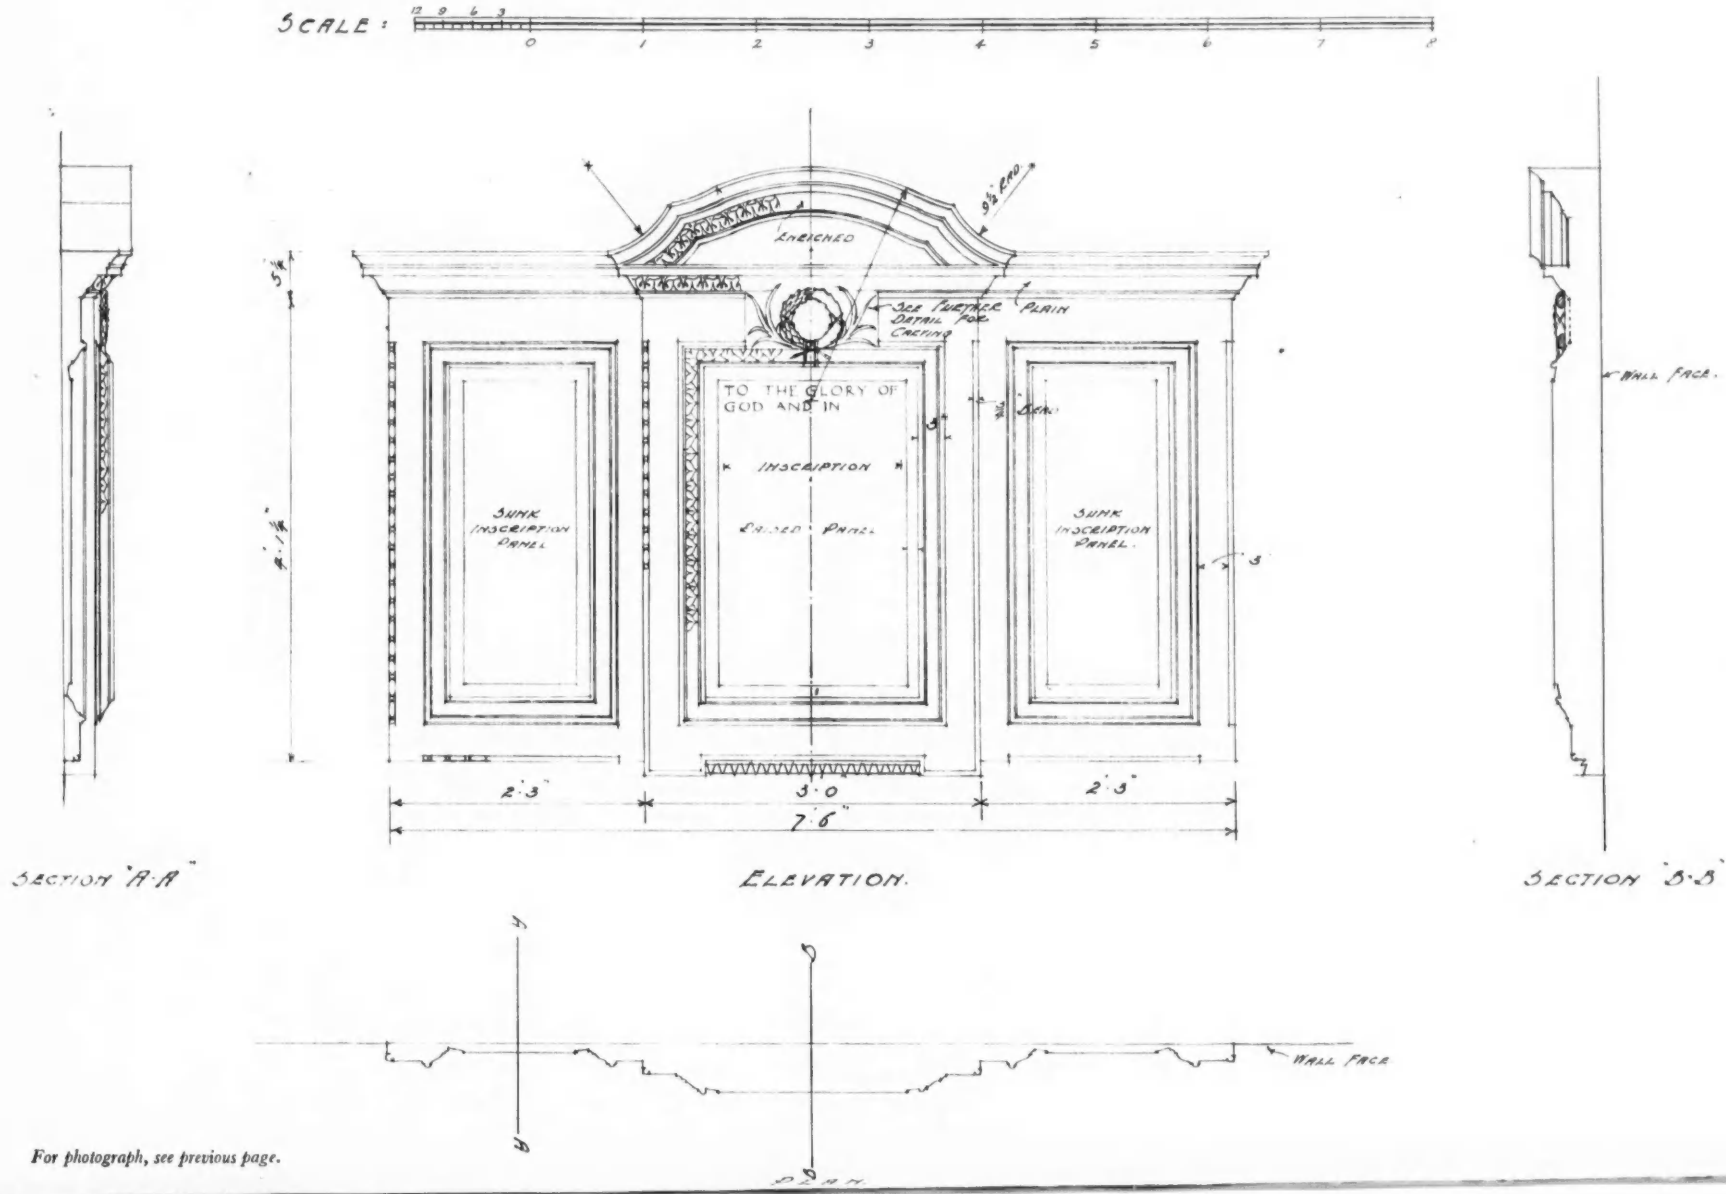
DEDICATORY TABLET IN THE ENTRANCE HALL: N.D.F.S. MEMORIAL CONVALESCENT HOME, SKEGNESS, LINCOLNSHIRE

By

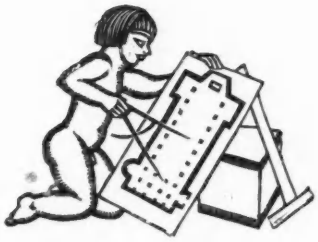
W. H. ANSELL



THIS tablet, bearing an inscription dedicating the Home to the memory of members of the National Deposit Friendly Society who fell in the war, has been designed as a commemorative feature in the entrance hall of the Society's Convalescent Home, in Lincolnshire. When newcomers arrive, it is an established custom for them to assemble in front of it for a minute's silence, in remembrance.

Designed by the Architect for the Society, others of whose details at their London headquarters have appeared in these pages, the carving was carried out by Laurence Turner.

The wood is untreated oak, waxed dull, which has now toned to a rich warm colour. The lettering is cut into the wood, which was left unsized and then gilded.



For working drawings, see the following page.

ON THE NATIONALIZATION OF ESTATES

An Alternative to the Bleeding of the Body of England Spiritual

WITH the ink hardly dry upon Mr. Snowden's Budget documents, this is perhaps not a very propitious moment for a dissertation on "death duties and how they may be diverted"; and were we actually concerned in an attempt to frustrate the legitimate rapacity of the Chancellor of the Exchequer we should keep silent until the present storm were past. The subject of our remarks rests rather with the incidence of taxation and concerns the body of England spiritual, as well as financial.

Death duties have played an important part in former Budgets. They are exceedingly heavy and take toll upon the death of each succeeding heir to property, so that it is possible for a family rich in vested property to become impoverished within the passage of a few quick generations, and their estates and lands and all their useful property to be thrown upon the market or left to remain precariously balanced between solvency and bankruptcy.

Weakened by this and by the difficulties peculiar to an unagricultural and competitive world, the class of landowners who have been responsible in the past for the well-being of rural England are placed in the deplorable position of having to sell their possessions in order to pay the taxes on them. One after another, the great estates fall, disintegrate, and become eaten into by a horde of rapacious, mean-minded land developers. The rash of spoliation spreads over all the places which were once lovely, and in our anxiety to save what we may, we, the public, subscribe voluntarily or through our local taxes to buy the best of what is going.

We do not get the best, for we are not rich enough to buy what the public can make no concentrated use of; and rural England, the country of plough and pasture, field and hillside, is open to be violated as the axe of the Exchequer falls, now here, now there.

It has already been suggested that estates bequeathed to the nation should be exempt from death duties as a means of accelerating the flow of land worth keeping into the possession of the public; but this does not touch agricultural land, which, as the Duke of Montrose remarked in a recent article in *Country Life*, constitutes, in the aggregate, rural England.

He suggests, as a means of circumventing the nationalization of land, that the Finance Act of 1909–10 should be extended so that death duties may be paid in land of any description, and that this land should be dealt with by the Government according to its classification. Forest land could be looked after by the Forestry Commission; city land could be used for slum clearance, playing-fields, etc., and might be offered to the local authority on long-term credits; while agricultural land could be put back into farming under leases controlled by town planning regulations.

There would be no question of administration with red tape and officialdom. The change of ownership from private individuals would seek to perpetuate the existing order of things, and it would not be impossible to find the late owner a tenant under the Government, with most of the distresses of ownership behind him, with only a slightly decreased interest in the land, and with greater means at his disposal to make the best use of it.

The Government would naturally find itself responsible for the repair and maintenance of property, and would have to bear the local charges upon land and property; and there would have to be fixity of tenure for the tenant and a fair rent, properly determined.

This is a form of land nationalization, but it is a form that preserves and does not waste an inheritance upon which we daily set a greater value. None of it is pleasant for the landowner, but this method which the Duke of Montrose suggests appears less like dissolution than the saddening breaking-up of fine estates. It should be examined with every care, for even though Mr. Snowden is hard pressed for cash to swell his totals he cannot continue indefinitely to bleed the landowners without ruining their lands, which are our countryside.

RHYTHM IN RECTANGLES: LONDON'S NEW MODERNISTIC CINEMA

A photographic study of the cinema now in course of erection in Vauxhall Bridge Road, S.W., from the designs of Mr. W. E. Trent. The back of the building, in Wilton Road, opposite Victoria Station, is almost similar in design. Seating will be for 2,750. An entrance hall, behind the vertical treatment of the façade and extending the full width of the site, will connect these two thoroughfares with the auditorium. The stalls reach a depth of 20 ft. below the ground and are constructed partly under the pavement. Above will be a huge single balcony. A full stage, with dressing rooms, will be installed.

NEWS & TOPICS

CARDIFF SCHOOL AND THE UNIVERSITY OF WALES

UNDER Mr. W. S. Purchon the Welsh School of Architecture at Cardiff has gradually expanded to the point when, if it is to occupy the centre of architectural education for Wales as a whole, it must seek recognition by the University. It has quite deservedly won a place among the leading schools of the country, and it should now be possible for the young architect in Wales, as elsewhere, to take his training at a University centre. From the standpoint of the University, it would be a step in the humanizing of education to introduce a sense of good building and civic responsibility into its otherwise incomplete curriculum, and the incorporation would be to the good of general education as much as it would further the cause of architecture in a land where architecture is sadly needed.

THE NEW SACKVILLE STREET

What will become one of the completest pieces of rebuilding of contemporary London has been undertaken by the Sutton Trustees, who have commissioned Mr. George J. Skipper, F.R.I.B.A., of Norwich, to re-design Sackville Street in its entirety. This street, which runs from Piccadilly to Vigo Street, and thence into Regent Street, is one of the smaller streets which have benefited by the aggrandizations and popularization of the once very polite Regent Street. It carries no buses and may very well cater for what is known as "exclusive" shopping.

★

It is a little saddening to hear that it is to be in the eighteenth-century manner, fully equipped with columns and pediments; but to set against this there is the knowledge that the narrowness of the street is to be recognized in the reduced height of the façades, and that at a point about midway along the street there is to be a set-back in the frontage, forming a little square with fountains and pools.

★

No better means could be found of safeguarding the value of property than the creation of this gentle amenity. I hope they will prohibit undue advertising display, and control lettering; for the existence of such cultured landowners should be recognized by those who are to benefit.

BATTERSEA'S WREN HOUSE TO GO?

Not many people know of the little nucleus of Early Georgian buildings that cluster round the old church at Battersea. The church stands by the riverside, with its graveyard nearly tumbling into the water, and the pleasantest group of houses spreads about it. A little farther on is a fine old place that, if Wren did not build it, then at least it is so much animated by his quality as to appear the work of the master himself. This house stands in a large garden, behind an old brick wall, and for long has been a college. Now, however, it has been sold to the Borough Council of Battersea, who, it seems, are going to pull it down in order to put tenements upon the site. I am not certain whether this is actually their intention, for it is hard to believe that so fine a piece of work, soundly and beautifully built, straightforward in plan and useful for so many purposes, should be destroyed, when it could so well form part of whatever scheme of rebuilding the council have in mind. It is to be hoped that they will think twice before committing a crime.

WIDENING MEDIEVAL BRIDGES

Many medieval bridges, although of ample strength to carry the weight of modern traffic, are far too narrow for safety, and the question of widening these structures frequently arises. In most cases the ideal course would be to divert the road and build a by-pass bridge a short distance from the old one. So many bridges are built at right angles to the approach road that even when the bridge has been widened these sharp corners are a source of danger. If, however, a by-pass scheme is not possible, and the bridge must be widened, it is interesting to consider the alternative methods which have been used in the past.

★

The illustrations show three different types of procedure. In the case of the bridge over the Avon, at Fordingbridge, in Hampshire, the extra width has been obtained by building

Hele Bridge, over the River Tone, Somerset, a medieval structure lately widened in a manner detrimental to its appearance.

on to the cutwaters in such a way that the new work does not hide or shadow the chamfered arch-rings of the medieval bridge. It is otherwise with Hele Bridge, over the Tone in Somerset, which has been widened by carrying the parapet on iron girders built on the tops of the cutwaters, a method that has completely ruined the appearance of a fine bridge.

★

In both of these cases the amount of widening is comparatively small—about five feet—and should this not be sufficient the plan adopted at Bridford Bridge, over the River Teign in Devon, might well be more often followed. Here the sixteenth-century bridge has been widened, to nearly double its original width, by throwing across the stream a single segmental arch, leaving the middle pier of the bridge unspoilt.

THE SANCTITY OF SEALED DOCUMENTS

It is not very often that a case concerning the sanctity of sealed documents in connection with builders' tenders is before the courts. A recent case in which a co-operative society invited tenders for the erection of a building, and then examined the priced quantities in detail before

accepting one of them, cuts so dead against the traditional veneration for an honourable procedure in the handling of sealed documents that one may be glad to know that such things are of rare occurrence.

★

The priced bill of quantities is sent by the builder in a sealed envelope with his name on it, and, it being assumed that the builders who were asked to tender are reputable firms, the acceptance of one of their tenders is based on the totals and is nearly invariably the lowest

Extra width for the Avon Bridge at Fordingbridge, Hants, has been built on to, without obscuring, the cutwaters.

The widened portion of Bridford Bridge, over the River Teign, Devon, is inoffensively carried on a single span arch.

total. It is, of course, the duty of an architect to see that this procedure is carried out to the letter, since nothing destroys goodwill so easily as an attempt to question the honesty of a builder by taking advantage of his absence to probe into documents which are under seal.

THINK OF THE WINDOW-CLEANER !

There is a little point which, if attended to, would lighten the conscience of many an architect who designs high buildings. I refer to provision for the safety of window-cleaners. These men never seem to use the safety belts which the law orders them to use, and mainly because the law leaves the provision of suitable hooks or rings for hitching the belt on to, to the building owner. In America, where nobody would dare to stand on a sill hundreds of feet above the pavement, such rings are standard equipment. They should be here, of course, for a man who falls backward from the sixth floor is not much better off than the fellow who takes a little longer to fall from the sixtieth floor.

THE COUNTRY CRAFTSMAN'S BUREAU

The annual report of the Rural Industries Bureau shows a remarkable widening of its sphere of usefulness. The Bureau is an organization working under semi-Government auspices to provide an advisory service for country craftsmen. Now, country craftsman may denote nearly anything. It may be, for instance, the particularly futile manufacturer of useless knick-knacks, who is usually a woman; or it may be, on the other hand, the type of useful person whose activities have been temporarily thrown out of gear by a sudden rush of civilization.

★

I was glad to notice that the advisory bureau has concentrated upon the practical side of the business of making useful things well. It has helped the small man to use modern methods of working, and it has helped him with his costing and his accounts, which anyone who has had to do with village craftsmen, blacksmiths and the like, will recognize as one of their real stumbling-blocks. It is natural that the bulk of the work has had to be done by post and through the medium of pamphlets, charts, working drawings and the like. This is a drawback, but, when compared with the lack of all encouragement formally obtaining, it constitutes a very real advance, for encouragement sets a man to work and gives him the wish to make things. He needs but guidance and a certain public for his goods and he will learn to make them well.

★

There can be no doubt that the existence of a class of independent country workmen, maintaining a tradition and turning new furrows, is something that we cannot do without, and as architects we may perhaps help more than others in furthering the spirit of new health which the regeneration of rural industries will foster.

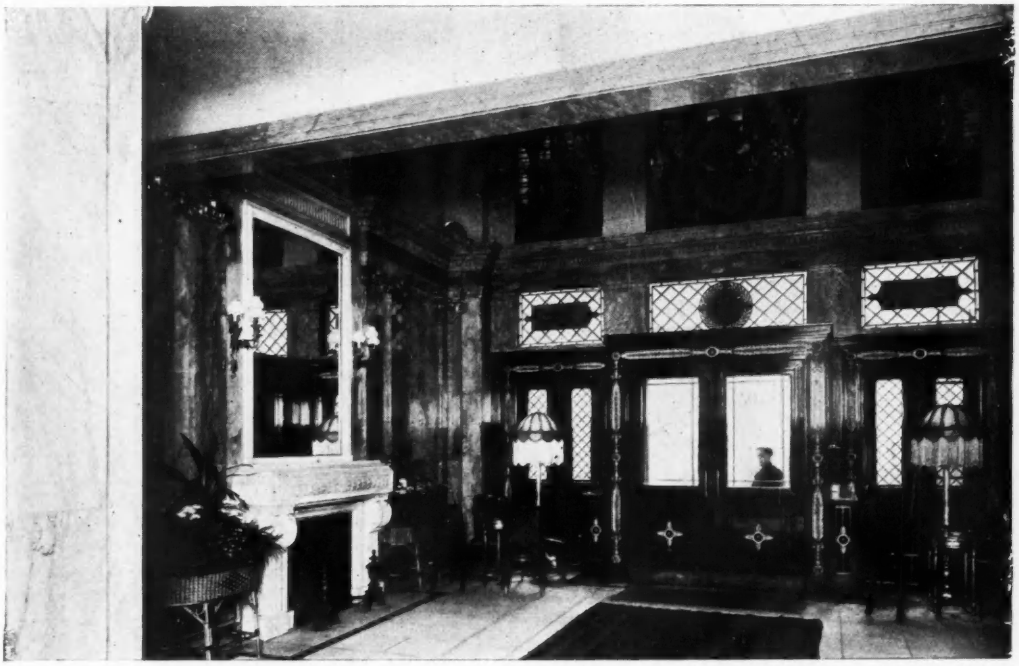
ASTRAGAL

TODAY : OPENING DAY

Today is the opening day of *THE SKETCH CLUB*. What is this *SKETCH CLUB* ? It is a place where sketchers meet, architectural sketchers of every sort and in every colour, to show their work. Whether they sketch for profit or for pleasure does not matter either. Once a fortnight their sketches are displayed in THE ARCHITECTS' JOURNAL. Today they may be seen for the first time. Admission is by way of pages 650 and 651.

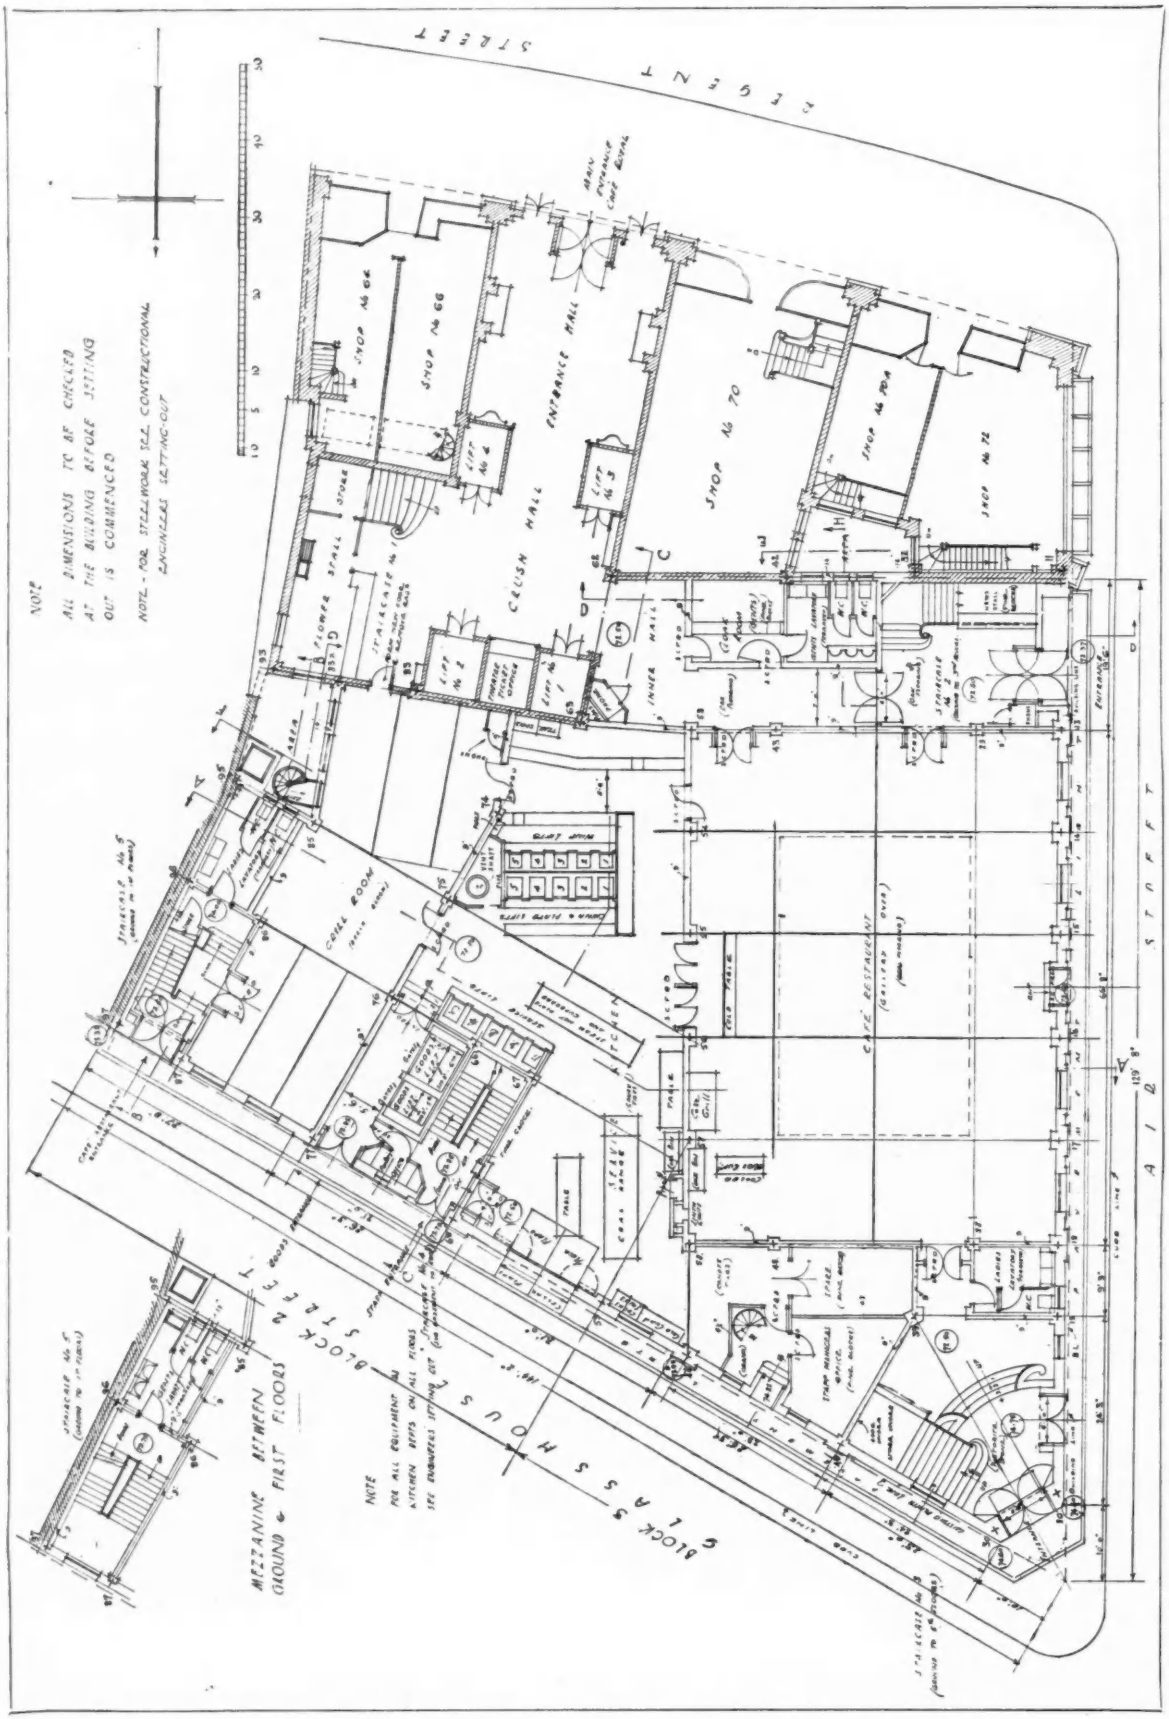
The Editor of THE ARCHITECTS' JOURNAL submits *THE SKETCH CLUB* to the notice of all those readers who own to a partiality for sketching. He hopes one day to reach the secret sketchers too, but those who indulge openly and pursue their hobby in public places must, he feels, set an example to the others. They are cordially invited to show their work in the ensuing exhibitions. Sketches should be addressed to the Editor, THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W.1.

The main entrance, from Regent Street. The doors and lamps are bronze; the pilasters of black Belgian marble, with bronze caps and bases.



The entrance hall, looking from the main entrance doors. It is lined with marble, and contains two monumental fireplaces and two fountains similar to those shown.

THE CAFÉ ROYAL, REGENT STREET, W.



DESIGNED BY MESSRS. HENRY TANNER

THE Café Royal stands on a three-sided site, bounded by Regent Street, Air Street and Glasshouse Street. It comprises basement and sub-basement, and eight floors above. On the Regent Street front the building is faced with Portland stone, and on the other fronts with cast stone.

The main entrance is from Regent Street, and leads into a vestibule designed in the French manner. Immediately inside the door is a lofty entrance hall, lined with marble and containing two monumental fireplaces

The entrance hall, looking towards the main entrance. On the ceiling is an original painting from the old building. The doors are mahogany. Above the leaded windows are three stained glass windows.

Café Royal, Regent Street, W. [*By Messrs. Henry Tanner.*

Outstanding features on the ground floor are the café restaurant and the grill room. A view of the former, which extends through two floors, appears on page 641. The grill room is refitted with all the original wall and ceiling decorations from the old café. Building was carried out in three sections, spread over a period of five years.

and two small fountains. Adjacent is the crush hall, containing the staircase and lifts. This hall is even more French and dignified than the entrance hall, and is particularly notable for the reason that a square stair plan has been adopted by the architects instead of the traditional Gallic spiral. The stair has a fine black iron and gilt balustrade.

has a gallery. They can be used for banquets or as ballrooms. The largest is the Napoleon. This can be divided into two apartments by steel shutters dropping from the ceiling, and can be used, if necessary, in conjunction with the adjoining Empire Room, for public and other functions.

In some of the apartments are original

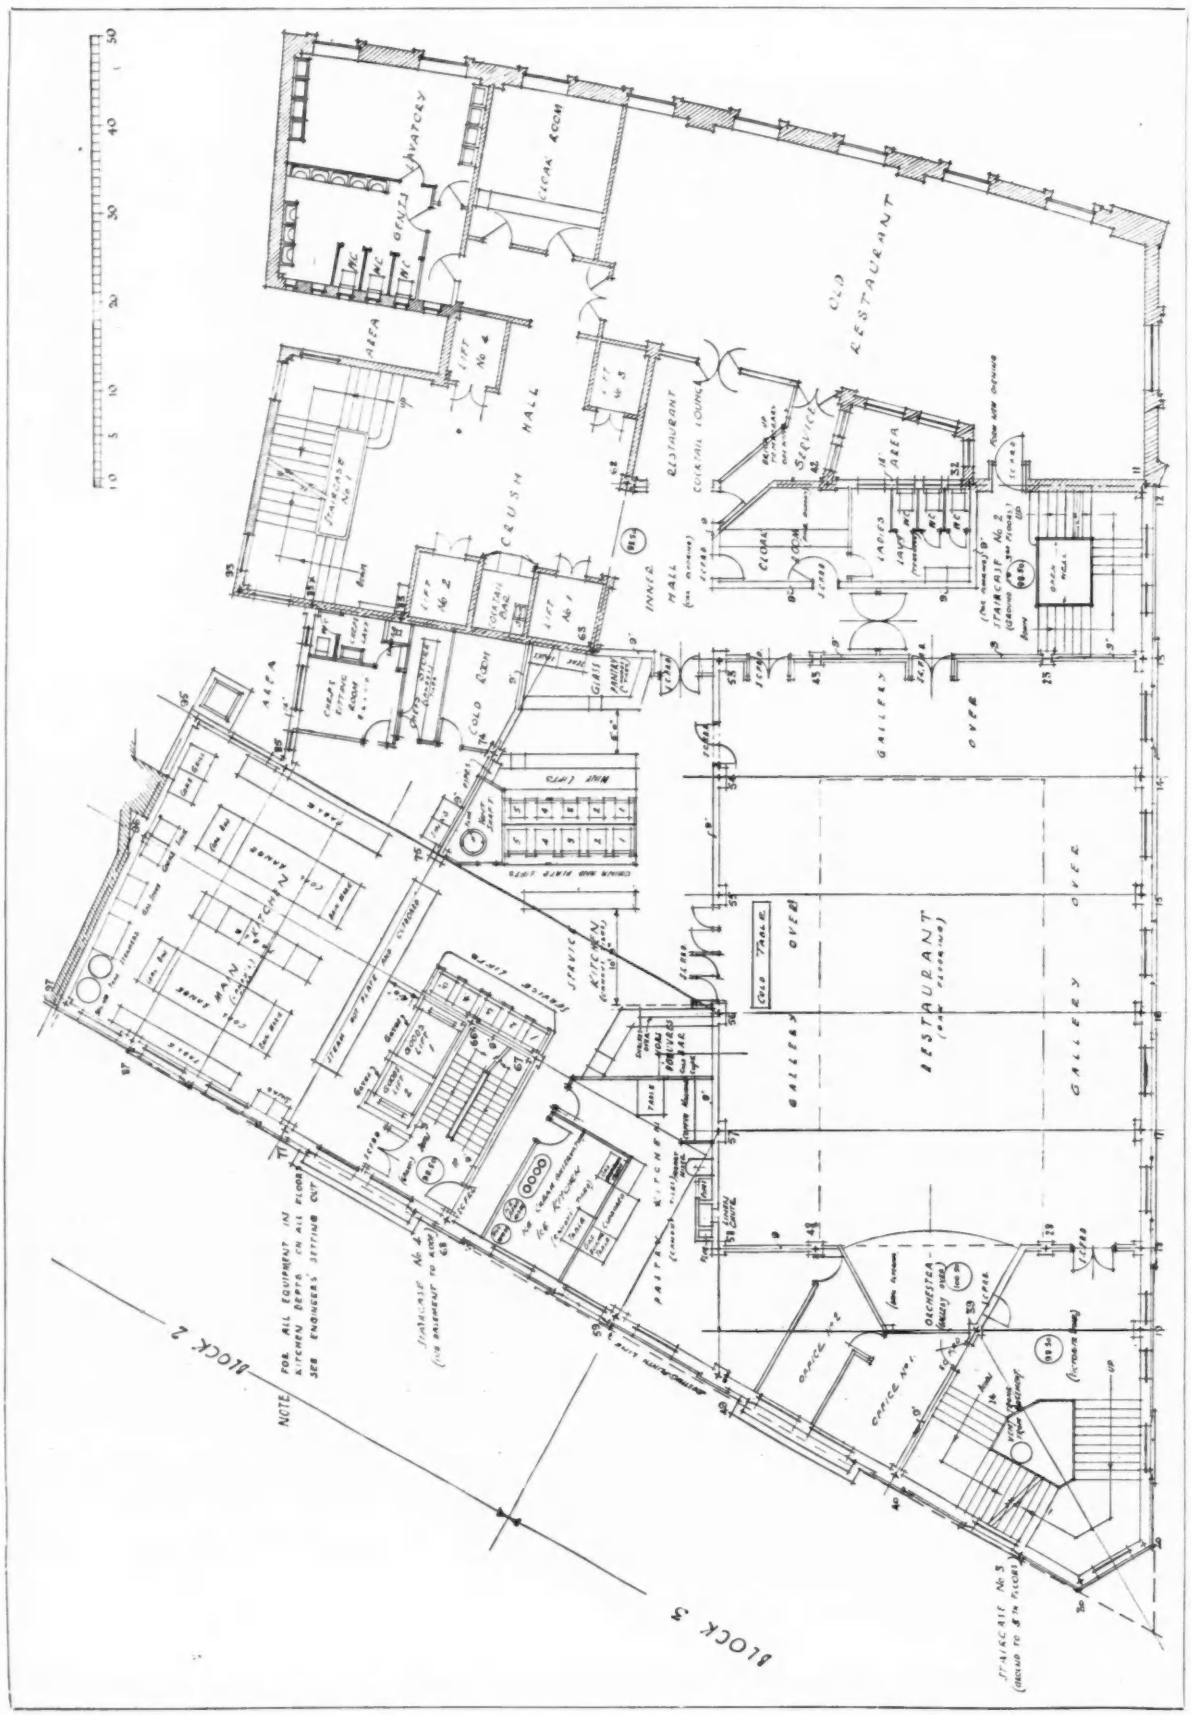
predominate. A more modern Continental feeling has been introduced in the Napoleon Room, and a new note struck in the details of the fittings generally, particularly the ornamental ironwork.

The Café Royal was founded in a small way by Daniel Nicol, a Burgundian and wine merchant of Paris,

Café Royal, Regent Street, W.] [*By Messrs. Henry Tanner.*

The Glasshouse Street (left) and the Air Street façades are of cast stone. The entrance doors at the corner are of mahogany with a grey granite surround. Steel casements are fitted.

Under the soffit of the staircase is a flower stall with a marble counter and wrought-iron trellis work.



Four high-speed lifts connect the various upper floors containing, among other apartments, the Marie Antoinette, the Josephine and other banqueting rooms, and the Masonic temples. The Napoleon and Louis XVI Rooms extend through two floors, and each

painted ceilings and tapestries re-used from the old building, and on the ground floor the grill room has been refitted with all the ceiling and wall decorations from the old café.

The banqueting rooms and restaurants gave the architects ample scope for variety of decorative treatment, a treatment in which the French designs of the Napoleonic and Empire periods

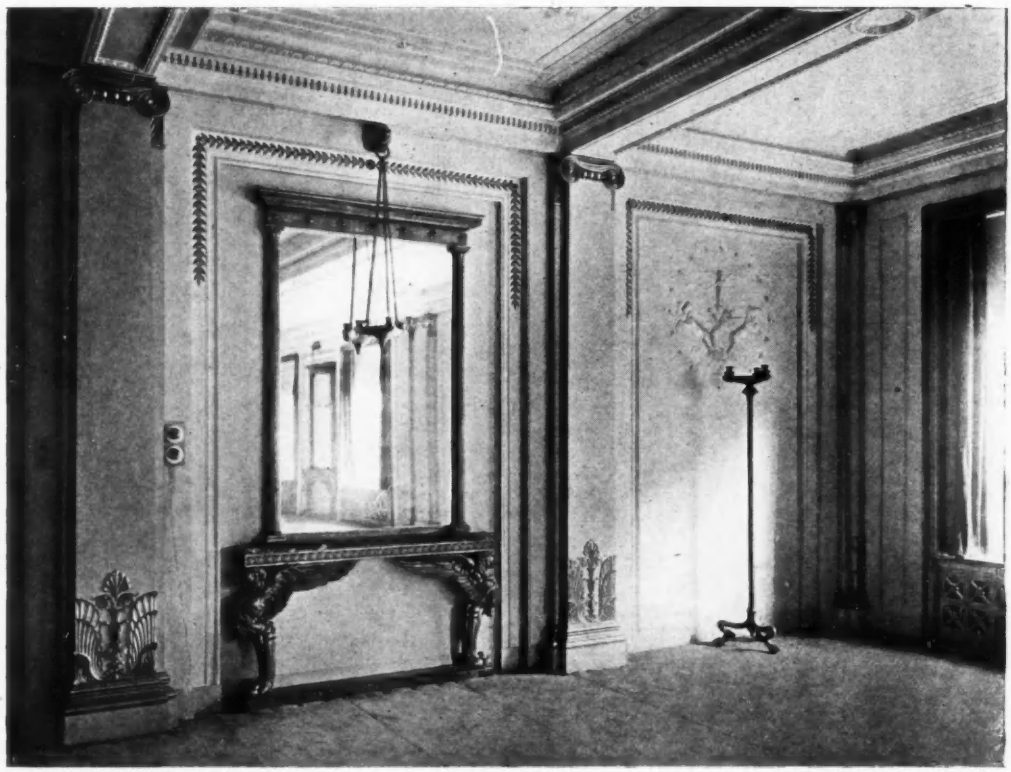
and his wife, both of whom had come to this country in the 'sixties.

At once it became the resort of French refugees and Huguenots, and later the rendezvous of outstanding personalities in literature, music, art and sport. Here might have been seen together Rossini, Garibaldi, Paderewski, Whistler, Wilde, Aubrey Beardsley and John Ruskin.

Café Royal, Regent Street, W. [*By Messrs. Henry Tanner.*

On the second floor are the restaurant, with its gallery on the floor above, and what is known as the old restaurant (for photograph, see page 642). All the kitchens and grill and service rooms are planned on the Glasshouse Street front, shown on the left of this drawing. Room has been found, above the central area, for a chef's suite.

The main staircase has a black wrought iron and gilt balustrade. On the left are seen lift-gates, similarly treated. Beneath the stair is a flower shop with a marble counter and fine trelliswork.

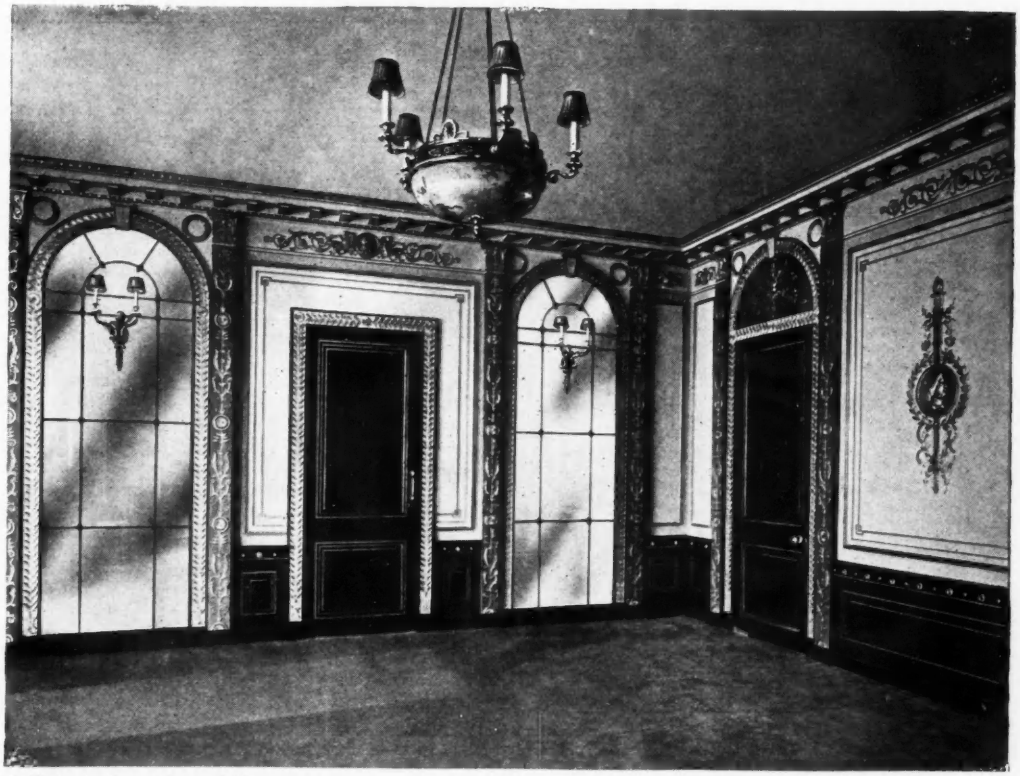


Café Royal, Regent Street, W. [*By Messrs. Henry Tanner.*

The gallery above the café restaurant. Both are decorated in striking colours, in which red seems to predominate. The electric light fittings in the ceiling and on the gallery balustrade are particularly effective.

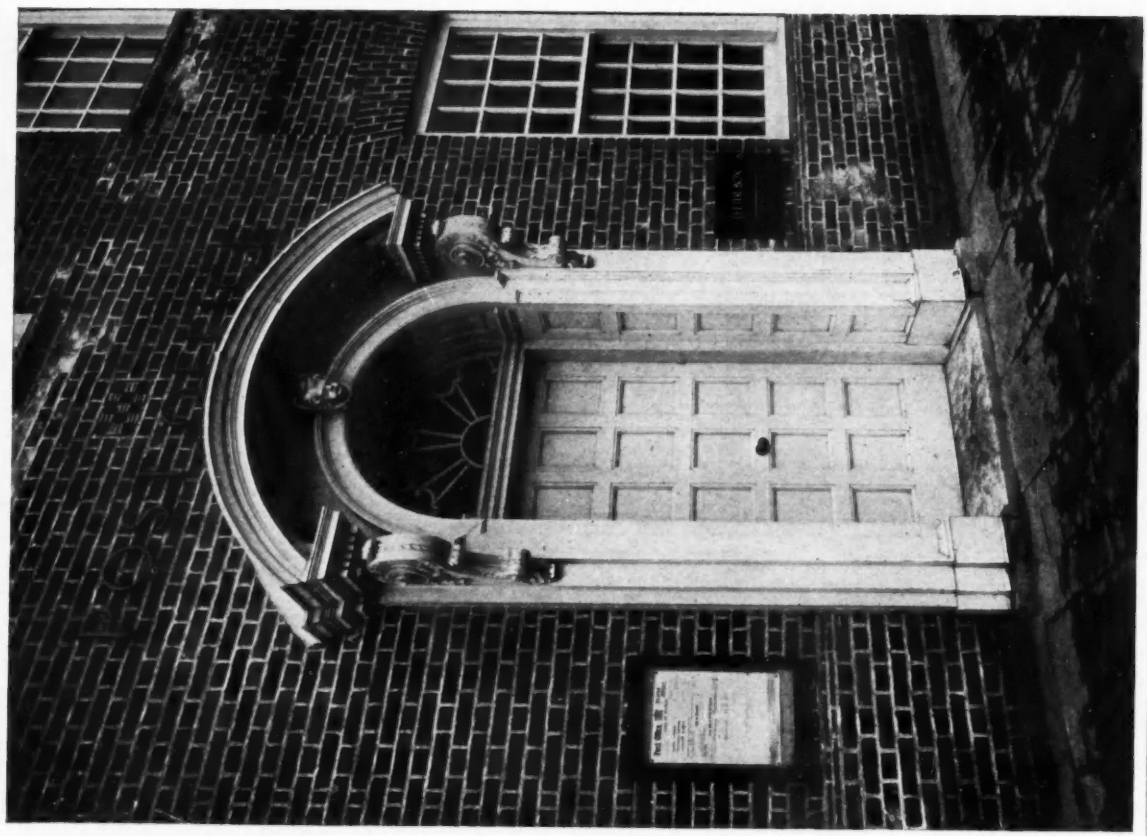
C

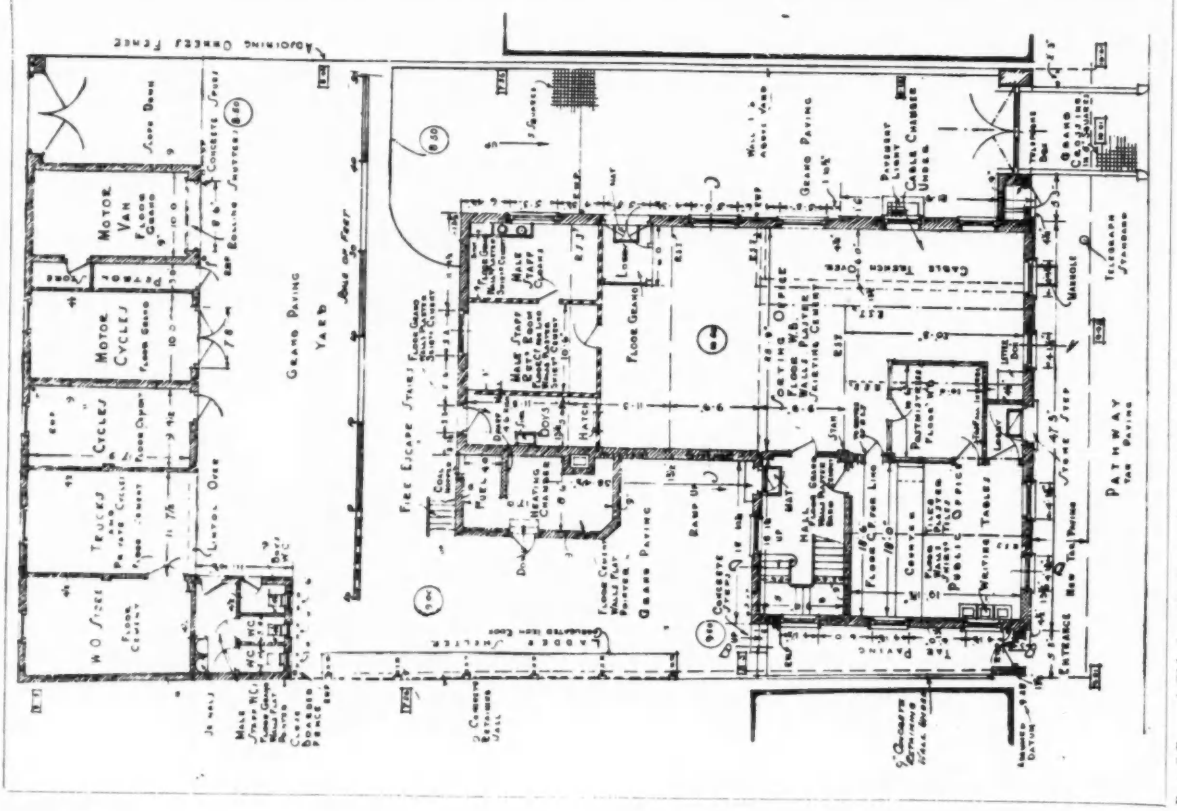
This is known as the old restaurant, for the reason that some of the materials from the original building have been re-used in its construction, such as the paintings on the ceiling.



Café Royal, Regent Street, W. [*By Messrs. Henry Tanner.*

In the Empire Hall the walls and ceiling are yellow parchment colour, picked out in gold. The panels on the ceiling beams themselves are of a full green tone.





The Napoleon room is the largest in the building. It is two floors high, and can be divided by steel shutters, which drop from the ceiling. Decorative colours include yellow parchment, green, amber and red.

Café Royal, Regent Street, W. [*By Messrs. Henry Tanner.*

The club room, like much of the other decoration, is in the Empire style, after the manner of Percier Fontaine. It has parchment coloured walls, red pilasters, and blue semi-circular door heads, all picked out in gold.

Post Office and Telephone Exchange, Egham, Surrey. [*By A. Balloch, H.M. Office of Works.*

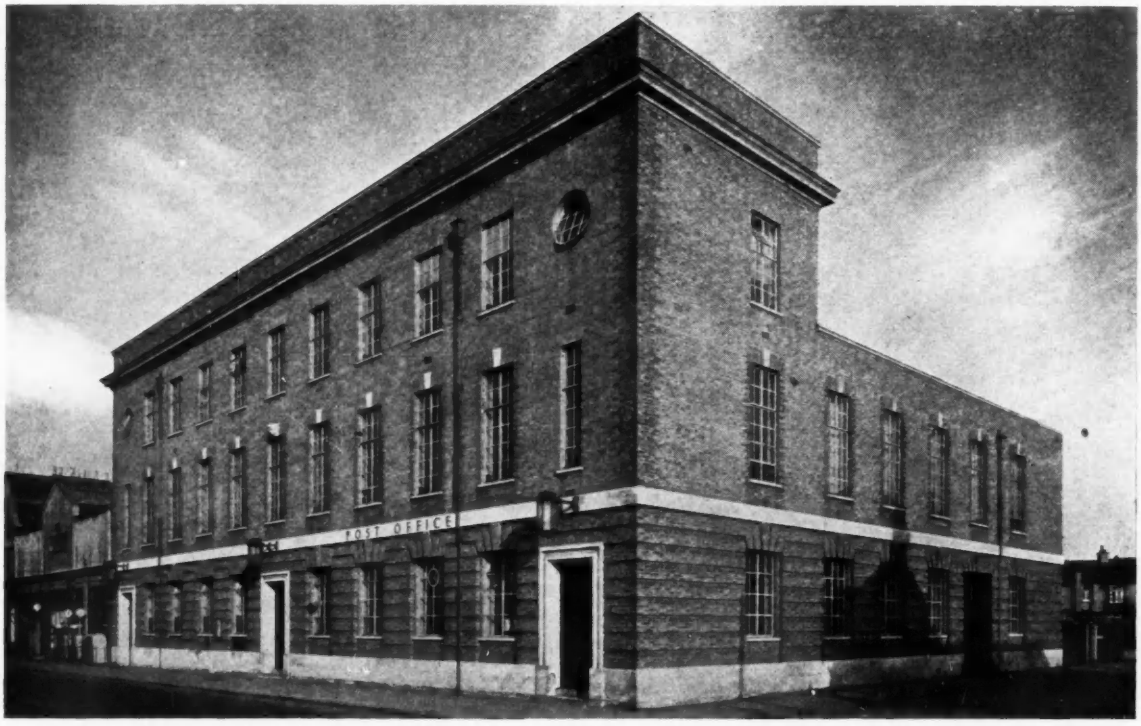
The ground-floor plan, and a photograph of the main entrance. The ground floor is used solely for postal purposes and comprises the public office, sorting office and retiring rooms for the male staff. On the first and second floors are the telephone exchange and welfare accommodation for the operating staff. The main entrance has a wooden doorway with carved hood brackets.

TWO MODERN POST OFFICE BUILDINGS

Egham : A. BULLOCH *ARCHITECTS* A. SCOTT : Mitcham

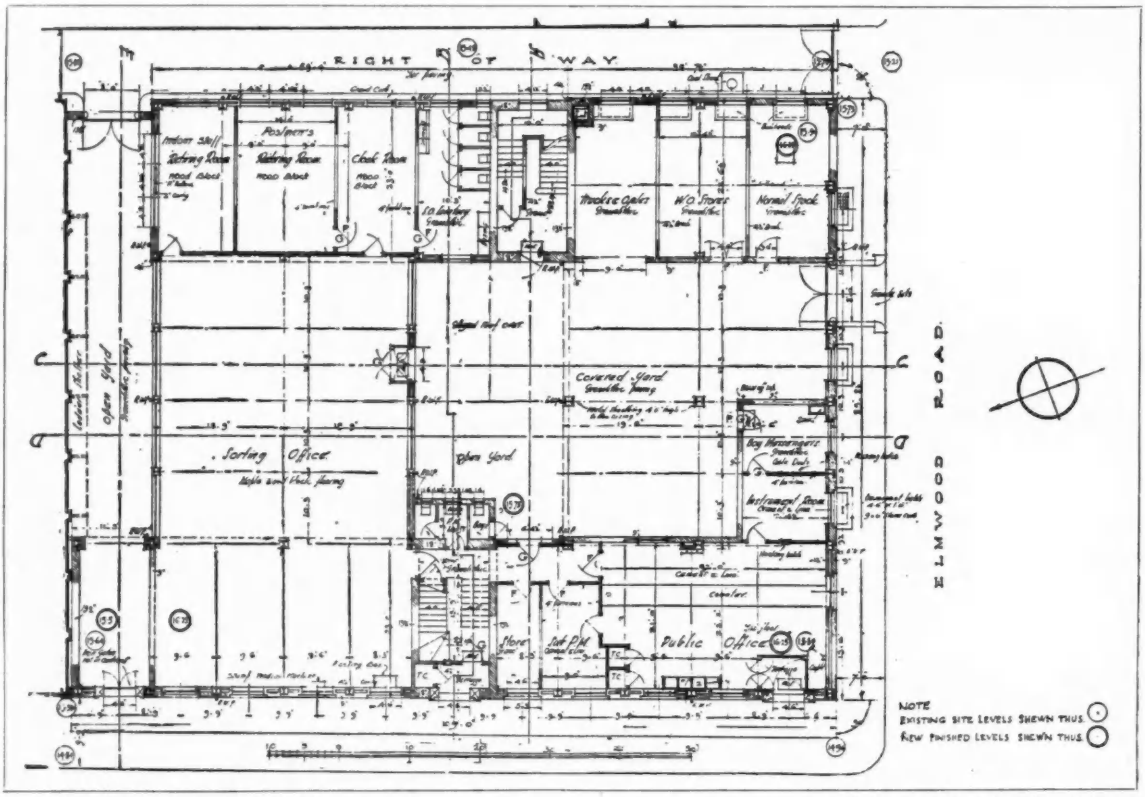
Post Office and Telephone Exchange, Egham, Surrey.] [*By A. Bulloch, H.M. Office of Works.*

The main front to Station Road. The principal elevations are faced with multicoloured, hand-made bricks, and the roof is covered with red sand-faced tiles.



(Plans reproduced by permission of H.M. Office of Works and the Controller of H.M. Stationery Office.)

THESE two buildings, in each case comprising a post office and telephone exchange, were designed by architects of H.M. Office of Works. That at Egham stands in Station Road, adjacent to the railway station; and that at Mitcham occupies a corner site, with frontages to London Road and Elmwood Road.



Each building is three stories high, and is planned with the public and sorting offices on the ground floor, and the telephone exchange on the upper floors.

On the ground floor at Egham, in addition to the public and sorting offices, are the postmistress's room and retiring room and "cloaks" for the male staff. Beyond the yard are outhouses for motor van and cycles, ordinary cycles, and stores. On the first floor are the apparatus room, battery and workmen's rooms, and retiring and cloak rooms for the women: on the second floor are the switch and night operators' rooms, and a spacious asphalt roof, upon which is an apparatus entrance to the switch room.

At Mitcham the building provides accommodation of a similar nature but in a more pretentious manner. The site is larger, and more space is devoted to the main working departments. Both buildings are situated in Surrey, and are erected in brick. An interesting feature at Egham is the installation of a clock on the right-hand side of the façade at first-floor level.

A view of the London Road (left) and Elmwood Road façades. The elevations are of purple bricks from the base to the string-course, and above of picked stocks. The three doorways on the main front, the cornice, stringcourse and base are of Portland stone.

Post Office and Telephone Exchange, Mitcham, Surrey.] [*By A. Scott, late of H.M. Office of Works.*

On the ground floor are the public and sorting offices, and a covered yard and stores for the use of the telephone exchange, which occupies the first and second floors. The building is designed to carry a further story in the roof.

ENGLISH PRECEDENT No. 112

IRONWORK IN GREAT ORMOND ST., LONDON, W.C.1.

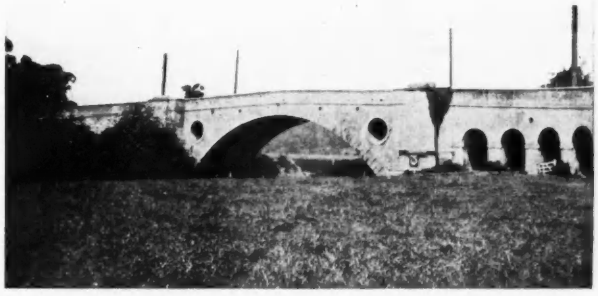
The ironwork of this house is unusually complete, as not only are the lamp holders and link extinguishers in position, but a gate still shuts off immediate access to the front door.

The ironwork is typically English, made from square and rectangular section bar, and of a weight seldom varied over the period. The remarkable point about it, however, is its harmonious blending with the other decorative work, in this case with the carved consoles and frieze over the door. Such unity of conception and decoration is the mark of a culminating period. It is beginning to be found again in the best modern work.

—[E. MAXWELL FRY.]

[*This illustration was one of many shown by Mr. W. A. Clark, F.R.P.S., in a lecture on "A London Pilgrimage," given at a recent meeting of the Royal Photographic Society, and is reproduced by his kind permission.*]

THE RURAL BRIDGE IN SOMERSET AND DORSET



Load Bridge, over the River Ivel, a few miles from Ilchester.

The bridge at Higher Wood, a quaint design in brick and stone.

Grey's Bridge, Dorchester, over the River Frome, built in stone in 1748.

Four miles from Bath, New Bridge, Corston, carries a tram road over the Avon.

Woolard Bridge spans the River Chew, a Somersetshire tributary of the Avon.

Cornford Bridge, near Sherborne, in Dorset, crosses the Caundle Brook.

Astragal has some notes, in this issue, on methods of widening medieval bridges.

A Quayside House, the Sound, Plymouth, Devon.
By E. B. Musman.

IN our seaside towns, with their medley of Victorian bay windows and twentieth-century dolls' houses, the interest of the visitor is often held by relics of older days. Small, unpretentious little dwellings, beautified by the passing of years, holding priceless historical secrets within their storm-swept walls, stir the imagination, and freshen the memory, of the passer-by. Stories of boyhood, buried treasure, pirates, windjammers, deep seas, storms and visions of the remote corners of the earth come rushing back.

Such little houses as those illustrated, one in Deal and the other in Plymouth, both in the most exposed and bleak positions, express an unqualified allegiance to the sea. The house at Plymouth looks out over the Sound, where the preparations were made to meet the threatened invasion by the Armada, and where, as tablets affixed on the adjoining quayside inform one, the embarkation of the Pilgrim Fathers on their perilous journey took place, and, in these later days, one of the first west and east transatlantic aeroplanes landed.

One must surely go back to the days when the artisan was the artist, when dwelling-houses were not the result of unimaginative use of tee and set squares, but were an expression of the life, work and environment of our fore-fathers, for the true, unspoiled character of our seaside towns.

E. B. M.

A Corner in Wiltshire.
By J. D. M. Harvey.

THE SKETCH CLUB

FEW sketchers work consistently in one medium. Many a masterpiece in the genre has been done in burnt match-stick on a marble-topped table, and, dusted away within the hour, has thereby been lost to posterity. Even in turning the leaves of the more permanent sketch-book, it is the diversity of means that is intriguing. It is fitting, then, that several of them should be exhibited here. The two seaside houses are small water-colours; the delicious corner in Wiltshire is in red crayon, while another couple of impressions from the same hand are in pencil; the study at Bordeaux shows sepia pen-and-ink work, with a sepia wash over all.

A sketch, however, is nothing if it does not tell its own tale; and as there is here, too, a background of marginal notes, the showman has no more to do than to declare open this

First Session

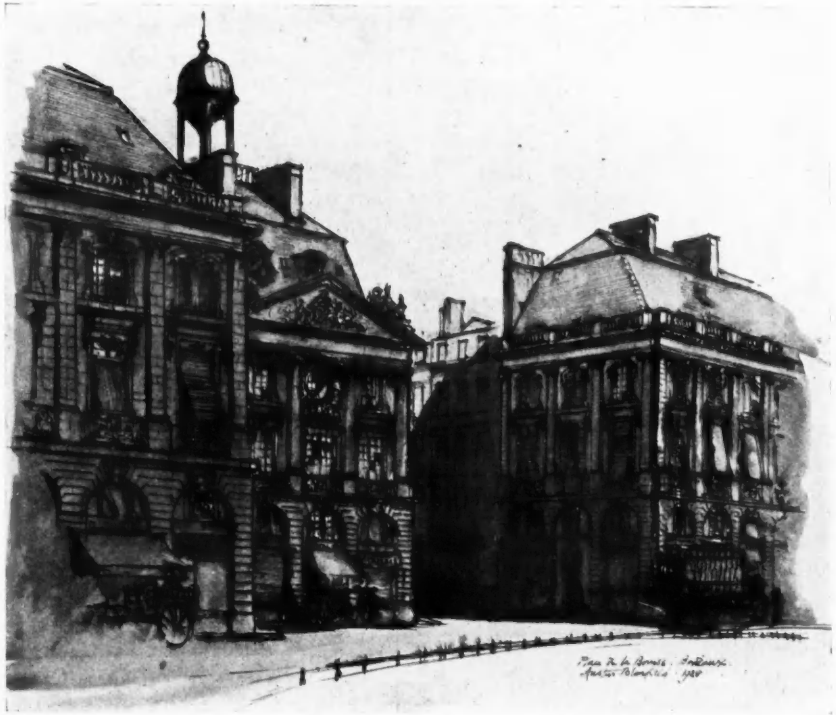
the accustomed treatment of the Bordeaux

positions, express an unqualified allegiance to the sea. The

First Session

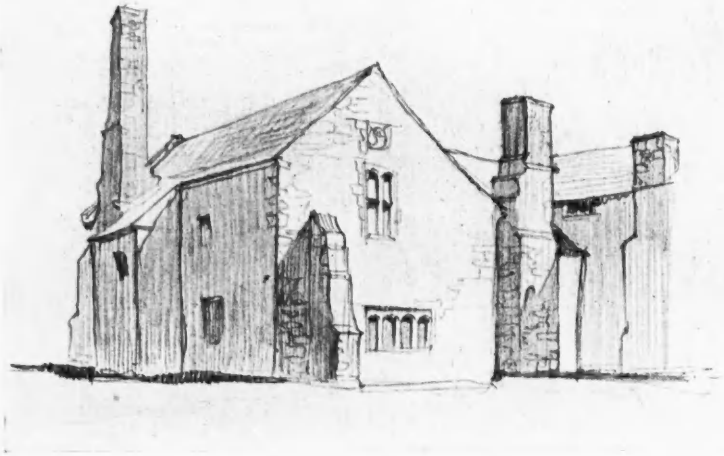
fathers, for the true, unspoiled character of our seaside towns.

E. B. M.



SOME cities will recall at a glance their distant histories and their medieval greatness. Bourges has not changed since the time of Jacques Cœur; Sémur, with its little crooked ways, could still be the home of ambushments, onfalls, sallies, and camisadoes. But of Bordeaux, the capital of the Black Prince, and of those times "when all the great lords of England and Gascony were within its walls, and each would have his trumpeter to blow as loud as his neighbour, lest it might be thought his dignity had been abated," there remain but a single tower, the fragments of its abbey, and its churches.

In effect, it is a town of commonsense planning and eighteenth-century comfort. There are none of the byways, ruelles, the impasses of a medieval town, but an array of imposing streets, well-planted boulevards, and an ordered cleanliness. There are many churches, but they do not catch the eye, nor is any one—as is the Cathedral at Amiens—the focus of the town.



The quays, where are the great wine-merchants' stores and the true wealth of the town, culminate in the Place de la Bourse, of its kind as good a piece of architecture as is to be found in France. It was begun in 1738, from Gabriel's design, and finished in 1755. The actual detail follows the accustomed treatment of the Bordeaux façades and, though extremely good, is in the regulation manner, but it is uncommonly impressive in its mass and scale. The buildings form three sides of a rectangle with canted inner angles; the centre block, thrown right back to allow of two streets entering, is treated with a pediment and cupola which repeats on either side; and the fourth side is formed by the embankment and river. It is placed at a part of the quay lying on a very flat curve, and forms the centre of an arc more than a mile long, and the gradual sweep to this great centrepiece, with the relief of the water and the shipping, form a most impressive composition.

It is the ordered seemliness of its streets and buildings that gives Bordeaux its place among cities famous for their architecture. Lovers of the picturesque and the medieval will be disappointed. Here are no fantastic skylines, no brave confusion of roofs' gables, broken skylines nor cobbled streets, but something of far greater value—method, dignity and restraint, the "ordonnance" of building beloved of the great French architects. And it is these that teach the lesson not lightly to be forgotten by the true lover of architecture.

IN PARLIAMENT

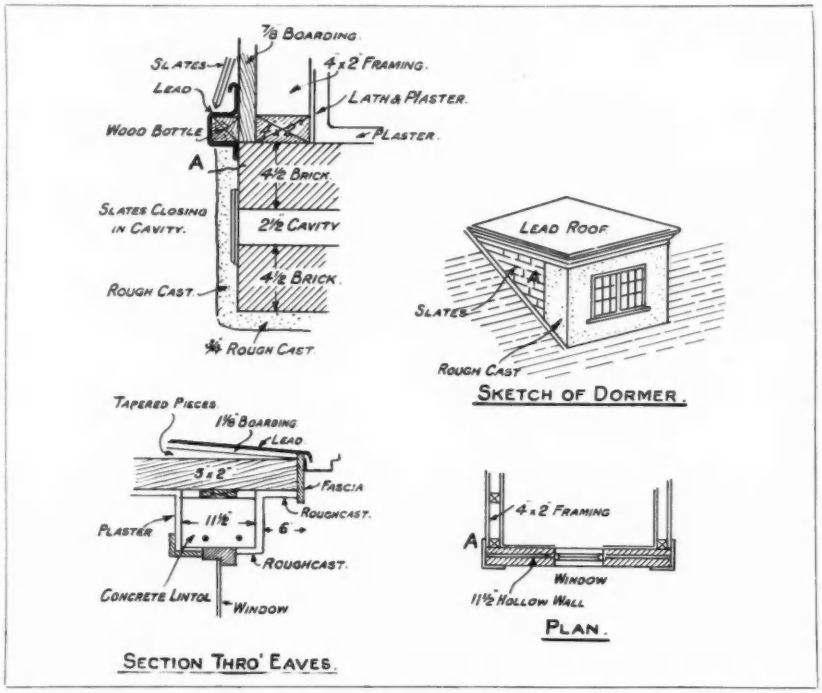
[BY OUR SPECIAL REPRESENTATIVE]

The Scottish Housing Bill

THE Scottish Housing Bill, resembling in its main features the Housing Bill or England and Wales, has received a second reading in the House of Commons unopposed. The feature of the discussion was the speech of the Secretary of State for Scotland, describing the depressing housing conditions in the country for which he is the responsible Minister. He drew a picture of the conditions which prevailed when the Royal Commission on Scottish Housing made a memorable report in 1919, revealing a distressing tate of affairs in many parts of the country. In a general way it showed unsatisfactory sites of houses and villages, insufficient supplies of water, unsatisfactory provision for drainage, inadequate provision for the removal of refuse, widespread absence of decent sanitary conveniences, houses in many of the mining areas badly constructed, incurably damp labourers' cottages on farms, whole townships unfit for human occupation in the crofting counties and the islands, primitive and casual provision for many of the seasonal workers. The Royal Commission did not deal in broad generalities; they came down to actual figures of houses needed. Briefly, the Commission recommended that there were required in Scotland no fewer than 121,430 houses to meet the needs of the people, based on the standard of housing in general acceptance in 1917. But the Commission were not satisfied with the standard of housing accepted at that time, and they were strengthened in that opinion by a reference to the census figures, which showed that half the houses in Scotland were of one and two rooms only. Accordingly, the Commission recommended the raising of the standard, and to raise the standard of housing an additional 114,560 houses were required—a total of 235,990 houses—before Scotland could be regarded as adequately housed. Each Government since the issue of the Commission's report in 1917 has made its contribution to the solution of that problem, and altogether to February 28 last, the latest date for which returns were available, there had been provided under all forms of State assistance by local authorities and private enterprise a total of 107,451 houses.

As it was estimated that 10,000 houses were required annually in Scotland to meet the normal needs and to provide for the new yearly demands, it would be realized that since 1919, when the first scheme of Government assistance was passed by Parliament, building operations have on average only just kept pace with the normal needs of the Scottish people. All who had given consideration to the subject were convinced that, however commendable the efforts of local authorities up to date had been, the houses built had not to any extent solved the problem of the slums or of the housing of the poorer section of the community. That section of the community comprised those whose economic position prevents them from paying the rent which was charged for the greater number of houses which had already been built. Some steps, however, had already been taken in that direction with the aid of the 50 per cent. grant made available under the 1923 Act, and 11,205 houses had been built at low rents specifically to take the place of houses that were occupied but were unfit for occupation.

Major Elliott, speaking for the Opposition in the Commons, said they intended to give the Government the Bill without a division. The Government had the responsibility—a grave and tremendous responsibility—for the housing of the people of Scotland. They had taken a considerable time to bring forward their proposals, and their responsibility was therefore all the greater.



The Haig Statue

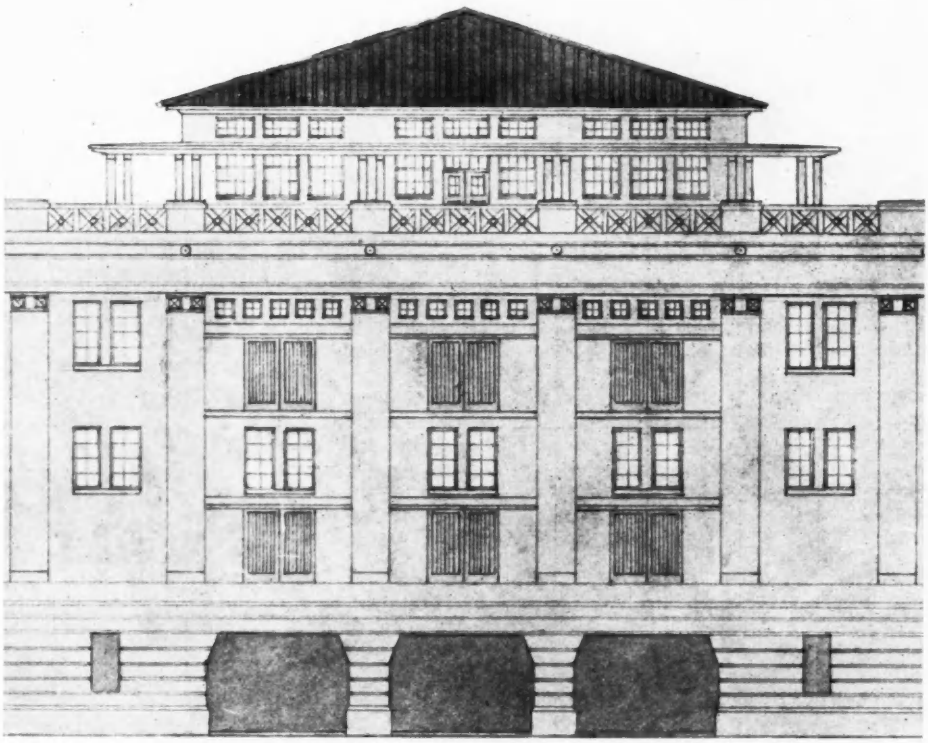
Mr. Lansbury, the First Commissioner of Works, answered a question with regard to the Haig memorial statue, the first model of which, it will be recalled, evoked much criticism from many quarters. When he last made a statement with reference to the statue (in November) the expenditure that had been incurred was £450, but an instalment of £100 is about to be paid to the sculptor towards the sum of £500 which it was agreed should be paid for the new and larger model. He pointed out that it was not possible to name any date for the completion of the statue, but the work on the new model was expected to occupy at least six months from the present time.

Hadrian's Wall

There have been strong expressions of indignation in the House of Commons at the news that a quarrying company proposes to quarry in the area of Hadrian's Wall in Northumberland. These operations, if they proceed, will change the countryside, it is said, in such a way that the Wall will be wholly changed in appearance, and the value of a famous monument of ancient Rome greatly depreciated. The difficulty in the situation, from the point of view of the Office of Works, appears to be that there is not sufficient power under the Ancient Monuments Act to protect the Wall.

It was announced in the House of Commons, in reply to members who used strong expressions about the proposed quarrying enterprise, that Mr. Lansbury, the First Commissioner of Works, will pay a personal visit to the Wall. His Department, it was also stated, are deeply concerned about the proposed operations.

S. E. M. writes: "*Can you inform me as to the detail of a windskew at the junction of slates and roughcast, as shown in the accompanying illustration? I have sketched out a detail which I do not think is quite satisfactory, as the roughcast is liable to crack, as shown at A, thereby admitting dampness.*"



[The Editor invites readers to reply to the above query.]

PROPOSED EXPORT WAREHOUSES AT ACCRA, GOLD COAST

H. B. CRESWELL, F.R.I.B.A., *Architect*

The warehouses, of which there are five separate units, are for the storage of cocoa preparatory to shipment. This is the elevation to the road at the back, from which the cocoa bags are transferred to the warehouses. This road is at the top of a low cliff against which the building abuts. Each warehouse has two floors, and the cocoa is delivered to the upper floor, where it is distributed by moving belt-conveyors running from back to front of the building, opposite each door, or by shoots to the lower floor, where it is distributed by similar conveyors. The small doors give access to stairs leading to office blocks on the roof.

This is an elevation of one unit of the building, facing the beach. The loading into ships is by beach-boats. The open basement is for storage of boats and gear. The bagged cocoa is conveyed to the water's edge by transporters, served by the band-conveyors, bringing the bags to each of the three doors on each of the two floors. The office building in which the business of the warehouse is conducted is arranged on the concrete roof. The walling materials throughout are concrete blocks; the floors and stanchions are of armoured concrete. The "ashlaring" is finished by facing the mould with an aggregate of fine chippings and washing and brushing the exposed surface while green.

This is the elevation towards the beach. The tower comprises quarters for signalmen, and signal mast and lantern (here only partially indicated, on right) for keeping ships informed of the state of the fairway, etc., by day and night. The building was part of a scheme for the development of Accra as a port, but engineering difficulties in building the necessary breakwater to shelter the embarkation beaches has led to the whole scheme being abandoned. The building was designed in collaboration with C. W. Pettit, M.I.M.E., M.I.Struct.E., the then Director of Public Works, Gold Coast Colony. These drawings are by Oliver Law, A.R.I.B.A.

LAW REPORTS

PUBLIC HEALTH ACT : IS DAMPNESS A NUISANCE ? COURT DECISION

Harbottle v. *Singleton. King's Bench Division. Before the Lord Chief Justice and Justices Swift and Branson.*

THIS appeal raised an interesting point under the Public Health Act, viz. whether dampness in a building constitutes an offence in law under the Act.

The matter came before the Court by way of appeal by Mr. Harbottle, as Town Clerk of Blackpool, from a refusal of the Justices of Blackpool to convict Mr. R. K. Singleton, who was the owner of No. 200 Promenade, Blackpool, of an offence against the Public Health Act.

Mr. Jolly, K.C., for the appellant, stated the facts of the case and said it appeared that there was a hole in the roof of the premises in question, and the rain percolated through the party wall into some of the rooms and ceilings of the adjoining premises, No. 202 Promenade. The result was that dampness of an extensive nature appeared on the walls and ceilings, and there were complaints of a nuisance. As the respondent failed to abate the nuisance, proceedings were taken by the Corporation, but the Justices dismissed the complaint, without calling upon the respondent. At the hearing before the Justices, the respondent argued that the evidence tendered by the Corporation did not disclose a nuisance in law, or that there had been any substantial damage, or that the health of anybody had been affected. The case put forward by the Corporation was that the evidence disclosed a nuisance and that it was not necessary to prove extensive damage or injury to health to establish the complaint. The Justices did not accept the Corporation's submissions, which counsel contended were good in law.

The Lord Chief Justice : Can you produce any general proposition of law that any degree of dampness is evidence of nuisance ?

Mr. Jolly said that here the evidence was that there was substantial dampness, and it was sufficient to show that there was interference with personal comfort and the possibility of health being affected to establish a complaint as to nuisance.

The appeal was dismissed with costs.

The Lord Chief Justice, in giving judgment, said the case was a plain one. Here the Justices had come to the conclusion on the evidence of the appellants that the respondent was entitled to succeed, being of opinion that on the facts proved or admitted no substantial nuisance existed, nor was there any evidence that there existed any injury to health. That matter was essentially a question of fact, and the Justices were perfectly entitled to come to the conclusion they had. The appeal would therefore be dismissed with costs.

Justices Swift and Branson concurred.

RIGHT TO SUB-LET : IMPORTANT POINT

Thorpeness, Ltd. v. *Davison. Chancery Division. Before Mr. Justice Maugham.*

This action is of interest because of the point decided by the Court in regard to terms of an agreement for a tenancy and the right of the landlord to withhold consent to sub-letting.

The plaintiffs, Thorpeness, Ltd., brought an action against Mrs. Dorothy Davison to recover possession of a furnished bungalow known as New Croft, Thorpeness, Suffolk, on the ground that she had committed a breach of her tenancy agreement by sub-letting the bungalow without the written consent of the plaintiffs.

Defendant by her defence relied upon a letter in which she said consent was given. She counter-claimed for damages for alleged interference with her right to quiet enjoyment of the premises.

Mr. Beebee, for the plaintiffs, who practically owned and ran Thorpeness, said the action was based on the alleged sub-letting of New Croft for August and part of September, 1928. Counsel said that the defendant went behind the back of the plaintiff and sub-let her bungalow to a Mrs. Farquhar, a most desirable tenant, without the consent of plaintiffs. When plaintiffs discovered this they felt bound to uphold the principle of the agreement. The letter on which the defendant relied was from the plaintiffs, in which they told her that her (defendant's) private arrangement with Mrs. Farquhar was not "in accordance with the terms of their agreement," and asking for particulars to enable them to adjust their commission charges. This letter, said counsel, was not answered and no consent to the letting was ever asked.

Mr. Roland Oliver, K.C., for the defendant, said the plaintiffs were angry at not getting their commission in this case. He submitted that the defendant had not committed any breach of her agreement, and that having got the consent of the plaintiffs it did not matter whether it was asked for or not. It was admitted that Mrs. Farquhar was above criticism as a tenant, and therefore in law the plaintiffs could not reasonably have withheld their consent to the sub-letting. Nor could the plaintiffs legally impose a fine in the nature of commission as a condition of their consent.

His lordship, in giving judgment, said he was of opinion that the letter of the plaintiffs meant that they had no objection to the sub-letting provided they were allowed to make out the agreement and their commission was paid. It was an assent on a condition which was the payment of something in the nature of a fine. That was contrary to section 144 of the Law of Property Act, 1925. Further under the Landlord and Tenant Act, 1927, the consent must not be unreasonably withheld, and it was admitted that Mrs. Farquhar was a respectable and responsible tenant. It had been clearly laid down in a number of well-known authorities that if a landlord asked for a fine as a condition of assent in such a transaction as this, or if he unreasonably withheld his assent, in either case the tenant was at liberty to effect the sub-demise without the assent of the landlord. It was stated that the company had brought this action to establish the principle that they were entitled to draw up the agreement and charge commission. His lordship said he wholly disagreed that they had any such right. The action therefore failed and would be dismissed with costs.

LIGHT AND AIR DISPUTE—A CASE FOR DAMAGES

Price v. *Hilditch. Chancery Division. Before Mr. Justice Maugham.*

This was an action by Mr. Walter Henry Price, the owner of No. 19 Surrey Road, Margate, against Miss Nellie Hilditch, of No. 17 Surrey Road, Margate, for a mandatory order to pull down a certain wall and building erected by the defendant in so far as it illegally obstructed the light of certain ancient windows of the plaintiff's house.

Mr. Gavin Simonds, K.C., and Mr. Nesbitt appeared for the plaintiff, and Mr. A. Grant, K.C., and Mr. Christy for the defendant.

Mr. Simonds said the issues for the Court were whether what was done by the defendant amounted to a nuisance, and if a nuisance, whether, having regard to all the circumstances, the appropriate remedy was injunction or damages. Plaintiff was the owner of No. 19 Surrey Road, which he let at £90 a year. Defendant's house was next, and a passage-way some 10 ft. wide, divided by a dwarf wall 3 ft. 6 ins. high, was between the houses. Plaintiff complained that the defendant had erected a building 42 ft. long and 23 ft. high over the passage on the side of her house, building on the site of the dwarf wall, which was her wall, and that this had interfered materially with the light coming to the plaintiff

kitchen and scullery. Defendant had suggested that a window should be cut in the scullery wall in the bay which opened upon the drawing-room window, but this suggestion plaintiff could not entertain. The result of the defendant's building operations were that the light to the kitchen and scullery was substantially diminished.

Mr. Geo. Holliday, a chartered surveyor, and Mr. John Douglas Scott, an architect, gave evidence that the lighting of both rooms had been very much interfered with and the light and amenities substantially decreased.

Miss Choisis, the tenant of No. 19, said she did not consider the kitchen and scullery were now adequately lighted.

Mr. Grant, for the defendant, said the real and serious issue here was the remedy. The defendant had spent £800 on the additions. His case was that the scullery was reasonably and adequately lighted and that the kitchen was practically not affected at all.

Mr. Percy Levett, an architect, of Margate, expressed the opinion that the quantum of light in the scullery was quite ordinary and with the reflected light he could read a newspaper in the remote end. The kitchen was adequately lighted.

Col. Stanley Page, of Margate, architect, surveyor and assessor, gave similar evidence and said the defendant's building had not affected the value of plaintiff's house one penny.

Mr. Potter, an estate agent of Margate, said the scullery was sufficiently lighted for all practical purposes. The kitchen was better lighted than the scullery. If the plaintiff's property had been depreciated, it was only to a small extent, if at all.

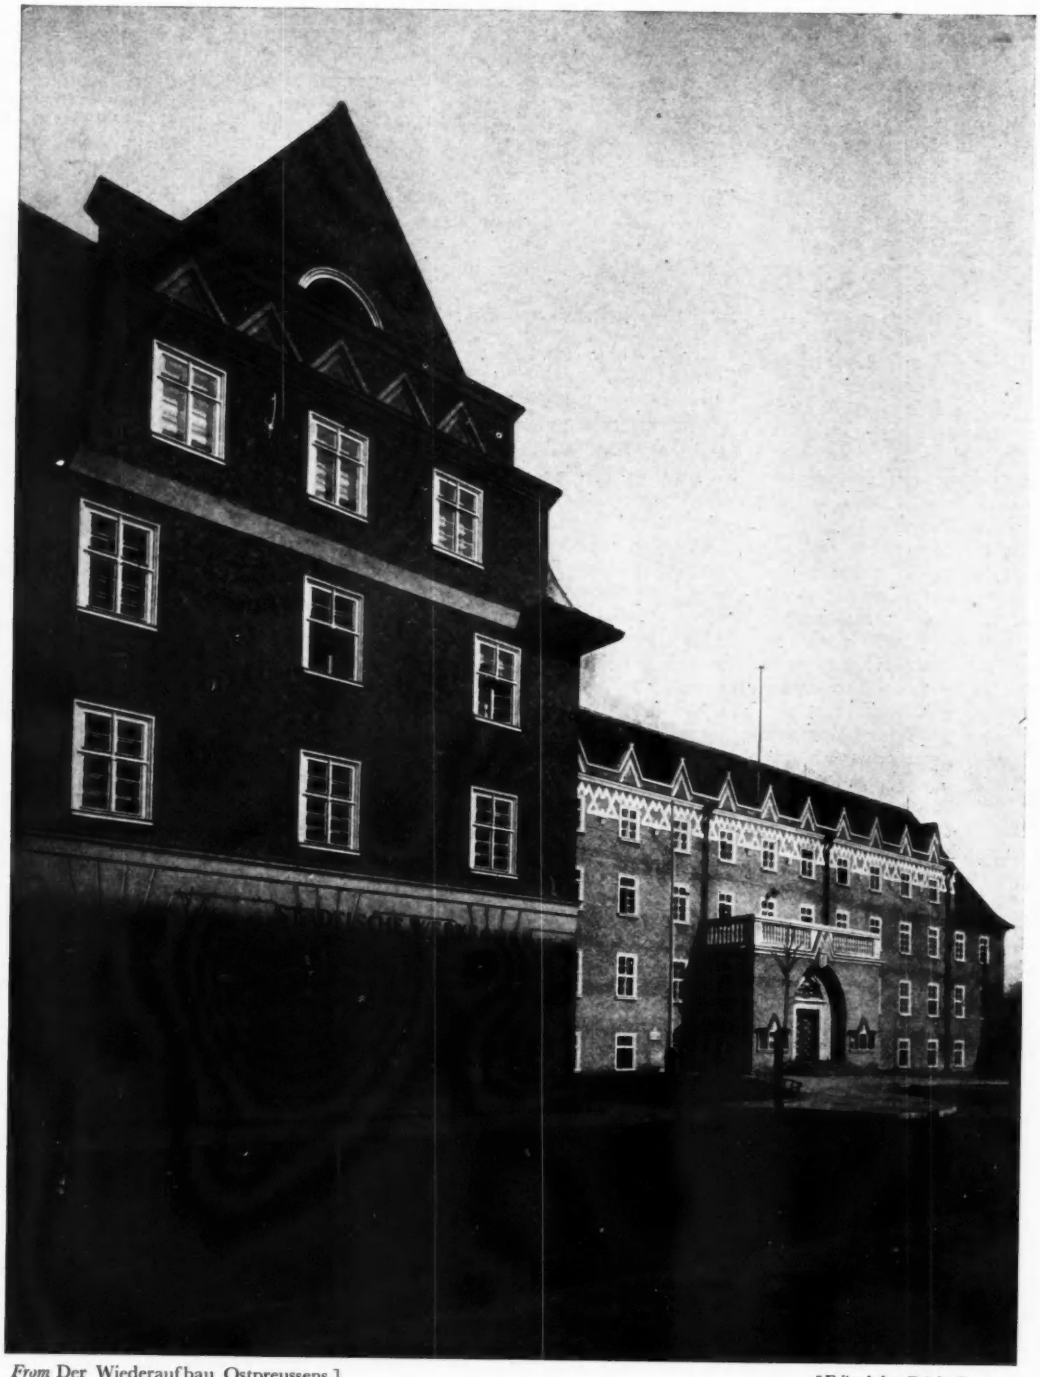
Other witnesses gave evidence to the same effect.

His lordship, in giving judgment, said it had not been established before him that the defendant's building was "rushed up" or that there was any attempt to "steal a march" on the Court. Under all the circumstances he could not think that this was a case in which the plaintiff could call upon the Court to make a mandatory order. The question was what was now to be done? He could not help thinking that some of the plaintiff's evidence was surprising. In his opinion the reflected light to the scullery did not make up for the loss of light owing to defendant's building. The light that now remained left the scullery a gloomy room, in which artificial light would have to be used to a large extent. The damage to the kitchen in regard to light was small compared with the scullery. In his judgment the plaintiff had suffered a legal wrong. In all the circumstances the case would be met by an award of damages, and he found for the plaintiff and ordered an inquiry as to the amount of damages the plaintiff was entitled to.

LITERATURE

THE HISTORY OF HITCHIN: VOL. II

IT would be a real gain if enthusiasts such as the writer of this exhaustive book could be found in every town and village in England, who would be willing to spend years of unremitting labour in compiling local records of every description and weaving them into a rich and interesting pattern. This is the second and concluding volume of *The History of Hitchin*. It covers a wide variety of subjects, based upon, and freely illustrated by, quotations from abundant contemporary accounts. The townspeople of Hitchin, through the centuries, live, move and carry on their business, both public and individual, their courts of justice and imprisonments, their sports, and their religious worship.



From a historical account of the now ruined chapel of Minsden, the book goes on to deal at some length in an interesting manner with the Puritans of Hitchin—and Hitchin, like Bedford, was a stronghold of Nonconformity. The "Church books" of the Baptists, the Independents, and the Quakers, provide an illuminating contemporary record of persecutions and vicissitudes, internal discipline and real piety. We read of how Hitchin people stole into the country to some cottage or dell to hear Bunyan preach as he passed by on his itinerary, sometimes, in pouring rain, with four women holding an apron over his bare head, or with scouts posted—or of Bunyan in disguise as a waggoner. Whitefield, too, preached in the fields till the sun made him faint with exhaustion.

There is a vivid portrait of Mercy Ransom, the Quakeress, in the handsome simplicity of her clothes, her strength of mind, her toils in the slums, her missionary journeys through England, Ireland, Scotland and Wales, her preaching in the London streets and in Hyde Park, her indefatigable visiting, her power to help and comfort.

From The History of Hitchin : vol. ii.] [*By Reginald L. Hine.*

Garden view of James Hack Tuke's house, The Croft, Hitchin. From a painting by James Lobley, 1873.

From Der Wiederaufbau Ostpreussens.] [*Edited by Erich Göttgen.*

Council House (Rathaus), Lyck, Germany. Designed by Herr Brurein.

Every aspect of the town life is touched upon, with authorities quoted, chapter and verse. Wills and testaments are the most human of documents, and here a long array of Hitchin citizens stand revealed in self-portraiture. The book is a mine of information, and the narrative runs easily and smoothly. It is a monumental work, the fruit of years of labour on the part of the author and his assistants.

The illustrations are from photographs of Hitchin, with portraits, and drawings by Samuel Lucas, from blocks engraved by Emery Walker.

ELEANOR K. D. HUGHES

The History of Hitchin: Vol. II. By Reginald L. Hine, F.S.A., F.R.Hist.S. George Allen and Unwin, Ltd. Price 15s. net.

GERMANY'S DEVASTATED REGIONS

IT is not generally realized that the five successive invasions of East Prussia by the Russian armies between August 1914 and March 1915 devastated over 17,350 square miles, or some three-quarters of this large and prosperous province. In the thirty-nine townships and 1,900 villages or hamlets temporarily occupied by the enemy,

41,414 buildings were totally and some 60,000 partially destroyed. Photographs of Schwirindt, Gerdauen and Ortelsburg, taken after their recovery, bear witness to ruin as desolating as anything seen on the Western Front, and no less complete for being more often the result of incendiarism than bombardment. It is only natural, therefore, that, in spite of the rural-architectural appeal of a very striking coloured dust-jacket, the book under review should be dedicated to "the Liberator of East Prussia," Field-Marshal von Hindenburg, now President of the Reich, commemorating, as it does, the wholly justifiable pride of his native province in having successfully terminated the reconstruction of its devastated areas.

Edited by an architect, who was himself actively engaged in that stupendous undertaking, this beautifully-produced volume, which is copiously illustrated with photographs, plans and maps, provides an admirably-documented, semi-official record of a splendid achievement.

Each of the ten chapters deals with a separate aspect of the province's restoration. They have been contributed by two of the leading architects employed and the seven distinguished civil servants who were directly responsible for its organization, supervision and finance. The original estimate of a milliard and a quarter gold marks (rather under £61,200,000) was barely exceeded, thanks to an administrative control that effectively precluded any possibility of the traffic in fraudulent claims which was such a scandalous concomitant of the reconstruction of the French war zones. Begun in 1915 and actually half finished during the war, the work was completed in 1925, notwithstanding the period of inflation which led to the collapse of the mark in 1923. An even more impressive thing about this immense concerted effort—which I would specially commend to Mr. Lansbury's notice—is that, though officialdom has always been regarded as omnicompetent in Germany, it was entrusted exclusively to architects in private practice.

This act of governmental self-denial has been amply justified by its fruits. Many of the rows of shops and houses illustrated are really charming. Serious exception, indeed, could scarcely be taken to a single detail on the score of taste. Street plans and building-lines, almost everywhere perpetuated in resuscitated Picardy villages, have been judiciously modified wherever an opportunity presented itself. Even the meanest cottage has been rebuilt to conform with the exemplary Prussian planning and building laws in regard to sanitation, the minimum number of rooms, and the minimum cubic and window space prescribed for each. So much for what has been gained on the utilitarian side. Comparison between buildings before and after, given on pages 180 and 181, shows that amelioration in seemliness, sightliness and general amenity is just as remarkable. Here again the contrast with France is anything but to her advantage. Though the domestic note is never allowed to exalt itself into affectations of a monumentality inapposite in quiet market towns, the gaiety and variety of groups of houses like those designed by Oberbaurat Lange in Eydtkühnen and Stallupönen enable small localities to express a distinctive architectural physiognomy. Something more human than mere model exercises in civic planning has been attained.

North Germany has very marked local mannerisms. These have been assimilated, reanimated, and then grafted on to more modern types of structure. It is particularly interesting to see forms, with which we are growing every day more familiar, beginning to emerge as early as 1915 from that intermediate chrysalis stage between Classicism and Modernism, vaguely described as Neo-Baroque. The doorways and fanlights are uniformly excellent. Good examples are those designed by Oberbaurat Lange (who has been responsible for more buildings than any of the eight architects whose work is represented), Paul Stephan and Erich Göttgen, the editor of this monograph. Notable among individual buildings illustrated are Herr Brurein's Rathaus at Lyck; the vicarage at Possessern; the courtyard entrance of a mansion in Schwirindt and the Haus Ebner in the same town; together with cow-byres on the Lindicken and Ranten estates, and a tile-works at Goldap, by Fritz Schopohl.

PAINT ON CEMENT SURFACES

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—It is a matter of common experience that when linseed oil paint is applied to cement-rendered surfaces which have not been given sufficient time to dry out, failure of the paint film often takes place. The degree of failure may vary from a few unsightly patches to a general softening and tackiness of the paint, sometimes accompanied by the formation of wrinkles and blisters containing a yellow liquid. Such a type of failure is also liable to occur on plastered surfaces.

It is commonly supposed that these failures are directly due to the presence of lime which, on account of its caustic nature, may destroy the oil film and also attack many classes of pigments, causing bleaching of the paint. On this account the pigments which resist attack have been termed "lime fast."

This type of failure has been the subject of recent investigation at the Building Research Station, and the results obtained have thrown rather a new light on the problem. After a series of tests, it has been demonstrated that such failures are not caused by lime alone, and that it is possible to paint on a freshly-prepared lime plaster surface without any softening or bleaching of the paint, even when the pigment used is not "lime fast."

If, however, soluble salts of soda or potash are also present, the paint film is quickly attacked unless the material is quite dry. The reason for the destruction of the paint is that, in the presence of moisture, the alkali salts are causticized by the lime, forming caustic soda and potash, which decompose the oil film. The tackiness which is experienced in such cases is due to the soluble soaps which are formed as a result of the reaction.

Portland cement nearly always contains both free lime and soluble salts of soda and potash. Hence painting upon Portland cement rendering before it is thoroughly dry and well matured (that is to say, before the free lime contained in it has been carbonated by a long period of exposure to the atmosphere) usually results in failure. Some classes of lime are liable to contain alkali salts whilst clay, introduced in dirty sand, is also a source of these salts.

Besides elucidating the cause of a number of failures experienced by painters, it will probably prove possible to utilize the reaction to demonstrate the presence in a given material of amounts of calcium hydroxide or soluble alkalis which are likely to cause trouble. It is hoped to publish shortly a full account of the experiments.

R. E. STRADLING,
Director of Building Research.

SOCIETIES AND INSTITUTIONS

LIVERPOOL CATHEDRAL

MR. G. H. FOGGITT, F.R.I.B.A., occupied the chair at a meeting of the West Yorkshire Society of Architects, held at Leeds, when the Rev. Canon W. Thompson Elliott delivered a lecture on "Liverpool Cathedral."

The lecturer first gave a brief history of the enterprise and said that it began with the acceptance of a design by the late Sir William Emerson. Sir William's scheme, however, was finally abandoned, and, after years of delay, a competition was held which resulted in the designs of Sir Giles Gilbert Scott being adopted.

The lecturer showed, by means of lantern slides, the relationship of the already executed portion to the contemplated whole, and dwelt upon the many characteristics of the buildings.

REGIONAL PLANNING

Mr. A. T. Pike, secretary of the Housing and Town Planning Association, discussing the intermixture of housing and industry at the concluding sessions of the Housing and Town Planning Conference organized by the Liverpool University Settlement for Students, said that today one saw industry occupying sites which would be better utilized for houses, and houses built on areas which were obviously industrial areas; so that when industry wished to extend, it either went in for the costly business of buying up houses or opening up in another part of the town and running two establishments. The type of upside-down town, in which everything was in its wrong place, was very costly.

If, he said, towns were planned from the beginning with each type of growth in its proper position, transport facilities, for example, would be less required, and that would be a means of considerable saving.

R.I.B.A. COUNCIL MEETING

Following are some notes from the minutes of a recent meeting of the R.I.B.A. Council :

The Twelfth International Congress of Architects, Budapest, September, 1930. On the recommendation of the Congress Committee it was decided to invite the following members to prepare papers for the Congress : (1) "Architectural Education in England in Relation to Practice," Mr. L. Sylvester Sullivan; (2) "The Registration of Architects in England," Major Harry Barnes; (3) "Architectural Copyright in England," Mr. W. E. Watson; (4) "The Rôle of the Architect in the Design of Industrial Buildings in England," Mr. R. A. Duncan; (5) "The Acoustics of Large Halls in England," Mr. Hope Bagenal.

The World Engineering Congress, Tokyo. A resolution of thanks was passed in favour of Mr. J. C. Wynnes, F.R.I.B.A., for acting as the R.I.B.A. delegate at the recent World Engineering Congress, Tokyo.

The British Engineering Standards Association. Mr. R. J. Angel, F.R.I.B.A., was appointed to represent the R.I.B.A. on the Committee recently set up by the British Engineering Standards Association to consider the standardization of commercial plywood.

The Council gave their formal approval to the extension of the province of the Liverpool Architectural Society which has taken place by reason of the North Staffordshire Architectural Association having become a branch of the Society.

The Council gave their formal approval to the affiliation of the Preston, Blackburn and District Society of Architects with the Manchester Society of Architects.

The Misuse of Power by Local Authorities. On the recommendation of the London Building Acts Committee the Council approved the publication of a note in the R.I.B.A. *Journal* asking members to submit evidence of cases in which local authorities appear to have exceeded their statutory powers.

The Fellowship. The Council by a unanimous vote elected Mr. R. H. Macdonald, of Montreal, to the Fellowship under the powers defined in the Supplemental Charter of 1925.

Membership. Nominations for membership were approved as follows : As Hon. Associates, 2; as Hon. Corresponding Members, 2; as Fellows, 18; as Associates, 43.

Reinstatement. The following ex-member was reinstated : As Licentiate, Mr. William Hull-Brown.

Application for election as Licentiate under Section III (*f*) of the Supplemental Charter of 1925. One application was approved.

Resignations. The following resignations were accepted with regret : Messrs. E. J. Wellman, F.R.I.B.A.; Charles Forsyth, A.R.I.B.A.; H. P. Briggs, L.R.I.B.A.; George C. Copestick, L.R.I.B.A.; Patrick Coughlan, L.R.I.B.A.; Alex. Gordon, L.R.I.B.A.; R. J. Hill, L.R.I.B.A.; G. Sharman, L.R.I.B.A.

Retired Fellowship. The following member was transferred to the Retired Fellowship : Mr. J. W. Stanley Burmester (elected fellow, 1891).

Election of Students. The following probationers were elected as students of the R.I.B.A. :

Albery, J. M. (Architectural Association).
Arthur, G. (Glasgow School of Architecture).
Briggs, J. W. (Leeds College of Art).
Brown, C. W. (Leeds College of Art).
Darroll, W. W. (Intermediate Examination).
Drury, E. (University of Manchester).
Fell, I. B. (University of Sydney).
Fish, J. (Intermediate Examination).
Gordon, H. V. (Architectural Association).
Gurney, H. V. M. (Intermediate Examination).

STUDENTS AND ARCHITECTURE

The National Union of Students has issued an appeal for an Establishment Fund, to place its finances on a sound basis. This Union, it is claimed, is the only organization which links together the students in the different Universities and University Colleges of this country, and in turn provides the means of actual relationship with those of the Dominions and foreign countries.

Tours to various countries are arranged, on which groups of students can not only see the practice of their future profession in that country, but learn something of the mentality of the people of the country which they are visiting. During the seven years of the Union's existence, these tours have been arranged in architecture and fifteen other subjects.

Further particulars may be obtained from the Appeal Secretary, the National Union of Students, 3 Endsleigh Street, London, W.C.1.

BUILDING RESEARCH INTELLIGENCE SERVICE

There has been set up at the Building Research Station of the Department of Scientific and Industrial Research, an intelligence service, one of whose primary functions is to collect and disseminate all information available regarding building materials and methods of construction. This organization is devoted to the provision for the building industry of a continuous stream of information collected from all sources throughout the world. All new books and pamphlets and over 150 scientific, technical and trade journals in the various languages are scrutinized. All items of interest are classified and indexed and the information that has been accumulated in this way is available free to all inquirers.

Mr. William John Hale, of Tainby, Snaithing Lane, Sheffield, architect, left £10,887 (net personalty £7,000).

READER'S QUERY

RAIN WATER DISPOSAL

A. G. writes : "*A steel-framed building is to be erected, consisting of two parallel bays 204 ft. long, one roof slope from each bay draining into one centre longitudinal valley gutter. The total area of roof to be drained is approximately 11,000 ft. super, and it is proposed to use a 16-in. by 8-in. c.i. box gutter to receive the rain water. It is only possible to arrange outlets at each end of the gutter. Is the size proposed sufficient and what should be the size of down pipes at each end?*"

Assuming the area which drains *to the valley gutter* to be 11,000 ft. super, and the gutter to be level or practically so (without fall towards outlets), the capacity of the gutter should be sufficient to allow for any normal rainfall getting away, so long as the two outlets remain unblocked; 5-in. circular or 4-in by 3-in. rectangular down pipes without offsets or bends likely to check the flow would be suitable.

To provide against the contingency of abnormal downpour or a blocked pipe, it is advisable in such cases that the cast-iron box gutter should be projected clear of the end walls, the direct outlet to the down pipes being formed beneath the projecting portion, and as a safeguard against the gutter filling and brimming over within the building, ample overflow outlets (akin to gargoyles) should be formed at the open ends.

E. G.

COMPETITION CALENDAR

April 28.—Messrs. Josiah Wedgwood and Sons, Ltd., invite designs in competition for a Wedgwood Vase, to be made in commemoration of the Bicentenary of the Birth of Josiah Wedgwood, which will be celebrated this year. Assessors : Philip Connard, R.A., W. Reid Dick, A.R.A., H. S. Goodhart-Rendel, F.R.I.B.A., and Frank H. Wedgwood. Premiums : £100, £50 and £25. Full particulars may be obtained on application to the Secretary, Messrs. Josiah Wedgwood and Sons, Ltd., Etruria, Stoke-on-Trent. Latest date for submission of designs : April 28.

May 16.—Messrs. Ewart and Son, Ltd., in conjunction with the Association of Architects, Surveyors and Technical Assistants, invite designs for a lock-up hangar for an aeroplane. The competition is divided into two classes, for those over and under 25 years of age at midnight, May 15–16, 1930. Assessors : William H. Hamlyn, A.R.I.B.A., and Chas. McLachlan, A.R.I.B.A., with A. N. Cathcart as technical adviser with regard to roofing, ventilation and hot-water supply. Two prizes will be awarded in each class, namely, free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. Messrs. Ewart and Son, Ltd., reserve the right to publish or make use of any of the designs for which a prize is awarded, but do not reserve the right to build in accordance with any of them. Particulars of the competition, etc., are obtainable from A. Seymour Reeves, Secretary, A.A.S.T.A., 26 Buckingham Gate, S.W.1. Latest date for submission of designs : May 16, 1930.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs : June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor : J. Ernest Franck, F.R.I.B.A. Premiums : £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs : June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor : Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor : H. V. Ashley, F.R.I.B.A. Premiums : £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs : July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor : Sir Brumwell Thomas. Premiums : £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs : July 31.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

10574. Tweed, H. J. Collapsible buildings, etc. April 3.

SPECIFICATIONS PUBLISHED

304327. Schaub, O. Shear-proof connection between the wood reinforcement and the concrete in wood-concrete structures.

327240. Ferrant, R. Floor construction.

308268. Lefevre, A. Reinforced-concrete constructional elements.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors, specialists and some of the sub-contractors for the buildings illustrated in this issue :

Café Royal, Regent Street, W. (pages 637-643). General contractors, Trollope and Colls, Ltd., and Higgs and Hill, Ltd. Sub-contractors : Moreland, Hayne & Co., Ltd., steelwork ; The Empire Stone Co., Ltd., Empire stone; Dent and Hellyer, Ltd., drainage, plumbing, etc.; George Jennings, Ltd., sanitary fittings; The Kleine Patent Fire Resisting Flooring Syndicate, Ltd., floors, roofs, flats, etc.; Richard Crittall & Co., Ltd., heating, hot water and ventilation; Cochran & Co., Ltd., boilers; Higgins and Griffiths, Ltd., and Higgs and Hill, Ltd., electric lighting ; Patent Victoria Stone Co., Ltd., stairs; Wotton and Sons, casements, sashes, etc.; Express Lift Co., Ltd., lifts ; J. A. King & Co., Ltd., pavement lights; J. Whitehead and Sons, Ltd., marble work to lavatories; The Art Pavements and Decorations, Ltd., mosaic work; Harold Cooper & Co., Kingsmill Art Metal Co., Caston & Co., Ltd., Jones and Willis, Ltd., Comyn, Ching & Co., Ltd., The Bromsgrove Guild, Ltd., and Bagues, Ltd., metalwork ; Higgs and Hill, Ltd., Harrods, Ltd., Hampton and Sons, Ltd., Robersons, Ltd., Paul Turpin, H. H. Martyn & Co., Sidney Laughton, Battiscombe and Harris, and Stratford-upon-Avon Guild, Ltd., decorations ; Sturtevant Engineering Co., Ltd., vacuum cleaning plant and despatch tube; Estey Organ Co., organ installation ; Benham and Sons, Ltd., kitchen equipment; Lightfoot Refrigeration Co., Ltd., ammonia ice-making and refrigerating plant ; Standard Telephones and Cables Co., Ltd., telephone installation ; Carter and Aynsley, Ltd., and Charles Smith, Sons & Co., Ltd., ironmongery ; J. A. Stevenson, carving.

Egham Post Office (pages 644-645). General contractors : Bunning and Fitton Adams, Ltd. Sub-contractors : Measures Bros., Ltd., steelwork; Macdougall and Son, wood-block floors ; Val de Travers, asphalt work to roof.

Mitcham Post Office and Telephone Exchange (page 646). General contractors : Wilson Lovatt & Co. Sub-contractors : Crittall Manufacturing Co., Ltd., steel casements ; N. F. Ramsay & Co., Ltd., bronze lamps; W. Aumonier and Sons, carving; Acme Flooring and Paving Co., Ltd., wood-block flooring; Humphreys, Jackson and Ambler, wrought-iron gates and grille.

House, Gervis Road East, Bournemouth (pages 662-663). General contractors. Hawkins Bros.

TRADE NOTES

For over three hundred years from its foundation in 1602 no artificial light of any kind was allowed to be introduced into the Bodleian Library, Oxford, but in 1913 the use of electric torch-lamps was permitted for staff purposes. On account of this lack of artificial lighting, it was necessary in winter to close the reading-rooms at 3 p.m. The proposal to instal the electric light into the building was brought forward in 1926 and finally approved in 1929. The contents of the library being of priceless value, quite irreplaceable and uninsurable, the most important point was to make the electrical installation perfectly safe.

A scheme has therefore been devised by which no flexible cords are used. The highest quality electric lighting wires enclosed in steel tubing are used and are conveyed to every lampholder whether they be portable fittings, pendants or other similar devices. All switches, lampholders and fittings of every description are metallically and electrically connected to the conduit, and the whole system earthed at many points, so that in the event of any improbable damage to an insulated wire, the only effect would be that the fuse protecting that circuit would "blow" and cut off the circuit from the supply until it was repaired. This system has been carried out throughout the reading-rooms and the picture gallery. Very little conduit is visible, in spite of the fact that no walls have been chased and no tubing sunk or hidden anywhere except under the floorboards.

In the upper reading-room and picture gallery, which are full of readers' desks and catalogue stands, a general lighting scheme of high intensity has been provided with no local illumination at all. This arrangement permitted the rearrangement of the desks, catalogue stands or bookcases without any alteration to the electric wiring. Each of these rooms is illuminated by nine Holophane reflector refractor units and 300-watt lamps.

These fittings are unobtrusive by daylight, and the shape of the glassware and lines of the four supporting chains blend with the architectural features of the room. The circuit wires are continued down to the lampholder from the junction box in the ceiling and are protected by a flexible metallic tube which is metallically connected both to the conduit and to the lampholder.

The older part of the building, the Duke Humphrey's Library, and the Arts and Selden Arts, are treated in an entirely different manner. Here the ceiling is painted, and of great beauty, and was required to be illuminated at night. Standards with wooden columns and heavily frosted enclosed bowls have been placed upon the tops of the projecting bookcases in the Duke Humphrey's Library, and on the tops of the gallery rails at the two ends. In each alcove in this library short brackets are clipped to the bookshelves, with metallic reflectors, and certain of the desks in other parts of the old reading-room have standards also with metal reflectors. The bookcases under the galleries are illuminated by a number of lamps with metal shades hidden under the mouldings. In every case the circuit wires are taken direct into the lampholder and each lampholder connected metallically to the conduit.

The illumination and electrical specifications for the installation were prepared by Messrs. Dolby and Williamson, Consulting Engineers, Westminster, S.W., and the entire electrical work has been carried out by Messrs. Hill, Upton & Co., of Oxford.

A corner of the picture gallery and the upper reading room of the Bodleian Library, Oxford, in which a safety system of electric lighting, here described, has been fitted.

Some interesting notes concerning the floors and ceilings adopted during the rebuilding of Nos. 23 to 29 Bouverie Street and Nos. 11 to 15 Whitefriars Street, now completed; and the rebuilding of No. 30 Bouverie Street and 9 and 10 Whitefriars Street, in course of progress, are given in a book recently published by the Tentest Fibre Board Company (1929) Ltd. The new building is for *The News of the World*, and the architect is Mr. A. Alban H. Scott.

The book shows the advantages of using Tentest for ceilings in conjunction with concrete. A photograph of a façade of the completed portion of the building forms the frontispiece, and on the opposite page are particulars of the constructional work involved. The machine hall, at basement level, covers three-quarters of an acre, and is spanned by massive bridge-like girders, which carry the stanchions of the five upper floors. Photographs and descriptions are then given of each of the various operations adopted during the construction of the ceilings.

To the hollow tile reinforced concrete floors, constructed upon rough timber shuttering, ceilings, it is said, were required of a material which would be fire-resisting, insulated as to sound and temperature, proof against condensation, and against damage due to vibration. They had of necessity to be of pleasing appearance, economical in cost, and capable of immediate and permanent decoration. The material forming the ceilings consisted of Tentest, supplied in sheets $\frac{7}{16}$ths of an inch thick by 8 and 9 ft. long by 4 ft. wide. These sheets were cut, by unskilled labour, into the exact lengths required to fit between the beams and girders supporting the floor, and were then laid face downwards on the shuttering. The next operation consisted of wetting down the back of the sheets. Water was applied freely, and allowed to remain for about ten minutes prior to the sheets being brushed with a stiff brush. The brushing raised the fibres on the back of the sheets, thus ensuring a key for the cement slurry, which was afterwards applied as a medium for securing adhesion of the Tentest to the underside of the concrete floors.

A stiff slurry of pure cement, mixed to a mortar-like consistency and laid to a thickness of at least $\frac{1}{8}$th inch, was next applied to the back of the Tentest. The slurry was applied whilst the Tentest was wet, and was worked only just ahead of each row of the hollow earthenware tiles which form the core of the concrete floor. Before bedding, the tiles were wetted on the underside to prevent undue absorption of moisture from the slurry. A pause was occasioned in order to place the reinforcing bars, which form the concrete ribs of the floor, in the spaces between the rows of tiles. During this pause the slurry between

the tiles was constantly wetted until the pouring of the concrete took place.

Concrete was then poured into the spaces, the mixture being sufficiently mastic to allow it to flow readily around the reinforcing bars, and brought flush with the top of the tiles. Additional concrete, necessary to complete the floor to a finished level, followed immediately, and was screeded off in the usual manner ready to receive a surfacing of asphalt terrazzo, or wood blocks, as desired.

After the temporary shuttering was removed the Tentest sheets were found permanently bonded to the floor, and, it is claimed, possessing all the fire-resisting and other properties required.

A new drawing office requisite has just made its appearance. It is called the "Ideal" frictionless tee square, and has been devised to avoid dust, rubber and loose graphite from pencils being ground into the drawing by the movement of tee square blades. By using an "Ideal" tee square the rubbing surface is reduced to a minimum as only the ebony edge is in contact with the paper. Frictional area, it is said, is reduced from 140 square inches to less than 10 square inches. Furthermore, the "Ideal" tee square is more easily moved than the ordinary type. It is made by Messrs. Douglas and Walls, Ltd., of 14 Tithebarn Street, Liverpool.

During last year approximately three million super yards of all-concrete road work, equivalent to 254 miles of 20-ft. carriage-way, were laid in the British Isles by the British Portland Cement Association, Ltd. This figure constitutes, it is claimed, a record for this type of construction, and shows the substantial increase of twenty-five per cent. over last year's figure. In the lighter trafficked areas approximately 164,651 super yards of the cement-bound road were laid during the year. This work has necessitated the production of at least 10,000 tons of steel, 120,000 tons of cement, 230,000 tons of sand and 460,000 tons of broken stone. For the manufacture of the cement and steel about 80,000 tons of coal were required.

Architectural Lighting, a new electric illumination bulletin, No. 8, issued by the Lighting Service Bureau, should be of service both to the electrical engineer and the architect. It is divided into two sections: the first dealing with the fundamentals underlying the subject, and the second presenting the various applications, suitably illustrated with successful examples. The incandescent lamp today finds application in almost every phase of human activity, and during the last few years it has rapidly become an indispensable adjunct to modern civilized life. Among the many interesting methods are lighting from panels in the frieze, lighting the ceiling, and providing a semi-indirect form of illumination, ceiling panels giving direct illumination and decorative luminous panels in the walls being used merely for effect.

THE ARCHITECTS' DIARY

WEDNESDAY, APRIL 23

KING'S COLLEGE, Strand, W.C.2. College term begins. **10 a.m.**

THURSDAY, APRIL 24

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee. Exhibition of Architects' Drawings of 1800–1850. 10 a.m. till 8 p.m. Saturdays 10 a.m. till 5 p.m. Exhibition closes on May 24. **10 a.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Architecture in its Relation to Modern Life." By Alfred C. Bossom, F.R.I.B.A. **6.30 p.m.**

FRIDAY, APRIL 25

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. **4.30 p.m.**

TOWN PLANNING INSTITUTE, Caxton Hall, Caxton Street, Westminster, S.W.1. "Road Surface Design." By G. L. Pepler, F.S.I. To be followed by a discussion. **6 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. West Wales (Swansea) Sub-Centre. "Surge Investigations on Overhead Line and Cable Systems." By S. W. Melsom, A. N. Arman, B.Sc. (ENG.), and W. Bibby, B.Sc. (ENG.).

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Visit to the works of Kodak, Ltd., Wealdstone. **2.15 p.m.**

SATURDAY, APRIL 26

Sunrise, 5.43 a.m. Sunset, 8.14 p.m.

MONDAY, APRIL 28

R.I.B.A., 9 Conduit Street, W.1. General Meeting. "Architects' Drawings of 1800–1850." By Professor A. E. Richardson, F.R.I.B.A., F.S.A. 8 p.m. Meeting of the Executive Committee. 4 p.m. **4 p.m.**

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. General Meeting. "Aerial Surveying and Archæology." By O. S. G. Crawford. 8 p.m. Exhibition of Wall Papers. 10 a.m. till 10 p.m. **10 a.m.**

NATIONAL FEDERATION OF RETAIL FURNISHERS, 11 Tavistock Square, W.C.1. Annual Dinner to be held at the Trocadero Restaurant, W.1.

TUESDAY, APRIL 29

R.I.B.A., 9 Conduit Street, W.1. Last day for receiving applications for the Intermediate Examination.

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Visit to the Armourers' and Brasiers' Company, 81 Coleman Street, E.C.2. **3 p.m.**

LONDON UNIVERSITY Term begins. **10 a.m.**

WEDNESDAY, APRIL 30

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. Annual General Meeting. **8 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

THURSDAY, MAY 1

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. Annual General Meeting. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Ordinary Meeting. The twenty-first Kelvin Lecture. "Some Recent Advances in the Electron Theory of Metals." By R. H. Fowler, F.R.S.

FRIDAY, MAY 2

NATIONAL SMOKE ABATEMENT SOCIETY, 71 Eccleston Square, Westminster, S.W.1. "By-laws under section 5 of the Public Health (Smoke Abatement) Act, 1926." By C. J. Allpass, L.C.C. To be followed by a discussion. **3.30 p.m.**

ROYAL SANITARY INSTITUTE. At the Town Hall, Tunbridge Wells. Tea, 5 p.m. Discussion on: "Can the Slum be Abolished?" to be opened by H. T. Taylor, M.S.I.A. 5.30 p.m. Edward Willis, M.INST.C.E., F.S.I., M.INST.T., will preside. **5 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Meter and Instrument Section. "The Metering Arrangements for the 'Grid' Transmission System in Great Britain." By C. W. Marshall, B.Sc. **7 p.m.**

SATURDAY, MAY 3

Sunrise, 5.30 a.m. Sunset, 8.24 p.m.

ROYAL SANITARY INSTITUTE. At Tunbridge Wells. Meet at Town Hall for visit to the premises of the New Maternity Home, 10–12 Calverley Park Gardens, where the architect, A. S. Killby, F.R.I.B.A., will give a brief address. 9.45 a.m. Visit to the Isolation Hospital. 10.45 a.m. Light refreshments will be provided. **9.45 a.m.**

MONDAY, MAY 5

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition opens to the public.

TUESDAY, MAY 6

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. "Luminous Traffic Signals." By T. Austin. (Light refreshments at 6.30 p.m.) **7 p.m.**

WEDNESDAY, MAY 7

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "National Parks." By S. K. Ratcliffe. Sir Fabian Ware, K.C.V.O., K.B.E., will preside. **8 p.m.**

THURSDAY, MAY 8

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. Ordinary and Annual General Meetings. **6.30 p.m.**

FRIDAY, MAY 9

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Annual General Meeting. "The Rotary Automatic Telephone System." By J. W. Moffatt and J. C. Emerson. **6.15 p.m.**

SATURDAY, MAY 10

Sunrise, 5.18 a.m. Sunset, 8.36 p.m.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION, The Castle, Winchester. Annual General Meeting. Address by G. C. Laurence, F.R.I.B.A., R.W.A., Chairman of Allied Societies Conference. **6.15 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. **2.30 p.m.**

MONDAY, MAY 12

R.I.B.A., 9 Conduit Street, W.1. Ninety-sixth Annual General Meeting. **8 p.m.**

WEDNESDAY, MAY 14

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Annual Dinner at the Hotel Victoria, Northumberland Avenue, W.C.2. The Earl of Crawford and Balcarres will preside. 7.30 for 7.45 p.m. (Tickets 12s. 6d. each.) **7.30 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art to be opened by the Archbishop of Canterbury.

LONDON UNIVERSITY Presentation Day. Albert Hall. **2.30 p.m.**

THURSDAY, MAY 15

R.I.B.A., 9 Conduit Street, W.1. Annual Dinner to be held at the Guildhall, E.C.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual General Meeting, 6 p.m. Irish Centre (Dublin). At the Physical Laboratory, Trinity College, Dublin. Annual General Meeting, 7.45 p.m. Hampshire Sub-Centre. At Southampton, Summer Meeting. **6 p.m.**

FRIDAY, MAY 16

INSTITUTION OF ELECTRICAL ENGINEERS. Scottish Centre. At the Technical College, Dundee. The twenty-first Kelvin Lecture. "Some Recent Advances in the Electron Theory of Metals." By R. H. Fowler, F.R.S. **7.30 p.m.**

SATURDAY, MAY 17

Sunrise, 5.6 a.m. Sunset, 8.47 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Second visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. **2.30 p.m.**

MONDAY, MAY 19

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. General Meeting. "The Architectural Association, 1847–1930." By F. R. Yerbury. (Lantern Illustrations.) Exhibition of Architecture of Bloomsbury. Until June 14.

WEDNESDAY, MAY 21

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

THURSDAY, MAY 22

ARCHITECTURE CLUB. Dinner to Eric Mendelsohn. Particulars will be announced at a later date.

SATURDAY, MAY 24

Sunrise, 4.57 a.m. Sunset, 8.57 p.m.

MONDAY, MAY 26

R.I.B.A., 9 Conduit Street, W.1. General Meeting. "Recent Excavations at Ur." By C. Leonard Woolley, M.A., HON.A.R.I.B.A. **8 p.m.**

WEDNESDAY, MAY 28

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Father of English Pottery—Josiah Wedgwood, F.R.S., Potter, Inventor and Man of Science." By Harry Barnard. Frank H. Wedgwood will preside. **8 p.m.**

SATURDAY, MAY 31

Sunrise, 4.50 a.m. Sunset, 9.5 p.m.

MONDAY, JUNE 2

INSTITUTION OF ELECTRICAL ENGINEERS. Summer Meeting at the Irish Centre. June 2–6, inclusive. Assemble in the evening at the Gresham Hotel, Dublin.

TUESDAY, JUNE 3

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Motor trip in Co. Wicklow, including inspection of overhead transmission lines. Lunch and tea at Glendalough.

WEDNESDAY, JUNE 4

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Proceed by special train to Limerick for visit to the Shannon Scheme.

THURSDAY, JUNE 5

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Visit the brewery of Messrs. A. Guinness, Sons & Co. Lunch by invitation of the Company. Afternoon: Leave Dublin by special train for Belfast. Evening: Reception by the Lord Mayor of Belfast, Rt. Hon. Sir William Coates, at the City Hall.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BARKING U.D.C. Health Committee has asked the architect to submit revised plans and estimate for the erection of a clinic in the Town Yard.

The L.C.C. is to extend the Dickens housing estate at Hickman's Folley area, BERMONDSEY.

The Royal Institute of Public Health is appealing for financial aid for the scheme for erecting new premises in Queen Square, BLOOMSBURY, W.C.

The CHELSEA B.C. is negotiating for the sale of a large housing site in Manor Street, to a large philanthropic housing trust for development.

The CITY OF LONDON Corporation has granted the application of the Postmaster-General to erect three passenger bridges across and over Knightrider Street, in connection with the proposed telephone building on the site between Knightrider Street and Queen Victoria Street.

Plans passed at CLAPHAM: Alterations, 833 Wandsworth Road, for Messrs. Holliday & Greenwood, Ltd.; additions, Queenswood Court, King's Avenue, for Mr. H. P. Sanders; house, Bonneville Road, for Mr. G. W. Dorley Brown.

The COULSDON U.D.C. is considering the purchase of ten acres of land forming part of the Kenley Park Estate, for recreation ground purposes.

The COULSDON U.D.C. Housing Committee has instructed the surveyor to submit a report on the question of the provision of further Council houses.

The EAST HAM Corporation Electricity Committee has instructed the borough engineer to submit an estimate for the erection of the Plashet sub-station.

On behalf of Kerr's Bakeries, Ltd., Mr. W. S. Grice is to erect buildings in Tysoe Street, FINSBURY.

The FINSBURY B.C. has prepared a scheme for the development of a site in Margaret Street, by the erection of tenements comprising 773 rooms, at an estimated cost of £153,000.

The FULHAM B.C. Electricity Committee has reported that, in connection with the proposed extension of the generating station, Sir Cyril Kirkpatrick has recently concluded his negotiations for the acquisition of premises in Townmead Road. The suggested terms have been approved by the Central Electricity Board.

The L.C.C. is to invite selected firms to quote for the erection of extensions at the Geffrye Museum, HACKNEY.

The Kensington Housing Trust, Ltd., is to erect twenty-one flats at Kensal Road, KENSINGTON.

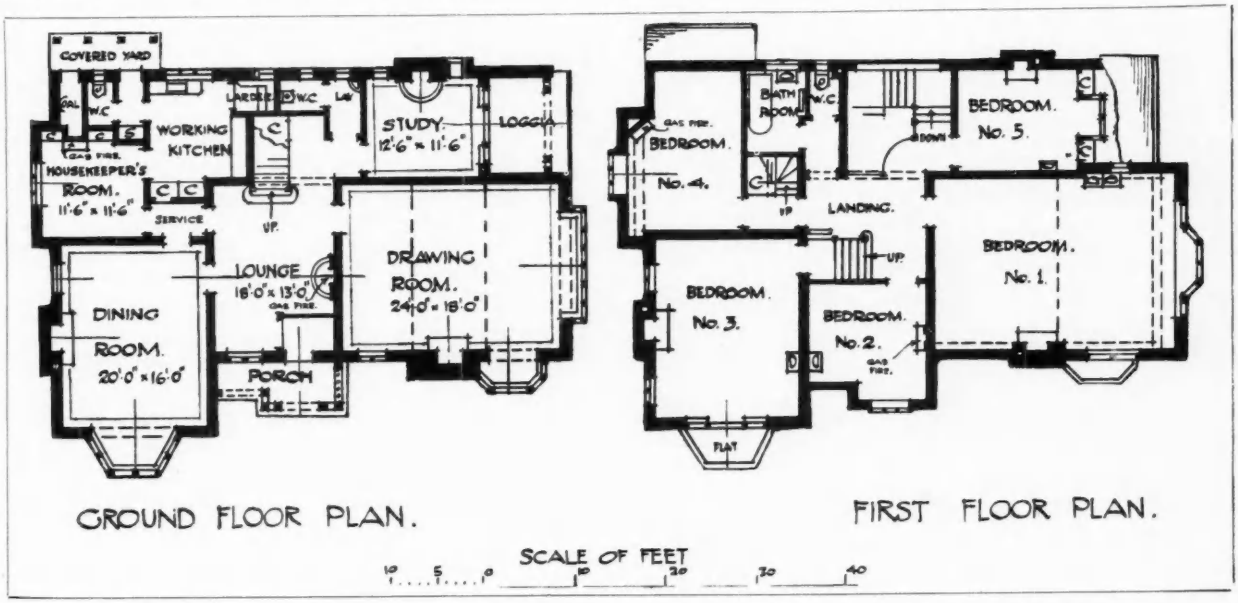
The TYNEMOUTH Corporation is asking the Town Improvement Committee to consider proposed sites for new baths and washhouses.

The YORK Corporation is to prepare a scheme for the erection of conveniences in various districts.

The managers of the Fifth Avenue Roman Catholic school, YORK, are to provide additional accommodation for 150 children.



WALES

The CARDIGANSHIRE C.C. has asked the surveyor to prepare a scheme and plans for alteration of a number of bridges considered dangerous to road traffic.

The SWANSEA Corporation is to prepare a scheme for extensions at Rheanfa Hospital, at an estimated cost of £18,000.

The SWANSEA Education Committee is seeking sanction to borrow £47,054, required for the proposed improvements and additions to the intermediate girls' school.

Plans passed by the SWANSEA Corporation: Reconstruction of "Park Buildings," Portland Street, for Mr. Evan Rees; four houses, Pwll-y-domen Road, for Messrs. Weaver Bros.; three houses, Carmarthen Road, for Messrs. Thomas and Jones; house and shop, Eaton Road, for Mrs. R. Jones; house, Robert Street, for Mr. H. Ll. James; rebuilding, 31 Waterloo Street, for Messrs. J. Bloomberg and Sons; house, Zouch Street, for Mr. J. Jewell; office and loading platform, Great Western Railway sidings, rear of Neath Road, Hafod, for Shell-Mex, Ltd.; two houses, Pinewood Road, for Mr. J. Davies; two houses, Moorside Road, for Messrs. Marriott and Skone; twelve houses, new road off Townhill Road, for Mr. Ben Jones; house, Gower Road, Killay, for Mr. H. T. Adams; two houses, Lon Gwynfryn, Cwmgwyn, for Mr. Dl. Phillips; house, Stepney Road, for Mrs. Wright; house, Le Mayals, for Mr. T. Brader; pavilion and sub-electric station, St. Helen's Cricket and Football Ground, for the Committee; house, Gower Road, Killay, for Mr. R. K. Bellingham; new road, off Hadland Terrace, Norton, for Messrs. W. J. Rees and Partners; two roads, Manselton, for Sir C. Mansell; seventy-six houses, Penlan, Treboeth, for Mr. Ll. L. Thomas; two shops, Sketty Road, for Mr. Hubert Roberts.

House, Gervis Road East, Bournemouth. Designed by Mackenzie and Phillips. Ground- and first-floor plans. The principal rooms are panelled in oak. The newels and balusters of the staircase date from the sixteenth century and have been re-used from an old demolished country house.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Broken brick or stone, 2 in., per yd.	0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

	£	s.	d.
Portland cement, per ton	2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

	£	s.	d.		£	s.	d.
Cart and horse	1	3	0	*Trailer*	0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.
IF left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. . . 0 2 10
PUDDLING, per yd. cube 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube . 1 7 0
DO. in lintels, etc., per ft. cube . . 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* BRICKLAYER, 1s. 8½d. *per hour ;* PLUMBER, 1s. 8½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Stoneware pipes, tested quality, 4 in., per ft.	0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.

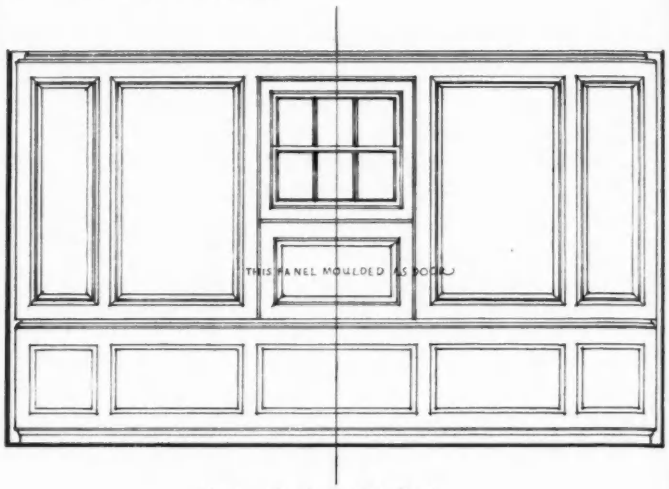
PANELLED DINING ROOM: No. 1 HAMPSTEAD WAY, N.W.11.
For and by
C. H. JAMES

THIS room, built in 1922, is panelled in Californian redwood (sequoia). The sideboard, side-table and table are of Australian blackwood, relieved by cross bandings of the same material. The whole of the woodwork except the floor, which is also of blackwood, is fumed to a dark purple by the Drytone process. The ceiling is painted with metallic paint of orange gold colour.



The room being very small—only 13 f by 10 ft.—every inch of space was of value; hence the recessing of the sideboard 4 ins. into the wall, which, behind it, is reduced to 1 in. of expanded metal and cement. The table was carefully proportioned to the size of the room, making it possible for six persons to dine in comfort. The serving table covers a radiator—the only means of heating in the room.

The large panels made possible by the use of sequoia, which is obtainable in very large widths, have never moved; but in building a similar room today plywood would obviously be used in preference to so soft a pine. The blackwood furniture took a wonderful polish in quite a short time.

The architect's working drawings are reproduced on the following page.

COMPETITION CONDITIONS

A Lead from the Corporation of Kingston-on-Thames

THE question of the proper promotion and conduct of architectural competitions is one upon which most architects hold very definite views. It is difficult for those who have met with considerable success to advocate any change in the system under which, in open competitions, conditions are drawn up and awards made by a supposedly competent assessor. It is as difficult for those who have tasted too much of the bitterness of defeat not to question in principle the competitive system, or the wisdom of an assessor who has failed to appreciate the merits of their wasted labours.

Let us admit all this at once. The fact is that though theoretically the competition system is the fairest method of selecting an architect for an important building, many awards within our recollection have been unsatisfactory to the promoters, or to both promoters and competitors. The frequent competitor is driven to assume the armour of cynical indifference and, given a certain standard of competence, to take his chance in a lucky dip in which success probably depends upon evading, ignoring or definitely breaking clearly defined conditions.

Do the " Conditions " mean what they say? Will they be enforced? Will the assessor like the competitor for " playing up to him " in imparting to his designs just that touch of modernism or the antique which he is supposed to favour, or will he hate him for it?

There are, it appears, three possible ways of escape from a situation that has admittedly been unsatisfactory in the past :

(a) Conditions must be clearly laid down, be concise and definite, and admit of no variety in interpretation as to specific requirements; and they must be rigidly enforced in every particular, the penalty for infringement being disqualification.

(b) Apart from the statement as to the required accommodation, in general terms, the limits of the site, and the amount to be expended, competitors must have a perfectly free hand. Virtually there are to be no conditions.

(c) Certain conditions must be absolute and binding, certain specific accommodation being regarded as essential; but otherwise, within the limits of the site, it may be " suggested " that other accommodation is desirable, competitors being free to make any modifications in providing further or alternative accommodation as they think fit. Competitors must estimate the cost of the building.

Accordingly, it is with great pleasure and interest that we turn to the recently issued Conditions of the Competition instituted by the Royal Borough of Kingston-on-Thames for Proposed Public Swimming Baths, and examine the manner in which they have been drawn up. It is true that the document is far too long and that some of the remarks are redundant. We all know, for instance, that " sound grouping and good proportion are most essential "; and that the building should have " architectural merit " is not such a novel requirement as it may seem. We do not believe that any competitor is likely to submit a scheme in an architectural competition which he does not believe has " architectural merit."

It is not upon these grounds that we commend these conditions, but on account of Clause 18, which is most significant as being an indication that a move is being made in the direction of our possible solution (c).

Clause 18 in the Conditions of the Kingston Competition is as follows :

> The requirements of the Corporation are given in the following schedule, and whilst the sizes of the Baths ponds and the number of Slipper Baths are to be adhered to, Competitors may make modifications, providing further or alternative accommodation, fitments or fittings which they may deem desirable. The general spirit of the instructions should be adhered to, and compliance with the Schedule, whilst not absolutely binding (except as stated), will be a matter of first importance.

In other words, the Corporation of Kingston requires certain definitely stated accommodation; the Council would also *like* additional accommodation, but in this respect a certain latitude is allowed to the competitors, who are to follow " the general spirit of the instructions," which indicate that a good up-to-date bathing establishment is required and that the architect who can best interpret this requirement will be successful.

We trust that the assessor will have no difficulty in making his award, and that the promoters of the competition and the competitors will have every reason to be entirely satisfied with the result.

THE HOLKER LAW LIBRARY, GRAY'S INN, W.C.:
BY SIR EDWIN COOPER, A.R.A.

The new library at Gray's Inn is a recent example of the work of Sir Edwin Cooper, who, with Mr. A. K. Lawrence, the mural painter, was last week elected an Associate of the Royal Academy.

This view of the interior is taken looking towards the octagon, which, situated on the axis of the old, or Middle Library, was the determining factor in planning the new one, which branches away at right angles. The materials used include Austrian oak and limewood carving, an oak floor, laid in narrow widths, and fibrous plaster. The balustrades to the galleries are in wrought iron and bronze, and the furniture is in oak. The portrait over the fireplace is of Justice Holker.

NEWS & TOPICS

SIR EDWIN COOPER'S ELECTION TO THE R.A.

THE election of Sir Edwin Cooper as an Associate of the Royal Academy will cause general satisfaction in the profession, and, indeed, one may well wonder why the honour has been deferred so long. To have designed two such buildings as that of the Port of London Authority and the new Lloyds is surely a notable distinction, and even if Sir Edwin had done nothing else he would have set his mark upon the metropolis and secured for himself a considerable reputation. But Sir Edwin is still at the height of his powers, and we may expect that the great structure that will house the national headquarters of the National Provincial Bank, a further section of which is now in process of erection, will be followed by other important city buildings bearing his imprint.

★

The work of Sir Edwin Cooper provides emphatic proof that it is still possible to erect a building having the most modern internal equipment but yet exemplifying the Classic style. It shows, moreover, that this same style, so far from being effete or lifeless, can suitably cloak architectural forms possessing very great vigour of outline. I have occasionally listened to hostile critics of the Port of London Building, but I have never heard it blamed for any lack of virility in conception. And even if this very solid, ceremonial and much-decorated architecture is a little out of favour among our modern puritans, it may still survive to give pleasure to a later generation. In the city of London, where there still appears to be a preference for the Classic, the new Lloyds takes its place extraordinarily well and, moreover, the back elevations of this building, which I have not yet seen co nmented upon in any criticism, are examples of urban street architecture of a pleasant yet unobtrusive kind.

WHAT SHOULD HAPPEN AT CHARING CROSS

Professor Adshead's letter to *The Times* of April 17 rather crystallizes the best-informed opinion on the subject of Charing Cross Bridge. The findings of the Select Committee have served to show, as he remarked, that the official scheme has laid too great a stress upon traffic problems to the exclusion of other very important factors.

★

An adjournment of one month is not time enough to consider the real problem of where the Southern Railway station is to go, and no scheme can be formed until the railway can see their way to manage their suburban traffic even a little less adequately than was possible with the old station. The official scheme, condemned on the south bank, is as worthy of condemnation on the north. Much consideration of the real underlying factors of town-planning should stand between now and the happy time when a final scheme may be thrown open to public competition.

WANTED : A MINISTRY OF FINE ARTS

Every proposal for controlling and improving the architectural and other amenities of this country leads us nearer to the establishment of a Ministry of Fine Arts or some such similar body. It is obvious to anyone who has looked into the question that there exists no central authority with sufficient power of veto, and no co-ordinated official body of taste with any hold upon the popular imagination. The Ministry of Health influences the æsthetic side of many forms of amenity through Town Planning and other Acts, but this power is used politically and cannot be relied upon, while the Fine Arts Commission has to be asked for its limited opinion. When one realizes that power lies in these scattered and conflicting bodies and with whomsoever may set themselves up to be judges and arbiters of taste, it will be seen that a directed policy of encouragement and guidance is impossible.

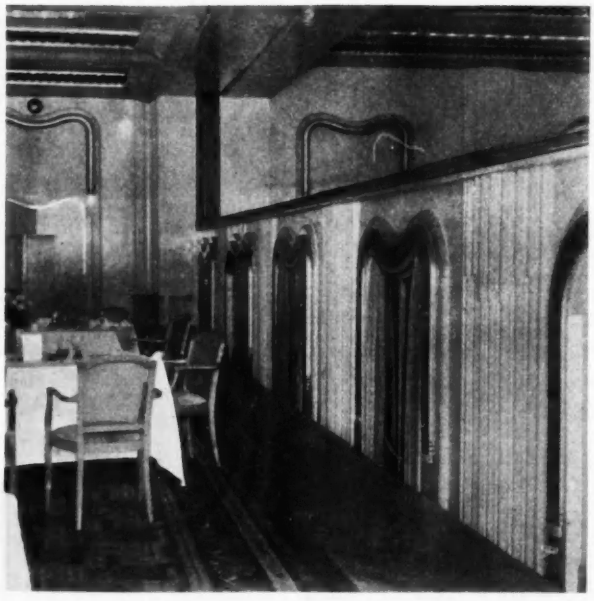
★

A Ministry of Fine Arts might be a class of dryasdust busybodies, though it would be more likely to be a body of zealous, intelligent and cultivated men, acting without political bias for the public good. One has only to compare the B.B.C. with the wireless broadcasting of other countries to see what may be done by a centralized control of this sort. I think a Ministry of Fine Arts is something very well worth talking about.

The seventeenth-century King's Head Inn, Winchester, threatened with demolition to make room for a cinema.

VANDALISM IN WINCHESTER

Readers who possess a strong magnifying glass should apply it to this illustration of the seventeenth-century King's Head Inn in Minster Street, Winchester, when they will read on the poster put up beside the public bar entrance the following words :



Site of
NEW
SUPER
CINEMA

The cinema is undoubtedly bound to come, but is it necessary that this charming front should disappear to make room for it ? There are people on the Hampshire County Council who think otherwise, and there seems a chance that the cinematograph licence may be granted only on condition that the front is left alone. This seems to me a wise and beneficial way of using existing legal powers to protect our amenities. I am aware that the building of a brand-new cinema behind an old half-timbered front is open to criticism, but our country towns are going to the devil so fast that what little we can do to retard this progress should be done. Unfortunately,

in this present case the liquor licensing authorities seem to be acting at cross-purposes with those who are in control of the cinematograph part of the business. Let us hope that they will put their heads together and work harmoniously for this good cause.

MR. ALFRED BOSSOM'S LECTURE

The profession in England stands to gain much by Mr. Alfred Bossom's decision of a few years ago to return from America to his native country. His genial personality, his energy and public spirit, and his exceptionally wide knowledge of American building methods are great assets. When I attended his lecture at the Institution of Structural Engineers last week, I could not help being struck by the wealth of his information upon numerous aspects both of architecture and of engineering, and also by the fact that he seemed especially intent upon utilizing the maximum

The 10-ton steel disappearing wall in the Empire Room at the Trocadero Restaurant, shown partly lowered through the floor. (Architect: F. J. Wills; Decorations by Oliver P. Bernard.)

constructional skill which we can muster for the purposes of social betterment. He spoke with deep conviction about the slum problem, and it is quite understandable how, though fighting in the Conservative interest, he so nearly captured an East End constituency in the last general election. In the event of his success next time, he should prove a valuable champion of architecture in the House of Commons.

★

Undoubtedly, it would be an enormous aid to housing reform if, by improved organization of building processes, we could erect healthy and suitable dwellings at a price which would make possible the payment of a reasonable interest upon money invested in them. Mr. Bossom, however, is fully alive to the dangers of excessive standardization in the American manner. Yet he made clear to his audience the magnitude of recent American achievements in architecture, and he laid particular stress upon the spiritual effect of skyscrapers, which, he claims, induce in those who behold them the desire to do great things. But all is not well in the Land of Progress, and it certainly comes as rather a shock when we are told that in certain streets in New York the first fourteen stories of a building must have their windows hermetically sealed because of the noxious fumes from motor cars in the streets below them.

MODERNISM AND THE MAN IN THE STREET

How do great blank spaces appeal to the man in the street—those calm, unfretted surfaces which the disciples of modernism contrive, and which are sometimes permitted to remain in all their expansive purity by owners of buildings? Pause before the new Underground offices in Broadway, Westminster, for fifteen minutes, any time between noon and 2.30 p.m., and listen-in to the comments of the very considerable number of people in whom that building and its embellishments implant the desire to speak, if not to protest. Epstein apart, the building holds them, and in the search for comparisons they fall back on movie-memories of New York.

★

So to some it is just a skyscraper; to others it is still unfinished ("although they 'ave taken the scaffolding away"); to all of them it is something strange and vaguely disturbing. But it has no message for them, and nobody notices how mean and fussy some of its neighbours have become by comparison. "Silly, building it of that white stuff—won't look so posh in a year or two!" So far does imagination take them; but the majority is too absorbed in that urgent matter of personal taste, inevitably raised by the contemplation of Mr. Epstein's work, to have any thought to spare for the easy simplicity of the building.

★

The new extension of Olympia is easier to consider, and it comes in for occasional references at the bus stop opposite its western end. It has been likened to "a canvas-covered trunk," but apart from that I have surprised no spontaneous criticism concerning its æsthetic merit. Evidently that unruffled exterior is disquieting, and people want to know why there aren't more windows. They resent what they don't understand, and, so far from soothing them, these restful expanses of stone and concrete set them worrying and pecking at details to find errors wherewith to give substance to the instinctive protest of a conservative race against something new. What beauty the new thing may possess is unobserved. What the public wants is what it's used to: Corinthian columns and the Crystal Palace, and "a little bit of Toodor for the 'ome."

MR. LANSBURY AND HADRIAN'S WALL

Mr. Lansbury proves as commonsensical over the Hadrian's Wall scare as in his attitude towards the amenities of the London parks. He realizes that the advice of enthusiastic antiquarians is to be listened to with great attention, but followed with caution. For, as Mr. Lansbury remarked, there are some seventy miles of Hadrian's Wall, and quarrying is a native industry in those wild parts. It is questionable whether there would have been any questions asked had there been no wall to endanger, and yet the wall is but a line of shadow across a fine, strong landscape, and it is the landscape that goes.

★

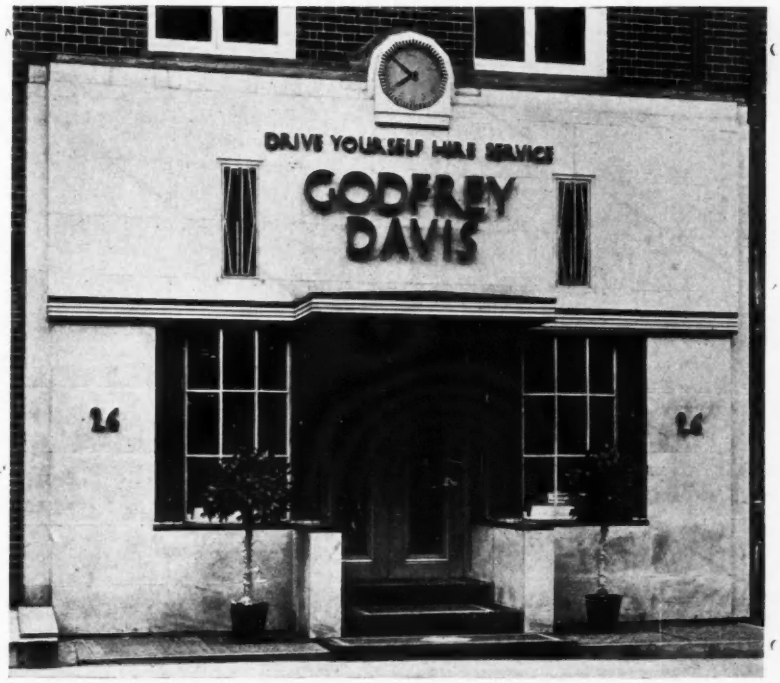
As I have said before, there are china-clay mines on Bodmin Moor that to some people spoil the severity of that lonely place, while others find the great cones of white clay, standing very strangely among the brown, stimulating and majestic. I think we may trust Mr. Lansbury.

ASTRAGAL

No. 26 BRUTON STREET, MAYFAIR

DESIGNED BY P. E. PALMER

THE hiring out of really first-class cars to be driven by the hirers themselves is a modern idea, and for the type of room to house the executive of a business of this nature there is no precedent. Here everything possible has been done to simplify the matter for the prospective client and, incidentally, for the members of the staff who, in rotation as he passes from desk to desk down the room, will deal with him.



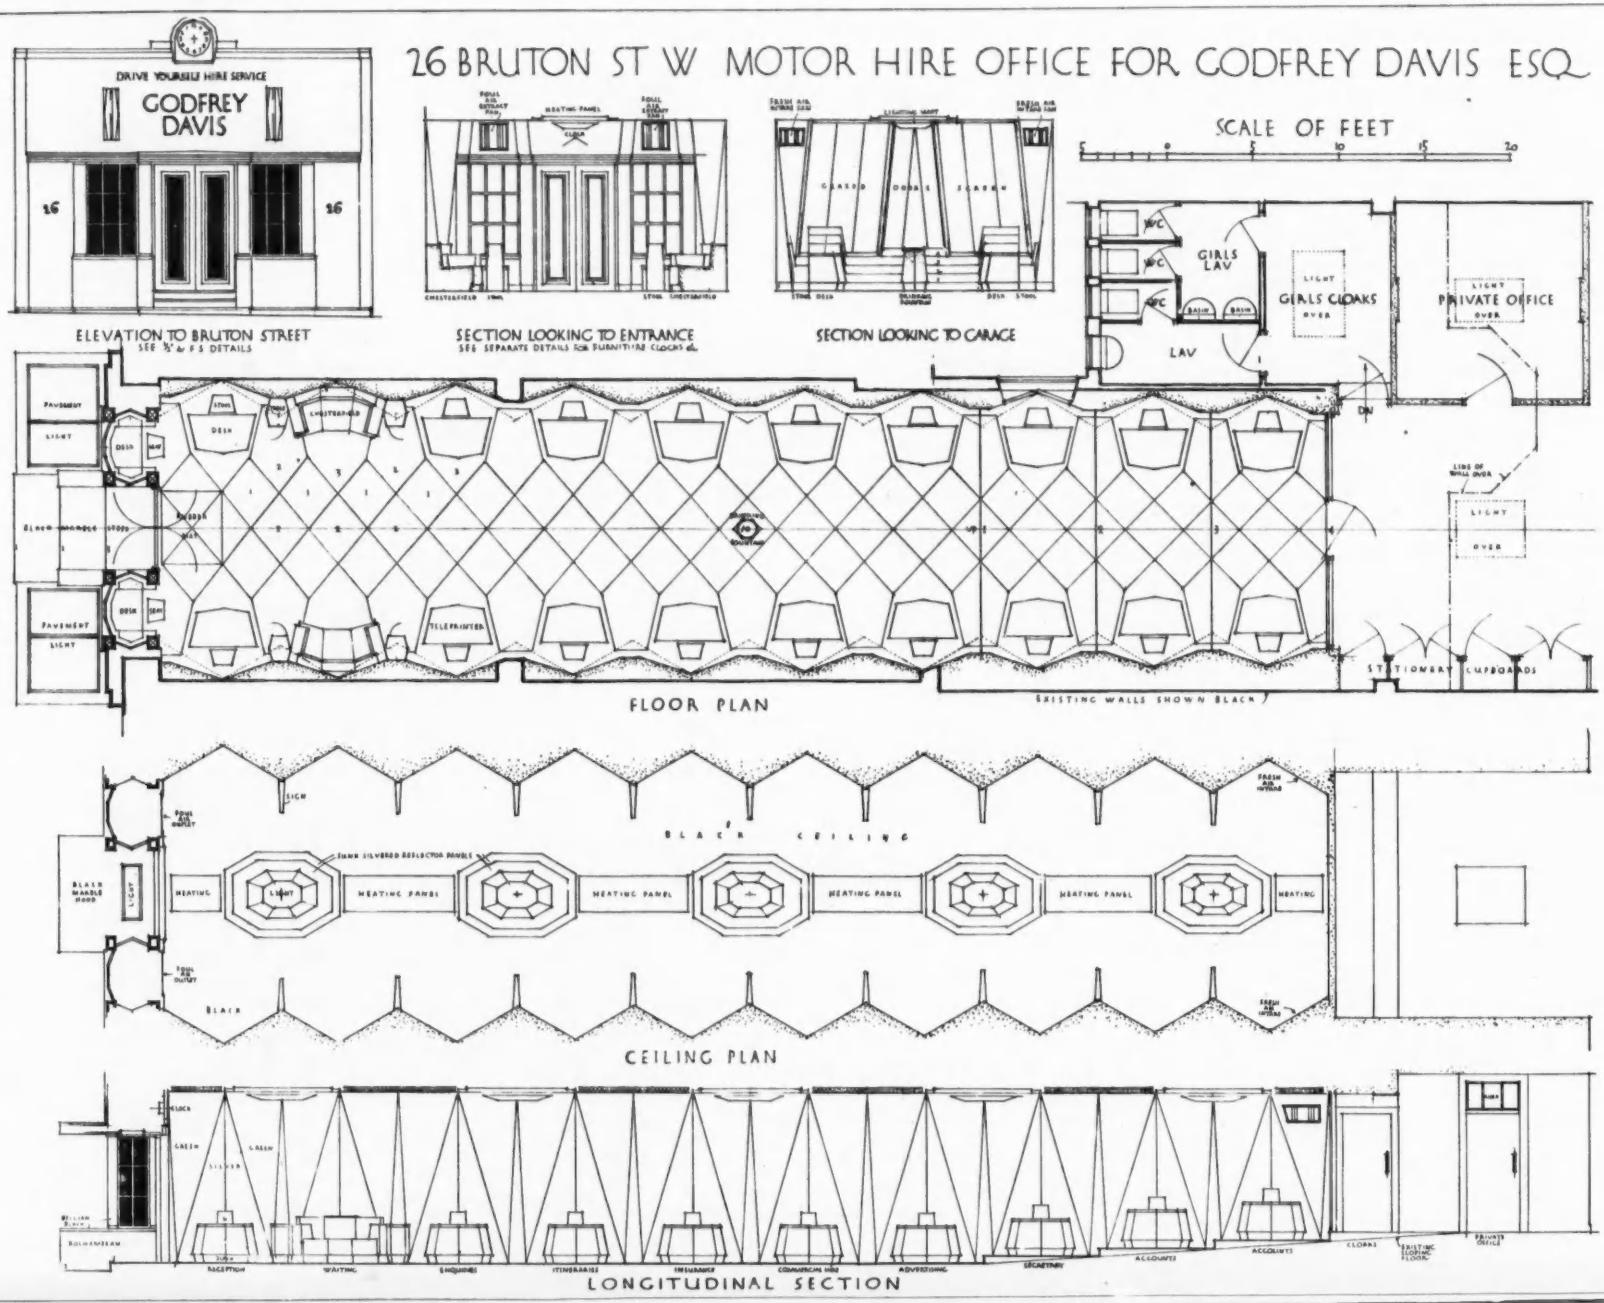
Externally, an attempt has been made to give a strong and clean interpretation of the needs of a modern business, while at the same time paying some deference to the traditions of the neighbourhood in which the premises happen to be situated. The facing is a warm biscuit-coloured marble from France, known as Rochambeau, while emphasis is supplied by the use of Belgian black. Windows and doors, air-extract grilles and the sides of the large letters are finished green. The small letters and numerals are finished in black cellulose, with central ribs, at right angles to their faces, in silver. The large letters are separately lit with lengths of green neon tubing, and the clock face also is illuminated.

Internally, the modelling of the side walls into equal bays, which will perhaps be better understood from the drawings, is an attempt to mask several existing brick piers, carrying joists over, or encasing stanchions placed at irregular intervals. Each desk has its own "bay" which, while giving a sense of individuality, does not destroy the "one-room" motive, a treatment decided upon as more economical as far as heating, ventilation, lighting and cleaning are concerned, and better for purposes of supervision and co-operation in working.

An interesting feature of the room is the small font-like casing which contains a press-button drinking-water fountain.

The walls are finished in pale green and silver, while the desks are in silver with green nosings and black skirtings. The highly polished black ceiling gives considerable apparent height to what is, for its length, a comparatively low room, while the sunk and silvered panels above the specially designed lighting units add to the illusion. Walls, desks, all woodwork and metal and also the ceiling have been finished in cellulose enamel, sprayed.

Between the lighting bowls are a series of flat rectangles. These are the heating units, and no taps, pipes or dust-collecting radiators are anywhere used.

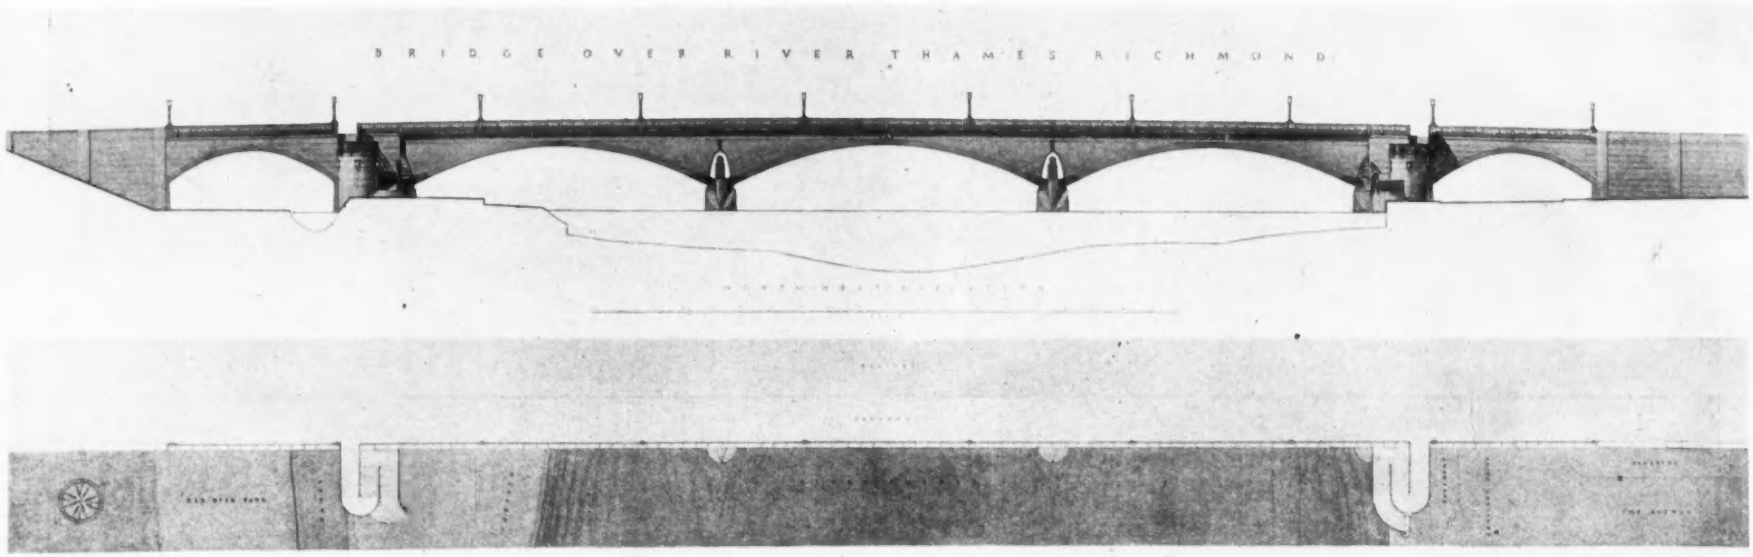


The entrance doorway has a hood and steps of Belgian black marble; the front generally is of Rochambeau, a warm biscuit-colour marble. Doors, grilles and windows are in green. While the larger lettering is in green and silver, neon-lit after dark, the smaller is in black and silver. The clock-face reads "anti-clockwise."

[*Photography by Howard Coster.*

The entrance, or "reception" end of the office, showing the ample chesterfields in pale green hide, and other accommodation for waiting clients, finished in a colour scheme of green, silver and black. The clock is in silver and black, to symbolize Day and Night; the door handles are designed as G D, the initials of the firm.

26 BRUTON ST W MOTOR HIRE OFFICE FOR GODFREY DAVIS ESQ



LONGITUDINAL SECTION

No. 26 Bruton Street, W.]

[*By P. E. Palmer* (*photography by Howard Coster*).

The architect's drawings of the entrance exterior, and of the interior in plans and sections; and a general view of the office, looking towards the entrance through the screen separating it from the car park. The steps in the foreground were devised to hide the rake in the existing floor, but also give a sense of distance on entering through the doors at the far end. The flooring lozenges are in black, grey and white, the desks in silver with green nosings, black skirtings and grey tops, and the central drinking fountain is in green and silver, to match the walls, beneath a black ceiling.

RICHMOND'S NEW CONCRETE BRIDGE: ELEVATION AND HALF PLAN

(A. Dryland, County Engineer, Middlesex; Maxwell Ayrton, Architect.)

The new bridge over the Thames at Richmond is to be constructed entirely in reinforced concrete and is of the hinged type. The coving below the balustrade is designed to be inset with semicircular red tiles, set in the concrete during operations. Horizontal bands of roof tiles, showing approximately 1½ inches on the face, are laid flat in the approach walls and staircase walls at the top of each "lift," the chief idea being to overcome any irregularity in the finish of the concrete as it is poured in. The aggregate will be Thames ballast, and the whole of the exposed surface, including the tiles, will be bush hammered. The balustrades and lamps are in bronze.

The original of this drawing is to be exhibited at the Whitechapel Art Galleries in the forthcoming exhibition of pictures of Thames bridges. The model of a portion of the bridge is exhibited in the Royal Academy this year.

On page 688 of this issue of THE ARCHITECTS' JOURNAL *will be found views of some early bridges on the upper reaches of the Thames, affording interesting comparisons.*

A view of the garden side from the tennis courts, showing the skilful manner in which the sloping site has been laid out.

AN ARCHITECT'S HOUSE AT SINGAPORE

DESIGNED BY H. C. ATKIN BERRY (SWAN AND MACLAREN)

THE climate of Singapore is always humid and usually very hot. Hardly any seasonal change is to be observed, and the prevalent dampness causes the heat to be more oppressive than are higher temperatures in drier climates. Therefore, from perusal of the photographs of Mr. Atkin Berry's own house in Dalvey Road, Singapore, it will be observed that one of the predominant features of the design has been the supply of the maximum amount of ventilation. Wherever possible the architect has planned louvres, notably over doors and below the upper floor lounge windows.

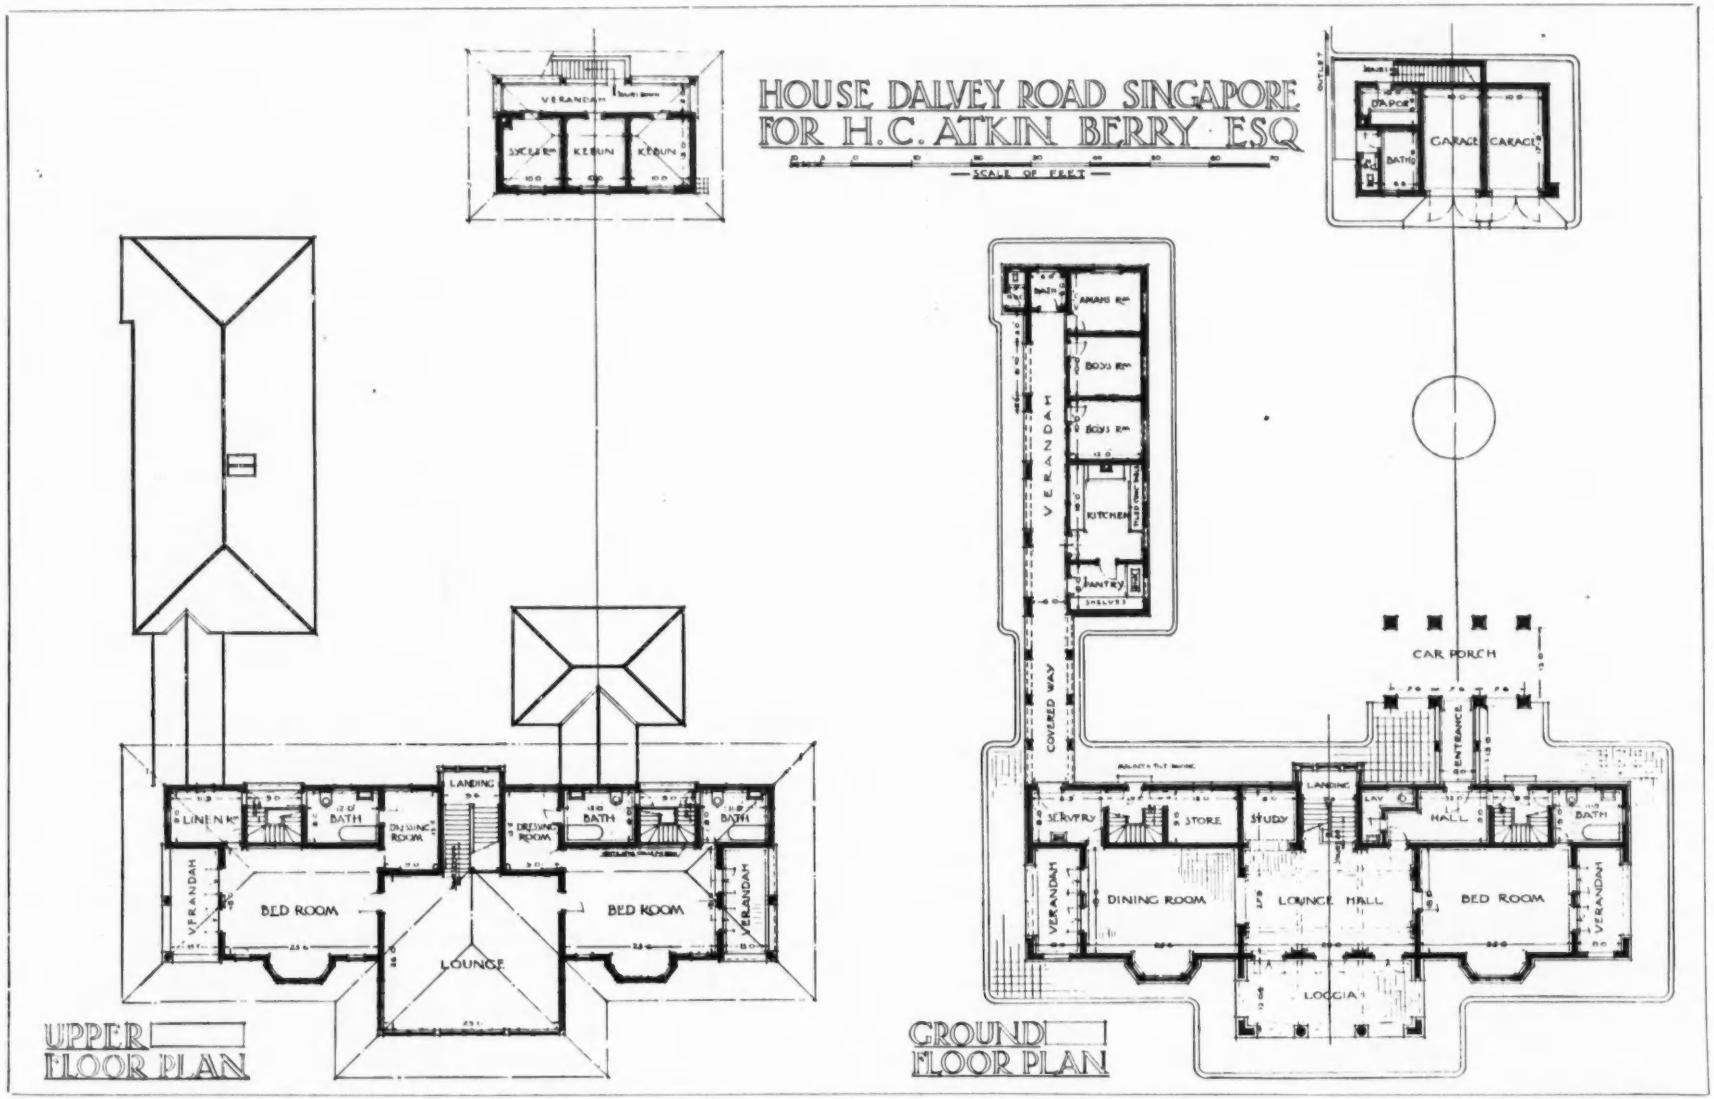
The house stands on an open site and is executed in brick and roughcast.

The ground-floor accommodation comprises a small hall, lounge hall, dining-room, bedroom, study, servery, store, bathroom, two verandas and a loggia.

On the upper floor are the lounge—the principal room in the house—two bedrooms, three bathrooms, two dressing-rooms, a linen room, and two verandas, planned above those on the ground floor. Above the beds in the bedrooms is framework, supported by chains hanging from the ceiling, from which mosquito netting is suspended and drawn tightly round the beds. Electric fans are fixed in the ceilings in every room.

The house contains three staircases. The main staircase, leading up to the lounge on the first floor, is situated in the lounge hall, whilst the other two have open landings overlooking the entrance courtyard, both accessible through doors on either side of the main entrance.

It will be noted from the plan on page 678 that no servants are housed in the main building, due to the practice of isolating the servants' quarters from that of the householder, customary in the tropics. These servants, or "boys" as they are usually termed (although some of them may be over forty years of age!), are accommodated in a wing on the right of the main front and connected to the house by a covered way. This wing is one story high and contains three living-rooms, kitchen, pantry, bathroom, and a veranda.



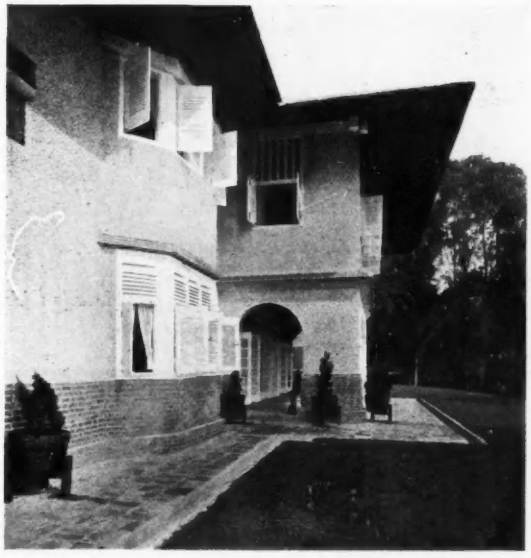
The garage stands on a site in close proximity to the entrance to the grounds. Above the garage is a self-contained flat for the chauffeur, which is reached by stairs at the rear of the garage.

Surrounding the house is malacca-tiled paving, containing a drain-water gulley, so designed that during torrential downpours the rain will fall direct from the overhanging eaves on to the paving and rapidly drain off into the ground. If, of course, the usual method of rain-water pipes had been employed, they would quickly have been flooded by the tropical downfall.

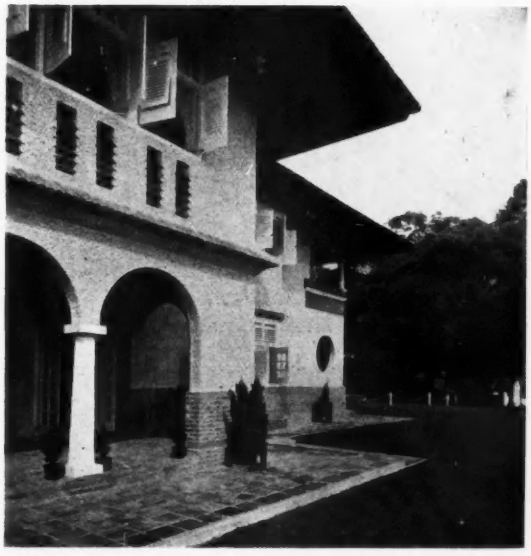
The ravages of the white ant make short work of woodwork, so that the house is floored with tiles throughout, thus preventing any wood being used near the ground. Even the bottom step of the staircase is of marble.

The four bathrooms are well equipped in an up-to-date manner and include water-closets, hand wash-basins and a shower spray. The bathrooms are a great asset to the household, due to the fact that the occupants bathe two or three times daily. Until a few years ago fitted baths were a rarity in the district. The substitute provided was a room with tiled flooring, in which the bather stood and poured water, from out of ewers, over his head, the water running out through gulleys in the floor.

The open nature of the house can be gauged by the fact that it is possible to obtain a direct view through it from one veranda to the other, on the ground floor. It stands in the midst of very beautiful country, thickly wooded in places, of which every room affords a striking prospect.



Architect's House at Singapore.] [*By H. C. Atkin Berry.*



Plans of the ground and upper floors, the garage and chauffeur's flat. On the ground floor the accommodation comprises a small hall, lounge hall, dining-room, bedroom, study, bathroom and a loggia, the latter practically part of the lounge hall. Servants are accommodated in the one-story wing on the right of the main front, to which it is connected by a covered way. This isolates the servants' quarters from those of the householder. The principal room on the upper floor is the lounge, which affords a fine view of the surrounding district.

The entrance courtyard, showing the main entrance beneath the covered car porch, and the servants' quarters, which are provided in the one-story wing on the right of the illustration. The walls are of brick and roughcast.

A detail of the garden front and terrace, looking towards the doors of the loggia giving direct access to the lounge hall.

A half view of the garden side of the house, showing the ventilation system planned beneath the upper lounge windows.

Architect's House at Singapore.] [*By H. C. Atkin Berry.*

This view of the side elevation, with the main entrance covered-car approach to the right and the garden side to the left, illustrates two of the four verandas, planned one above the other, at both ends of the house.

From the loggia magnificent views are obtained of the surrounding hills. It is floored with tiles, having exceptionally wide jointing, about an inch thick. The pillars are of concrete. On the left are seen the tennis courts.

Architect's House at Singapore.] [*By H. C. Atkin Berry.*

Looking from the lounge hall, through the dining-room, on to one of the four verandas. The ground floor of the house is covered throughout with tiles, to avoid the ravages of the white ant. As will be seen from the plan on page 678, it is possible to obtain a direct view through the house from one end to the other.

The lounge hall, looking towards the staircase landing, which is planned in the centre of the main elevation. The bottom step of the staircase is of marble. The alcove on the left of the illustration is used as the study.

Architect's House at Singapore. [*By H. C. Atkin Berry.*

The lounge on the first floor is the principal and largest room in the house. It is situated immediately above the lounge hall and loggia, and overlooks the garden. A view of the exterior louvres of the ventilation system, below the window openings, is to be seen on page 679.

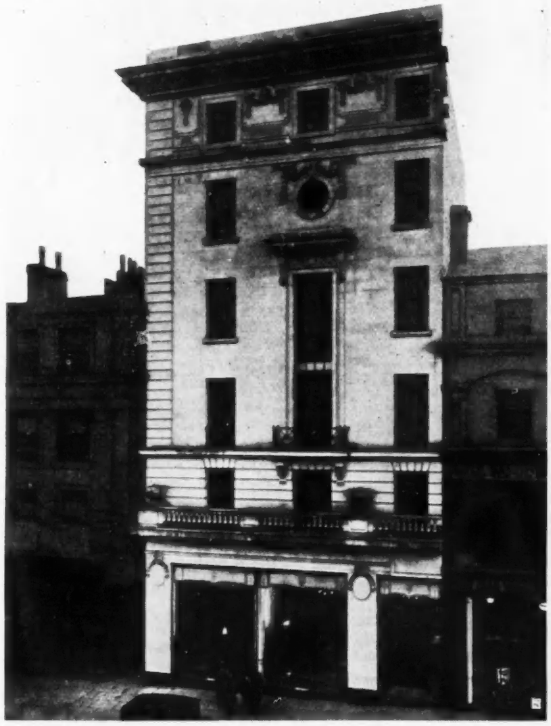
Another view of the lounge on the first floor, showing the head of the staircase. The black dado rail is of teak, as also is the floor. The door shown gives on to the bedroom on the upper floor, which is illustrated below.

Architect's House at Singapore.] [*By H. C. Atkin Berry.*

One of the two bedrooms on the upper floor, looking into the lounge. The door on the right leads to a small dressing-room, giving access to one of the two adjoining bathrooms. Above the bed is the framework for mosquito netting, and in the ceiling are electric fans.

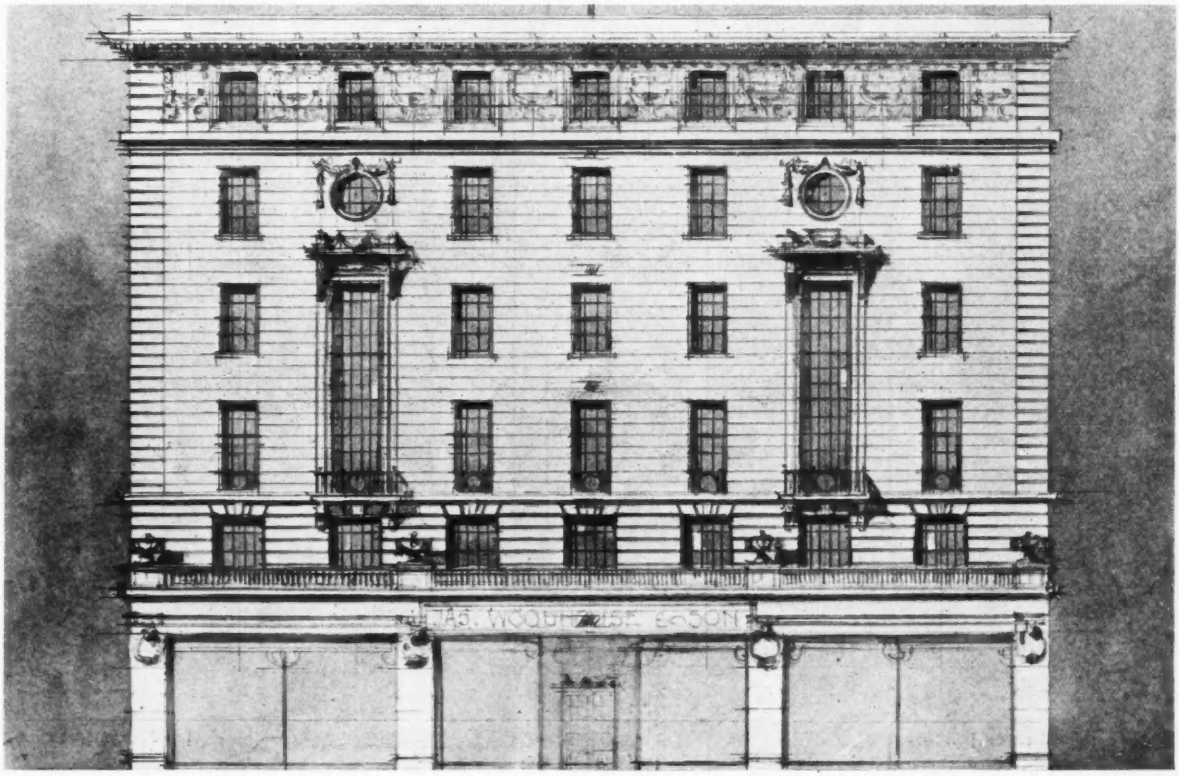
FURNITURE SHOWROOMS: LORD ST., LIVERPOOL

DESIGNED BY



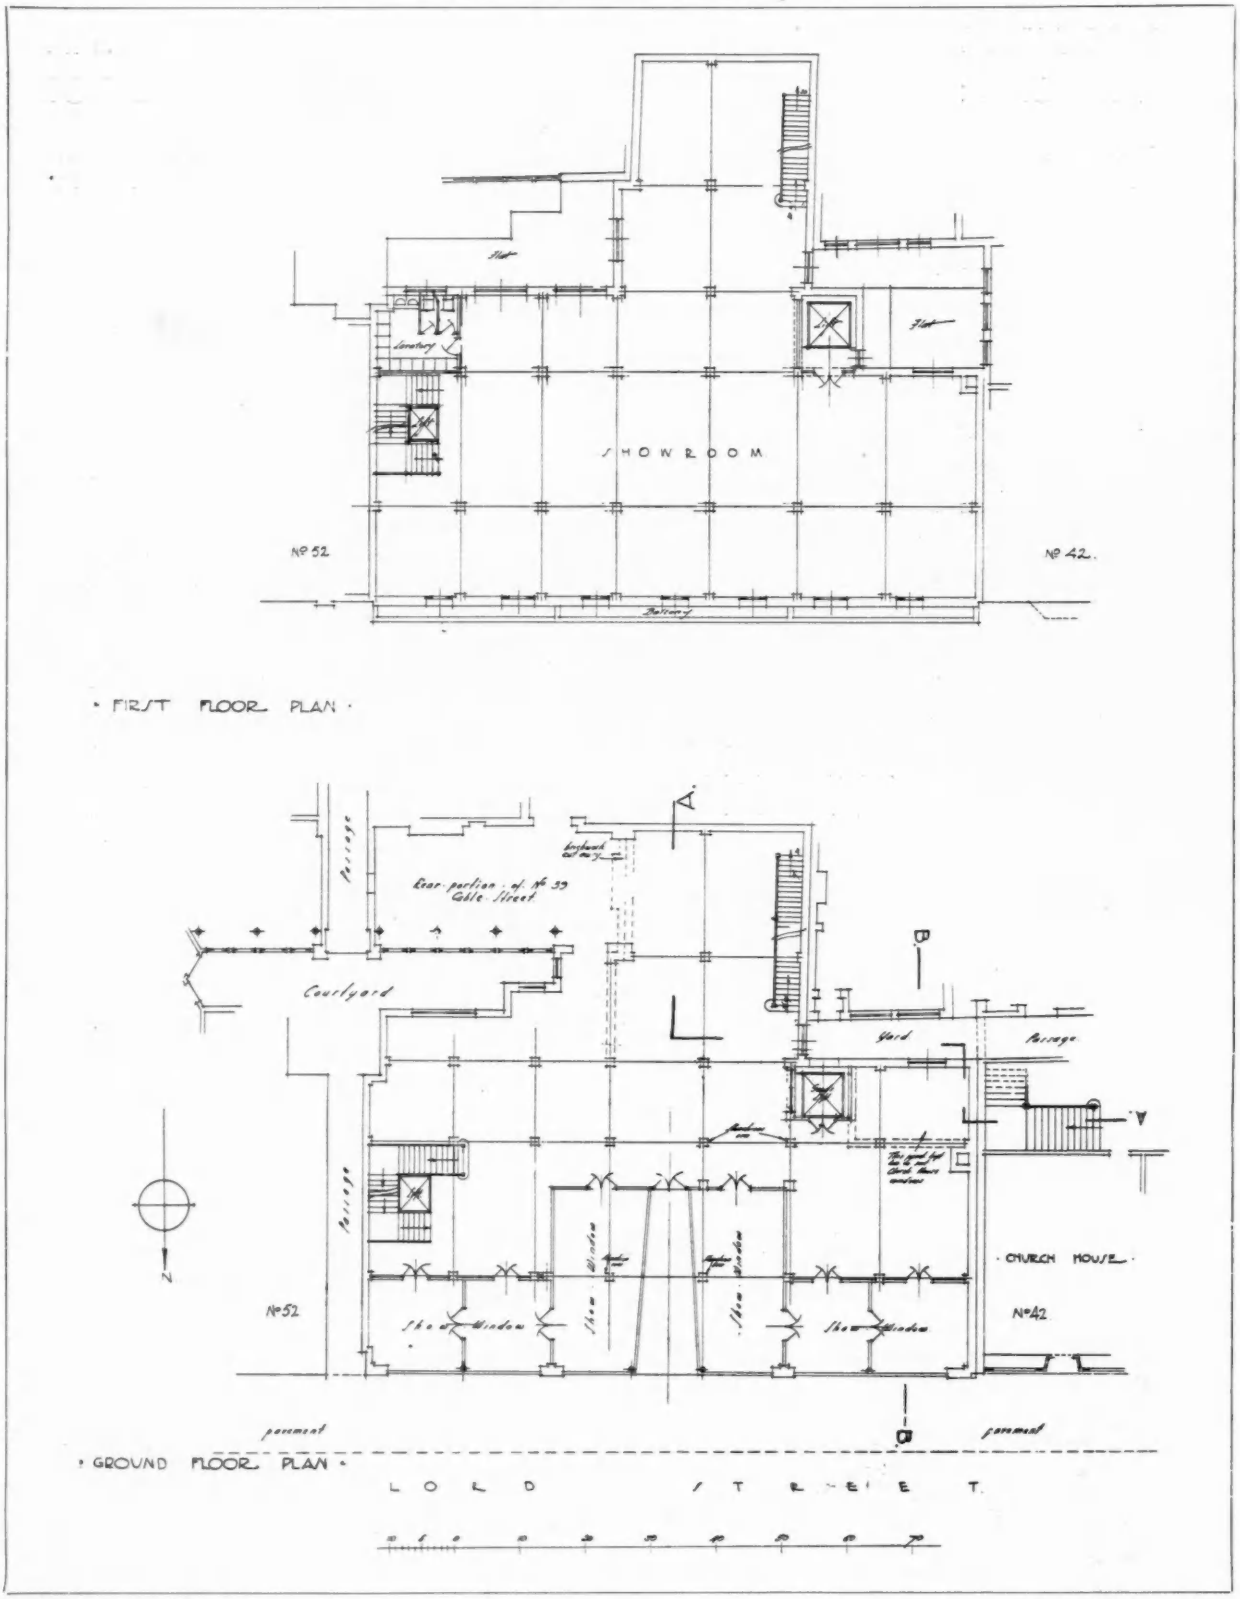
LEWIS SOLOMON AND SON

ON this and the following pages are illustrated a photograph of the first section of the new showrooms for Messrs. James Woodhouse and Son, now completed, and the architects' drawings of the premises as they will appear when the second and final portion is erected. This firm of house furnishers originally occupied numbers 44 and 46 Lord Street, but owing to expansion of business these premises became inadequate, and they acquired the freehold of the adjacent buildings, numbers 48 and 50.



Designs were thereupon prepared by Messrs. Lewis Solomon and Son, FF.R.I.B.A., of London, for the erection of a new building to cover the whole of the site occupied by the existing premises of the firm and those on the adjacent property they had acquired.

For the present, numbers 48 and 50 only have been rebuilt, so that the firm can transfer their business to the new building while the erection of the remainder is proceeding.



The new building is designed as a steel-frame structure, with fire-resisting floors, a Portland stone façade to Lord Street, and a shop-front of bronze, with panelled enclosures. It consists of basement, ground, and five floors above. All floors are served by a high-speed electric passenger lift, travelling in the centre of the stair well. The staircase is of oak throughout. Messrs. E. Kirby and Sons, of Liverpool, acted as local supervising architects.

This photograph of the first section, now complete, of the new front should be compared with the architects' drawing reproduced below.

The architects' elevational drawing of the main façade, as it will appear when the second and final section is erected. The exterior is faced with Portland stone, and the shop front is of bronze with panelled enclosures.

Furniture Showrooms, Liverpool.] [*By Lewis Solomon and Son.*

The ground- and first-floor plans of the complete scheme. The first section has been built and extends from the left-hand side of the Lord Street front to the centre of the third show window. It is six stories high and also contains a basement.

ENGLISH PRECEDENT No. 113

LANSDOWN CRESCENT, BATH

Lansdown Crescent is one of the later developments of Bath, sitting high above the Royal Crescent and approached from the centre of the town by the steepest of hills. It is by Baldwin, an architect who succeeded the brothers Wood in much of the finest work in the town.

Its fine curve, falling away at each end in stepped terraces, its exquisite refinement of detail, and its situation among trees that do not appear in this photograph, give it a charm that is lacking in the severer work on the lower slopes.

The advent of motor cars has made the Crescent once more accessible, so that the fine houses are now occupied as they should be.

—[E. MAXWELL FRY]

[*This illustration is a companion to that of Royal Crescent, Bath, reproduced as English Precedent No. 100, in the issue for January 29, 1930.*]

THAMES AND MEDWAY BRIDGES

BY E. JERVOISE

Astragal had some comments, last week, on methods of widening medieval bridges to meet the demands of modern traffic, and photographs were given on another page of rural structures of the kind in Somerset and Dorset. Overleaf are illustrated some ancient Thames and Medway bridges to which the following historical notes apply.

DURING the past century numbers of fine old bridges were swept away, and it is only of recent years that it has been possible to organize public opinion when the destruction of a bridge is threatened. County surveyors are now far more inclined to retain the old structures than formerly, as can be seen by the number of bypass bridges recently built. In addition to saving the old bridge, the bypass, if not crossing too close alongside, frequently gives a fine view of it.

Unfortunately, little historical evidence is available about the actual building of bridges in medieval times; it was not until the seventeenth century that the custom started of inscribing on bridges the dates of their erection. A fair number of bridges are mentioned in the Patent Rolls of the Middle Ages, usually in cases where the bridge was described as "decayed" and when the onus of the repair could not be placed. Many inquiries are on record when the verdict was that "no one is responsible for the repair of the bridge"; and often what was known as a "Grant of Pontage" was issued by the King, authorizing the collection of tolls on goods passing over and sometimes under the bridge. After the sixteenth century the matter was dealt with by the Quarter Sessions.

Few medieval bridges remain over the River Thames, the only unspoilt examples being Radcot and New Bridges, both above Oxford. The two pointed arches of Radcot Bridge may date from the fourteenth century. Each of these bridges has ribs under the vault, a type of construction not often employed after the sixteenth century, but comparatively common during the preceding one. It is thought that the ribs were built to save centering material, and that when they were completed the arch proper was built upon them; they were then sometimes removed, their purpose having been served.

The middle arch of Radcot Bridge is certainly of later date, and may have been rebuilt to give more headroom for river-borne traffic. Several grants of pontage for this bridge were issued during the fourteenth century.

New Bridge was probably built later, and if so, this would explain its name. It carries the road from Kingston Bagpuize to Standlake and is no doubt the same bridge as was seen by Leland, the first official archæologist, who made an itinerary of England during the reign of King Henry VIII. All the arches are pointed in shape, and originally they had ribs. Only two still retain them, but signs of ribs are visible in the other arches. New Bridge is fifteen feet wide, as measured between the parapets; the width of Radcot Bridge is three feet less.

Abingdon Bridge was built during the fifteenth century, and in this case there are contemporary records about its construction. Part has recently been rebuilt, as the navigation arch built early in the nineteenth century was found to be giving way. The section of the bridge between the island and the town of Abingdon still retains its seven "four centred" arches. These also have ribs, and this is the part of the bridge which was widened on the upstream side early in the nineteenth century.

About a mile or so from Abingdon is another fifteenth-century bridge, over a cut known as the Backwater. This was threatened a few years ago, but has been saved by the building of a bypass.

The only other bridge over the Thames with claims to medieval features is that at Wallingford. Here, although the present arches over the river were only built early in the nineteenth century, several of the land arches on the Oxfordshire side were built during the fourteenth century; they are pointed and have ribs.

Below Reading none of the bridges is earlier than the eighteenth century. A number of stone bridges of that period remain; the only brick one is Sonning, a delightful specimen of late-eighteenth-century bridge-building.

Quite a number of medieval bridges still remain over the River Medway, and they represent many styles of construction. East Farleigh Bridge, about three miles above Maidstone, is a perfect example of the type built with ribs inside the arches. This feature is absent in the bridge at Aylesford, only seven miles farther downstream, although both have pointed arches. They probably date from the fourteenth century, although the lofty navigation arch in Aylesford Bridge is of later date.

A third type is seen in Twyford Bridge, which crosses at the junction of the Medway and the Teise.

CORRESPONDENCE

FREE ADVERTISEMENT INSERTIONS

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I do not doubt that you will have a very large number of grateful letters from architectural assistants expressing their appreciation of the helpful and understanding attitude of their problems revealed in your leading article in the JOURNAL for April 16.

But as many men mean to write and allow their good intentions to be overlooked, I send you this letter as I feel you have solved a very real problem by offering to print the announcements of needs in your paper free of cost to both assistants and architects.

I would thank you, too, for the dignity of your remarks in respect of the position of assistants. It is one thing to understand difficulties; it is another thing to be able to express one's mind about them, and to make a valuable and practical offer of help for their solution without any hint or suggestion of patronage.

Unless I misread your offer, I presume your paper is willing to publish announcements from men who are in "jobs" but who wish to "feel" the market to see if they can find something better, as well as advertisements when men *have* to find a new position. If this is so, I am sure you will remedy a very real difficulty and be of the utmost use.

Architects need, at certain times, an assistant with some particular kind of experience, or one who has had previous work in some special branch of building design.

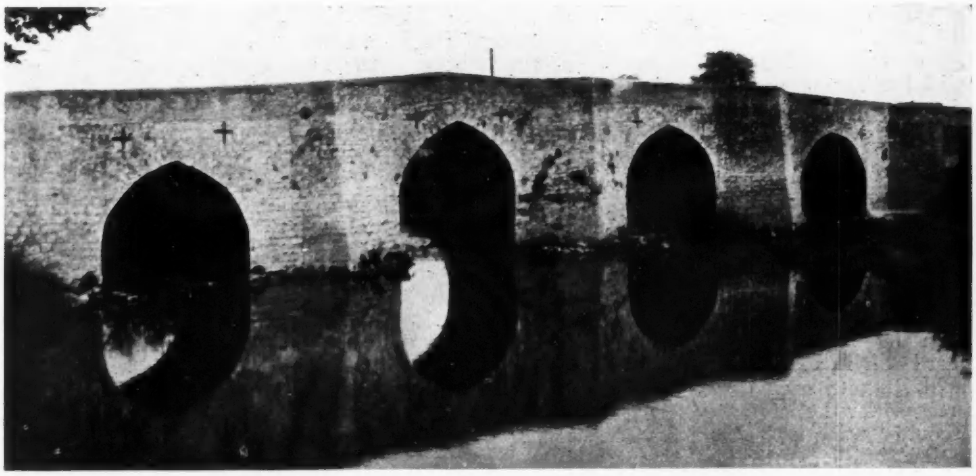
If this advantage is offered in your scheme, possibly a note might be written to answer the point, as I know several assistants who fancy they would be taking an unfair advantage of your generosity if they used its columns for such purposes as I describe.

I think possibly the only thing I can add to this letter is a single "Thank you." You are doing a great thing for a large body of men by your enlightened policy. GRATEFUL

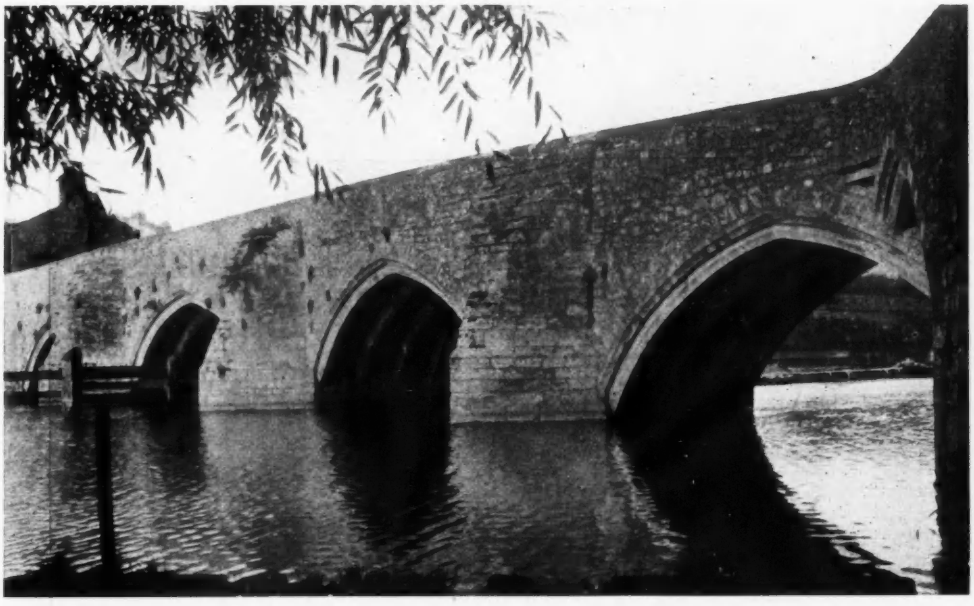
[We welcome the opportunity of answering our correspondent's query in the affirmative. It is certainly intended that the offer should be equally open to those desiring to improve their present positions, as well as those out of employment.—ED. *A.J.*]

THREE ANCIENT BRIDGES OVER THE RIVER THAMES

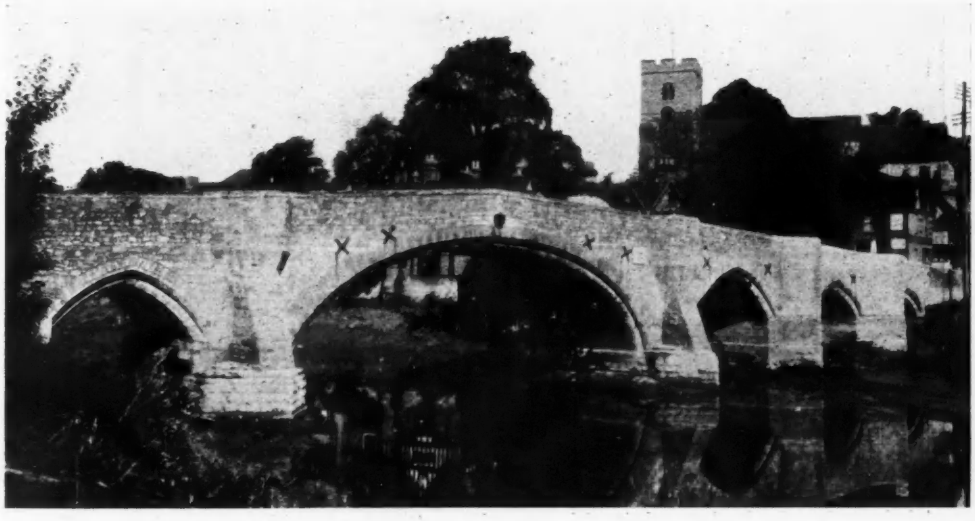
The bridges illustrated on these two pages are the sequel to material published in last week's issue. This is Sonning Bridge, below Reading, a delightful example of eighteenth-century brickwork.



An unspoilt medieval Thames bridge : Radcot Bridge, from downstream. The ribs under the vaults merely served a constructional purpose, but in this case remain. (Photo. : E. H. Binney.)



New Bridge, nine miles from Oxford—here taken from the northern bank on the upstream side—dates from about A.D. 1300. Two of the arches retain ribs. (Photo. : E. H. Binney.)



THREE ANCIENT BRIDGES OVER THE RIVER MEDWAY

Twyford Bridge, Kent, which spans the Medway at its junction with the Teise, is one of several medieval examples still remaining in their original condition in this part of the county.

At East Farleigh, about three miles upstream from Maidstone, this Kentish bridge shows very clearly the ribs within the arches, characteristic of medieval constructional methods.

The bridge at Aylesford, only seven miles away, downstream, however, shows no sign of ribs under the fourteenth century pointed arches. The lofty navigation arch is of later date.

INTERIOR DECORATION

The Work of Modern English Artists

THE May number of *The Architectural Review* is a special issue devoted entirely to modern English interior decoration. It is a big achievement, a production of rare value, and a direct challenge to the great English furnishing houses who consider it might be difficult to sell the work of "artists of repute."

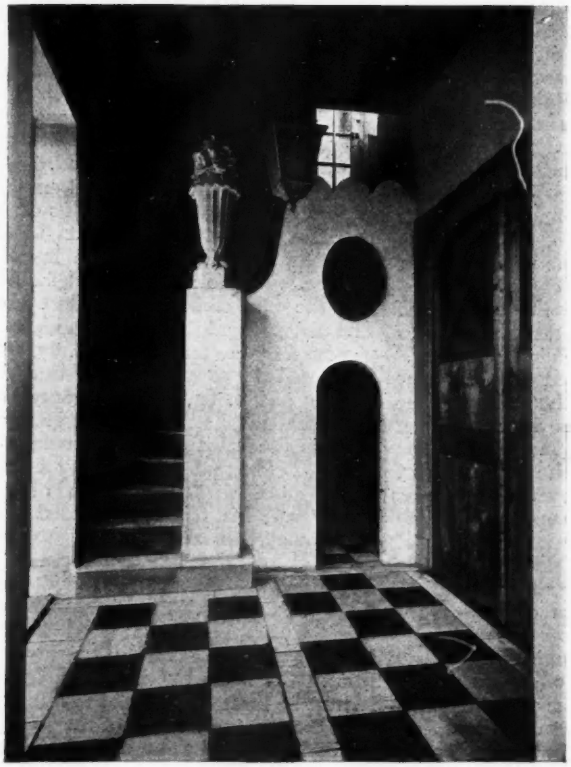
In a leading article entitled "Give the Public What it Wants" the Editor points out that the special issue is the result of three advertisements of Harrods in a Sunday newspaper, written by no lesser authors than Bernard Shaw, H. G. Wells and Arnold Bennett, each of whom gave his reasons for declining the offer that he should "write up" Harrods. The firm had justified their invitation by the claim that as they employed the best artists, designers, architects and craftsmen, so also they needed the finest writers to make known their wares to the world.

The Architectural Review asked very pertinently: Who were these living artists and designers, and why, instead of the work of living English artists, the rooms of Harrods were full of reproductions? The reply of Harrods was a familiar one—that it was not the business of the big store to create taste, but to meet a demand, etc. And later on their architect admitted that it might be difficult to sell the work of "artists of repute." The *Review* thereupon approached the other great English furnishing houses and found that Harrod's architect was merely voicing the general commercial opinion of England.

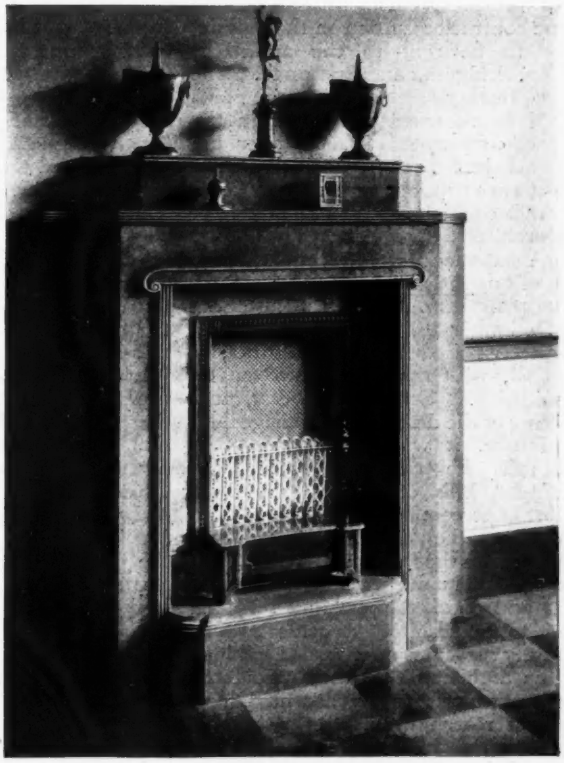
The special issue provides a valuable record of living English artists and their achievements in decoration. It is profusely illustrated with the best work, and contains nine plates devoted to decorative schemes by Duncan Grant, Marion Dorn, Lord Gerald Wellesley and Trenwith Wills, Evelyn Wyld, Raymond McGrath, Easton and Robertson, Edward Bawden, and Boris Anrep.

Among the literary contributions are "three views"—I. "The Man of the World," by the late Sir Lawrence Weaver; II. "The Artist," by John Gloag; III. "The Man in the Street," by A. E. Blake. Other articles of outstanding interest are "1830–1930—Still Going Strong: A Grown-up's Guide to the Recent History of Interior Decoration," by John Betjeman; "New Materials—New Methods," by Raymond McGrath; and "Electric," by Raymond Mortimer.

The *pièce de résistance* of the issue is the competition for the decoration and furnishing of a dining-room and a living-room. The Editor of *The Architectural Review* offers a first prize of £100, a second prize of £50, and a third prize of £25 for the three best schemes submitted to him by August 1, 1930. The competition is open to any architect, decorator or artist of British nationality or living in the British Isles. The conditions of the competition are published in the issue and it is stated that the winning design will be carried out and put on exhibition at Messrs. Waring and Gillow's.



[*From* The Architectural Review, *May, 1930.*



A bedroom in a London house, designed by Guy Elwes. The floor is a black composition with silver inlay. The walls are covered with a Persian blue-green and black waxed wallpaper. The curtains are sulphur yellow. The lighting for the room is concealed behind the pillars.

A corner of the Bridal Suite at Grosvenor House, London, designed by Oliver Hill. The furniture is in sycamore and the mirror glass is grey. The colour-scheme is white and silver.

A staircase leading to the studio of Mr. Clough Williams-Ellis, at Romney House, Hampstead. The staircase is built in marble and white stucco against a blue background. The doors are of plain pine. The vase is of white cast stone.

[*From* The Architectural Review, *May, 1930.*

A gas fire in the garden room of No. 9 Lansdown Crescent, Bath, designed by Adams, Thompson and Fry. The surround is of wood, painted with a slightly uneven patina. The recess is lined with light Sienna marble.

LAW REPORTS

ARCHITECTS AND BILLS OF QUANTITIES: RIGHT TO OPEN

Willcocks and Barnes v. *Paignton Co-operative Society, Ltd. King's Bench Division. Before the Lord Chief Justice.*

LORD HEWART, the Lord Chief Justice, delivered his reserved judgment in an action he tried at the Exeter Assizes, in which the plaintiffs, Messrs. Willcocks and Barnes, builders, sued the Paignton Co-operative Society, Ltd., for damages for alleged breach of contract.

The Lord Chief Justice, in his judgment, said the plaintiffs' claim was for damages for breach of contract to employ them to carry out certain works at Paignton. The plaintiffs were builders and contractors, and in November, 1928, the defendants invited tenders by advertisement for the erection of certain premises stating that applications for bills of quantities should reach the defendants' office not later than December 4, 1928. Towards the end of November the plaintiffs duly applied for bills of quantities, which were sent them on December 6, and which were accompanied by a letter stating that sealed and endorsed tenders were to be delivered to the defendants not later than 5 p.m. on December 18 and that the priced bills of quantities, in a separate sealed cover with the name of the contractor written on the outside, were to be sent to the architects, Messrs. Bridgman and Bridgman. The letter further stated that the bills would be returned unopened, in the case of unaccepted tenders, after the contract had been signed, and that plans, specifications and conditions of contract could be seen at the office of the architects during the usual hours. These statements were repeated in the bills of quantities.

The plaintiffs duly delivered a tender on December 18, and delivered to the architects priced bills of quantities, as directed, with their name written on the outside. On the same day, at a meeting of the defendants' management committee, it was resolved that the architects be asked to verify the plaintiffs' bills of quantities and to report thereon. Acting on that resolution the defendants' quantity surveyors on the following day obtained the bills of quantities from the architects and checked them and returned them to the architects as correct. The quantity surveyors afterwards explained to the architects that they considered the tender was to be accepted, and for that reason obtained the bills of quantities from the architects and checked them.

There was a special meeting of the defendants' management committee on December 22, and it was resolved that the architects be asked to include in their verification of bills of quantities those relating to the lowest tender, that of Messrs. Melhuish and Berry, and to consider the matter again on December 28. At that special meeting the tender of Messrs. Melhuish and Berry was accepted.

On January 2, 1929, Mr. Barnes, a partner in the plaintiffs' firm, called at the architects' office and saw Mr. Bridgman. On this point he accepted the evidence of Mr. Barnes as to what took place at the interview, viz., that plaintiffs' tender was to be accepted by the committee, that the bills of quantities were checked and found to be correct, that the committee afterwards accepted another firm's tender, and handed the witness back his bills of quantities opened. Mr. Barnes said he did not think this was playing the game and that he should have to consult his partner. Later plaintiffs heard that a contract had been entered into with Messrs. Melhuish and Berry. For the plaintiffs, Mr. du Parcq, K.C., had contended that the opening of their bills of quantities constituted an acceptance by the defendants of their tender, and that the return to them by the architects of the opened bills on January 2, after the bills had been checked and ticked off by the defendants' quantity surveyors, was a signification to the plaintiffs of that acceptance, and that there was therefore a completed contract between the plaintiffs and the defendants. For the defendants, Mr. Croom Johnson, K.C., admitted that what had been done was highly undesirable, and that the bills of quantities ought to have been returned unopened to the plaintiffs. But he submitted that the opening of the bills of quantities did not amount to an acceptance of the plaintiffs' tender.

His lordship regretted that he was unable to agree with the argument for the plaintiffs, who seemed to have been shabbily treated. Even though it be assumed that, when the resolution of the defendants' management committee of December 18 was passed, it was the intention of the defendants to accept the plaintiffs' tender, that he thought was not enough. In such a case an intention to accept an offer was not an acceptance, unless and until the intention was communicated to the person by whom the offer was made; and the returning of the plaintiffs' bills of quantities to them opened on January 2 could not in his lordship's opinion be regarded as the communication of an acceptance, because before they were returned Mr. Bridgman informed Mr. Barnes that the defendants had decided to accept the contract of another builder. There must therefore be judgment for the defendants.

BOUNDARY DISPUTE

Bellis and another v. *Fieldgate. Chancery Division. Before Mr. Justice Clauson.*

This action concerned the rights to a piece of land at the rear of premises in the High Street, Chatham. The plaintiffs were Mr. E. C. Bellis and his three sisters, of New Road, Chatham, and Mr. G. Catchpole, of High Street, Chatham, and they sued Mr. G. H. Fieldgate, of Richmond Road, Gillingham, Kent, for a declaration that a certain piece of freehold land at the rear of 67 High Street, Chatham, premises let to Mr. Catchpole, was their property. The plaintiffs also sought an injunction to restrain the defendant and his tenants from trespassing upon it and an order to remove pegs and any other erections upon the land.

The defendant counter-claimed for a declaration that by virtue of a conveyance dated October 3, 1911, or in the alternative by virtue of the statute of limitations, he was the owner in fee simple of the disputed land. The dispute related to the boundary of the land at the rear of 67 High Street, and plaintiffs did not press for a mandatory injunction in respect of alleged trespass, if they got a declaration that the land belonged to them.

Mr. Morton, K.C., argued the case for the plaintiffs, and Mr. Arnold Jolly for the defendant.

His lordship, in giving judgment, said the question he had to decide was one of title to a small piece of land. Unfortunately the difficulties and expense of ascertaining the precise rights of the parties were not in proportion to the smallness of the area of the land in dispute. In one respect the defendant had the Ordnance map against him. The disputed ground had, he said, been possessed by the tenants of No. 67, who had used it as their own, but the tenants of No. 69, which belonged to the defendant, had without interference been in the habit of passing along the disputed land and going out by a back way. On the construction of the documents, his lordship decided that defendant was not entitled to the disputed land and he granted plaintiffs a declaration that the disputed land belonged to them. His lordship added that he was bound to grant an injunction to protect plaintiffs' rights and title in the land, but if he did do so, it must be limited, so as not to interfere with the right of passage of the persons occupying No. 69 to access by the back way.

Mr. Morton said under those circumstances he did not ask for an injunction.

His lordship granted plaintiffs a declaration that the land belonged to them and gave them the costs of the action. He dismissed the defendant's counter-claim with costs.

CLOSING OF HIGHWAY : COMPENSATION FOR INJURIOUS AFFECTION

Wright v. *President of the Air Council. King's Bench Division. Before the Lord Chief Justice and Justices Avory and Talbot.*

The question at issue in this case was whether a property owner could claim compensation for injurious affection when access by road to his premises and land had been interfered with by the closing of the highway.

The matter came before the Court on an award by an arbitrator under the Acquisition of Land (Assessment and Compensation) Act, 1919, the claimant being Mr. A. G. Wright, of The Cottage, Plough Lane, Purley, near Croydon.

Mr. Giveen, for the Air Council, said the litigation arose out of the reconstruction of Sandy Lane, Wallington, by the Air Ministry. It was turned into a highway now known as Foresters Drive, and a part of Plough Lane that had been a thoroughfare was stopped up. The claimant was the freeholder of a house and land at Plough Lane, and his case was that by the closing of the road the distance from his house to Waddon had been increased, and he was entitled to damages for "injurious affection." The damages were agreed at £100, and that sum had been awarded by an arbitrator, with £25 costs. His clients (the respondents), however, submitted that the claimant had no case in law. The question for the Court was whether there had been the injurious affection alleged which entitled claimant to make his claim under the Land Clauses Act. Counsel contended that this had nothing to do with the Act, as the respondents had taken no land and there was no notice to treat. It was true that claimant had a little farther to walk, but he had a better road to walk on.

Mr. O'Callaghan, for the claimant, argued that the Land Clauses Act automatically incorporated itself into any public Act, such as the Acquisition of Land, etc., Act, and that what had happened here was the result of "works or undertakings" carried out under the latter Act and in accordance with the special Act of the Ministry.

The Court took the view that the stopping up of Plough Lane had interfered with the claimant's access to his premises and was carried out after the acquisition of land. They were of opinion that the claimant was entitled to the compensation of £100 and instructed the arbitrator accordingly.

Mr. Giveen said his clients would pay the claimant's costs without prejudice to their right to refuse to pay costs in other cases.

LITERATURE

PLANNING GREATER LONDON

THIS report may be regarded as the outline sketch of the programme for the development of Greater London, which will take several years, at the very least, to reach even a measure of finality. It is most desirable that such a report should be issued, as this has been, as early as possible, in order to afford a visualization, not only of the extent of the problem, but also of the principles on which possible solutions may be reached.

The subjects which have been regarded as of paramount importance are three in number—the provision of Open Spaces, the treatment of Arterial Roads, and the Administrative requirements. Each of these is dealt with by Mr. Raymond Unwin, the Technical Adviser to the Committee, in three memoranda which form the bulk of the report.

As regards the provision of the vast area required to bring the playing fields and other open spaces up to the standard accepted as adequate to the needs of the population of Greater London, which demand an additional 200 square miles, Mr. Unwin makes a number of very interesting points. First and foremost, the public ought only to have to pay for the agricultural value of the land acquired, as the building value is automatically transferred to other land. It is admitted that the adjustments may present difficulties as between separate owners and separate authorities, but the validity of the general principle is proved up to the hilt.

Then, as a matter of good planning,

Old Highway, with Service Road, promoting freedom for Traffic and Safety for All.

[*From* The First Report of the Greater London Regional Planning Committee.]

New Highway with Frontage Building, masking five Road Junctions.

From The First Report of the Greater London Regional Planning Committee.

it is pointed out how much better the result would be if the land to be developed were regarded as a vast open space from which areas should be chosen as appropriate for building development, rather than as uniformly potential building land out of which open spaces are to be rescued by acquisition. The first of these has not hitherto been visualized by reason of the varying attitude of landowners as regards development, but it is obviously the more natural procedure which would ultimately lead to greater efficiency.

Mr. Unwin's conception of the arterial road is based on that of the American parkway, namely, that it should be an attractively laid-out route so that high-speed travel is possible with safety. It should not, in his view, afford building frontages, for the very good reason that these make rapid travel impossible and waste expensive road surface by reason of its frequent obstruction by standing vehicles. For similar reasons he deprecates frequent side roads, and would so plan that these only entered at long intervals, say at least one-third of a mile apart. Speaking generally, it is obvious that he feels we have still a long way to go before we shall reach efficient town planning on comprehensive lines.

As regards administrative requirements, various proposals are put forward either alternatively or to some extent in combination. The line of action regarded as most likely to be effective is the development of existing town planning powers and authorities, subject to a general co-ordination by means of a statutory regional committee or committees. A special memorandum is appended suggesting appropriate procedure, and the functional divisions between the various types of authority.

Two important appendices deal respectively with the methods of acquiring, planning, and redistributing land in Germany and with the use of special assessments in Kansas City, U.S.A., as a mode of recovering the cost of land allocated as open spaces.

SCENIC MODELLING

ONE does not have to walk far along any public thoroughfare to realize the importance of scenic models as a means of attracting the attention of the public to the shop window. Examples include such diverse productions as a model of a ship's cabin, to illustrate its comfortable appointments; a portion of a railway system, such as those employed at big exhibitions by the leading railway companies; or graphic displays that occupy the whole of a large window. There are figures which stimulate a smile, and others which suggest the seduction of the dance; models of busy street scenes imbued with the roar of printing machinery and the insatiable demands of the giant presses, and of settlements which fill the onlooker with the spirit of adventure and the hope of adequate reward for intelligent labour.

Such and many other models, to the number of over a hundred, are illustrated in a practical handbook on the planning, design, and construction of scenic models by Edward W. Hobbs, Vickers gold medallist. The subjects covered vary enormously, as a perusal of the pages will show. Widely divergent also are the methods of construction and treatment, but they have one aim in common—the presentment in an agreeable form of an object, scene, or quality which cannot be achieved so effectively by any other means. The author surveys the whole subject, giving many practical hints on the construction of models of a like character to those illustrated.

Several chapters are devoted to materials, modes of manipulation, the principles of composition and design, based on the experience of the author, gained during thirty years of varied practical work. The art of successful modelling lies in knowing what not to model. The artist conveys with a few lines or splashes of colour an impression of an actual scene and presents it in all the glowing vigour of actuality. In scenic modelling the aim should be much the same, the representation of a scene by implication and suggestion.

Scenic Modelling. By Edward W. Hobbs. Cassell & Co., Ltd. Price 1s. 6d. net.

OBITUARY

VERNON BLAKE: 1875–1930

It is with deep regret that we record the death of Vernon Blake, in a nursing home at Avignon, at the age of fifty-four. We hope to publish, next week, a summary of his career.

JAMES VILLAR: 1843–1930

We regret to record the death of Mr. James Villar, F.S.I., L.R.I.B.A., of Cheltenham, who died recently in his eighty-seventh year.

After leaving school he was articled to the late Mr. D. Humphris, and subsequently, on qualifying, he obtained a position with Messrs. Field and Castle, architects, of Oxford, with whom he remained for some years. Later, returning to Cheltenham, he commenced to practise on his own account, and designed many buildings in the district.

SOCIETIES AND INSTITUTIONS

R.I.B.A. INTERMEDIATE EXAMINATION

The forthcoming R.I.B.A. Intermediate Examination will be held from May 30 to June 5, 1930. The last day for submitting applications to the R.I.B.A. for entrance to the examination is April 30.

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS

At the forty-second annual general meeting of the above society, held at Sheffield, the president brought forward the following resolution, which was passed unanimously: "That a junior section of this society be formed in conjunction with a Students' Society of the Department of Architecture, University of Sheffield, for the purpose of the study of architectural design and construction." It was decided that a committee, consisting of Messrs. W. G. Buck, H. B. S. Gibbs, S. Welsh, E. A. Ashburner and one student from the Department of Architecture, with power to add, should act together and make the necessary arrangements for starting such a junior society.

The election of officers for Session 1930–31 resulted as follows: President, Mr. W. G. Buck, F.R.I.B.A.; Vice-president, Mr. J. E. Lancashire, L.R.I.B.A.; Hon. treasurer, Mr. J. R. Wigfull, F.R.I.B.A.; Hon. secretary, Mr. H. B. S. Gibbs, A.R.I.B.A.; Fellows, Messrs. R. Cawkwell, A.R.I.B.A.; J. M. Jenkinson, A.R.I.B.A.; H. I. Potter, A.R.I.B.A.; J. A. Teather, L.R.I.B.A.; J. C. P. Toothill, A.R.I.B.A.; S. Welsh, M.A., B.ARCH., A.R.I.B.A.; Associates, Messrs. H. W. Inott, L.R.I.B.A.; A. M. Lusby, A.R.I.B.A.; F. H. Wrench, L.R.I.B.A.; Provincial members, Messrs. C. F. Moxon (Barnsley); F. H. Bromhead, A.R.I.B.A. (Chesterfield); E. H. Walker, F.R.I.B.A. (Doncaster); Lt.-Col. J. E. Knight (Rotherham).

NORTHERN POLYTECHNIC SPEECH NIGHT

At the annual speech night of the Department of Architecture, Surveying and Building of the Northern Polytechnic, Sir John Gilbert, K.B.E., Chairman of the Education Committee of the L.C.C., distributed the prizes to the successful students and, in the course of his address, referred to the growth of the Northern Polytechnic and to technical education generally throughout London. He said that the London County Council was alive to the value of technical education, which was now the subject of their most serious attention.

THE SKETCH CLUB TO THE RESCUE!

SUCCESS is a mild and colourless word which gives no hint of the jollity that met the first session of the Sketch Club in last week's ARCHITECTS' JOURNAL. *But the jollity is tempered just now with the sadness that becomes the recipient of evil rumours. Yes, evil and sinister rumours have reached the ears of the Sketch Club, and given it pause.*

Members and their friends are perhaps familiar with another and older Exhibition Club, known to its intimates or habitues *as the Royal Academy. For years this Royal Academy has been reluctantly compelled to admit architectural drawings to its show, much to the detriment of other works depicting subjects of inferior interest. This present year there has been issued a decree making the Third Dimension illegal in the architecture room. Drawings of buildings may be shown, but the drawings must be Innocent of Perspective and the buildings must be Devoid of Thickness. The fashionable Euclidean Silhouette must pervade the room. Nothing must Recede or Stand Out; nothing must have more than One Side.*

In 1929 three persons, one man and two women, entered the architecture room during the same week. It is confidently anticipated that the present year the attendance figures will be more reassuring. But rumour (this rumour which has so disturbed our Club) has it that a special guard is further to be posted at the doors of the room to warn off unheeding visitors.

After mature deliberation the Sketch Club has resolved to extend hospitality next week to the Royal Academy exhibitors, whose fate has earned its warmest sympathy. As one member said, speaking amid universal acclamation: "We must be mindful of our duty to the glorious heritage of Englishmen. Port, income-tax, Bernard Shaw—examples of this heritage surround us on every side. How can we well neglect our weaker brethren of the Academy?"

Meanwhile, the Club sending-in days still go on. All will have their turn when the visitors have departed, and our normal routine is resumed. The Club's address is:

c/o The Editor,
THE ARCHITECTS' JOURNAL,

Westminster, S.W.1.

COMPETITION CALENDAR

May 16.—Messrs. Ewart and Son, Ltd., in conjunction with the Association of Architects, Surveyors and Technical Assistants, invite designs for a lock-up hangar for an aeroplane. The competition is divided into two classes, for those over and under 25 years of age at midnight, May 15–16, 1930. Assessors: William H Hamlyn, A.R.I.B.A., and Chas. McLachlan, A.R.I.B.A., with A. N. Cathcart as technical adviser with regard to roofing, ventilation and hot-water supply. Two prizes will be awarded in each class, namely, free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. Messrs. Ewart and Son, Ltd., reserve the right to publish or make use of any of the designs for which a prize is awarded, but do not reserve the right to build in accordance with any of them. Particulars of the competition, etc., are obtainable from A. Seymour Reeves, Secretary, A.A.S.T.A., 26 Buckingham Gate, S.W.1. Latest date for submission of designs: May 16, 1930.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor: H. V. Ashley, F.R.I.B.A. Premiums: £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs: July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of

the old town hall, at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

July 31.—The Dudley Education Authorities invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor: Herbert T. Buckland, F.R.I.B.A. Premiums: £150, £100, and £50. Applications for conditions of the competition, etc., should be made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs: July 31.

THE BUILDINGS ILLUSTRATED

Following is a list of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Showrooms for Messrs. Godfrey Davis, 26 Bruton Street, W.1 (pages 673-675). General contractors, Bovis, Ltd. Sub-contractors: Greenway and Ludlow, Ltd., marble work; Korkoid Decorative Floors, Korkoid flooring; Bennet Furnishing Co., desks, stools, tables, chesterfields, etc.; Troughton and Young, Ltd., lighting fittings; Rosser and Russell, Ltd., heating and ventilation; London Spray and Brush Painting Co., Ltd., cellulose paint; Walter Cassey, Ltd., metal letters and grilles.

Furniture showrooms, 44-50 Lord Street, Liverpool (pages 683-684). General contractors, Bovis, Ltd. Clerk of Works, J. Brundrit. Carving by Barry Harris. Sub-contractors: Ragusa Asphalte Paving Co., Ltd., dampcourses and asphalt roof, etc.; stone supplied by Barnes and worked by H. Thornton & Co.; Banister, Walton & Co., Ltd., structural steel; Diespeker & Co., Ltd., floors and encasing; Architectural Timbers, Ltd., wood-block flooring; Young, Austen and Young, central heating; E.P.I., Ltd., electric light fixtures; F. E. Pescod, sanitary fittings; Shapland and Petter, hardwood staircase; John Gibbs & Co., casements; Hart, Son, Peard & Co., Ltd., metalwork; Smith, Major and Stevens, Ltd., lifts; Quiggin Bros., lift enclosure.

Bungalow, at Sandon (pages 698-699). General contractor, John Rayner.

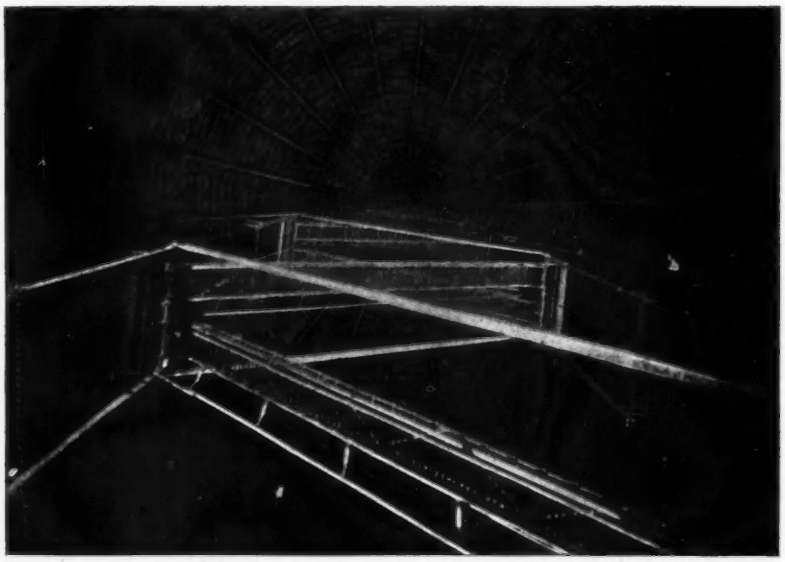
NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to H.M. Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

11432. Akerman, W. S. Roofing construction. April 10.

11419. Black, W. J., and Chisholm, W. D. Manufacture of floorings, pavings, etc. April 10.



11607. British Steel Piling Co., Ltd., and Hiley, A. Construction of piles or columns. April 11.

11644. Bromhead, F. H. Building-brick. April 12.

11079. Brown, G. N., and Eaton, H. Concrete, etc., flooring. April 8.

ABSTRACT PUBLISHED

325745. Tobias, B. Floor surfacing machines.

The new gasholder at Southall, looking up the interior collapsible staircases. It is more than 300 feet high and holds eight million cubic feet of gas.

TRADE NOTES

The Liverpool Branch of the British Thomson-Houston Company has been transferred from South Castle Street to 27-29 Stanley Street. Telephone: Bank 5700.

A private company has been formed by Messrs. Ruston and Hornsby, Ltd., Lincoln, under the title of Société Anonyme des Moteurs Ruston-Hornsby, 5 Avenue de la République, Paris, to exploit their oil engine business in France and the French colonies.

In a new illustrated booklet on church lighting just published by the Edison Swan Electric Co., Ltd., an important fusion of interests is announced. As a result of arrangements made between the firm and the British Thomson-Houston Co., Ltd., the wiring supplies, lighting engineering, refrigeration and radio business of the British Thomson-Houston Co., Ltd., has been taken over by the Edison Swan Electric Co., Ltd. All inquiries regarding B.T.H. church lighting equipment, and applications for advice or assistance in the planning of schemes, should be addressed to the Edison Swan Electric Co., Ltd., nearest branch office. In the booklet various systems of electric lighting are described, and photographs are reproduced of a number of the many churches electrically lighted by B.T.H. equipment. For the purpose of comparison other photographs are reproduced, showing some of the same churches lighted by means of their original installations, or by daylight. The adaptability of the firm's system of lighting to interiors of any style or period is indicated by these many photographs, especially those of Peterborough, Durham and Liverpool Cathedrals, and the Greek Cathedral of St. Sophia, London. Peterborough and Durham Cathedrals are several hundred years old; both are of Norman architecture. Liverpool Cathedral is modern, and the Cathedral of St. Sophia is in the Byzantine style. All are lighted by the firm's system of lighting, using B.T.H. equipment.

The accompanying illustration shows the new gasholder at Southall from a novel point of view, looking up the interior collapsible staircases. It is reproduced from an illustrated record of progress published by the Gas Light and Coke Company, on the occasion of the absorption of the areas of the Grays and Tilbury Gas Company and the Pinner Gas Company, Ltd. The new gasholder at Southall, which is equipped with a lift to enable the maintenance men to inspect the plant under the roof, is more than 300 feet high, and holds eight million cubic feet of gas—almost enough to fill both the R.101 and R.100.

The British Insulated Cables, Ltd., have secured the contract for erecting an overhead power line from Stourport to Banbury, to the order of the Shropshire, Worcestershire and Staffordshire Electric Power Co. This overhead line will, it is claimed, be fifty miles in length, and is to consist of

steel-cored aluminium conductors supported on steel lattice towers. The voltage is 66,000, and the approximate cost of the work £110,000. The steel-cored aluminium conductors will be manufactured at the Prescot works of the company.

Shop-window lighting is the subject of a useful manual compiled for all interested in modern shop-window illumination by Messrs. Philips Lamps, Ltd., with the object of placing the contractor in a position to offer the shop-keeper advice on how to produce the best possible effect by means of lighting. A wide variety of examples have been dealt with and also the method of installation of fittings, concealment of reflectors by pelmets and cornices, planning of mains installations, and methods of arriving at the correct wattage. Particulars of the various effects to be obtained by the use of different lamps and coloured light are given, whilst, finally, the peculiar requirements of different types of shops are dealt with.

The data, of which an example is given below, are the result of experience gained in actual practice.

DRAPERS.—Materials can be divided into two classes, each of which requires a different application of light. First, there are the shining materials such as brocade, silk, satin, taffeta, chiffon-velvet, shantung and the artificial silks, Tricoline and shining zephyr. In order to retain this shining effect they should be illuminated by clear lamps. Secondly, if a display is arranged consisting of woollen materials, or materials such as muslin, plush or velour velvet, woollen tricots, charmelaine, flannel, Viyella, Kasha, cheviot, worsted and poplin, soft light must be used, giving a warm effect and casting little shadow. Argenta lamps are recommended for this purpose. Materials in which yellow is the dominating colour, from light beige to reddish brown, are best illuminated with clear gas-filled lamps. In the case of various materials of different colours, clear lamps should predominate, with a few daylight blue lamps in between. Very bright colours, such as blue, green and purple, must be illuminated exclusively with daylight blue lamps.

From the above it will be seen that the shopkeeper should keep a certain number of lamps in stock, so that he can in every case give his display the correct illumination. The cross position of the lamps is of great importance in connection with the draping of the materials. If, for instance, the window-dresser wishes vertical folds to show up, he must not use upper lights, but side-lights, and if he wishes to soften the shadows thrown by the folds, it is necessary to make use solely of the upper light or foot-light.

The manual is pocket size and is profusely illustrated.

Messrs. Philips Lamps, Limited, of 145 Charing Cross Road, London, W.C.2, will send a copy free of charge to any readers making application on their business notepaper, whilst the limited supply of the first edition lasts.

THE ARCHITECTS' DIARY

WEDNESDAY, APRIL 30

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Drawings of 1800–1850. 10 a.m. till 8 p.m. Saturdays 10 a.m. till 5 p.m. Exhibition closes on May 24. **10 a.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. Annual General Meeting. **8 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

THURSDAY, MAY 1

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. Annual General Meeting. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Ordinary Meeting. The twenty-first Kelvin Lecture. "Some Recent Advances in the Electron Theory of Metals." By R. H. Fowler, F.R.S. **6 p.m.**

FRIDAY, MAY 2

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Exhibition of Wall Papers. 10 a.m. till 10 p.m. **10 a.m.**

NATIONAL SMOKE ABATEMENT SOCIETY, 71 Eccleston Square, Westminster, S.W.1. "By-laws under section 5 of the Public Health (Smoke Abatement) Act, 1926." By C. J. Allpass, L.C.C. To be followed by a discussion. **3.30 p.m.**

ROYAL SANITARY INSTITUTE. At the Town Hall, Tunbridge Wells. Tea, 5 p.m. Discussion on: "Can the Slum be Abolished?" to be opened by H. T. Taylor, M.S.I.A. 5.30 p.m. Edward Willis, M.INST.C.E., F.S.I., M.INST.T., will preside. **5 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Meter and Instrument Section. "The Metering Arrangements for the 'Grid' Transmission System in Great Britain." By C. W. Marshall, B.Sc. **7 p.m.**

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. Meeting of the West Midland District at the Town Hall, Kidderminster. "Ten Years' Municipal Progress in Kidderminster." By J. Hawcroft, O.B.E. To be followed by a discussion. Also, various visits of inspection. **2.30 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. "History of Ancient Sculpture." By Professor Bernard Ashmole. (Lantern Illustrations.) **5 p.m.**

SATURDAY, MAY 3

Sunrise, 5.30 a.m. Sunset, 8.24 p.m.

ROYAL SANITARY INSTITUTE. At Tunbridge Wells. Meet at Town Hall for visit to the premises of the New Maternity Home, 10–12 Calverley Park Gardens, where the architect, A. S. Killby, F.R.I.B.A., will give a brief address. 9.45 a.m. Visit to the Isolation Hospital. 10.45 a.m. Light refreshments will be provided. **9.45 a.m.**

MONDAY, MAY 5

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition opens to the public. **10 a.m.**

TUESDAY, MAY 6

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. "Luminous Traffic Signals." By T. Austin. (Light refreshments at 6.30 p.m.) **7 p.m.**

WEDNESDAY, MAY 7

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "National Parks." By S. K. Ratcliffe. Sir Fabian Ware, K.C.V.O., K.B.E., will preside. **8 p.m.**

THURSDAY, MAY 8

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. "Dante and Italian Art." By Professor Edmund G. Gardner, F.B.A. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. Ordinary and Annual General Meetings. **6.30 p.m.**

FRIDAY, MAY 9

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Annual General Meeting. "The Rotary Automatic Telephone System." By J. W. Moffatt and J. C. Emerson. **6.15 p.m.**

SATURDAY, MAY 10

Sunrise, 5.18 a.m. Sunset, 8.36 p.m.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION, The Castle, Winchester. Annual General Meeting. Address by G. C. Laurence, F.R.I.B.A., R.W.A., Chairman of Allied Societies Conference. **6.15 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. **2.30 p.m.**

MONDAY, MAY 12

R.I.B.A., 9 Conduit Street, W.1. Ninety-sixth Annual General Meeting. **8 p.m.**

WEDNESDAY, MAY 14

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Annual Dinner at the Hotel Victoria, Northumberland Avenue, W.C.2. The Earl of Crawford and Balcarres will preside. 7.30 for 7.45 p.m. (Tickets 12s. 6d. each.) **7.30 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art to be opened by the Archbishop of Canterbury.

LONDON UNIVERSITY Presentation Day. Albert Hall. **2.30 p.m.**

THURSDAY, MAY 15

R.I.B.A., 9 Conduit Street, W.1. Annual Dinner to be held at the Guildhall, E.C.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual General Meeting, 6 p.m. Irish Centre (Dublin). At the Physical Laboratory, Trinity College, Dublin. Annual General Meeting, 7.45 p.m. Hampshire Sub-Centre. At Southampton, Summer Meeting. **6 p.m.**

FRIDAY, MAY 16

INSTITUTION OF ELECTRICAL ENGINEERS. Scottish Centre. At the Technical College, Dundee. The twenty-first Kelvin Lecture. "Some Recent Advances in the Electron Theory of Metals." By R. H. Fowler, F.R.S. **7.30 p.m.**

SATURDAY, MAY 17

Sunrise, 5.6 a.m. Sunset, 8,47 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Second visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. **2.30 p.m.**

MONDAY, MAY 19

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. General Meeting. "The Architectural Association, 1847–1930." By F. R. Yerbury. (Lantern Illustrations.) Exhibition of Architecture of Bloomsbury; also work of Eric Mendelsohn. Until June 14.

WEDNESDAY, MAY 21

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

THURSDAY, MAY 22

ARCHITECTURE CLUB. Dinner to Eric Mendelsohn. Particulars will be announced at a later date.

SATURDAY, MAY 24

Sunrise, 4.57 a.m. Sunset, 8.57 p.m.

MONDAY, MAY 26

R.I.B.A., 9 Conduit Street, W.1. General Meeting. "Recent Excavations at Ur." By C. Leonard Woolley, M.A., HON.A.R.I.B.A. **8 p.m.**

WEDNESDAY, MAY 28

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Father of English Pottery—Josiah Wedgwood, F.R.S., Potter, Inventor and Man of Science." By Harry Barnard. Frank H. Wedgwood will preside. **8 p.m.**

SATURDAY, MAY 31

Sunrise, 4.50 a.m. Sunset 9.5 p.m.

MONDAY. JUNE 2

INSTITUTION OF ELECTRICAL ENGINEERS. Summer Meeting at the Irish Centre. June 2–6, inclusive. Assemble in the evening at the Gresham Hotel, Dublin.

TUESDAY, JUNE 3

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Motor trip in Co. Wicklow, including inspection of overhead transmission lines. Lunch and tea at Glendalough.

WEDNESDAY, JUNE 4

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Proceed by special train to Limerick for visit to the Shannon Scheme.

THURSDAY, JUNE 5

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Visit the brewery of Messrs. A. Guinness, Sons & Co. Lunch by invitation of the Company. Afternoon: Leave Dublin by special train for Belfast. Evening: Reception by the Lord Mayor of Belfast, Rt. Hon. Sir William Coates, at the City Hall.

SATURDAY, JUNE 7

Sunrise, 4.45 a.m. Sunset, 9.12 p.m.

THURSDAY, JUNE 12

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual Conversazione, to be held at the Natural History Museum, South Kensington, S.W.

SATURDAY, JUNE 14

Sunrise, 4.43 a.m. Sunset, 9.18 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Annual General Meeting and Annual Dinner. Particulars will be announced later.

MONDAY, JUNE 16

R.I.B.A., 9 Conduit Street, W.1. Election of Council and Standing Committees: Election of Members. **8 p.m.**

WEDNESDAY, JUNE 18

R.I.B.A., 9 Conduit Street, W.1. British Architects' Conference, to be held at Norwich. Until June 21 inclusive.

FRIDAY, JUNE 27

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL SOCIETY, The Castle, Winchester. Excursion to the Joinery Works of Messrs. W. E. Chivers and Sons, Ltd., Devizes, and buildings of architectural interest in the neighbourhood. A General Meeting will be held after lunch.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BARNES U.D.C. is to erect slipper baths and sixteen houses on a site in High Street.

The BATTERSEA B.C. is seeking sanction to borrow £4,330 for extensions at the maternity home at Bolingbroke Grove.

The BERMONDSEY B.C. proposes proceeding with a scheme for dealing with an unhealthy area in the vicinity of Rotherhithe Street, under the new Government slum clearance scheme.

The BERMONDSEY B.C. is to convert a large building at Grange Road into eight flats, and erect six flats and two cottages on an adjoining site.

The CATERHAM U.D.C. is to erect a further thirty-six houses on the Stafford Road site.

The COULSDON U.D.C. has appointed a sub-committee to confer with the surveyor upon the selection of suitable sites for the erection of further houses and the suggested layout.

Mr. H. Edmund Matthews has prepared plans for extensions at St. Peter's Hospital, Henrietta Street, COVENT GARDEN, the cost being estimated at £25,000.

Plans passed by the CROYDON Corporation: Alterations and additions, Purley Congregational Church, Brighton Road, for Mr. T. A. Lewis; two houses, Devonshire Way, for Messrs. Burcote, Ltd.; eleven garages, St. Oswald's Road, for Mr. F. W. Milton; additions to joinery works, 79 High Street, Thornton Heath, for Messrs. Truett and Steel, Ltd.; two houses, Croham Valley Road, for Mr. G. W. Peachey; alterations and additions, "The Wheatsheaf" public-house, London Road, for Mr. G. G. Stanham; four houses, Ballards Way, for Messrs. Taylor Bros.; five houses, Addiscombe Road, for Messrs. J. B. and W. B. Hemmings; twenty-eight houses, West Way, for Messrs. M. Brown and Sons, Ltd.; alterations and additions, 212 Lower Addiscombe Road, for Lloyds Bank, Ltd.; thirty-five houses, Covington Gardens and Covington Way, for Messrs. Thomas and Son; three shops, Bishops Park Road, for Mr. H. Macintosh; two houses, Grange Hill, for Mr. H. Beckett.

The Essex Education Committee has purchased sites in Rectory Road and in Eastbrook Road, DAGENHAM, for the erection of two elementary schools.

The EAST HAM Corporation is seeking sanction to borrow £133,000, for the construction of roads and the erection of houses on land at Charlmont Road.

Plans passed by FULHAM B.C.: Buildings, Parsons Green Lane, for Mr. A. Hulbert (London Co-operative Society); buildings, Fulham Pottery site, New Kings Road, for Mr. F. C. Wylde; buildings, Peterborough Mews, for Mr. G. Roberts.

The Deacons of the Highbury Church, ISLINGTON, are to reconstruct the building, in accordance with plans prepared by Messrs. Hobden and Porri, architects.

The ISLINGTON B.C. has obtained a site in Wharfedale Road, for the erection of an electricity sub-station.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Broken brick or stone, 2 in., per yd.	0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

	£	s.	d.
Portland cement, per ton	2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. . . . £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. . . . 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.
If left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. . . 0 2 10
PUDDLING, per yd. cube . . . 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube . . . 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube . 1 7 0
DO. in lintels, etc., per ft. cube . . 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube . . . 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* BRICKLAYER, 1s. 8½d. *per hour ;* PLUMBER, 1s. 8½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Stoneware pipes, tested quality, 4 in., per ft.	0	0	10
DO. 6 *in., per ft.*	0	1	3

STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1½ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded 1½ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring standard blocks laid herringbone in mastic :			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¾ in. with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra each	0	0	3
DOORS, 4-panel square both sides, 1¼ in thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labours, per ft. run	0	0	1
STAIRCASE work :			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS :			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1½ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1½ in. thick and bedding per ft. sup.	0	4	6
IRONMONGERY :			
Fixing only (including providing screws) :			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

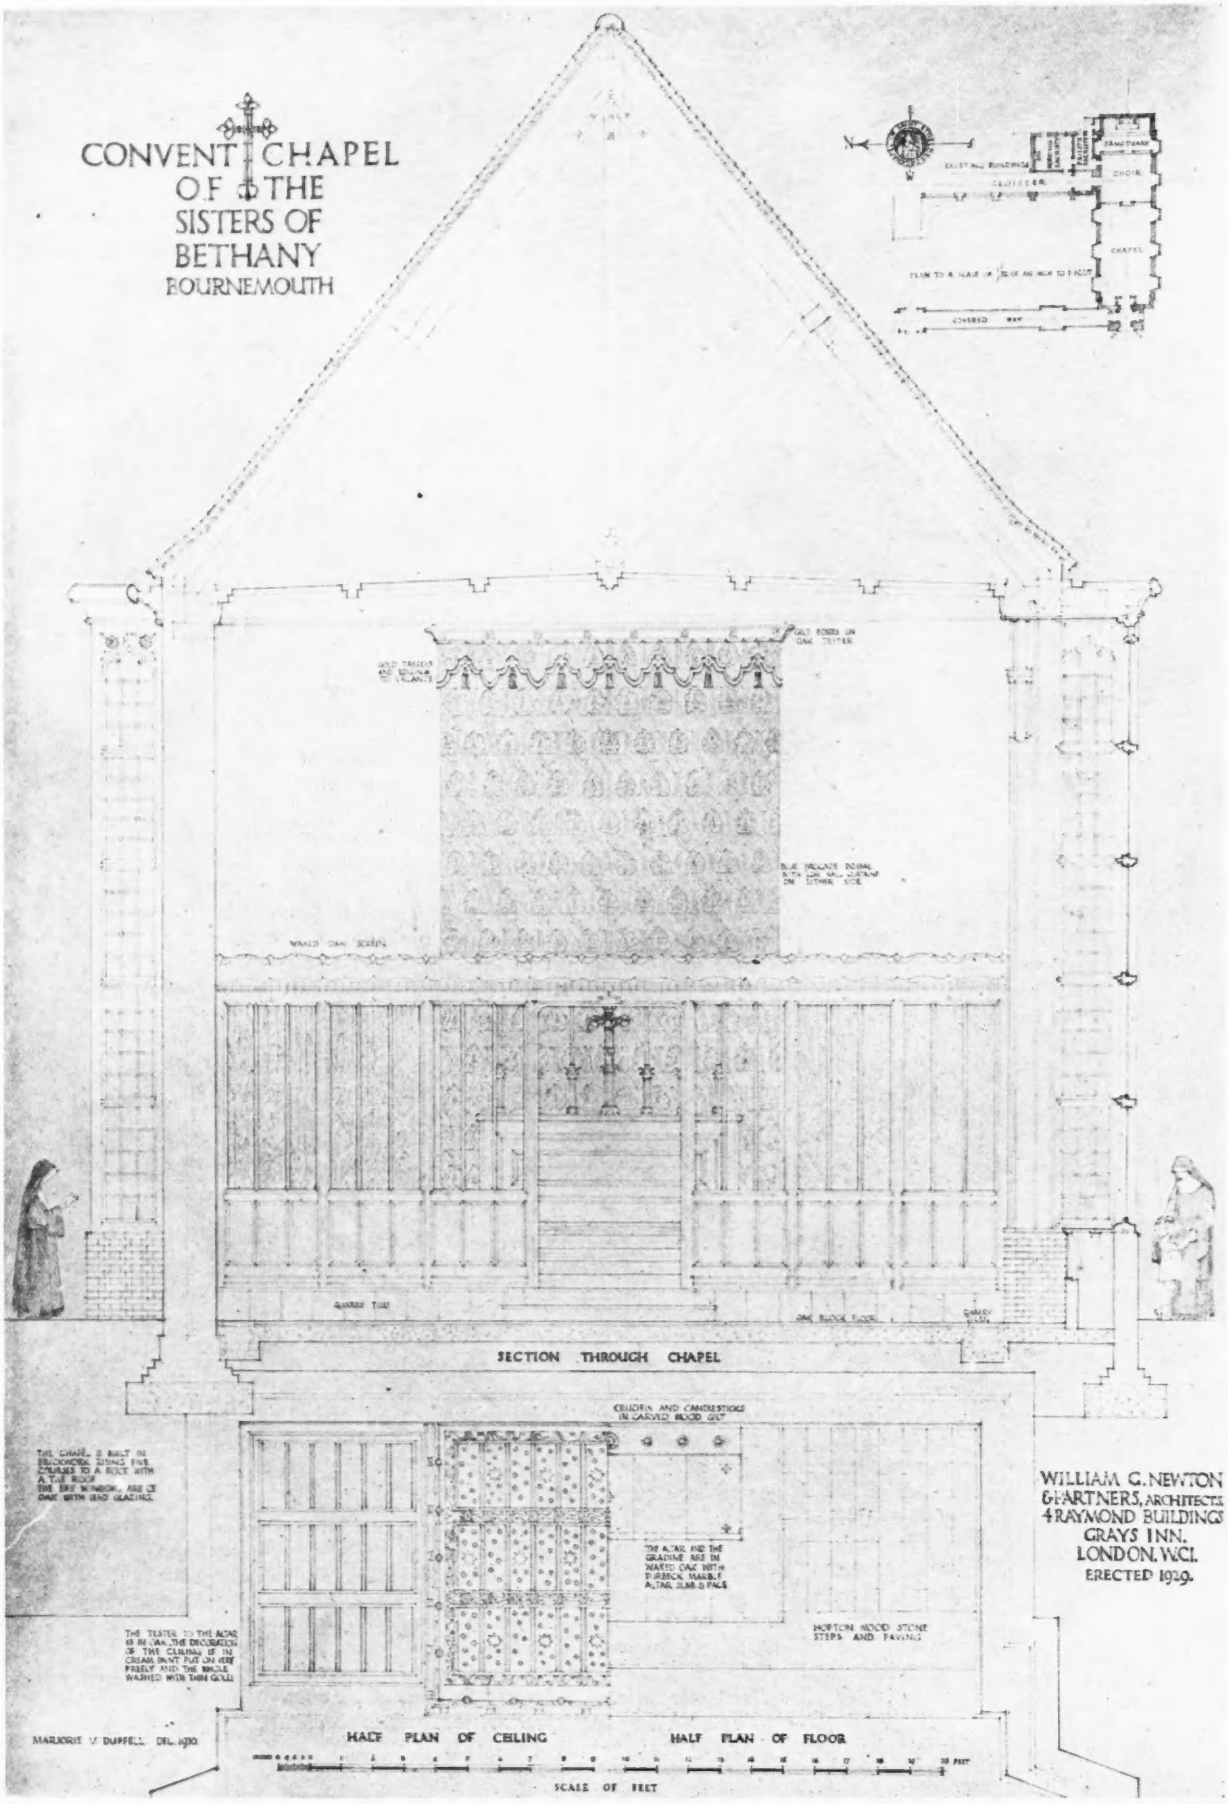
CONVENT CHAPEL
OF THE SISTERS OF BETHANY, BOURNEMOUTH.
By PROFESSOR W. G. NEWTON AND PARTNERS.

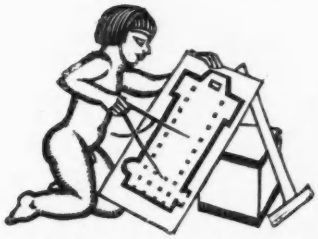


THIS chapel is an addition to a convent building, designed by Norman Shaw some fifty years ago. It is built in brick, having large oak bays with lead lights, and has a tile roof with an oak eaves cornice.

All the interior woodwork, including the beamed and canted ceiling, is in English oak, waxed and slightly polished, and the walls are warm cream coloured plaster : the floor of the chapel and the choir is of oak blocks with an edging and skirting of large quarry tiles. The floor of the sanctuary is of Hopton Wood stone, and the altar pace is of Purbeck marble.

The altar is oak, and has an oak tester with a moulded cornice having carved pateræ. The beams on the soffite of the tester are freely painted with patterns in cream paint and the whole washed lightly with gold. The valance to the tester, the dossal, and the side curtains are of Van de Weyden blue brocade, with gold tassels and border to the valance.

The altar candle-sticks are of wood gilt, and were made to the architect's design by Mr. Alan Durst, who designed and carved the figure on the cross.



A detail drawing of the chapel, hung in this year's Royal Academy Exhibition, is reproduced on the following page.

For photograph see preceding page.]

FIVE GOOD MEN AND TRUE

The Ideal Jury of Assessors for the New R.I.B.A. Building

FOUR years hence the new home of the Royal Institute of British Architects at Portland Place will be completed and in occupation. The building will be plain for all to see, and not only to see but to judge. A heavy responsibility rests, therefore, upon those whose duty it is to formulate the conditions of the great competition which before the end of this year will be instituted in order to obtain designs for so important a building. As is well known, however, there are two sides to the competition—the choosing of the assessor or assessors who will be called upon to appraise the rival merits of the schemes submitted; and the choosing of the design.

The first and most urgent task, therefore, is to elect assessors who will have the confidence of the profession as a whole. This is easier said than done. For let us frankly face the difficulties which are here to be encountered. Architects cannot afford to conceal from themselves even the most unpleasant truths which relate to their present condition. Let the printed word express the thoughts which must come to us when we survey the true nature of the problem of appointing suitable assessors for this competition. The architectural profession, to an extent previously undreamt of in living memory, is torn with internal faction. The various sects which strive for supremacy entertain little respect for each other, so the possibility of any design for the new R.I.B.A. Building winning the approval of the profession as a whole is extremely remote.

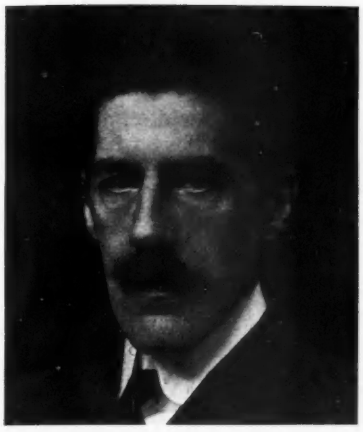
It is bad enough when architects quarrel over questions of professional organization. In such political matters, however, we have a national tradition of good humour, and have learnt how to differ and yet live in peace. But in art this commendable degree of intellectual tolerance is very much harder to achieve, and we have evidence that in the wordy warfare which is now waged between the rival schools of architectural thought the exponents on either side are out to kill. There is today a virulence and, indeed, one might say, a lack of scruple which was quite foreign to the discussions in which architects used to indulge a generation ago, and it augurs ill for the success of any attempt at a compromise such as might be arrived at by a middle party in the profession. Yet it is upon the formation of such a middle party that our hopes of solving the problem of the new R.I.B.A. Building must principally depend.

If the problem is difficult and seems at first sight almost impossible of solution, it is all the more incumbent upon us to put our heads together and tackle it in earnest. Reason and discussion and the methods of question and answer, provided that they are conducted fairly and with a genuine desire to elicit the truth, cannot fail to throw light upon this subject.

Can we find assessors whose combined talents and proved integrity of mind will inspire the competitors with the confidence that the decision arrived at will represent the collective wisdom of the profession?

In order to ascertain whether this be possible, THE ARCHITECTS' JOURNAL is today issuing a questionnaire in which readers are invited to suggest the names of five members who are best qualified to serve as assessors. Each member of this jury should not only supplement the gifts of the others, but should himself represent an important and reputable school of architectural opinion. We have, of course, our own views about this matter, but for the present we intend to keep them to ourselves. What is more important at the moment is to ascertain whether there is in any degree at all a concensus of opinion with regard to it in the ranks of the profession as a whole.

We request our readers to ponder well the questions which we are addressing to them. We anticipate that their answers will contain a wealth of suggestion which will merit the respectful study of the Committee engaged upon the task of appointing the Jury of Assessors for the new R.I.B.A. Building.



AN ESSEX YACHT CLUB:
BY JOSEPH EMBERTON

This perspective drawing, by W. Crabtree, shows the preliminary design for the proposed new premises for the Royal Corinthian Yacht Club, Burnham-on-Crouch, Essex.

On the ground floor the accommodation includes entrance hall, lounge bar, billiards room, mixed dining-room, and ladies' room; and on the first floor the men's dining-room and lounge, card-room, library, committee room and kitchen. Since the drawing was made it has been decided to add another floor, which will provide members' sleeping quarters and bathrooms.

The building is intended to be erected in reinforced concrete, and to occupy the site of the present club house. Large window areas are provided to give members the opportunity to enjoy, to the maximum extent, the magnificent views both up and down the river.

Royal Academy Exhibition No. 1302. Other R.A. drawings on pages 704 and 726-9.

NEWS & TOPICS

The Earl of Crawford and Balcarres, who in his Presidential address to the Council for the Preservation of Rural England, last week, said that the system of advisory panels was receiving the official support of the Ministry of Health.

Professor Patrick Abercrombie, who was last week elected the new President of the Liverpool Architectural Society, has held the Chair of Civic Design at Liverpool University since 1915, and has laid out eight new towns in Kent.

CHARING CROSS BRIDGE : LAMBETH'S SUGGESTION

LAMBETH Borough Council, who had not felt called upon during the course of the Parliamentary Committee's examination of the official Charing Cross Bridge scheme to offer suggestions, have now laid before the L.C.C. an alternative plan for dealing with the southern side of the river that goes far towards removing the objections raised to the official scheme. This plan is the result of collaboration between the borough engineer (Mr. Osmond Cattlin) and Mr. Thomas Adams and Mr. W. A. Davidge, both past presidents of the Town Planning Institute.

★

An essential feature of the scheme is that the Southern Railway station would be placed on the Waterloo Junction site, where it would occupy a position facing Waterloo Station itself, thus completing the semicircle of a D-shaped open space. Waterloo Road, without being buried under black tunnels, would be spanned by roadways connecting the two stations at high level, so that a complete circulation of taxi and motor traffic could be operated.

★

With the stations thus grouped together, the whole of the property lying between York Road and the river would be thrown open to the best form of development, and an embankment road of real usefulness would be not only possible, but, if the scheme were started upon, desirable and necessary.

★

The objections to this proposal are not by any means so evident as in the official scheme, while it definitely fulfils many of the requirements considered to be necessary by Sir Henry Cautley, the chairman of the Parliamentary Committee.

THE BURDEN OF DEATH DUTIES

The effects of death duties upon agriculture (and incidentally the countryside), discussed in a recent leading article of the JOURNAL, are given prominence in a letter to *The Times* from the Marquess of Lothian. He points out the unwisdom of draining the capital resources from an industry which is rotting for lack of capital, to spend them for current revenue purposes mostly in the towns.

★

The operation of high rates and taxes upon good agricultural land, well farmed, is such that all profit is taken away. The further imposition of death duties means that landowners are reduced either to diverting money that should be spent on maintenance to paying interest on mortgages, or selling the land in the open market. Both these methods spell ruin to agriculture.

★

The other way out of the dilemma is, as has been suggested, to allow payment of death duties to be made in land of any sort, and not only in land "suitable for public purposes." Otherwise every effort made to save the countryside will be frustrated by a Government bent on spending money in the towns.

FITTINGS TO ARCHITECTS' OWN DESIGNS

I was talking the other day to the Editor (or, to be quite accurate, he was doing the talking, for I couldn't get a word in edgeways) about the difficulties which architects in this country experience in getting their designs carried out by manufacturing firms. Only a few weeks ago, an architect of my acquaintance was telling me of an experience which he had had in this very connection, and was comparing English procedure with French. He wanted his own design of light fitting, which was composed of decorative metalwork and moulded glass. The estimates which he got from British manufacturers were absolutely out of the question, since, as he only wanted about a dozen fittings and had to cover all the overhead costs of production, the price per fitting was ludicrous. He therefore sent to France for alternative estimates.

★

At this point one has, of course, to make every allowance for the lower wages and lower overhead costs; but, apart from this, at least one French manufacturer was very shrewd. He quoted a very reasonable price for each fitting. He also asked permission from the architect to be allowed to manufacture these fittings as standard articles, but guaranteed that they would not be placed on the market for a period of six months or a year—whichever the architect preferred. Naturally, the architect, as designer, not only had no objection to the manufacturer's pursuing this course, but, in addition, was rather flattered by the compliment to his design. He agreed; and thus got his own individual design produced at a reasonable cost, the manufacturer taking the risk of defraying the remainder of the overhead charges by large sales to the general public, who would buy the fitting as a standard product. It would be interesting to know whether this experiment has been tried with manufacturing firms in this country, and, if so, whether it has met with success or otherwise from the points of view both of the manufacturer and of the architect.

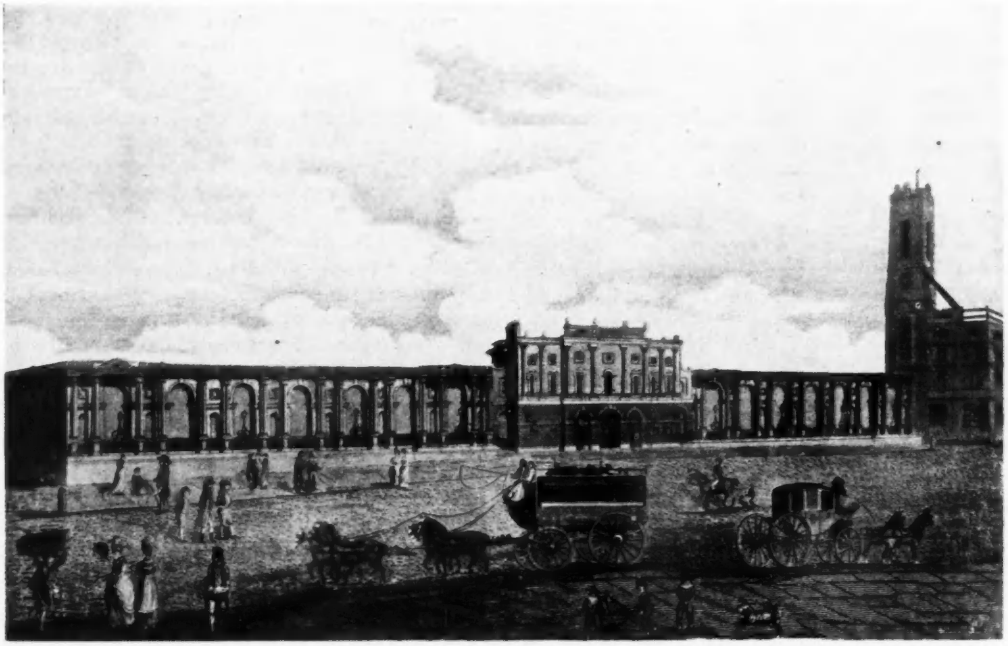
ARCHITECTS IN DEMAND IN SOUTH AFRICA

According to the annual report of the Union Public Works Department for 1928–29 (writes a correspondent in South Africa), great difficulty is experienced by the Department in maintaining a full staff of architects, in spite of repeated importations from overseas. The reasons advanced for this are that the number of fully-trained men is limited, the competition for such men in the profession strong, and the prospects outside attractive. But another very suggestive reason is recognized. "The situation has been met, to some extent, by improved grading and prospects in the Department," says the report, "but it should be understood that professional service of this kind must be remunerated with due regard to conditions obtaining outside. If salaries are pinched the country will not retain the men, and it will be necessary to consider the curtailment of a programme which, even now, meets no more than the bare minimum of need.

★

"The Department has during the last few years developed a system of training for young matriculated assistants and quantity surveying assistants, who obtain experience in design, specification work, drainage, structural engineering, and the essentials of quantity surveying, with supervision under capable assistants. Efforts are being made to ensure that they obtain experience not only on the æsthetic side, but on the business side as well. Moreover, the Universities of Capetown and Johannesburg have established full-time courses in the professional subjects; Pretoria University College has recently created a Department of Architecture and Quantity Surveying; and there has now been constituted, under the Architects and Quantity Surveyors (Private) Act, No. 18, of 1927, an Education Committee, which includes, among others, Professor Wheatley of Capetown University, and Professor Pearse of Johannesburg University. Durban, Port Elizabeth, and Bloemfontein will be centres for educational courses under University auspices."

IN IRELAND—NOW



Let this be a warning to all builders who do not like to start a contract on a Friday. A certain farmer of Londonderry sought to build a house and employed a builder. He did not employ an architect because he thought he could do all that himself. So he made his own plans and wrote his own specification—on tea paper! The poor builder did his best. He put in bay windows when the farmer's wife found there were none on the plan; and he put a fire in the pantry because, as the farmer's wife said, "If you were down in County Antrim you would see everyone has them"; and he put in pitch pine all over; and a copper tank, and many other things. Then he could go no farther, for there was no more money. And the house was unfinished.

★

Owner and builder met again in Court, and further sorry details were divulged: how the windows had to be re-glazed because the hens ate the putty; how the men left the job for a month because there were potatoes to be dug; and, finally, how the poor builder had to give up business and look for other work. It is one of the most saddening of warnings, for, as the farmer said, it is very unlucky to start anything on a Friday.

AN OLD PRINT OF THE BANK OF ENGLAND

The rapid transformation of the Bank of England gives an added interest to this old print of the South Front, made in 1800. On the extreme right is Saint Bartholomew's Church, removed in 1841 and now remembered in the name Bartholomew Lane, which bounds the Bank on the east side. The two-storied entrance in the centre of the Bank front is Sampson's work, built in 1734. The east and west wings, with the blind arcade, were designed by Sir Robert Taylor and built between 1765 and 1782. Sir John Soane was appointed architect in 1788, but no part of his work is shown in the print. ASTRAGAL

Under this eighteenth-century view of the Bank of England, from the corner of Bank Buildings, is a note to the effect that the "elegant building (in front) was begun in 1771, by Sir Robert Taylor, and finished by him, 1783."

THE R.I.B.A. Council has now decided that the new building in Portland Place is to be the subject of an open competition for which all members of the R.I.B.A. or of any allied society are to be allowed to enter.

There are people who hold that the recent announcement making known this decision conceals one of the most momentous situations in the history of our profession. In their view the competition for the new R.I.B.A. building is no ordinary competition. It is an event whose after-effects will be felt in fifty years' time and more, for the good or ill of our art and of all those who practise it.

THE ARCHITECTS' JOURNAL concurs in this view, and invites its readers to take their part in the shaping of this great event. If you are interested in your own work and your career, you must needs be interested in the future of the profession. The future of the profession will be vastly influenced by the result of this competition. Will you help to make sure that the right result is obtained ? Will you help to safeguard your own interests and those of your fellows four years hence—and after ? Read what is written below. Record your views and your preferences now, for what you have to say may make all the difference between a lasting achievement on the one hand and failure and discredit on the other.

?

ARCHITECTURE ON TRIAL

The Year 1934— What Will It Bring Us?

?

OUR FIVE JUDGES
WANTED: *REASONED* SUGGESTIONS

THIS competition will be assessed by a jury of five men, to be appointed by the President, Sir Banister Fletcher. In making his selection, however, the President will be largely guided by the suggestions placed before him by members of the profession. In theory, the choice of the five men will be made by the President. In reality, it is in the hands of all architects who are members of the R.I.B.A. or of one of its allied societies.

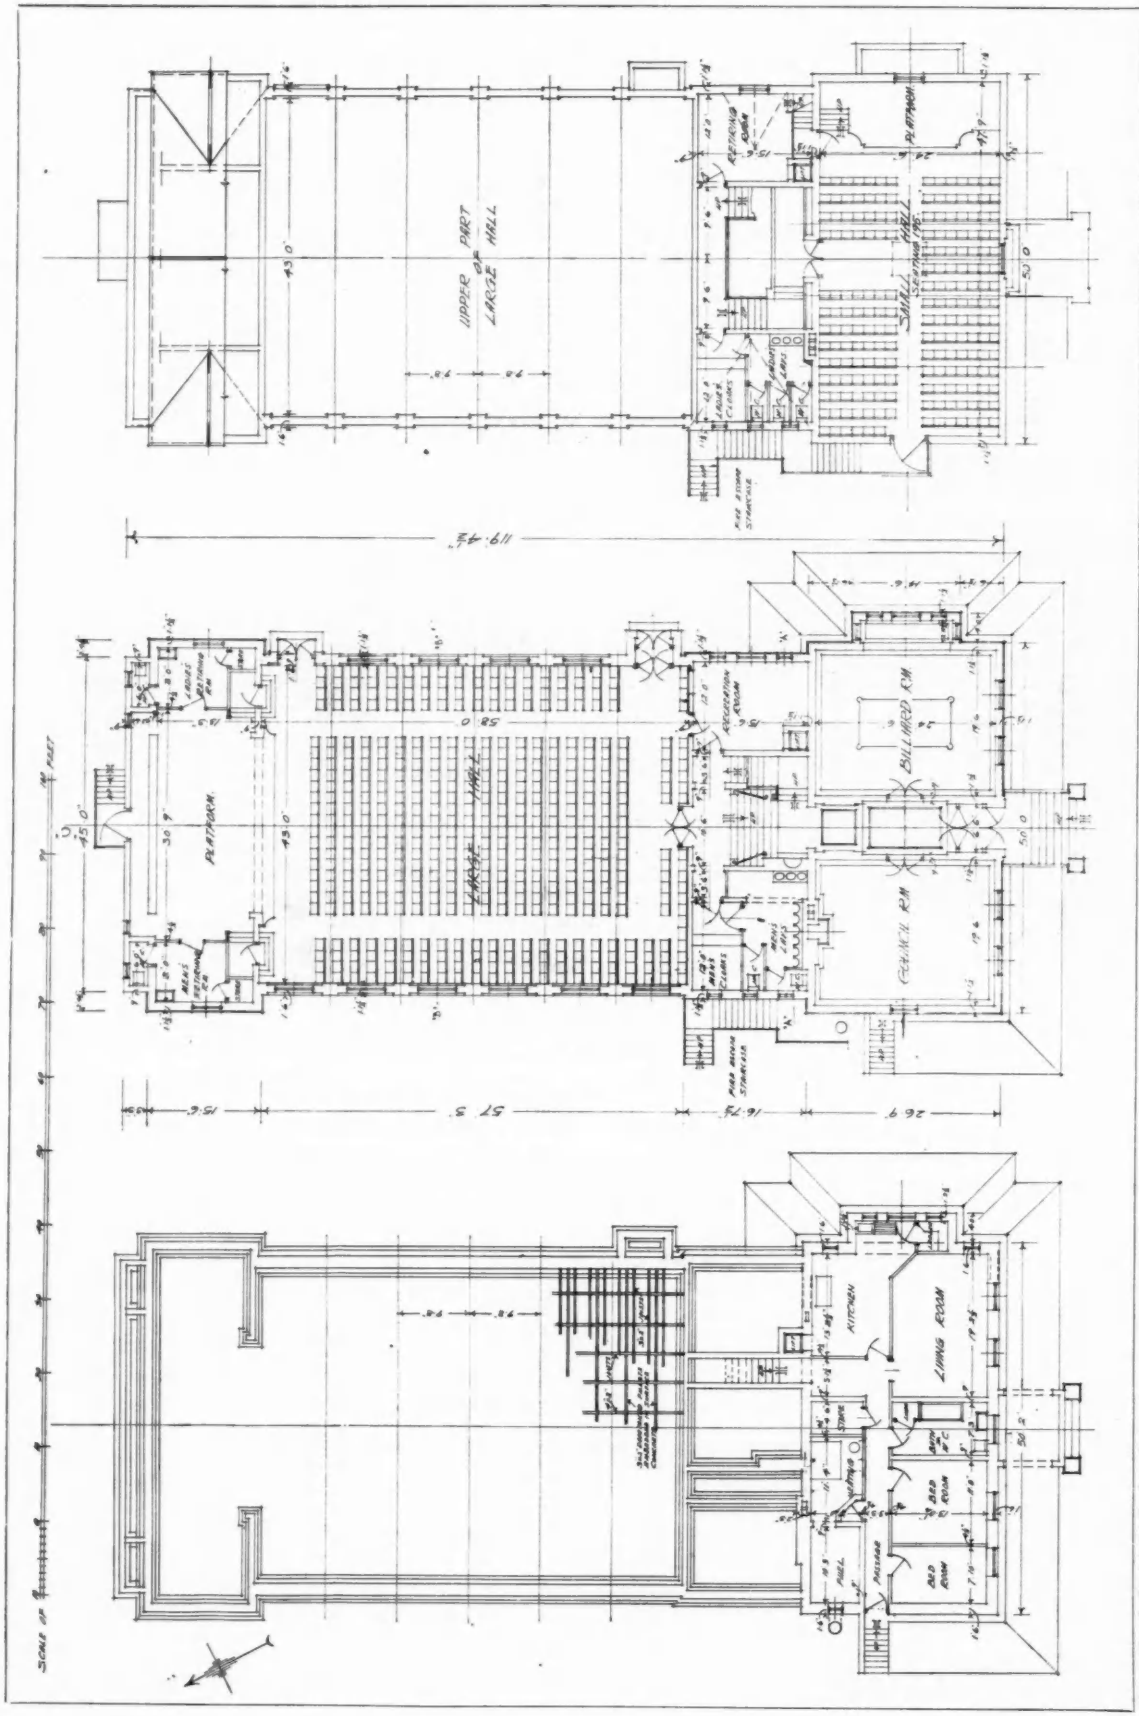
A QUESTION OF VITAL IMPORTANCE

This question is so important that it is every man's duty to ponder it, and ponder it well. And, having pondered it, all those who have arrived at some definite conclusion should make known their conclusion. If they do not, they fail in their duty to their profession and to themselves.

REASONED SUGGESTIONS INVITED

The Editor of THE ARCHITECTS' JOURNAL would like to place the views of his readers before the President, and he invites each one of them to send him their *reasoned* suggestions on or before Friday, May 16. The form printed on page xlv of this issue may be used to this end. It is expected that the President and Council of the R.I.B.A. will discuss the composition of this jury some time in June. Their task will be lightened considerably if they have before them a number of seriously considered statements.

WHAT A REASONED SUGGESTION MEANS



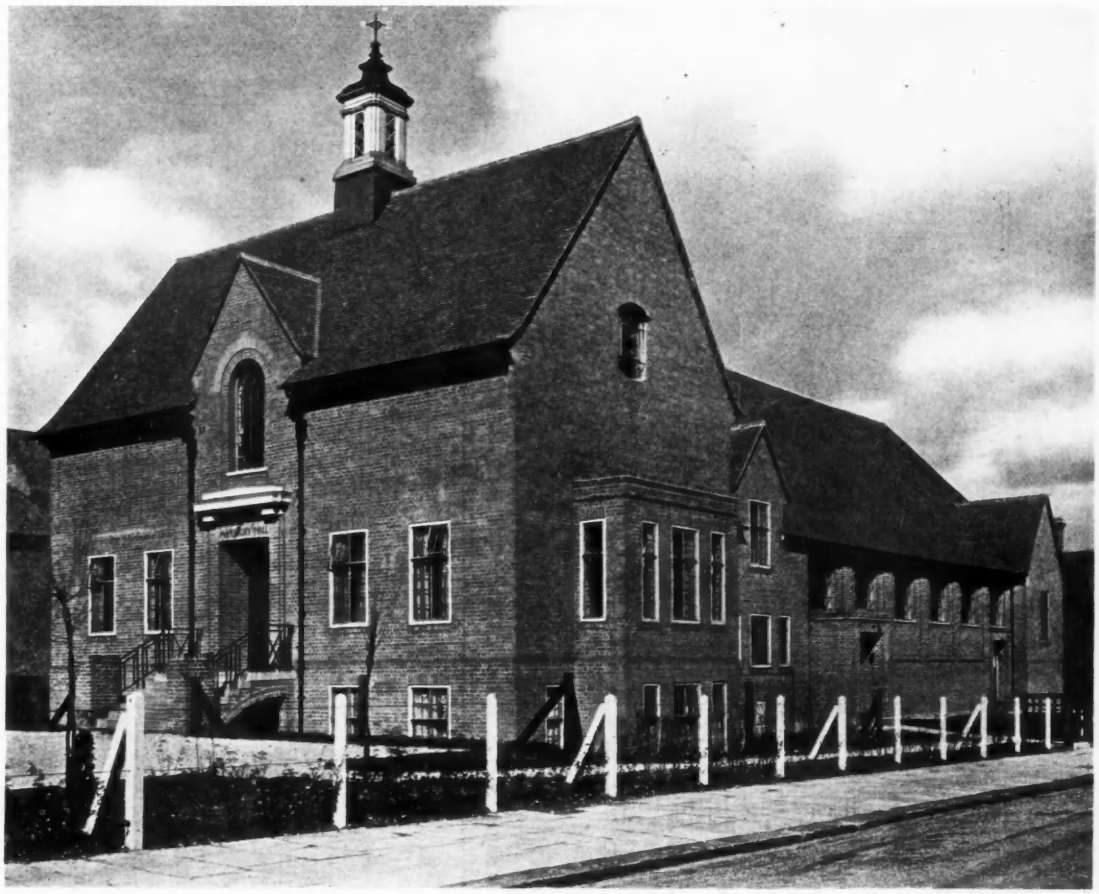
What do we mean by *reasoned* suggestions ? In our opinion a jury of five members is large enough to be really representative of the different trends of opinion that are found in architectural circles today. A jury of less than five could hardly manage this; the members of a jury of three, for example, would doubtless have to be selected on much the same sort of personal grounds that would govern the choice of a single assessor. With five it is different. There are more than five sections in the profession, or five types of architectural mentality. Some have put the figure at ten or eleven thousand. But with five assessors we do know that the most important ideas now current will be represented. It is even possible that extremes may meet and opposites be balanced. The possibilities of the number five are fascinating and all but inexhaustible.

WHAT IS YOUR CHOICE ?

What kinds of parties do you want to see represented ? What sort of attributes will you look for in this bench of judges to whom so much is being entrusted ? One elderly, experienced, slow to enthuse, accurate in his judgment ? One young, keen, plucky, willing to consider and even accept the unusual and untried ? Would you wish to see learning and tradition given their place ? Do you feel that the great provincial towns, and even the Empire, may have a point of view which differs from that of London men, and which should find expression on the jury ? You will have your views on all these matters, and on many others of equal importance perhaps. From Le Corbusier to the woman architect, your mind will range over the whole of modern theory and practice. Which five outstanding ideas or qualities will you select ?

WHAT TO DO

Pick the five. Put the ideas down in the appropriate spaces on the form which appears on page xlv of this issue of THE ARCHITECTS' JOURNAL. Then, and then only, fill in the names of the persons best capable, in your view, of representing these sections and of making a wise and sensible choice on their behalf. Cut out this form and send it to the Editor, THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W. 1, not later than first post on Friday, May 16. The views submitted by our readers will be analysed in THE ARCHITECTS' JOURNAL. They will, incidentally, throw a most interesting light on the present-day faith of British architects. But they are meant to be directly useful, and they will be placed before the President of the R.I.B.A. without delay. Do not think lightly of this question of the R.I.B.A. jury. It is one of the most serious the profession has ever had to answer.



Christ Church Parish Hall, Brondesbury.]

[*By Lanchester, Lucas and Lodge.*

Basement, ground- and first-floor plans. *The building has been erected for the Parochial Church Council, Christ Church, Brondesbury, and is intended to be used for the presentation of plays and concerts, and for wedding receptions, dances and other social functions. The accommodation comprises a large hall, a small hall, Council, billiards and recreation rooms, and in the basement a self-contained flat for the caretaker.*

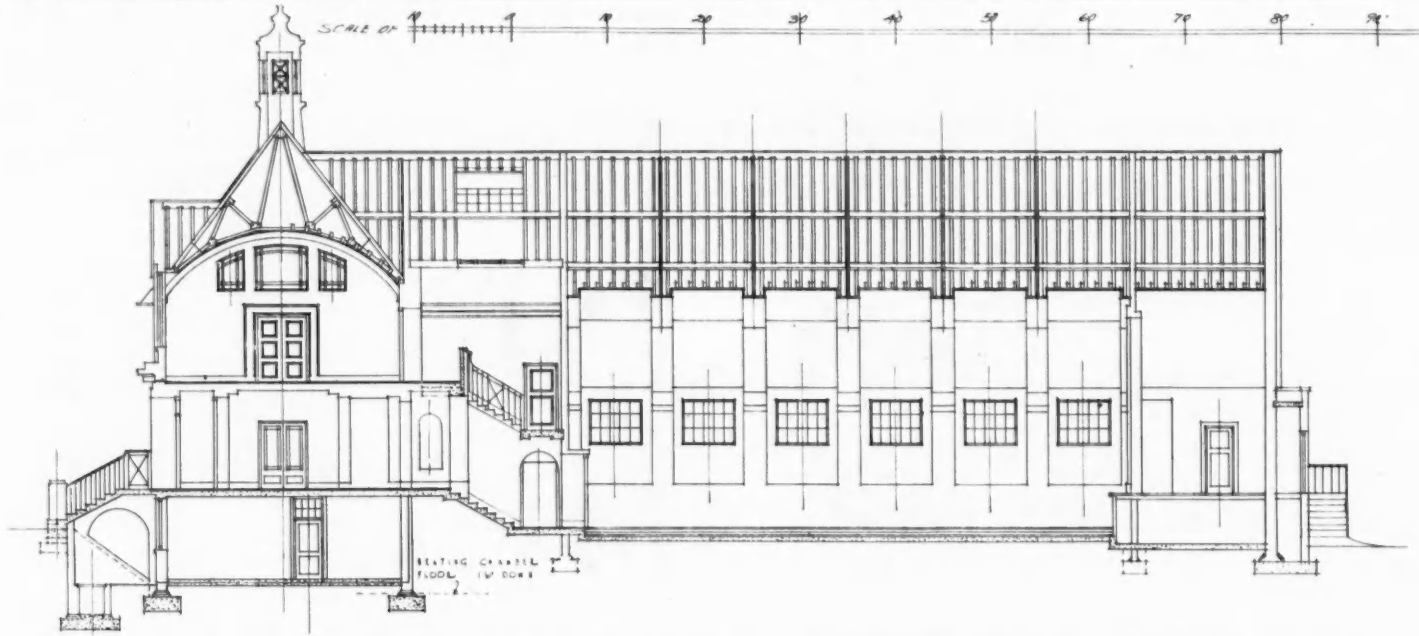
CHRIST CHURCH PARISH HALL, BRONDESBURY

DESIGNED BY LANCHESTER, LUCAS AND LODGE

A view from the corner of Willesden Lane (running to the left) and Coverdale Road. On the left of the main entrance is the Council room, and on the right the billiards room. The two doorways on the Coverdale Road side give entrance to and exit from the large hall. The small hall is above the main entrance, and is lighted partly from the semicircular headed window in the gable. Both halls are illustrated on page 713.

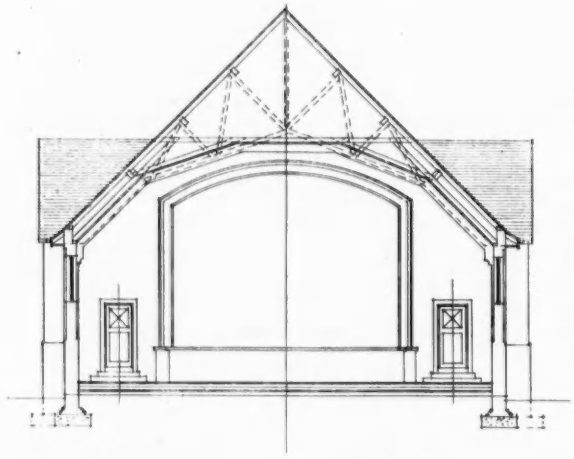
CHRIST CHURCH Parish Hall stands at the corner of Willesden Lane and Coverdale Road, and is used for the presentation of plays, operas and concerts, and for wedding receptions, dances, whist drives and other functions of a social character. It has been erected for the Parochial Church Council, Christ Church, Brondesbury. The exterior walls are of brick of a brownish tint, and the roof is covered with brown tiles. Metal windows are fitted. Above the main entrance are the words "Mapesbury Hall."

The principal apartment on the ground floor is a large hall capable of holding 500 people. This hall is 2,500 feet in area, being 58 feet long by 43 feet wide. It is two floors high, and is provided at one end with a stage about 30 feet wide by 14 feet deep. On the left of the stage is the men's retiring room, and on the right the ladies'. Each of the retiring rooms is provided with lavatory accommodation. This hall is the most important feature of the building, yet it is architecturally treated with the same simplicity and restraint that characterizes the other accommodation. The walls have a dado of blue-green, with a line of black to separate it from the cream walls above. The surrounds of the doors and the proscenium and base of the stage are also in blue-green. Stage hangings are in amber and brown, and the electric light fittings are green. The floor is constructed of timber to give the necessary spring for dancing.



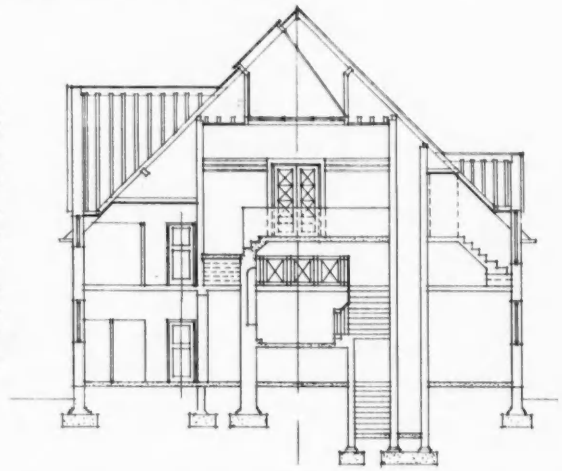
On the ground floor are also the Council, billiards and the recreation rooms. The Council and billiards rooms are each 24 feet 6 inches long by 19 feet 6 inches wide. The window sills and metal casements are blue-green, and the windows are hung with brown curtains.

A smaller hall, with seating accommodation for 200 persons, is provided on the first floor, immediately over the Council and billiards rooms. Here the walls also are in cream with a blue-green dado. The floor of this hall also is of wood.



On the ground floor are the cloak room and lavatory for men and on the first floor those for the ladies.

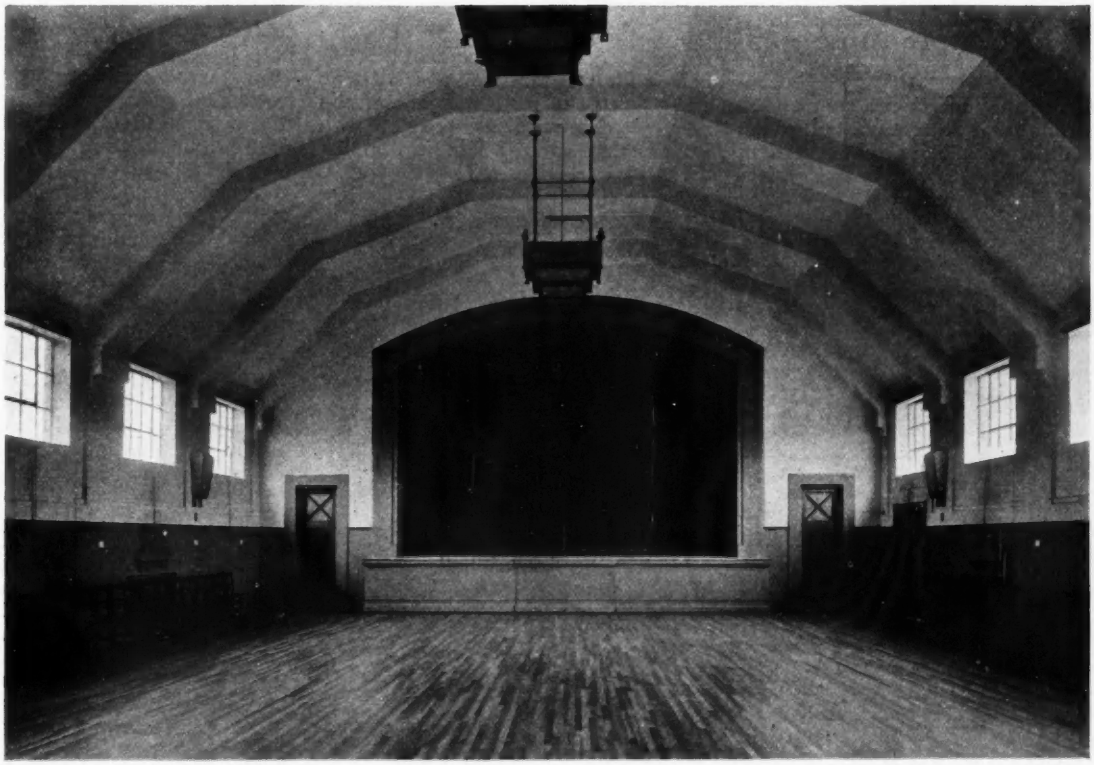
In the basement is accommodation for the caretaker, consisting of a living-room, two bedrooms, bathroom and w.c. Here also are the heating chamber and the fuel store. The kitchen in the basement is used for the service of refreshments to both halls, and is connected by a service lift to the upper floors.



The entrance hall and staircases also have a blue-green dado with cream walls above. The internal joinery is in oak, and the floors, other than those in the large and small halls, which are of wood, are of hollow block construction, terrazzo and composition.

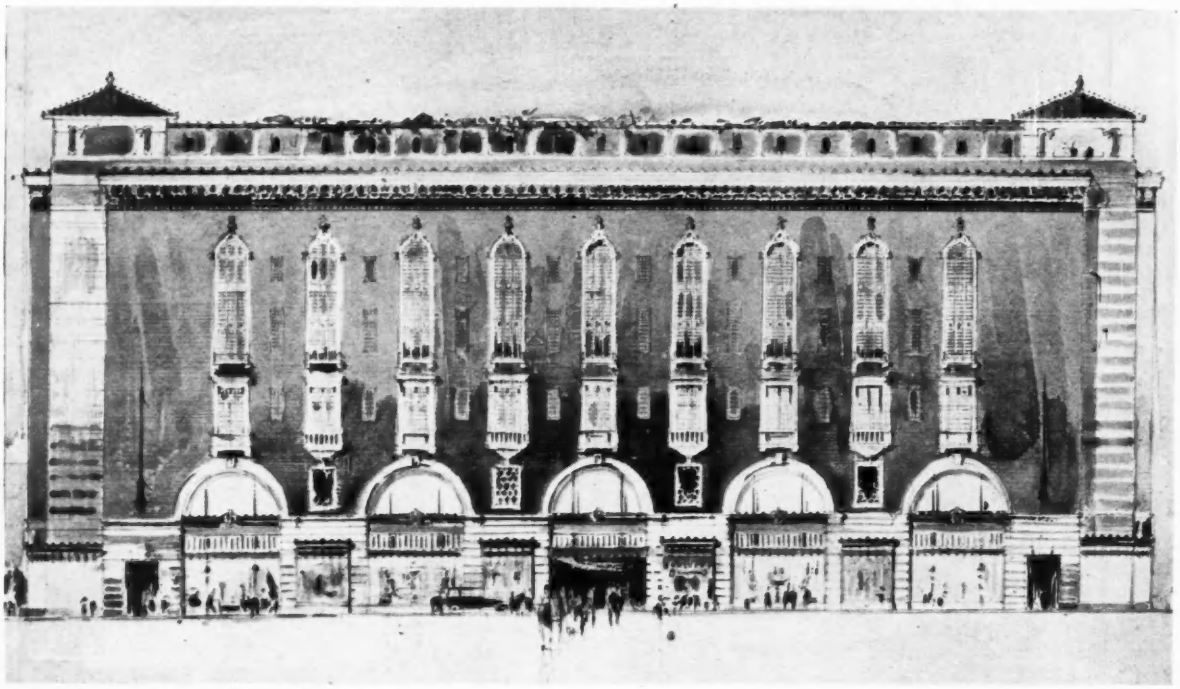
Longitudinal section. The main entrance, approached by the steps seen to the left of the drawing, leads into a hall, at the end of which, at a slightly lower level, is the large concert and dance hall. The small hall is on the first floor, beneath the turret.

Sections through the large hall looking towards the stage; and through the main staircase. On the left of the staircase on the ground floor are the men's lavatories, and on the first floor the ladies'. On the right are the service lift well, the recreation room on the ground floor and the steps leading from the small hall on the first floor to the retiring room.



Christ Church Parish Hall, Brondesbury.] *[By Lanchester, Lucas and Lodge.*

[By Lanchester, Lucas and Lodge.



The small hall, looking towards the platform. It is decorated in blue-green and cream, and provides seating for 200 persons.

Christ Church Parish Hall, Brondesbury.] [*By Lanchester, Lucas and Lodge.*

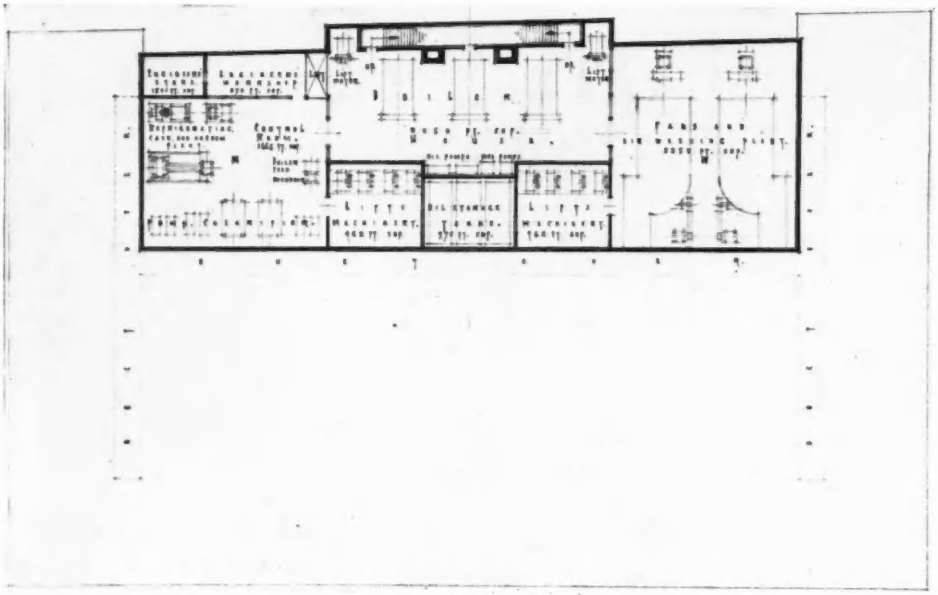
The large hall, called the "Mapesbury Hall," accommodates 500 persons. The proscenium, the base of the stage, the door surrounds and the dado to the walls are blue-green. Stage hangings are amber and brown, and the electric light fittings green. The upper parts of the walls are cream The floor is specially constructed for dancing.

Christ Church Parish Hall, Brondesbury.]

The winner's perspective drawing of elevation to Kensington High Street. The conditions carried an honorarium of two hundred guineas, payable to each of the invited competitors.

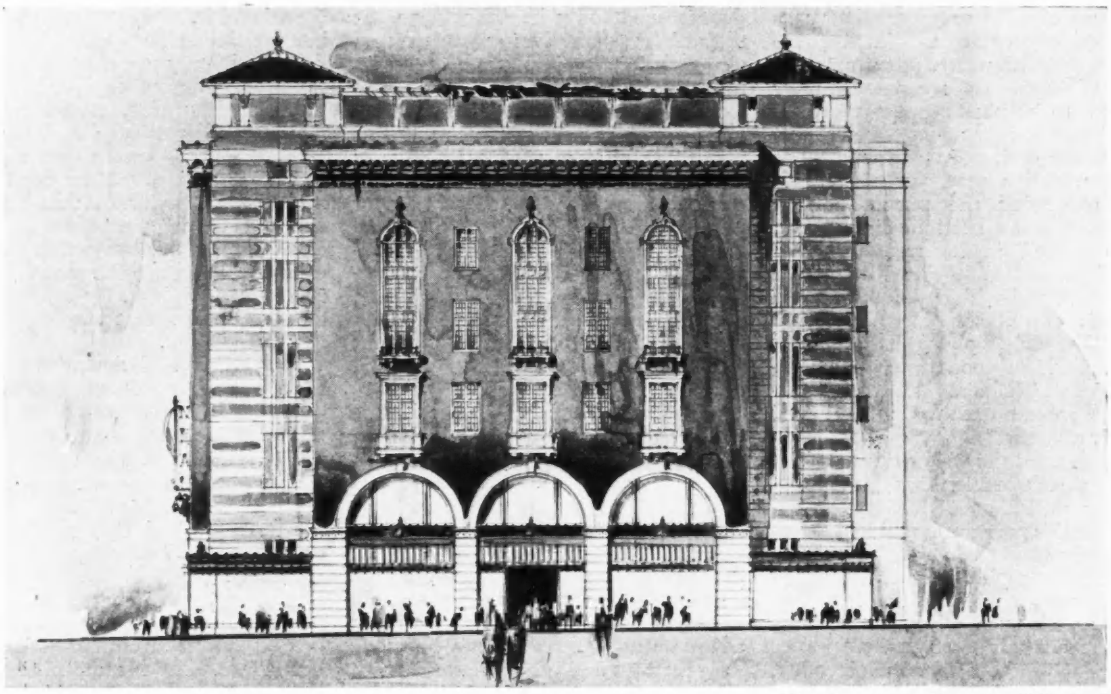
THE LIMITED COMPETITION

Winning Architect: E. Berry Webber—Assessors:



i: How It Arose

BY THE PROMOTERS



AT root the idea of this competition sprang from an appreciation of the possibilities of the site, about 210 ft. by 110 ft., on the north side of Kensington High Street, and also of architecture. A certain discontent was felt both with the practical and æsthetic embodiments of store requirements in many recent buildings, coupled with a belief that, given a fair field for the architect, intelligent study of the special problems involved could produce a notable result.

Very early, therefore, we were concerning ourselves with the right avenue of approach. But it was soon apparent that, in fundamentals, there was no common lore of store technique among architects, no school of thought and, therefore, no standard. This gave rise to the question : Had commerce refused adequate facilities and therefore stultified thought ? And if so, was there not much to be said in favour of tackling the job almost as a problem of research ? But that in turn would cut out the ordinary somewhat haphazard method of lighting on any one individual architect and pinning our faith on him. Why not, in effect, select a small panel of carefully chosen architects, invite them to make a scientific study of the question, and so pick the winner on known and substantial data ? In this way we came, with the help of our advisers, to the idea of a limited competition.

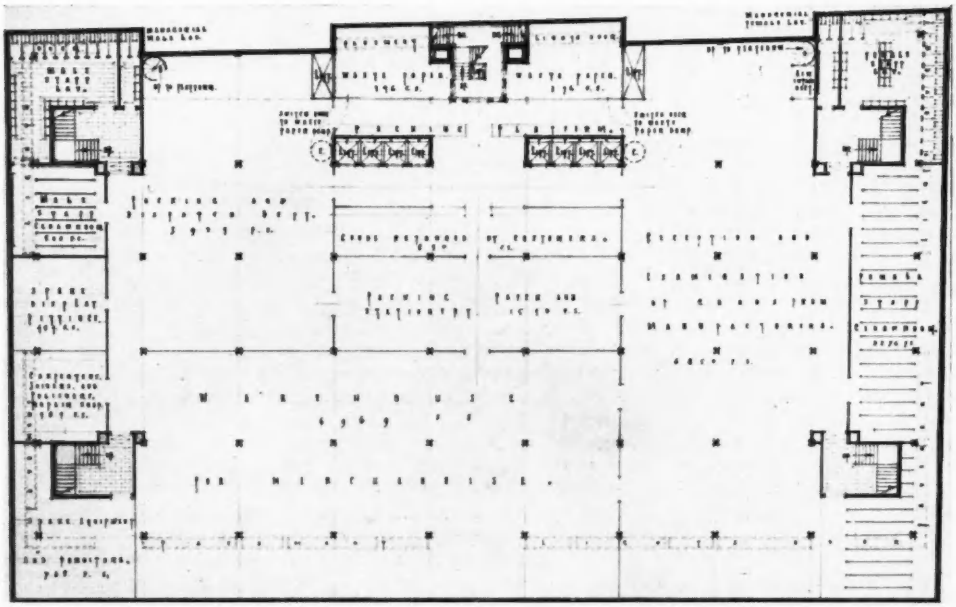
The next logical step was

The sub-basement plan of the winning design. Here are concentrated the various engineering services ; including heating, refrigeration and air-washing.

The elevation to Campden Hill Road. The five architects invited to compete included Robert Atkinson, Easton and Robertson (whose main elevation appears on page 729), H. Austen Hall, and P. J. Westwood.

FOR DANIEL NEAL'S NEW STORE

A. J. Davis; H. V. Lanchester; H. J. Neal.



to crystallize our conception of ourselves; to set down, in black and white, an epitome of the company's traditions and present activities, together with a forecast of our aims. But this proved, in effect, a protracted struggle, and we have to thank our assessors in particular for their persistence in wrestling with us on this matter. Certainly we found it more fascinating to enlarge upon our somewhat amateurish list of qualifications for the ideal architect than to undertake the collar-work of affording assessors and competitors that clear-cut definition of ourselves which was essential to a successful scheme.

In our own minds we divided the problem into six sectors, as follows :—

(*a*) Elevation.
(*b*) Internal planning.
(*c*) Internal treatment and decoration.
(*d*) Works' organization.
(*e*) (Wise !) Economy.
(*f*) Personality.

Taking these in order :—

(*a*) *Elevation.*—Our candid opinion of store elevations—with the notable, but to us inapplicable, exception of Selfridge's, and irrespective of the circumstances which may or may not have prejudiced them—was that generally they are a dull lot; and although interest came from certain Continental and American examples, there was no direct guidance to be found there. But when we were compelled to become more concrete our assessors fixed us on the horns of a dilemma. Did we desire a modern elevation ? Yes, within reason. Was it to harmonize with our Kensington surroundings? Yes, but . . ! Rightly or wrongly, I think we were never quite convinced that the two

In the basement is warehouse space and cloakroom and lavatory accommodation ; but the main stairs extend down to it in case of public use at some future time.

C

needs were quite so contradictory as the posing of the dilemma was meant to suggest. At any rate, after many an hour of discussion we were finally allowed to word the paragraph on elevation as follows :—

" It is the desire of the promoters to obtain a design that, while emphatically expressing the purpose of an up-to-date store, shall be both broad and dignified in its treatment and refined in detail. The firm, while progressive and with definitely modern ideas, is of old standing and has a reputation for supplying its customers with articles of good taste and workmanship, which characteristics the competitors should endeavour to express in their schemes."

All the same, the writer has to admit to a sneaking suspicion that the assessors in their award gave a friendly side-glance at this paragraph and its preceding controversy when they referred to " a difficult problem involving many features which were, if not in actual conflict with each other, at any rate by no means easy to reconcile."

Before passing on from the elevation, perhaps it will be permissible to make two small exceptions to the self-imposed ban upon discussion of the merits of the actual schemes submitted. First, then, to the lay mind, the winner's design appears possessed of a scale and size which is quite noteworthy. And the second point; we were disappointed —admittedly there were exceptions—in the general handling of the show windows.

Our leading instruction under this head was, we think, a good one, as follows :—

" The promoters are averse from anything approaching an uninterrupted expanse of plate-glass front, and desire that structurally the windows should rather perform—although of course without undue emphasis—their natural function as an integral part of the elevation. Some variation in size and treatment, consistent with economy in girder spacing, is recommended, larger windows possibly alternating to some extent with others that will be confined to smaller and more intimate purposes."

Unfortunately this was followed by a further paragraph about arcading on the flanks which was apparently capable of misconstruction; but our criticism is not directed to this so much as to a lack of practical application to the whole technique of show windows. There was too little awareness of correct size — a three-dimensional problem—of shape, of accessibility by the window-dresser, and of positioning generally.

(*b*) *Internal Planning.*—It was important for us to ensure that planning ability was abundantly present in our architect, but we realized the corollary that it could only be brought to the test if we ourselves undertook a thorough inquiry into our commercial needs and then proceeded to express many of them precisely in location and indeed in square footage. The word " many " is used advisedly, as another valuable service performed by our two assessors was the drawing for us of a sharp distinction between matters requiring only a recommendation and those necessitating an instruction. For instance, in the case of lifts, we tentatively suggested the reasons for grouping and general location, but when it came to numbers, we laid down a rigid quota.

As was to be expected, the schedule of accommodation proved to be an exceedingly onerous, although interesting, task; and we had literally, and bit by bit, to plan the whole building in theory ourselves first, so as to ensure that the desired grouping of the departments on each floor did not entail a total footage that precluded good architectural handling. Further, adequate allowances had to be made for gangways and other " losses "; but the resultant plans that were submitted certainly justified this labour. As no questions on the instructions were raised by any of the competitors, we were perhaps not unsuccessful in our efforts.

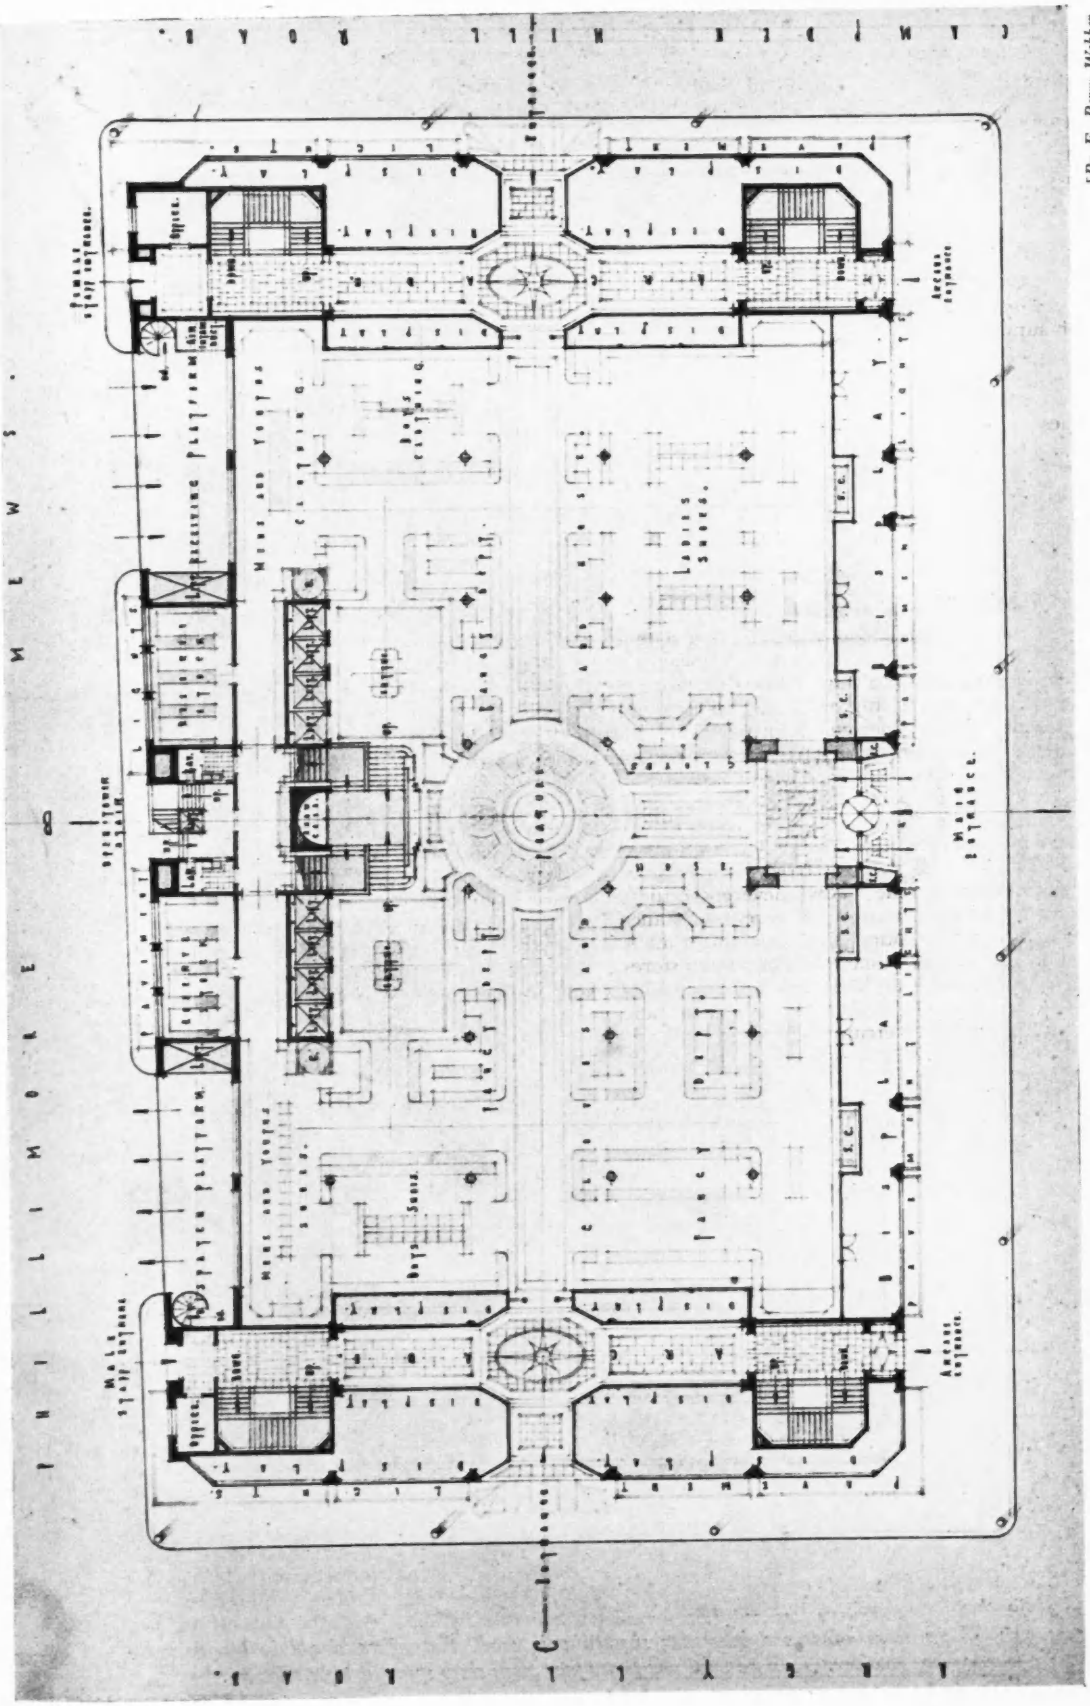
(*c*) *Internal Treatment and Decoration.*—This category covers in our minds a very broad field. We were, for instance, severely critical of the constructional forests of stanchions that are only too evident in many stores, more especially American stores. We thought that the architect should first cloak the skeleton and then add his embellishments. (Incidentally, is the paint-pot a utensil that is nowadays forgotten ?)

Bearing in mind, therefore, the specialist character of our business, we particularly asked that the attraction of an intimate and personal atmosphere should be retained, and to this end we submitted concrete suggestions. Recognizing, however, that this might mistakenly lend encouragement to a " honeycomb " design, a warning was inserted to the effect that, in order to allow of elasticity for future changes and expansion, *constructional* supports should be limited in number.

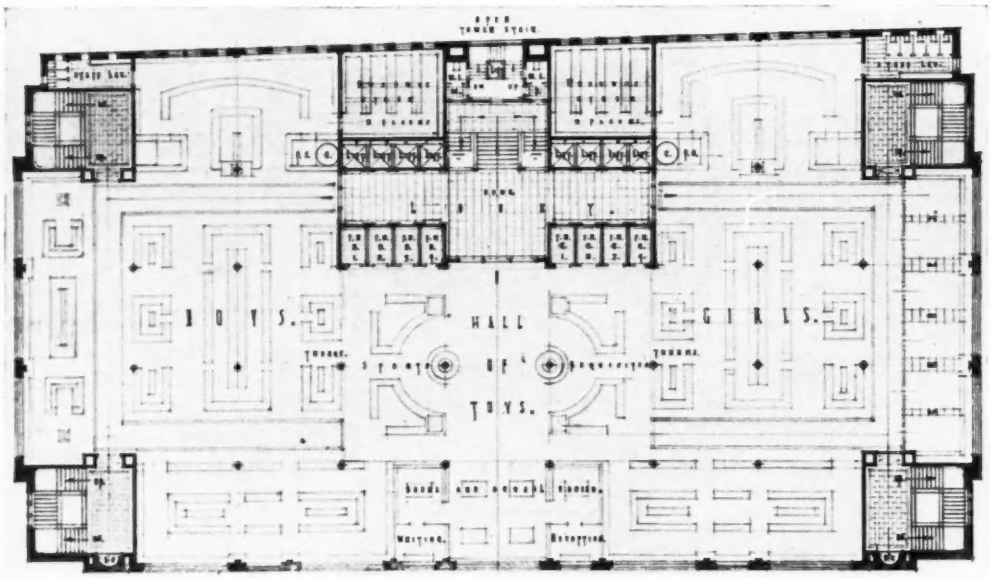
Certainly, here again, we were asking for a course to be steered between Scylla and Charybdis; and widely different interpretations resulted, though it may be noted in passing that the logical practicality of the winner's mind seized on the wisdom of avoiding constructional, and therefore permanent, interruptions, while emphasizing the feasibility of securing interest by means of movable fittings and decorative treatment.

(*d*) *Works' Organization.*—This factor is axiomatic, and perhaps its chief interest lies in its upshot, in that we had reluctantly to eliminate two or three of the more youthful, and therefore less tried, names from the lists of candidates considered by us.

(*e*) *Economy.*—Some names again fell down on this test. More need not be said (except, perhaps, a half-humorous comment on the remarkable unanimity displayed by the competitors in their estimate of the cubic costs of their respective schemes. An innocent question : Has cost any meaning to the profession ?).



(*f*) *Personality.*—I am not sure if we were not regarded as somewhat unorthodox in the emphasis we laid on this question, but we had clearly in mind certain risks which we ran. To start with, a not unusual criticism of competitions is that they lead to impersonality. A limited competition can go part of the way to dispose of this danger, but we desired to go the whole way. This meant doing much more than taking the obvious course of getting first-hand opinions of proposed candidates. It meant, in short, the creation of an atmosphere, and throughout we were at pains to try and create the right atmosphere. Even at the last stage, for instance, when we had narrowed down our choices to a final selection, we asked that we mig interview each of these architects individually, so as to establish a friendly accord prior to sending out any invitations. Finally, when the competition instructions were issued, a separate covering note was attached giving, in layman's language, a pen-picture of our firm's aims and ideals, and this was followed by an informal luncheon to the five candidates, at which our managing director outlined something of the Daniel Neal traditions and previous history.



We have enjoyed the task and profited by it. We should do it again in like circumstances.

ii : The Winner's Report

A SUMMARY OF ITS POINTS

THE fundamental requirements internally for a modern store are adaptability, efficiency and attractiveness. The author has designedly placed " adaptability " first and foremost, because upon this necessarily depend the other essentials. It is considered that the site is not of such size as to warrant an attempt to plan any great central hall going up through several stories in the manner of some Continental stores. This type would immediately bring into action the L.C.C. requirement that the " cells " shall be cut off by vertical walls on each floor and, in addition, valuable floor space would be lost; also, the

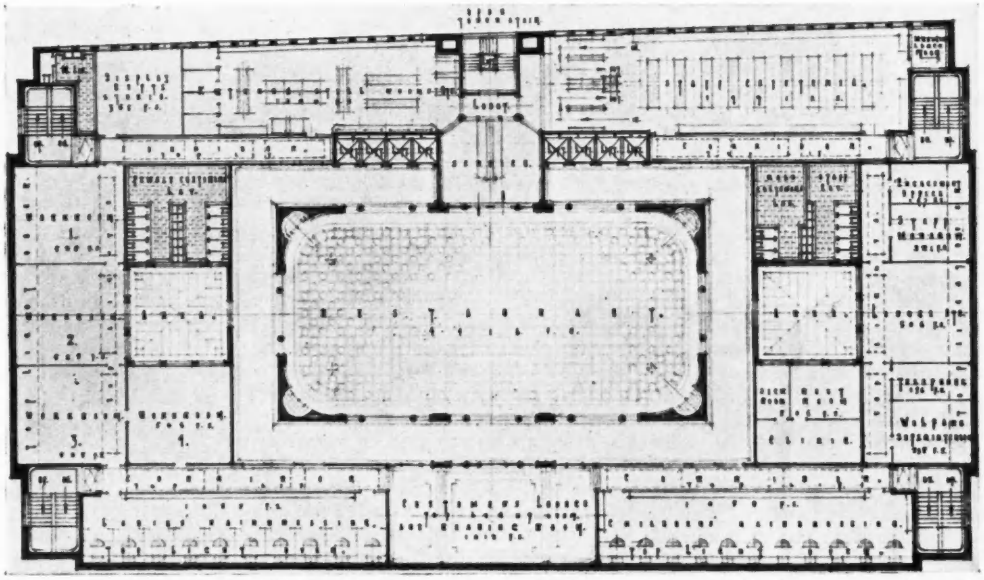
The first-floor planning is logical and symmetrical. First-floor windows on the main front are intended for the display of merchandise to catch the eye of passers-by on buses.

undamental principle of adaptability would be destroyed. That is why the internal arrangement of the store is worked as a simple grillage of steel supports at the most economical spacing for the site (approximately 22 ft.).

The general principle of the planning was to concentrate all the services in a central position. This central "nerve centre" seems inevitably to fall into the position indicated, at the north of the site, on which are located the transport facilities. Attention is also called to the arrangement of the reserve stock-rooms above each other, with intermediate levels in the same manner as a library "stack," thus practically doubling the amount of space available.



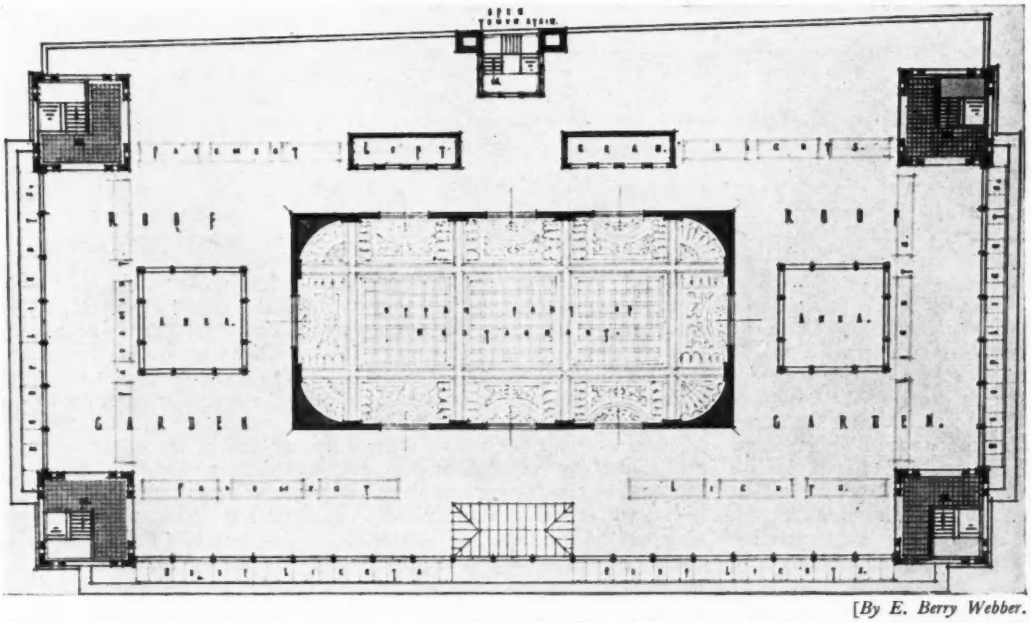
The ground floor is a different proposition from the others, because it contains the all-important show windows and main entrances. As required by the promoters, the former have been alternated in sizes so as to enable commodities of varying scale to be efficiently exhibited. Recessed arcading has been provided along the east and west fronts, apparent from the main thoroughfare—Kensington High Street. Should the proprietors in the future decide against the desirability of arcades these may be easily adapted to new requirements and converted into shop space. On the contrary, should they prove a success, it would be the simplest of operations to continue the arcade parallel to Kensington High Street.

The lifts, the most popular means of access, are so placed that customers traverse the shops to reach them and are thus obliged to inspect the goods

Daniel Neal's New Store, Kensington, W.: The winning design.]

On the plan of the second floor the interesting suggestion is made that offices should be placed on the fourth floor, not here. Both the third and fourth floor plans show space yet to be allocated.

The central feature of the fifth floor is the restaurant. Kitchens and staff cafeteria are opposed on the north front. There are also lounges, workrooms, a rest-room and a clinic.



en route. The promoters expressed the wish that one stair should act as an attractive invitation to customers. This "exhibition" stair, open to the shop, could not be considered in the L.C.C. quota for fire-escape purposes. The author does not, therefore, consider it desirable for it to extend farther than the first floor; the four angle-staircases, however, go down to the basement, in view of future possibilities.

The author has attempted to deal with the internal decoration on the same principle as that of a museum; that is, to make the interior act as a *background* to the goods for sale.

The exterior is relied upon to express the character of the business as well as to attract fresh custom. Careful consideration has been given to the information supplied by the promoters, and several facts emerge. First, the business is an old-established one, the custom of a class that is greatly inclined toward the traditional. It would be easy to alienate it by producing the *bizarre* in an endeavour to be ultra-modern. Secondly, the site is not of such a size as will compete with the almost adjacent stores of the "universal provider" type. Thirdly, the business being invariably thought of in connection with the "Royal Borough," it is desirable that it should have the necessary character and dignity to rank it as a part thereof.

Here is a building that will for all time proclaim the character of Daniel Neal and Sons. Therefore, an attempt has been made to infuse it with a definite individuality.

In London, a floor area of approxi-

[*By E. Berry Webber.*

Included in the roof plan is space for a roof garden, surrounding the upper part of the lofty restaurant. At this level the area includes the projecting cornice; and pavement lights give light to the rooms below.

mately 25,000 square feet, with a height of 14 feet, of the shape required by this site, could not be adequately lighted with natural daylight. The only result would be to turn almost every object between the spectator and the external windows into silhouette. Therefore, it has been thought far more important to stamp the exterior with a strong note of character.

Certain *first-floor* windows are designed for display purposes, in view of the very large number of people who travel past the site on omnibuses.

The building is to be steel framed, of fireproof construction throughout, faced with a good rich brick, with Portland stone dressings, and having bronze shop fronts and metal windows. The pergola on the roof is to be in limed oak, finished to a silver-grey colour.

All the engineering equipment is placed, practically under the engineer's eye, in the sub-basement, and includes apparatus for supplying heat to radiant panels in ceilings; cleaning fresh-air supply; vacuum cleaning; and refrigeration.

It is very essential in a store of this description that the floor be kept clear of pipes and radiators, and it is proposed to fix radiant panels (arranged to suit the architectural features) in the ceilings against the outside walls, supplemented by such a number as may be necessary at other points, so that part of the heat is radiated downwards and part conducted through to the floor above. Hot water will be supplied to all necessary points in the building.

From a financial point of view the stock must be kept very clean. The only way to ensure this is to free entering air from dust and dirt, and this, combined with vacuum cleaning, should give ideal conditions.

If comfort is to be maintained at all periods of the year, it is necessary to install refrigeration as part of the ventilation system. It may be pointed out that such refrigeration is very considerable compared with the small amount required for such purposes as keeping furs in good condition and kitchen requirements.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Ancient Buildings and Vibration

THE question of the damage caused to ancient buildings by vibration from heavy traffic was discussed last week by the Standing Committee of the House of Commons which is considering the Road Traffic Bill. Major Glyn, a Unionist member, moved an amendment to provide that a university or college or other important educational establishment, or the owners or guardians of any ancient monument under the Ancient Monuments Consolidation Act, 1913, should be authorized to apply to the Minister of Transport for restriction of traffic or any particular class of traffic. He said that not only the ancient universities but also modern universities were apprehensive as to the damage that might be done to valuable scientific instruments if the present vibration were allowed to continue. The University authorities all stated that unless there were restrictions imposed, their buildings and their work might be rendered useless as a result of heavy traffic passing their doors. The amendment which he moved bore the name of all the University members, who had been asked by the Universities to raise this matter. The heavy traffic which now passed through the High Street of Oxford made it almost impossible for lectures to be given in a great many of the lecture halls which had been used for centuries for that purpose, and the traffic did damage in many cases to the fabrics of the Colleges.

Major Hills said it was of very great importance that University and scholastic authorities should be given the right of access to the Minister of Transport. The town authorities might not always agree with the University authorities, and in his days at Oxford they were often at variance. Large sums were being spent on education, and the effect of heavy motor traffic was to detract from the educational value of the Universities.

Mr. Morrison, the Minister of Transport, expressed sympathy with the purpose of the amendment, but he found that there would be very great difficulties in the way of giving effect to it. Neither existing powers nor those proposed in the Bill would give power to stop traffic because of vibration of buildings or injury to amenities. He could only restrict the use of the road in the case of vehicles which would be dangerous to their occupants or others, or if a road were unsuitable to particular types of vehicles. It was difficult to get away from the highway authority; but, of course, it was open to anybody to communicate with the Minister at any time. University authorities or guardians of ancient monuments could communicate with him and say that the situation was very serious for them, and the matter could be taken up with the local authorities. The real remedy for vibration was for the local authority to reconstruct the highway, and in the case of Oxford the remedy was the construction of a by-pass road and a new bridge.

Vibration could be met, as he had said, by proper highways and by regulations which required pneumatic tyres; but he wished, if he could, to find words to meet the question of amenity and noise and danger to ancient buildings. He found great difficulty in this matter, but he had every desire to meet the points which had been raised in the amendment, and he undertook to think it over carefully before the Report stage.

On this understanding, the amendment was withdrawn.

Town Planning

Mr. Greenwood, the Minister of Health, in bringing forward the Ministry of Health Estimates last week, said with regard to the allied question of town planning, there were at present eighty regional committees, of which sixty were advisory and twenty were executive. There had been an increase in the number of executive regional committees, and he desired to emphasize the importance of proceeding by way of the executive committee rather than the advisory committee. Reports had been received from some of the more important regional committees, and particular interest attached to the work of the Cambrian Regional Planning Committee, which included a large part of the Lake District.

It was of interest to note, in view of the movement in favour of national parks, that a scheme was under consideration there which, if carried to success, would, he believed, permanently save to the nation the beauties of the Lake District, and would do something to control in an orderly fashion any future development that might take place. Substantial progress had been made in town planning in the course of the year.

At present, town planning schemes were in operation or proposed, covering, in England and Wales, over 5,417,000 acres. A year ago the number of acres covered by schemes was about 4,450,000, so that in a year they had added 1,000,000 acres to the areas which could look forward in the future to scientific and orderly development. But a good deal still remained to be done. Existing powers did not permit either the State or local authorities to do what was desirable in the sphere of town planning. The Government contemplated comprehensive legislation on this matter, and his Department was now, and had been for some time, in consultation with members of some of the more important organizations concerned. Their help had been extraordinarily valuable, and it was desirable that, before detailed proposals were put before Parliament, they should get the views of people of experience in this extremely important problem.

ENGLISH PRECEDENT No. 114

HOUSE IN MILTON REGIS, KENT

Though little more than a cluster of streets on the outskirts of an industrial town, Milton Regis was once a flourishing port. Within a narrow compass are houses of the sixteenth to the nineteenth century.

This very informal piece of work, bespeaking a certain remoteness from the fount-head of classical inspiration, is closely related to the neighbouring timber-framed houses that precede it in date.

[E. MAXWELL FRY.]

CORRESPONDENCE

MODERNISM AND THE MAN IN THE STREET

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—Finding myself interested in one of the buildings published in your issue for April 30, I bought a copy of your paper and read it with the very greatest interest.

I am writing because I am somewhat surprised at your view of the ideas of "the man in the street" in respect to modern buildings, as set out in some notes by Astragal. Surely you are out of touch with the real views of enlightened wanderers through our streets; in fact, your writer gives one the feeling that he is simply quoting the ideas of the labourer and the newsvendor, who forgather so often under these large modern buildings.

I should say that the ordinarily enlightened person is greatly impressed by this new movement in architecture. Its simplicity, its expression in its construction of utility and purpose, its recognition of the needs of daylight in all rooms, and the charm of well-proportioned wall spacing have made the ordinary man see more than anything, I imagine, what architecture means, and what it can do for the community.

Until this new movement came into being, to the man in the street architecture meant simply the reiteration of ancient symbols more or less cleverly handled, and any idea of a plan expressed in the contour and façades of a building was absolutely an unknown factor.

I could write at considerable length on this subject, as meeting a large number of men and hearing their views, I feel you are unjust and unfair in your comments, and your contributor should know that the layman is far more enlightened and quick to understand than he imagines.

"QUITE THE ORDINARY MAN IN THE STREET."

[If the views expressed in this admirable letter were as ordinary as we should like them to be, the modern movement would make more headway in this country than it is doing at present, and architects would meet with less opposition in trying to achieve those new virtues of "simplicity," and "expression in construction of utility and purpose." "That urgent matter of personal taste," and the tricks of popular celebrities like Mr. Epstein, are still allowed to obscure far too much of the real message of modern architecture, and to discourage and embitter its apostles.

Will architect readers whose strivings after modernity have met with genuine appreciation from clients and others drop us a line telling us of their experiences? We would like to hear about more people like this "quite ordinary man"; notes and recollections will be welcomed, and will be printed on this page during the next few weeks as received.—ED., *A.J.*]

SEA SALT AS A CAUSE OF DECAY OF LIMESTONE

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—We have read with interest the letter from Mr. P. W. Barnett, of the Building Research Station, published in your issue for April 9, and are glad to note that he is in general agreement with the opinions expressed in our article, which appeared in THE ARCHITECTS' JOURNAL for March 19 last.

It is quite true that huge quantities of Portland stone have been used in buildings in this country which have shown no signs of that type of decay under review (i.e. that accentuated by salt), and this we should expect, not only on account of the varying physical structure of the stone, but from the manner in which random blocks are cut up.

Like the workers of the Building Research Department, in all our observations we have found that decay due to the presence of sea salt is localized; and one of us (A. R. W.) began observations in regard to this kind of decay over six years ago. We feel, however, that at least for the present we must adhere to our opinion that "capillary head" or other capillary phenomena are the chief causes of local concentration of salt; in our observations we have come across, at times, only comparatively small patches in large blocks of stone suffering from the type of decay under review.

We can see no reason why a decaying stone should not infect a contiguous stone; it is quite possible that capillary action or similar phenomena may cause some flow of salt in solution from the infected to the non-infected stone. Whilst "capillary head" is a convenient term to use for a certain capillary phenomenon, we consider that the whole subject of capillary action in regard to stone and similar materials has not been so thoroughly investigated as to allow dogmatic opinions to be formed.

Whilst we agree upon the possible contamination of Portland stone by sea water, accidentally, or owing to the situation of the quarry, we had one case through our hands in which the quarry owners definitely stated that it was impossible for the stone to come in direct contact with sea water, accidentally or otherwise.

We are in cordial agreement with the last paragraph in Mr. Barnett's letter, with reference to the fact that, in their own interests and in the interests of their customers, the stone firms concerned would be well advised to take immediate steps to see that no stone is put on the market which has, from any cause, been in direct contact with sea water.

ARTHUR R. WARNES
D. NORTHALL-LAURIE

FREE EMPLOYMENT ANNOUNCEMENTS

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I am directed to thank you for your decision under this heading as my Council wishes to recognize your effort to assist in the solution of the employment problem.

The leading article in your issue for April 16 touches upon the uneconomical position of many salaried men and the problems arising thereby. My Council desires me to point out that these questions have received the close attention of the A.A.S.T.A. for over ten years with considerable success. The status and remuneration of salaried men have been improved, although much remains to be done.

There is also a need for greater recognition on the part of salaried men of the fact that only by organized action can their various problems be solved.

While congratulating you on your effort, I may remark that all the free employment registers in the country will not meet the difficulties arising from the state of the profession today. These new conditions need more direct attention, which they are receiving from the A.A.S.T.A.

A. SEYMOUR REEVES,
Secretary, Association of Architects, Surveyors and Technical Assistants.

[We trust Mr. Reeves did not seriously suspect us of believing that employment registers (like the one which appears in the JOURNAL this week) will suffice to "meet the difficulties arising from the state of the profession today." We emphatically believe no such thing. The object of the JOURNAL scheme is simply to lessen some of the evils that spring from what our leading article called the "seasonal and desultory" nature of ordinary architectural practice. It is even possible (though this we cannot tell) that from these evils it may be able to extract some little good.—ED., *A.J.*]

LAW REPORT

A SUCCESSFUL APPEAL BY A BROADSTAIRS ARCHITECT

IN a King's Bench Divisional Court on Wednesday, April 30, Justices Talbot and Finlay heard an appeal by Mr. William George Shipwright, an architect, of Broadstairs, from a decision of the official referee, Mr. G. A. Scott, in favour of Sir H. Lidiard, of Great James Street, London.

The appellant sued the respondent to recover £1,537 for fees as an architect in connection with the development of an estate at Woking. Appellant was to receive 2½ per cent. on the cost, and his case was that after twelve houses had been erected, respondent refused to go on with the scheme on the ground that the appellant had used Aerocrete as building material in the place of bricks or stone. The respondent in his reply alleged that the houses shrank, that there were cracks in the walls owing to the unsuitability of the material, but that it was advised by appellant as suitable.

The official referee thought that the architect had proved his retainer for the whole scheme, and when the building owner abandoned it the architect had been prevented from getting his remuneration. But then there arose the question of alleged negligence by the architect, who recommended an aerocrete material, which went wrong, and the official referee thought that the architect was not exercising proper skill as an architect in seeing that the materials used should not cause injury to the building owner. He found the architect guilty of negligence, but not such negligence as would entitle the building owner to say he would not entrust him with any further operations. He gave judgment for the building owner, with costs, and a declaration that the architect was liable to the building owner in negligence, but the builders and the Aerocrete Company agreeing to do what they could to put the places right and make good the cracks, etc., no further order was made.

Plaintiff now appealed from that decision, and his appeal was argued by the Hon. Stafford Cripps, K.C. Mr. Eales, K.C., appeared for the respondent.

The Court allowed the appeal, held that Aerocrete was not an improper substance to use, and that the architect had not been negligent, and entered judgment, with costs, for Mr. Shipwright on the claim and counterclaim, and further directed an account to be taken as to the amount due to the architect.

Mr. Justice Talbot, in giving judgment, said it would be a very serious matter for an architect if he were obliged to superintend the process of manufacture of material to be used in buildings for which he was architect and to satisfy himself that the process had been properly carried out. His lordship did not think that it had been proved that Aerocrete was an improper substance to use in buildings of this character. The whole of the evidence was that, if properly treated, Aerocrete was a proper material. In his opinion it had not been proved that this material was in fact unsuitable, and therefore it had not been proved that the architect was negligent in advising its use. There was no evidence that Mr. Shipwright had not the professional skill he proposed to have or that he in any way acted negligently. The case for the respondent wholly failed and judgment must be entered for appellant, with costs.

Mr. Justice Finlay concurred.

READERS' QUERIES

WATERPROOFING PREPARATIONS

F. G. T. writes: "*Can you give me any information regarding waterproofing liquids and preparations for brickwork? From an article in the* Encyclopædia Britannica, *it appears that there are compounds containing chiefly paraffin wax, compounds with silicates as their chief ingredients, and one method which combines a form of silicate with a subsequent application of chloride of lime. It is suggested that either the last-named method or the previous one results in considerable 'efflorescence' afterwards. The Szerelmey people state that there is no silicate in their fluid. In the midst of these statements I should like to know, if possible, what patent materials contain, and which of the various available processes is likely to result in waterproofing defective brickwork permanently; what is the nature of the 'skin' which all good brickwork is stated to acquire,* i.e. *whether of a mechanical nature or of vegetable origin, and whether any or all the waterproofing compounds interfere with this 'skin'?*"

[Following are our expert's reply to the above inquiry, and also the opinion of the Director of Building Research.]

The inquiry, evidently, is for a transparent and colourless preparation, and silicates, such as that popularly known as waterglass, seem most promising, if sprayed upon the brickwork when it is very dry—the spraying being done under considerable pressure. If the brickwork, and especially the mortar joints, were brushed over first with a wire brush, the fluid would penetrate better. It should be remembered that the mortar joints are usually the weak points of penetration by moisture. As they wear by weather, their surfaces crumble and the liquid sprayed on them would come away also. I cannot imagine any permanent treatment, except a fresh surface, as by rendering with cement containing one or other of the proofing preparations.

The natural "skin" which brickwork acquires is of lichens. The presence of these would reduce the efficiency of waterproofing fluids because they would interpose between them and the brickwork. The waterproofing effect of such natural "skins," in my opinion, has been overrated.

Annual brushing and spraying with a silicate solution in hot weather in September is probably the most hopeful course. N. L.

In requiring advice as to remedial measures the condition is often imposed that the treatment applied shall not result in serious change in the appearance of the wall. This involves the use of materials of the colourless waterproofing type, of which a very large number are on the market under proprietary names; it should be recognized at the outset, however, that the best of these preparations possess limitations in practice and cannot be expected to provide an infallible cure in every instance. A number of reports have, in fact, been received where such treatments have failed to prevent penetration.

Colourless waterproofers depend for their efficacy on the water-repellent properties of films of metallic soaps, fats or waxes, and in certain cases it is attempted to fill the pores of the material under treatment with insoluble compounds joined by the interaction of solutions applied to the wall, or by reaction of the solutions with constituents in the wall, or by reaction with atmospheric constituents. It has not been possible to carry out experimental work on all the numerous waterproofers available, but certain treatments have been taken as representative of the various types and, as a result of experiments on them, the following conclusions have been reached:

In applying such materials to a wall it is desirable to consider the behaviour of moisture which comes in contact with porous materials such as masonry or brickwork. Solid walls tend to absorb water by capillary force, the magnitude of this force being dependent on the extent to which the pores of the material are wetted by water. Certain colourless waterproofers, depending on the water-repellent effects of soaps, fats or waxes,

prevent the capillary movement of water, not by closing the pores, but by altering the contact angle between solid and liquid surface, and may actually reverse the direction of the capillary force. In addition to the capillary force, however, the hydrostatic pressure acting on the liquid must be considered. A high wind pressure may be sufficient to exceed the opposing capillary forces exerted by a treated surface, which will then be quite ineffectual in preventing the penetration of rain.

There can be little doubt, in certain cases where exposure conditions are not very severe, that a colourless waterproofer may afford a useful degree of protection for a limited period, but will probably require renewal at regular intervals. The number of variable factors to be taken into account, however, precludes the possibility of assurance of success in any particular instance.

Experiments have shown that treatments with interacting solutions do not completely fill the pores, so that capillary forces are still operative. The general conclusion reached is that such treatments are less efficient as waterproofers than the water-repellent type and, as F. G. T. suggests, there is the danger of the formation of efflorescence in certain cases.

With regard to the formation of a surface "skin" on brickwork, this, if it exists at all, is probably due to the crystallization of water-soluble material derived from the bricks or mortar in the surface layer, on evaporation of moisture by which it was conveyed to the surface. Such skins are more often than not a source of weakness, and are mainly responsible for deterioration manifested in the form of blistering or flaking.

DIRECTOR OF BUILDING RESEARCH

BLACK ROOFING SLATES

F.R.I.B.A. writes: "*Can you inform me where it is possible to obtain black roofing slates. I am aware of the dark blue-grey Welsh slate, which is sometimes sold as a black one, but am told a really black slate was once produced in Ireland.*"

[The Editor invites readers to reply to the above inquiry.]

COMPETITION NEWS

THE competition for laying out a portion of the Stokes Bay area as a pleasure resort with public walks and grounds, for the Gosport Town Council, has been adjudged as follows:

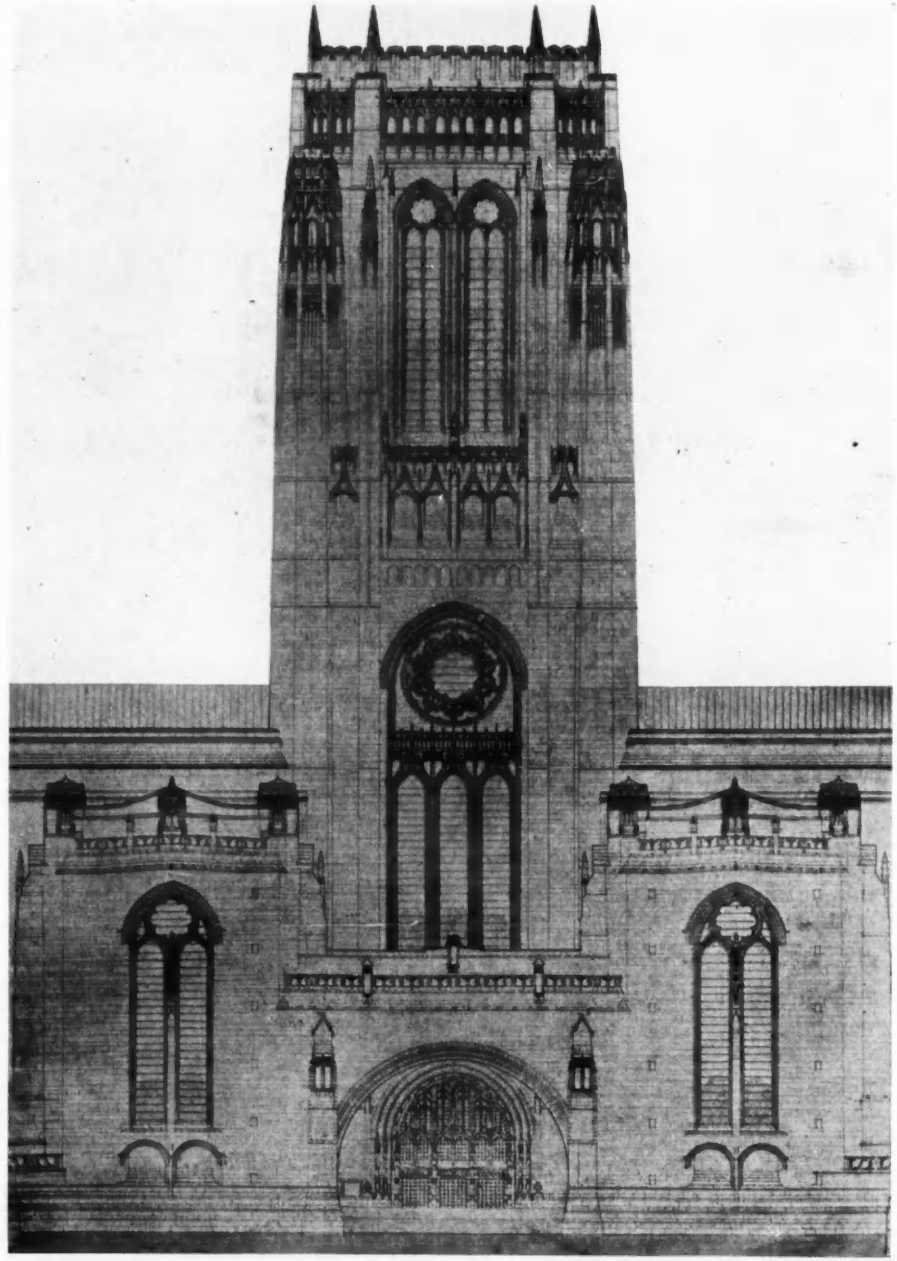
First place, Messrs. Bakers, of Wolverhampton.

Second place, Maxwell M. Hart, of London.

Third place, E. J. Tuck, of Gosport.

The winning design is illustrated on this page.

The design, by Messrs. Bakers, of Wolverhampton, placed first in the competition, promoted by the Gosport Corporation, for the layout of Stokes Bay as a pleasure resort. Second place was secured by Maxwell M. Hart, of London, and third by E. J. Tuck, of Gosport.



THE SKETCH CLUB: SECOND SESSION

UNDER the heading, "The Sketch Club to the Rescue!" the announcement was made in our last issue that it had been resolved to extend the hospitality of these pages, this week, to Royal Academy exhibitors.

The ban, or partial ban, on perspectives in the architectural room of the Academy does not seem to have been very effective, and indeed one scarcely notices any difference in this respect between the present exhibition and its predecessors. The actual veto only extended to the Royal Academicians themselves and to the Associates, and in the case of exhibitors of the rank and file permission was given to submit perspective, but they were "recommended" not to do so. As was to be expected, however, when the Hanging Committee had to come to a decision with regard to these elaborate perspectives, they had not the heart to reject them, or, perhaps, what is more likely, they did not think it politic to do so.

AT every Academy Exhibition those members of the public who have a sufficient interest in architecture to visit the diminutive apartment which is all that the Council of the Royal Academy can spare for the display of architectural designs, generally try to discover one particular exhibit which is more important or more striking than the remainder. In the present Exhibition few critics would dispute that first place should be given to the drawing which illustrates the tower of the new Liverpool Cathedral.

When we see this great structure rising from the ground, we cannot help feeling a sense of satisfaction that our own generation is capable of emulating the architectural achievements of the Middle Ages. Yet the conditions in the world of building in which Sir Giles Gilbert Scott finds himself are very different from those which prevailed in the period when a great cathedral took a hundred years or more to erect, and when the designing of its detail and ornament was the work of a large number of artist-craftsmen, each of whom, under the direction of a master builder or architect, was called upon to exercise his own originality. We may all congratulate Sir Giles Gilbert Scott upon fertility of invention in Gothic.

Liverpool Cathedral: elevation of Tower.
By Sir Giles Gilbert Scott, R.A.

In all probability the claim of Liverpool Cathedral upon the attention of architectural students resides principally in its qualities of mass and proportion. It will be remembered that in the original design with which Sir Giles won the competition many years ago, instead of the single central tower which we now see, there were twin towers which held the nave of the cathedral between them as in a vice. This design was certainly inferior to the one which afterwards took its place, for the two towers had no dominant to unify them and had little æsthetic relation to the nave. Unfortunately, however, the foundations of the building were laid before the alteration was decided upon; consequently, the central tower, which was placed in between the bases of the projected twin towers, had to fit into a space which was not originally designed for it. Sir Giles was able to amend his design with conspicuous success, and the silhouette of the cathedral must prove extraordinarily effective.

Perhaps the most remarkable feature in the plan is that the nave and choir are of equal length. This equality has been criticized on the ground that it is not justified in reason: as the high altar is at the end of the choir, it should itself be given a measure of formal emphasis.

But, however this may be, there is no question that the new Liverpool Cathedral makes us realize that Sir Giles Gilbert Scott is the originator of a new style for a great ecclesiastical building.

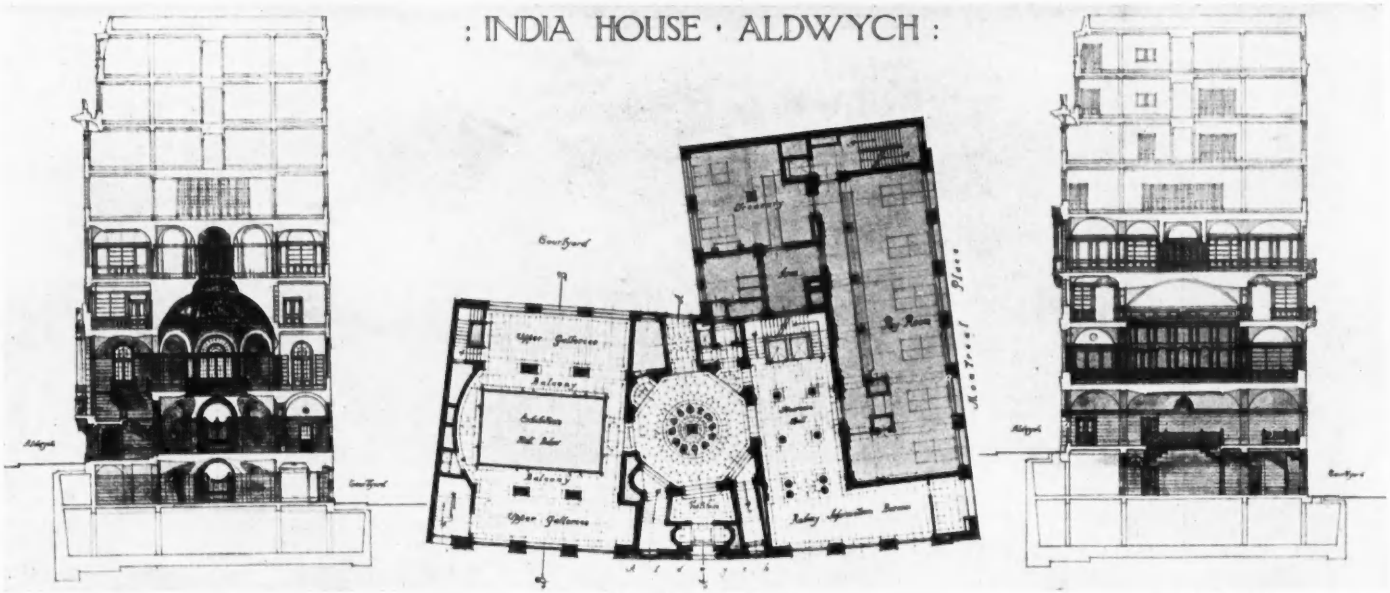
SIR HERBERT BAKER was here

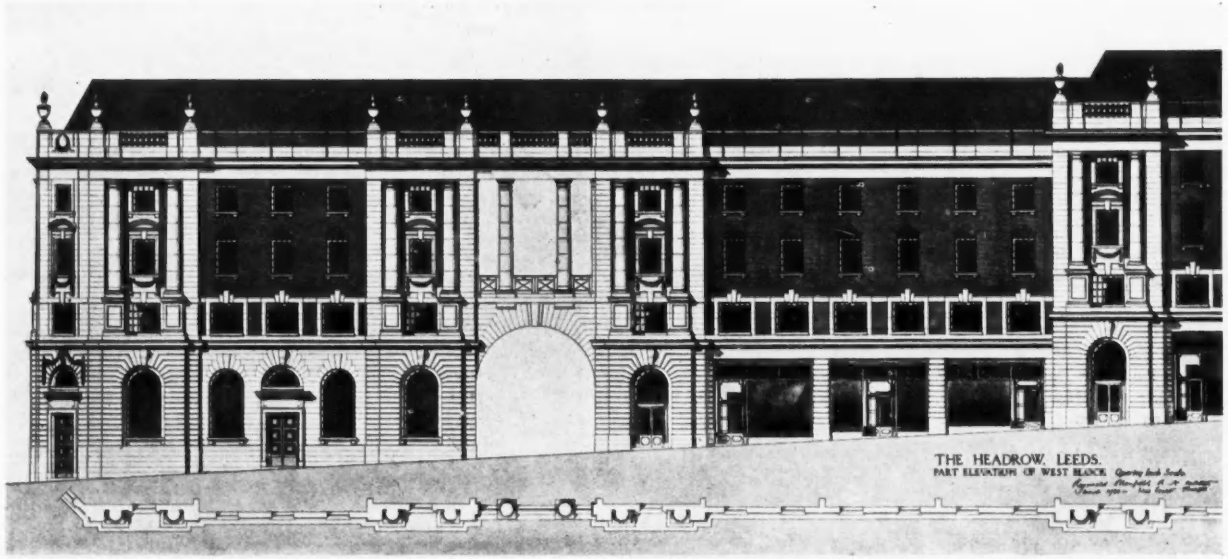


INDIA HOUSE · ALDWYCH ·

adjacent façade in Aldwych while the

By Sir Giles Gilbert Scott, R.A.

Royal Academy Exhibition, No. 1322.



SIR HERBERT BAKER was here faced with the difficult problem of erecting, in a thoroughfare where the architectural tone of the locality had been already set, a great building which nevertheless was required to give some expression to a civilization alien to our own. The compromise which Sir Herbert has decided upon is a highly satisfactory one; on the outside of the building he has maintained in essentials the repetitive and rhythmical arrangement of windows which is to be found in the adjacent façade in Aldwych, while the only specifically Indian note is in the decoration. In the interior the most remarkable feature is the domed hall, which is completely buried in the building. This is the first time for such an experiment to be made, an experiment which would not have been possible before the creation of modern resources of artificial illumination. Within the hall is seen a lofty dome with lantern, which gives the impression of being lit by daylight.

India House, Aldwych.
By Sir Herbert Baker, A.R.A.

[*R.A. Exhibition, No. 1347.*

THERE is today a revival of interest in street building, which is occasionally expressed in architectural competitions for unified designs of street frontages. In other instances an eminent architect is commissioned to prepare a scheme for a whole street. Sir Reginald Blomfield has made an important contribution to the architecture of Leeds, in which the conventions of the Renaissance are successfully exploited in a façade which has certain points of resemblance to the new Regent Street Quadrant. The main problem in street compositions is the combination of order with variety, and for its solution our own English traditions offer sure guidance. The lines of the street must be supported by a dominant horizontality in the composition of the façades which abut upon it; on the other hand, it appears necessary to avoid monotony in the fenestration and sub-divisions. It is here that the Classic Order, used with discretion, is of very great help to the designer. In the Headrow, Leeds, the long ridge line of the roof helps to give coherence to the composition, while there is a delightful variety in the forms of the openings.

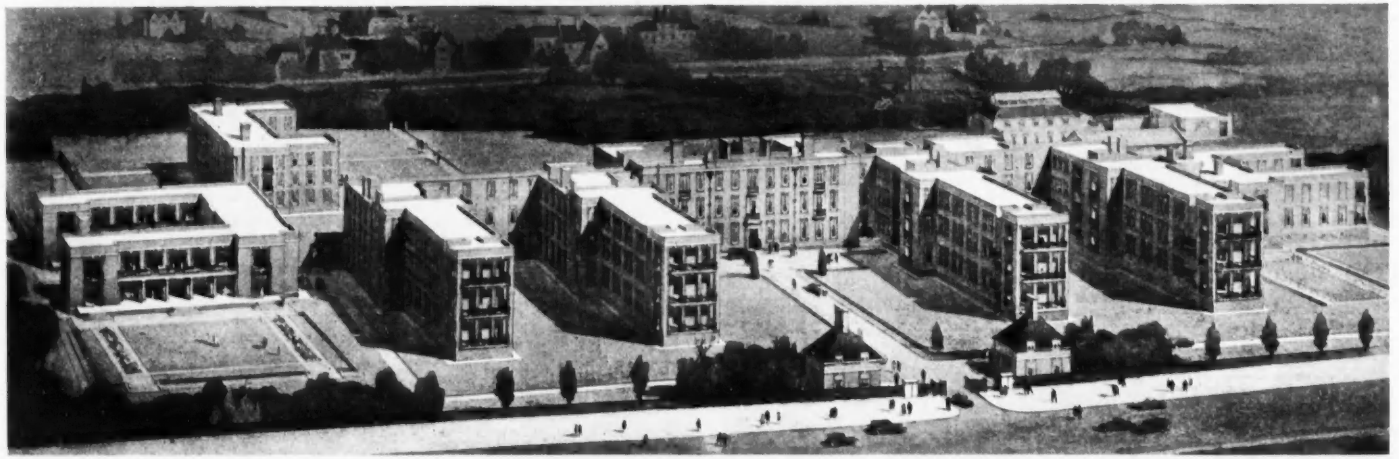
Houses at corner of North Street, Westminster.
By Oliver Hill.

IN these days of architectural iconoclasm it is pleasant to see a new building which accords so well with its eighteenth-century neighbours as does this one at the corner of North Street, Smith Square. The principal departure from the style of the Georgian period is in the roof, which is more steeply pitched and more prominent than that of the sedate urban buildings adjacent.



[R.A. Exhibition, No. 1378.

Deptford Public Baths: elevation to Evelyn Street.
By A. W. S. and K. M. B. Cross.

HERE is a building which, while serving a utilitarian purpose, is yet given a ceremonial character. Swimming baths are gradually assuming a greater importance in our social life and are deserving of the increased attention which they are now receiving at the hands of architects. This elegant façade, in the English tradition, should prove a welcome addition to the architecture of Deptford.

IN few departments of architecture has such an advance been made as in hospital design. Until recent years, there were erected a large number of hospitals conspicuous for the vulgarity of their appearance. Either their façades were broken up by a number of small subsidiary wings, displaying obtrusively the symbols of modern sanitation, or else—almost a worse defect—the buildings, to flatter the pride of donors, were ostentatious with their domes, turrets and other architectural emblems. In this great hospital a quite different and much more admirable convention is observed. In spite of the fact that the most complex requirements of planning are fulfilled, the new building has been given a simple form and ordered expression.

Southend General Hospital: bird's-eye view.
By Adams, Holden and Pearson.

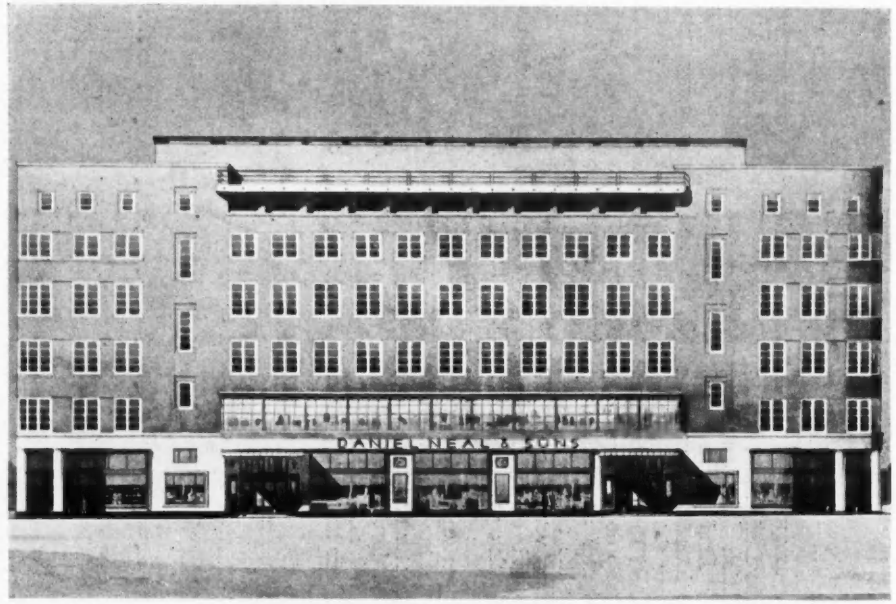
form and ordered expression.

BANKS have in recent years shown themselves to be most enlightened patrons of architecture. They have, however, exercised considerable caution, inasmuch as they have preferred a traditional Classic style. This policy is easily intelligible, for as a bank is by its very nature a conservative institution, so a bank building should express the ideas of stability and permanence. These elevations have a unity derived from the association of a well-articulated base, a central portion embraced by an Order and an attic properly subordinated to the whole, and it is difficult to imagine a period in which this type of façade will fail to give satisfaction to the beholder.



Lloyds Bank, Spitalfields. [*R.A. Exhibition, No. 1293.*
By W. Curtis Green, A.R.A., and Partners.

Artillery House, Westminster. [*R.A. Exhibition, No. 1405.*
By M. E. Webb and H. A. Dawson.

IN order to give to a tall office building, containing a hundred or more windows, a sufficient interest, architects are often tempted to belie the subject of the design by uniting the windows in artificial groups, suggesting that the building contains rooms of bigger dimensions than it actually does. Yet uniformity may lead to monotony or lack of it to tiresome diversity. In Artillery House vertical and horizontal emphasis is skilfully combined.

New Premises, Kensington High Street. [*R.A. Exhibition, No. 1354.*
By J. M. Easton and Howard Robertson.

THIS competitive design for a modern store, though apparently simple, is distinguished by a number of subtleties. To serve the ends of display of merchandise, the central first-floor portion has been incorporated into a shop front. The building has an adequate base, and upper terminal emphasis is given by a loggia, surmounted by an attic. The windows, of normal size, yet strike a modern note, for while bisected vertically by mullions, their panes are horizontal oblongs.

LITERATURE

THE FACE OF THE LAND

THE aim of the Design and Industries Association in compiling *The Face of the Land* has been to stimulate public interest in the most vital matter of our times—the beauty of our country and the seemliness of our civilization. To do so there could have been no better approach than that adopted by the authors: to let photographs speak very largely for themselves—the bad examples illustrating the civilization we seem to be heading for, and the good examples pointing to a better way.

Is it necessary that the new revolution resulting from motor transport and electricity should leave a trail of ugliness behind as it slowly but surely alters the face of our land? Have we learnt nothing from the mistakes of a generation which bequeathed us the Black Country, the slums and the Albert Memorial?

These and many other pertinent questions implied in the book must be answered by each individual member of the nation himself. The amenities of the countryside can only be preserved and improved by individual co-operation and by educating the large majority of the community who have been too long devoid of civic sense, too long uninterested in the design of everyday things, towards a greater love for seemliness and good order.

While certain legislation is called for, the Association ultimately and rightly pins its faith to education rather than to a multitude of bylaws. "We shall not make our country beautiful by legislation any more than we shall make it sober."

To those interests who are putting up a fight to retain the doomed roadside sign and hoarding, invoking the needs of British industry and the cause of the unemployed, the Association would say this: "Such cant would as well justify night-signs on Westminster Abbey itself, and as for business, it is a poor business sense that would spoil that countryside which draws hundreds of thousands of visitors from overseas." The book is dedicated to the memory of Sir Lawrence Weaver, sometime President of the Association, and its most steadfast friend.

The Face of the Land: the Year Book of the Design and Industries Association, 1929-1930. Edited by H. H. P. and N. L. C. With an Introduction by Clough Williams-Ellis, F.R.I.B.A. London: George Allen and Unwin, Ltd. Price 7s. 6d. net.

"When we come to scenery such as that of the South Downs or Lakes, we are entitled to ask whether it is not grotesque folly to mar such national heritages for the sake of uniformity."

DIRECT BUILDING

THE RT. HON. JOHN WHEATLEY, in an introduction to this book, states that it is intended as a reply to a "furious national campaign" conducted against Direct Labour, and the constant reiteration of the old grievances against the "capitalist" mars what is otherwise an interesting study. The case for municipal building as opposed to private contracts is set out with an imposing array of statistics. But statistics can prove anything, and one feels that the supporters of private enterprise could produce an equally convincing set of figures.

The argument for direct building is built up on the assumption that the workman is a perfect human being; but those who have had to do with such schemes know that the workman is the one incalculable unit—he may be incompetent, or ca' canny, or he has been known to go off and work for a contractor where the chances of employment seemed more lucrative. Neither the employment of non-union men nor the restriction of output imposed by the trade unions are mentioned; perhaps these factors, rather than the hostility of Capitalists to Labour, are the real cause of the shortage of working-class homes.

SOCIETIES AND INSTITUTIONS

THE R.I.B.A. ANNUAL DINNER

The R.I.B.A. annual dinner, which is to be held in the Guildhall, E.C., on Thursday, May 15, will give those present an opportunity of seeing the Art Gallery, the Library and the Council Chamber at the Guildhall, as these will all be open to the guests.

The price of tickets for the dinner is £1 15s. each (inclusive of wines, etc.).

For those members who are unable to attend the dinner, but who may wish to have an opportunity of hearing the speeches, a limited number of seats will be reserved in the gallery of the Guildhall. Members who take advantage of this facility will also be able to visit the Art Gallery, Library and Council Chamber at the conclusion of the dinner. Applications for tickets should be made to the Secretary, R.I.B.A., 9 Conduit Street, W.1.

A reproduction of the dust cover of The Face of the Land, *a review of which appears on the facing page.*

ARCHITECTS' DRAWINGS OF THE EARLY NINETEENTH CENTURY

An illustrated lecture on "Architects' Drawings of 1800–1851" was given recently by Professor A. E. Richardson, F.R.I.B.A., at the R.I.B.A. Sir Banister Fletcher, P.R.I.B.A., presided.

The perspective drawings on which Professor Richardson based his lecture are on exhibition in the R.I.B.A. Galleries.

During the course of his remarks, Professor Richardson said that the first half of the nineteenth century was one of the great periods of draughtsmanship in the history of architecture. There were greater periods, such as the sixteenth century in Italy, but few periods could show such purpose at a time so distinguished by Babylonian confusion as were the years 1800–50.

It was, he pointed out, a time of transition from aristocracy to democracy; the structure of society was changing, and these changes gave rise to engineering and building differences.

He said the coming of the railways found engineers and architects who were familiar with the work of Piranesi ready to modify Roman construction in the design of their bridges, viaducts and tunnels, and the picturesque aspect of such work was constantly before the directors of railway companies.

The time demanded that all styles should be investigated, and it saw the close of the Classic and the rebirth of the Gothic movements. Architects put themselves into competition with the best contemporary painters, and the excellence of English perspective drawing during these years was largely due to the schools of the Royal Academy. The period closed with the great exhibition of 1851, when the spirit of the eighteenth century was interred and the nation proceeded to make an exhibition of itself.

ANNUAL MEETING OF THE C.P.R.E.

The annual meeting of the Council for the Preservation of Rural England was held at the R.I.B.A. on Thursday last. The Earl of Crawford and Balcarres, the president, occupied the chair.

He said they hoped that in the course of time convenient sections of the whole countryside would each contain an honorary advisory panel of trained men, engaged in public life, to whom people could turn for technical advice on problems that were arising. He pointed out that the system of panels was receiving the official support of the Ministry of Health.

Mr. Clough Williams-Ellis, F.R.I.B.A., in seconding the adoption of the report, moved by Sir Henry Newbolt, said that in the past year they had done something for England, but they had not done enough. They wanted power to do, as well as to undo. That necessary power could only come to them through adequate recognition of their efforts by the Government and through a really comprehensive and far-reaching General Amenities Bill. If the law would only endorse ordinarily enlightened public opinion, the fight for rural England would certainly be won. Otherwise he foresaw defeat.

The following names were added to the executive committee: Major-General Sir Fabian Ware, Sir Arnold Wilson, and Messrs. Boies Penrose, Frank Pick, H. Peach and Kenneth Spence.

Additions to the constituent bodies were made as follows: The Oxford Preservation Trust, the Cambridge Preservation Society, the Pure Rivers Society, and the Design and Industries Association.

HAMPSHIRE ARCHITECTS' VISIT TO ENGINEERING WORKS

The president (Mr. J. Arthur Smith, F.R.I.B.A.) and members of the Hampshire and Isle of Wight Architectural Association, accompanied by friends to the number of about fifty, recently paid a visit to the Basingstoke motor engineering works of Messrs. John I. Thornycroft, Ltd., where an interesting and instructive day was spent. The party was met by Mr. Alban Scott, F.R.I.B.A., the designer of the works, who briefly described the general arrangement of the premises.

Later, the party broke up into small units, each being personally escorted through the various shops.

The Association were also entertained to lunch by the Company.

RESEARCH SCHOLARSHIPS IN TECHNOLOGY

The Governing Body of the Manchester Municipal College of Technology (University of Manchester) offers a limited number of research scholarships in technology, each of a value not exceeding £100. These will be tenable during the session 1930-31 in the College.

Forms of application and all information are obtainable from the Registrar of the College.

ANNOUNCEMENT

The Victoria and Albert Museum is now open from 10 a.m. to 6 p.m. on Mondays, Tuesdays, Wednesdays and Fridays; and from 10 a.m. to 10 p.m. on Thursdays, Saturdays and Bank Holidays. On Sundays the hours are 2.30 p.m. to 6 p.m.

COMPETITION CALENDAR

May 16.—Messrs. Ewart and Son, Ltd., in conjunction with the Association of Architects, Surveyors and Technical Assistants, invite designs for a lock-up hangar for an aeroplane. The competition is divided into two classes, for those over and under 25 years of age at midnight, May 15–16, 1930. Assessors: William H. Hamlyn, A.R.I.B.A., and Chas. McLachlan, A.R.I.B.A., with A. N. Cathcart as technical adviser with regard to roofing, ventilation and hot-water supply. Two prizes will be awarded in each class, namely, free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. Messrs. Ewart and Son, Ltd., reserve the right to publish or make use of any of the designs for which a prize is awarded, but do not reserve the right to build in accordance with any of them. Particulars of the competition, etc., are obtainable from A. Seymour Reeves, Secretary, A.A.S.T.A., 26 Buckingham Gate, S.W.1. Latest date for submission of designs: May 16, 1930.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor: H. V. Ashley, F.R.I.B.A. Premiums: £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs: July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall which is to be built on the site of the old town hall, at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor: Herbert T. Buckland, F.R.I.B.A. Premiums: £150, £100, and £50. Applications for conditions of the competition, etc., should be made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs: July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor: Professor Patrick Abercrombie, F.R.I.B.A. Premiums: £150 and £50 for first and second places, respectively. Copies of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs: September 1.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

11870. Hazell, R. Builders' floor cramp. April 15.

12259. Maschinenfabrik Fellbach Ges. Building-elements. April 17.

SPECIFICATIONS PUBLISHED

327731. Kuhn, M. Arrangement for rapidly drying out new buildings.

327766. Ingram, A. Building-blocks.

327821. Clare, G. E. Construction of fireproof floors and ceilings.

327841. Hollis, C. B. Blocks for flooring, paving, or the like purposes.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Christ Church Parish Hall, Brondesbury (pages 710-713). General contractors, W. H. Gaze and Sons, Ltd. Sub-contractors: Crittall Manufacturing Co., Ltd., windows; Jas. Gray and Son, heating; Redpath, Brown & Co., Ltd., steelwork; Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., fireproof floors; Joseph F. Ebner, terrazzo and composition floors; Douglas Cramb, electric light installation.

House, in Calonne Road, Wimbledon (pages 734-735). General contractor, G. Potterton. Sub-contractors: Rosser and Russell, Ltd., central heating; Bratt Colbran & Co., stoves; Claygate Brickfields, grates; The Farringdon Works, sanitary fittings; Educational Supply Association, garage doors; H. H. Martyn & Co., Ltd., decorative plaster; United Water Softeners, Ltd., "Permutit" water-softening plant.

TRADE NOTES

A new factory has been opened in Cambridgeshire for the manufacture of cement asbestos flat and corrugated sheeting, slates and tiles, etc., by the Atlas Stone Co., Ltd., of General Buildings, Aldwych, W.C. 2, who have been in the concrete paving slab industry for thirty years.

*

To the Foreman on the Job is the title of an interesting and useful handbook just issued by the Trussed Concrete Steel Co., Ltd., reinforced concrete engineers. As stated on the cover, it contains "useful information for the better execution of reinforced concrete." It is in fact almost indispensable to those responsible for the supervision of this form of construction. The information and instructions given are based on the firm's own experts' experience of reinforced concrete construction, over a period of twenty-five years. Aggregates, proportions, tables of weights and measurements and information concerning every phase of construction from start to finish are given, and space is also provided for working memoranda. The Trussed Concrete Steel Co. invite applications for copies from those whose duties bring them into contact with the many questions covered by the scope of the handbook.

*

Messrs. T. W. Palmer & Co. have sent us a copy of their latest catalogue of railings, gates, hurdle and continuous bar fencing, tree guards, and strained wire fences and gates. Photographs are also given of various types of steelwork fabricated by the firm. Among them are the main entrance gates and railings made and erected at the St. Pancras Housing Scheme for the architects, Messrs. H. V. Ashley and Winton Newman, FF.R.I.B.A.; ornamental gates and railings in London, Thames Haven, Mortlake and Ireland; a foot bridge with a span of 66 ft. for the Heywood Borough Council, Lancashire; an extension to the football stand for the Wimbledon Football Club; and iron fire escape staircases at Stillington Street, Westminster, for the War Office, and at Mitcham. The constructional steelwork, designed, fabricated and erected by the firm for a huge garage on the South Coast, and for studios at Elstree, Herts, are also illustrated. Copies of the catalogue can be obtained from Messrs. T. W. Palmer & Co., Merton Abbey Ironworks, Church Road, Merton Abbey, S.W. 19.

*

Messrs. J. H. Sankey and Son, Ltd., have sent us a new booklet illustrating and describing Sankmar plastic paint, by means of which innumerable variegated textures can be achieved by very simple means. Sankmar is a fine white powder which is mixed with water to a plastic consistency and applied to any surface. After applying, it is textured and then allowed to dry overnight, after which a coat of Sankmar surfacer, or a good white semi-flat inside paint, is added. When this has dried, any paint of reputable manufacture, lacquer, or

graining colour can be added to give the colour effect. Stippling, dabbing, or swirling can be done with a brush or cloth, or the fingers or palm of the hand may be used.

*

During the past two months the contracts placed with Messrs. Smith, Major and Stevens, Ltd., for S.M.S. lifts included those of forty-four important firms and individuals in London, the provinces, and abroad. There were seventeen repeat orders, always one of the most convincing tributes to the engineering standards of any firm. These included lifts for: the Bank of England, second section; London and Central Markets Cold Storage Co., Ltd.; Austin Reed, Ltd.; Edinburgh University, Geology Department; and for hotels for Watney, Combe, Reid and Co., Ltd., and the London, Midland and Scottish Railway.

*

The second number of *Leyland Rubber Relay*, published by the publicity department of the Leyland and Birmingham Rubber Co., Ltd., has made its appearance. With this number starts a series of articles describing the manufacture of the firm's main productions. Moulded hose is the first. The first part of Mr. Harry Sharp's description of his journey to South Africa also appears this month, and in the next issue it will be concluded, whilst Mr. Anderson's journey to Chile will commence. These articles promise to be exceptionally interesting. The journal, which is published at present every two months, gives much interesting and entertaining information as to the activities of the company.

*

In the shadow of the old Norman keep at Castle Hedingham there is an industry which still fosters the old pride of craftsmanship. It is that of Rippers, Ltd., whose woodwork adorns churches and great buildings throughout the land. Illustrations of much of this work and of buildings in which the firm have carried out the whole, or the major part, of the joinery involved appear in a brochure entitled *Ripper Woodwork*. Among the architects for the buildings shown are Sir John Burnet and Partners; Messrs. Joseph; Keynes Purchase; George Vernon; Wallis, Gilbert and Partners; M. E. and O. H. Collins; Wykeham Chancellor, and Alfred Cox; and among the illustrations are such important buildings as Adelaide House, London; Pensions Office, Acton; Melbury Court, Kensington, and Cox's Bank, S.W. There are also air-views of the firm's works and photographs of the mills, setting-out department, joinery, and other workshops. The actual manufacturing area covers 240,000 ft., and in addition there are over ten acres of sheds and stock grounds for raw material. Much attention is paid to the welfare of employees. Two housing schemes have been developed, one of fifty houses and thirteen bungalows, and a second of a further fifty houses. All these houses have large gardens.

THE ARCHITECTS' DIARY

WEDNESDAY, MAY 7

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Drawings of 1800–1850. 10 a.m. till 8 p.m. Saturdays 10 a.m. till 5 p.m. Exhibition closes on May 24. **10 a.m.**

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Exhibition of Wall Papers. 10 a.m. till 10 p.m. Until May 17. **10 a.m.**

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition open to the public. **10 a.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "National Parks." By S. K. Ratcliffe. Sir Fabian Ware, K.C.V.O., K.B.E., will preside. **8 p.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art, held in the North Court. Open until September 14. **10 a.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

THURSDAY, MAY 8

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. "Dante and Italian Art." By Professor Edmund G. Gardner, F.B.A. (Lantern Illustrations.) **5.30 p.m.**

The BIRMINGHAM Education Committee has acquired land at Warstock Lane, as a site for a public elementary school.

The BIRMINGHAM Education Committee is to erect a Council school at Kelby Close, Northfield, at a total cost of £50,300.

The BIRMINGHAM Corporation is to provide new stores and office accommodation at Selly Oak Hospital, at an estimated cost of £17,500.

Messrs. F. W. Woolworth, Ltd., are to erect new premises in Spiceal Street, BIRMINGHAM.

Mr. G. Linnecor is to erect twelve houses in Devonshire Street, Winson Green, BIRMINGHAM.

The Bourneville Village Trust is to erect eleven houses in Griffins Brook Lane, BOURNVILLE.

The COVENTRY Corporation has selected a site on the Pinlet estate for the erection of a new infectious diseases hospital. Provision is to be made in the first instance for a hospital of 150 beds. Competitive designs are to be invited.

The LEICESTER Education Committee is to enlarge the Syton Street school, at a cost of £4,000.

The LEICESTER Corporation is to prepare a scheme for widening Churchgate, from 38 ft. to 50 ft.

The LEICESTER Corporation is to extend the Gilross cemetery, at a cost of £5,800.

Plans passed by the NORTHAMPTON Corporation: House and shop, Birchfield Road, for Messrs. A. Glenn and Sons, Ltd.; two houses, Ardington Road, for Messrs. Stafford and Agutter; eight houses, Park Avenue, for Messrs. Walker and Perrett; two houses, Clarence Avenue, for Mr. H. Holloway; additions and alterations, The Rowans, Cliftonville, for the governors of St. Andrew's Hospital; alterations and additions, "Saracen's Head," Lawrence Street and Barrack Road, for Messrs. P. Phipps & Co.; two houses, Harlestone Road, for Messrs. W. S. Brown and Son.

The SMETHWICK Corporation is to erect, by direct labour, a further sixteen parlour type and four non-parlour type houses and twelve maisonnettes in Chapel Street.

Plans passed by the SMETHWICK Corporation: Seven shops, two offices and fourteen flats, Bearwood Street for the Ideal Benefit Society; house, Pitcairn Road, for Mr. Bayley; house, West Park Road, for Dr. Smout; extension of offices, Halfords Lane, for Messrs. Henry Hope and Sons, Ltd.; house, Lightwoods Hill, for Messrs. W. C. Stevens, Ltd.; show room and garages, St. Paul's Road and Galton Street, for Mr. W. J. Cooper; additions, 363–374 Bearwood Road, for Mr. H. Fawdry.

The SMETHWICK Education Committee has approved plans for the erection of a secondary school for 600 pupils on the Hall estate, at an estimated cost of £49,000.

The WILNCOTE (Warwickshire) Parish Council is to erect a parish hall, at a cost of about £3,000.

NORTHERN COUNTIES

The BURY Corporation has decided to erect twenty houses for sale on a site at Walmersley, on the outskirts of the borough. The cost will be £10,020. Approval has also been given to the purchase of land, at a cost of £3,262, at the Springs for the erection of houses. It has also decided to invite tenders for the erection of 100 flats at Woolfold.

The HULL Corporation recommends the acquisition of the Winstead Hall estate, for the provision of a mental institution for males.

The HULL Corporation Baths Committee has decided upon a site at the corner of Regent Street and Hessle Road, for the erection of public washhouses.

The HULL Corporation has obtained sanction for a loan of £6,000, for the erection of eight shops and houses on the Derringham estate.

The HULL Corporation is considering an alternative widening scheme for Waterloo Street, estimated to cost from £70,000 to £80,000.

In connection with the proposal of the HULL Corporation to purchase Queen's Dock from the London and North Eastern Railway, the Corporation Dock Committee has asked the city engineer to prepare plans for and estimates of the cost of the making of two new roads in the place of Whitefriargate bridge and the Old Dock bridge, and a scheme for a large underground garage to accommodate, say, 200 cars.

Plans passed by the HULL Corporation: Twelve houses, Pickering Road, for Mr. D. Smith; two houses, Silverdale Road, for Mr. P. Cheeseman; six shops, Inglemire Lane, for Mr. J. M. Bladon; compressor house, etc., National Avenue Works, for National Radiator Co.; two houses, Bricknell Avenue, for Mr. H. Sanderson; two houses and shops, Beverley High Road, for Mr. J. Taylor; two houses, Southfield Road, for Messrs. Camp and Sanderson; two houses, Riplingham Road, Kirk Ella, for Mr. F. C. Polley; billiards room, Waldegrave Avenue, for Mr. C. E. Ruston.

The HULL Education Committee is considering the provision of a school swimming bath.

The HULL Corporation has decided to erect twelve houses on the Derringham estate, to rehouse displaced slum dwellers.

The HULL Education Committee has appointed a sub-committee to consider the provision of nursery schools.

The MANCHESTER Corporation is to lay out grounds, etc., at the new sanatorium, Abergele, at a cost of £5,930.

Messrs. Harrison and Moore are to develop a building site in Lancaster Road, MORECAMBE.

The YORK Corporation has decided to reserve a site on the Burton Lane estate, for flats or small-type houses.

The YORK Corporation has asked the Building Sub-committee to consider whether the Council should apply for the sanction of the Ministry of Health to erect flats on the Hope Street site, instead of houses already approved.

Plans passed by the YORK Corporation: Additions, 58 and 60 Heworth Road, for Mr. E. Waudby; layout, Huntington Road, for Messrs. Culliford and Tindall; additions, East Parade, for Heworth Constitutional Club; revised plan, St. Helen's Square, for Barclays Bank, Ltd.; additions, Knavesmire, for York Race Committee; omnibus garage, Fulford Road, for the Corporation; alterations, Queen Inn, Lawrence Street, Black Swan Hotel, Peaseholm Green, and Black Bull Hotel, St. Sampson's Square, for the Tadcaster Tower Brewery Co., Ltd.; additions, Tang Hall Hotel, for Messrs. J. J. Hunt, Ltd.; four houses, Grange Garth, Fulford Road, for Messrs. R. J. Pulleyn and Sons; two houses, Chatsworth Terrace and Winchester Grove, for Messrs. W. E. Puckering & Co.; two houses, Cornborough Avenue and Tang Hall Lane, for Mr. J. Dowling; six houses, Muncaster House estate, for Mr. Denby Collins.

The YORK Housing Committee has recommended the York Corporation to accept a tender by Paul Rhodes, Ltd., to erect 124 houses on the Burton Stone Lane estate, at a cost of £46,748.

WALES

The ABERDARE Corporation has asked the borough engineer to prepare plans for extensions at the Fedw Her isolation hospital.

The MERTHYR Corporation is to prepare plans for extending the municipal bus garage.

Mr. W. Davies is to erect showrooms at the corner of Glebeland Road and Castle Street, MERTHYR.

The MERTHYR and SWANSEA Joint Hospital Board has prepared plans for the erection of a home for sixty-five nurses and an admission block at the mental institution. A chapel is also to be erected.

The PEMBROKE county engineer has prepared amended plans for the reconstruction of Hakyn bridge, at a cost of £33,000.

SCOTLAND

The following figures show the progress that has been made in State-aided housing schemes in Scotland to March 31, 1930: 1919 Act, by local authorities, 25,129; 1919 Act, by public utility societies, 421; private subsidy schemes, 1919 Additional Powers Act, 2,324; slum clearance schemes, 11,341; under construction, 2,133: 1923 Act, by local authorities, 4,030: 1923 Act, by private enterprise, 17,803; under construction, 1,426: 1923 Act, by public utility societies, 80: 1924 Act, by local authorities, 42,826; under construction, 5,468: 1924 Act, by private enterprise, 1,431; under construction, 1,512: 1924 Act, by public utility societies, 127; demonstration houses, 17; steel houses erected on behalf of the Government by Scottish National Housing Company, 2,552. Total, completed, 108,081. Total under construction, 10,539. Complete total, 118,620.

Messrs. Mactaggart and Mickel, Ltd., are to erect ten shops at Woodside Aikenhead, GLASGOW.

MISCELLANEOUS

The CAPE TOWN Corporation has approved a layout plan, prepared by the city engineer, of land on the Klipfontein Road, Mowbray, on which 470 houses can be erected. It is proposed to utilize the site for a housing scheme for non-Europeans. The Corporation desires, for the present, to proceed with a portion of the scheme which provides for the erection of 135 cottages.

The CAPE TOWN Corporation is preparing plans for the erection of a central fire station in Roeland Road, at an estimated cost of £40,000.

The CAPE TOWN Corporation has prepared a further housing scheme at a cost of £54,000.

The *Cape Times*, Ltd., has purchased from the CAPE TOWN Corporation the old fire station premises in Burh Street, for £40,000.

The Green and Sea Point Hebrew Congregation is to erect a synagogue on the Bordeaux estate, CAPE TOWN.

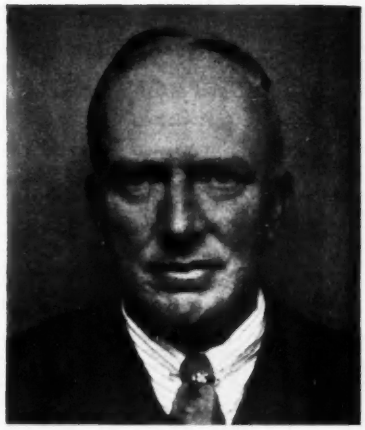
The DOUGLAS (I.O.M.) Corporation is considering a report of the Housing Committee's visit to Pulrose, with respect to the proposed additional houses and public hall.

The GOVAN District Board of Control has prepared a scheme for improving the heating at Hawkhear asylum, at a cost of £16,580.

The NEWPORT (I.O.W.) Corporation has appointed a committee to consider the provision of a bathing pool or public swimming baths.

THE PUBLISHER'S PAGE

THE page at the head of which these words are printed is by way of being something new in THE ARCHITECTS' JOURNAL. Hitherto the Editor has had his say week by week, and many hundred different contributors, from famous people like Karshish down to insignificant little fellows like [deleted by Editor], have told readers what they think. The only person who has not been admitted to the pages of the JOURNAL is the Publisher. And yet the Publisher of THE ARCHITECTS' JOURNAL is not an altogether negligible person, nor is THE ARCHITECTURAL PRESS a concern of no importance. It is important not, because it publishes THE ARCHITECTS' JOURNAL: dear me, no! But it publishes many other things besides, including the finest architectural monthly in the world and books that are found on every architect's shelf wherever English is spoken. In a word, the doings of THE ARCHITECTURAL PRESS are as varied as they are significant, and it is believed that the notes on their doings which are to appear here every week will be welcomed by very many readers and will be eagerly read.



Mr. Maxwell Ayrton, in whose Hampstead studio a sketch club meets weekly.

A WORD was dropped about *The Architectural Review* just now. Are readers of the JOURNAL aware that the *Review* has made, this month of May 1930, one of the noblest efforts of its long and distinguished career? A double number on *English Decoration* has been produced which will remain the most authoritative publication on this subject for years to come. A great deal has been heard about the modern movement, and a great deal written, even in our own language; but those books and articles that have appeared in England make so little of the English contribution to modern decorative art that our country might be a provincial French town or an island in the Pacific for all the attention that is paid to its activities. No doubt there is a reason for this neglect, but whatever the reason it cannot excuse it. *The Architectural Review*, May issue, furnishes proof (if proof were needed) that English decorative art is not less but more alive than that of most Continental countries, and shows us (as indeed we do need to be shown) that our national habit of self-depreciation must be broken for once if this movement is to continue its growth and to earn its rightful place in the world's esteem.

THE Sketch Club hardly knows itself this week, so bustling is it with the invasion of guests from the Royal Academy. Members cannot be expected to feel quite at home with so many strangers about, but what is one to do? These little courtesies have become an established custom in the Club world, and next month the West End clubs will start on their annual cleaning work and the same sort of invasion will give a score of smoking-rooms a very unaccustomed air. Who knows? A day may come when the Sketch Club will be glad to accept a return offer of hospitality. Meanwhile we try to be as polite as our position of hosts requires we should be, and members will no doubt have some very pleasant things to say about the present fortnight's exhibits.

A number of Sketch Clubs precisely like ours are functioning up and down the country, and this week we print the portrait of Mr. Maxwell Ayrton, the presiding genius of such a club which has been flourishing at Hampstead for some time past. The Club assembles once a week at a studio which is lent to it by Mr. Ayrton. Members bring their work, which is hung up around the walls, and a pleasant evening is spent discussing members' sketches over a sandwich and a pipe of tobacco. The only difference between this Club and THE ARCHITECTS' JOURNAL Sketch Club is that Mr. Ayrton's fellow-members are set a subject to which they all work. There is, in other words, a regular programme for each meeting. This is a procedure which we may well ask leave to adopt ourselves one day. At the moment, however, our freedom is rather dear to us, and we shall be surprised if members are not found clinging to it a little longer. It will become especially valuable in connection with a new development, particulars of which have been promised for the next assembly of the Club on Wednesday, May 21.

ARCHITECTURAL literature is amply supplied with detail drawings and directions for the everyday things of architectural practice—the bread-and-butter stuff; but who can name a book of any importance to provide really *well-designed* examples of such things as door and window frames, eaves, staircases, simple brick details, or any of the thousand and one things which form the bulk of most architects' work? To combine practicality with

Mr. A. J. Penty, whose book, "The Elements of Domestic Design," has just been issued.

good design is the *raison d'etre* of Mr. Penty's new book, *The Elements of Domestic Design*, which has just come forth from THE ARCHITECTURAL PRESS. Some of the material in this book has already appeared in THE ARCHITECTS' JOURNAL, but the majority of the book is new. Any architect who read Mr. Penty's spirited defence of "cribbing" which appeared in the JOURNAL recently might perhaps think that this book is a "crib" book. In point of fact, however, Mr. Penty deals with the principles underlying the design of simple things in domestic work, and shows how the old traditional principles can be adapted to fit in with modern conditions. An appreciative reader writes us as follows: "I have been reading Penty's book, and am enthusiastic. It ought to be a universal reference book; it is the only book I know of that deals with constructive detail from the point of view of design, which is what architects have always wanted and never had. The book is also of enormous interest and delightful to read. It seems to me a memorable work and one that is bound to establish itself, if it has a good chance, at once. Penty is a great man." We would venture to say that this reader has seen the point of *The Elements of Domestic Design*.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5 ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* BRICKLAYER, 1s. 8½d. *per hour ;* PLUMBER, 1s. 8½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. 6 in., *per ft.*	0	1	3
DO. 9 in., *per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. 6 in., *per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour ;* LABOURER, 1s. 3½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. 9 *in. per roll*	0	4	9
DO. 14 *in. per roll*	0	7	6
DO. 18 *in. per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0
DO. in stocks, add 25 per cent. per rod.			
DO. in blues, add 100 per cent. per rod.			
DO. circular on plan, add 12½ per cent. per rod.			
DO. in backing to masonry, add 12½ per cent. per rod.			
DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ½ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour ;* DO. *fixer,* 1s. 9½d. *per hour ;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone :			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super.	0	11	0
York templates sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			

HOISTING and setting stone, per ft. cube £0 2 2
DO. for every 10 ft. above 30 ft. add 15 per cent.

PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER, 1s. 8½d. *per hour ;* TILER, 1s. 8½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200 :			
Portmadoc Ladies	£14	0	0
Countess	23	0	0
Duchess	32	10	0

Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	£8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see "Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal :

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey			*Med. Green*		
24 in. × 12 in.	£5	0	0	£5	2	0
20 in. × 10 in.	5	5	0	5	10	0
16 in. × 10 in.	4	15	0	5	1	0
14 in. × 8 in.	4	10	0	4	15	0
Green randoms				6	7	0
Grey-green do.				5	9	0
Green peggies. 12 in. to 8 in. long				4	13	6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6
Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.			
FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour ;* JOINER, 1s. 8½d *per hour ;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds) :			
7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0
Memel or Equal. Slightly less than foregoing.			
Flooring, P.E., 1 in., per sq.	£1	4	6
DO. *T. and G., 1 in., per sq.*	1	4	6

CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0	
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½	
DO. 9 in. wide and over per ft. sup.	0	1	2	

[*continued on page* xxxi

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in. with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra each	0	0	3
DOORS, 4-panel square both sides, 1¼ in thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labours, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1½ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick and bedding per ft. sup.	0	4	6
IRONMONGERY:			
Fixing only (including providing screws):			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
DO. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

BUILDING CONTRACTS OPEN

Unless the contrary is expressly stated, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district. Application for plans and particulars should be made to the address given at the end of each entry.

BUILDING

EAST WEMYSS : HOUSES

May 8.—For the various trade works in connection with the erection of thirty-two three-room houses of the flatted type and sixteen two-room houses, and for the street works at East Wemyss, for the Kirkcaldy District Committee. G. B. Deas, Architect, Central Chambers, Kirkcaldy.

BEXHILL : TOWER

May 8.—For the erection of a drill and hose tower, 50 ft. high and 9 ft. square, in the Town Hall Yard, Bexhill, for the T.C. The tower will be a steel-framed building, timber covered. This contract will not include the provision and erection of the steelwork. W. Pearce, Borough Surveyor, Town Hall, Bexhill. Deposit £1 1s.

BARKING : SCHOOL

May 9.—For extensions to the Park Modern School, Barking, consisting of two manual training classrooms, two dressing rooms, two shower-bath rooms, lavatories, two cycle sheds and small wooden pavilion, for the E.C. C. J. Dawson, Architect, Clock House Chambers, Barking. Deposit £2 2s.

CATERHAM VALLEY : HOUSES

May 10.—For erection of thirty-six houses upon the Stafford Road site, adjoining Croydon Road, Caterham Valley, for the Caterham and Warlingham U.D.C. The Engineer and Surveyor to the Council. Deposit £3 3s.

NOTTINGHAM : CHAPEL

May 10.—For erection of a new chapel in Nuthall Road, Cinderhill, Nottingham, for the trustees of the Primitive Methodist Chapel. Booker and Shepherd, Architects, Albion Chambers, King Street, Nottingham. Deposit £2 2s.

ALTON : HOSPITAL BLOCK

May 10.—For the following, for the Alton Joint Hospital Committee: (1) Erection of a new hospital block (timber and corrugated iron) and covered-way, and alterations to existing buildings; (2) preparation of site and construction of foundations for same. G. H. Webb, Surveyor, Town Hall, Alton. Deposit £1 1s.

GREAT LEIGHS, ESSEX : BUNGALOWS

May 12.—For erection of four semi-detached bungalows at Great Leighs, for the Chelmsford R.D.C. J. Dewhirst, Engineer and Surveyor.

CROYDON : HOUSES

May 12.—For erection of sixty-eight houses (seventy lettings) at Mitcham Road estate, for the T.C. The Borough Engineer, Town Hall, Croydon. Deposit £5 5s.

LUMB-IN-ROSSENDALE, LANCS : HOUSES

May 12.—For the erection of twelve three-bedroom non-parlour-type houses at Burnley Road, Lumb-in-Rossendale, for the Rossendale T.C. The Borough Surveyor's Office, Town Hall, Rawtenstall. Deposit £2 2s.

SLEAFORD : HOUSES

May 12.—For erection of a block of four workmen's dwellings in Martin Fen, near the Dales Head Bridge, for the Sleaford R.D.C. E. H. Sills, Architect, Council Offices, Northgate, Sleaford.

SUNDERLAND : HOUSES

May 12.—For erection of ninety four-roomed houses at Ford estate, under the terms of the Housing (Financial Provisions) Act, 1924, for the Corporation. The Borough Engineer's Office, Town Hall. Deposit, £2 2s.

CHORLEY : HOUSES

May 12.—For the erection of ninety-two houses on the Springs Road site, for the Corporation. The scheme comprises blocks of two, three, four, six and eight houses. Tenders may be submitted for the complete scheme or a portion thereof. Contractors should tender for only such number of houses as they are prepared to undertake substantially to commence at once and complete in all respects ready for occupation before October 1. The Borough Surveyor. Deposit £2 2s.

PETERBOROUGH : HOUSES

May 13.—For the erection of forty-seven houses adjoining St. Paul's Road, for the Corporation. The City Engineer, Broadway, Peterborough. Deposit £2 2s.

MANCHESTER : SCHOOL

May 14.—For the several works required in the erection of the Mauldeth Road Municipal School, Withington, Manchester, for the E.C. The Education Offices, Deansgate, Manchester. Deposit £2 2s.

ORSETT, ESSEX : HOUSES

May 14.—For the erection of twenty-two houses in the parish of Orsett, together with the demolition of certain existing property, for the Orsett R.D.C. G. F. Andrassy, Engineer. Deposit £1 1s.

HELSTON, CORNWALL : SCHOOL

May 17.—For the erection of a proposed new Sunday School at Godolphin Cross, Helston. P. Smitham, Godolphin Cross.

LONDON COLNEY, HERTS : SCHOOL

May 23.—Erection and completion of an elementary school to accommodate 200 scholars at London Colney, nr. St. Albans, for the Hertfordshire C.C. The County Surveyor's Office, Hatfield. Deposit £3 3s.

ILFORD : HOUSES

May 24.—For erection of 146 houses, together with the necessary house drains, at the Fencepiece Road housing estate, Barkingside, for the T.C. L. E. J. Reynolds, Borough Engineer, Town Hall, Ilford. Deposit £5 5s.

TENDER

PROPOSED MATERNITY HOME, Grove Road, Balham, S.W.12, for the Wandsworth Borough Council. R. J. and J. S. Thomson, Architects, 49 Hill Road, Wimbledon, S.W.19. Following is a list of the tenders received:

F. D. Hidden & Co., Ltd. (accepted)	£29,332	0	0

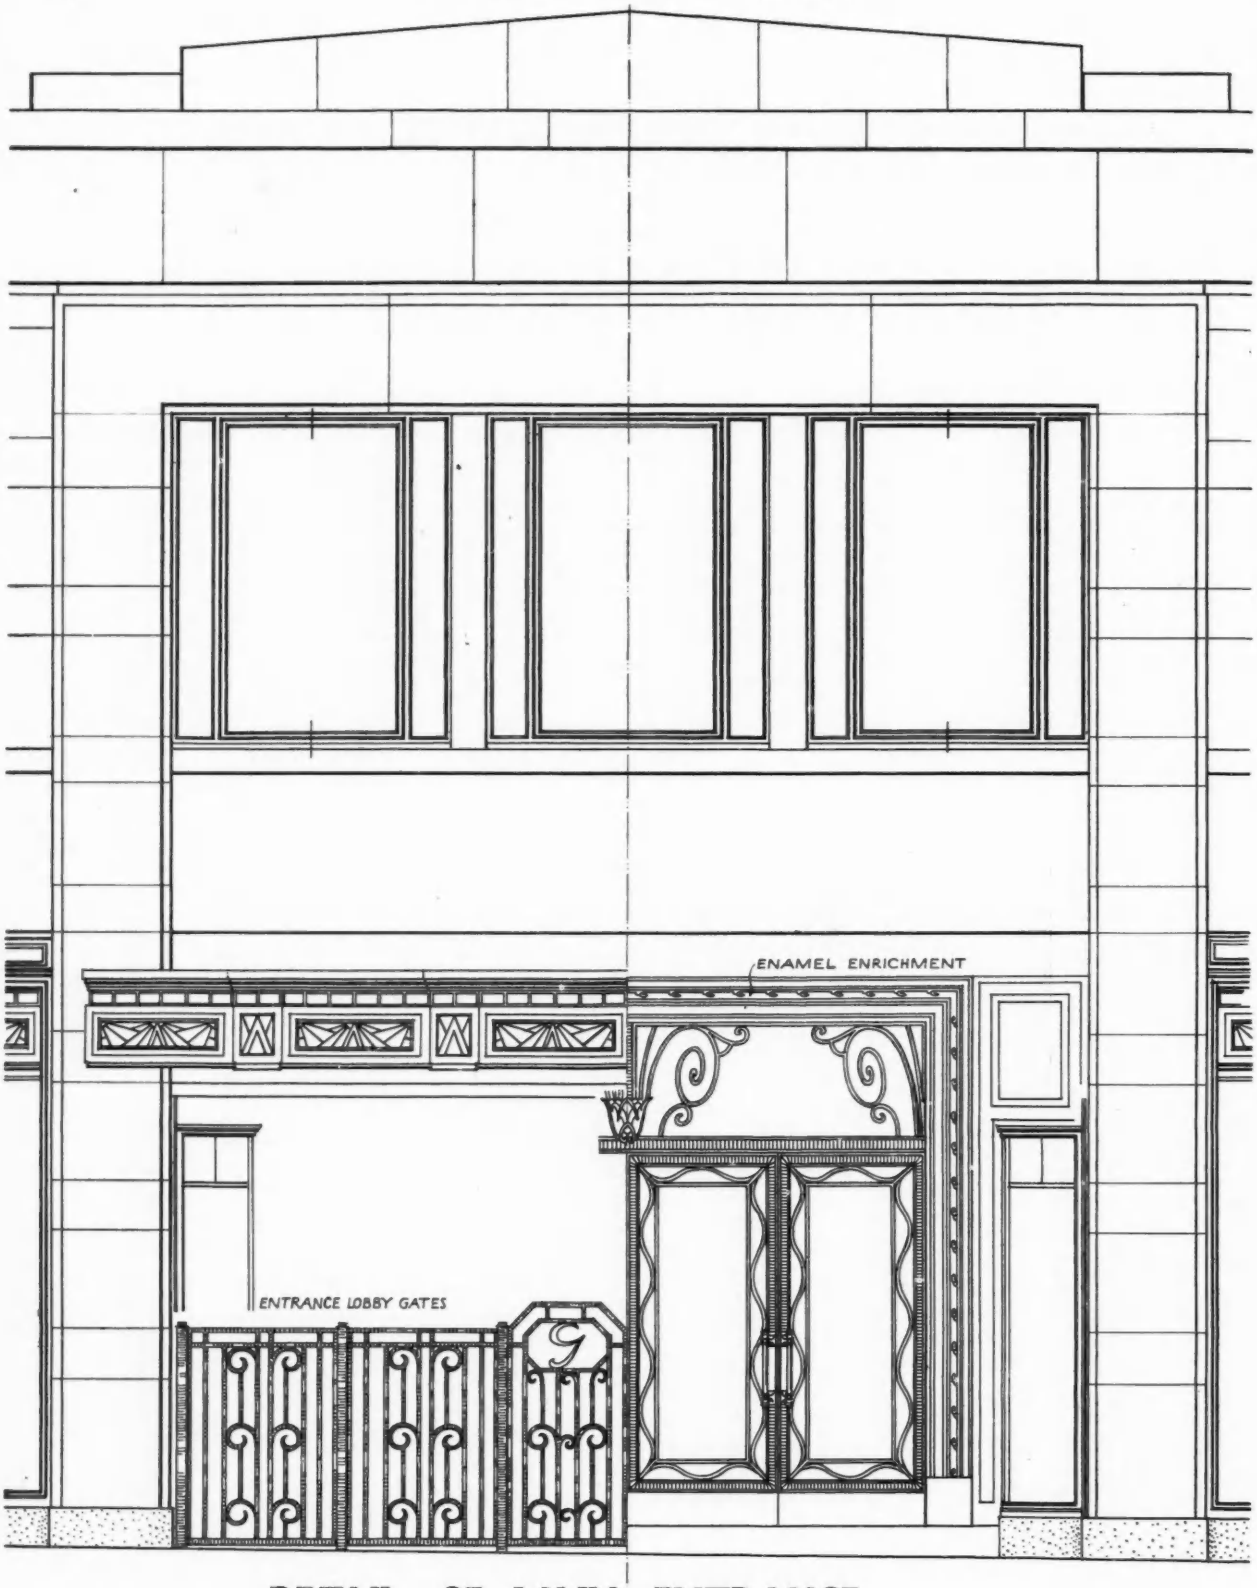
Telephone No.: Hop 3985 (4 lines).

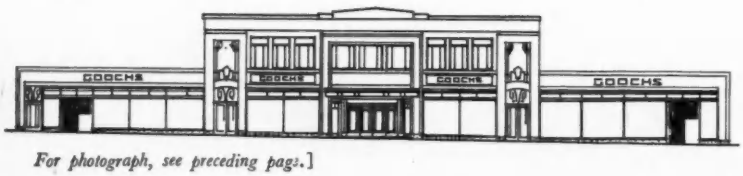
SOUTHWARK STREET, LONDON, S.E.

MAIN ENTRANCE, MESSRS. GOOCH'S PREMISES, BROMPTON ROAD, S.W.



By G. ALAN FORTESCUE

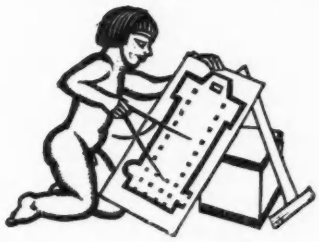
THIS main entrance forms the centre feature of a new shop-front, faced in precast stone, and having stall risers and the bases of the piers and pilasters in Bon Accord granite of vertical section.



The entrance doors, frames and fanlights are of mahogany, faced on the street side with bronze having a special corrugated surface. On the inside the mahogany is French polished to a special neutral egg-shell finish. The exterior of the main entrance door-frame is finished with a two-colour enamelled border. In the centre lobby are splayed recesses, boxed out with an illuminated frieze and soffit. All the lobby floors are covered with Travertine marble.

The window enclosures have wrought-iron frames and grille work, with hinged opening doors, the whole of the metalwork being finished with sprayed gilding. The sashes are glazed with polished plate glass, secured with hardwood beads. The letters on the fascia are of cast bronze, with bronze margins and blue enamel filling.

Large- and small-scale drawings of this subject are reproduced on the following page.



DETAIL OF MAIN ENTRANCE

For photograph, see preceding page.]

THE ARCHITECTS' JOURNAL

WEDNESDAY, MAY 14, 1930

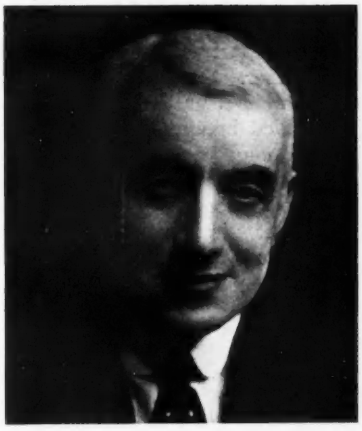
THE MORAL OF CHARING CROSS

"What is now urgently needed is a town-planning authority for the whole of London."

NO one can have followed the sequence of events which have accompanied the controversies over Waterloo Bridge and Charing Cross Bridge without coming to the conclusion that all is not well with the architectural government of London. It seems, to say the least of it, peculiar that the London County Council, which is given so much executive power to make or mar the architectural development of the Metropolis, should consistently flout the authority of the learned bodies whose members have given serious and disinterested study to the major problems of civic design.

In no other country in Europe is the metropolis governed in such a provincial spirit. In fact, one might go farther and say that of all the big towns in England itself London has the most provincial-minded town council, and it appears that by the very nature of its constitution it must continue to have this unenviable distinction. The reason is that London is too big. Several of the metropolitan boroughs have a population equal to that of a great industrial city, but the inhabitants of Bermondsey, for instance, cannot bring themselves to have the same pride in Bermondsey as Liverpudlians have in Liverpool. Questions of rates and other local matters loom large in their eyes, and they find it difficult to envisage the relation which one metropolitan borough must bear to the next, or to the County of London as a whole. And, unlike the great provincial cities, these boroughs have no obvious and recognizable boundaries, and are without the æsthetic attribute of separate and distinct unity. Moreover, a person who lives in Bermondsey may find his daily employment in the city of London; a person who lives in Hampstead may find his employment in Westminster; and so his allegiance is apt to be divided. Yet we generally find that recruits to the London County Council are drawn from the ranks of those who have first had some experience in the local government of a metropolitan borough, and they start with the handicap of having served with a council which has never had to deal with the affairs of a township as a whole.

During the last few years the London County Council, each time with the most astonishing self-confidence, has tried more than one fall with the learned societies and has come off second best. The influence of the latter upon public opinion and upon Parliament itself was found to be sufficient to compel the L.C.C. in the first instance to postpone the fulfilment of its declared intention to demolish Waterloo Bridge, and in the second instance to abandon its singularly ill-considered layout for a new Charing Cross Bridge and its environs. And now, in a huff, the L.C.C. reverts once more to its original purpose with regard to Waterloo Bridge. Let its members, then, make this latter attempt if they will. It will only provide one more, and perhaps a final, argument which will prove the necessity of the London County Council being deprived of its present powers to determine matters of town planning and civic design, with which the majority of its members are not qualified to deal. What is now urgently needed is a town-planning authority for the whole of London, whose members will have authority to decide all the major questions of urban development in so far as these concern the co-ordination of traffic routes, the provision and preservation of open spaces, and the general control of street architecture in the Metropolis.



In such a body, the R.I.B.A., the Town Planning Institute, the London Society and the Royal Academy should be permanently represented, so that it should hereafter be impossible that there should be submitted for parliamentary approval a scheme so lacking in practical and artistic merit as that recently devised by the London County Council in collaboration with the Southern Railway Company and the Ministry of Transport. We do not attempt at this stage to offer detailed suggestions of the composition of such a body, for many questions would need to be considered before its executive powers could be defined and its personnel properly constituted. We believe, however, that matters have now reached an impasse, and that the present system of government in London has definitely failed to provide an adequate policy such as would enable the Metropolis to develop in accordance with accepted standards of civic design. We invite our readers to offer suggestions for the formation of such a new body which would serve the objects which we have outlined.

HEREFORD GARDENS: A MODERN STORE AND BLOCK OF FLATS.
BY MESSRS. JOSEPH.

This building, now nearing completion, has been planned as a store for Messrs. Gamages, Ltd., and a block of forty-four flats. The main front faces Oxford Street, W., and the flats occupy the zoned wings from the second floor upwards, facing Park Street (to the left of the illustration) and towards Park Lane. The store is to utilize the centre portion of the building above this level, and the whole of the basement, lower ground, ground and first floors. The store area alone is approximately 300,000 square feet. The building has been designed to comply with a preconceived style of the Grosvenor estate.

NEWS & TOPICS

Gerald McMichael, architect for most of Birmingham's municipal banks, and for the Great Barr Colony for Mental Defectives, illustrated in this issue.

THE DEMISE OF THE CHARING CROSS BRIDGE BILL

THERE is an old superstition that thirteen is an unlucky number. From the point of view of the London County Council it would seem to be true in the case of the Charing Cross Bridge Bill, for it was at the thirteenth meeting of the Private Bill Committee of the House of Commons, presided over by Sir Henry Cautley, that the grandiose scheme of the Council was definitely rejected. To those who have followed the sittings of the Committee the result will cause little surprise, for it has long been apparent that the members were not enamoured of the proposal to put the new Charing Cross Station at the bridge-head, and the dilemma of the Committee was in no way lessened by the stubborn attitude of the London County Council. Members of Parliament of all parties are now asking what the next step will be. In their present mood it seems unlikely that the Council will put forward a fresh Bill for a new Charing Cross Bridge: they are more likely now to concentrate on Waterloo Bridge. Lovers of Rennie's work of art should be prepared to withstand yet another onslaught.

THE ARCHITECT AS SERVANT?

A leading article is the proper place for the discussion of the Charing Cross Bridge developments, and I should not be led to add my opinion were it not that Mr. Frank Pick's letter to *The Times* of May 8 provokes me to a certain indignation, that he at this hour should be so mistaken as to imagine that architectural opinion has wished the Southern Railway station set back from the south bank *because a station is hard to make beautiful.* If that were the issue, architecture might well be bankrupt, and architects as childish and as little able to use their peculiar sense of fitness as he makes them out to be.

*

I quite agree with him that those architects who have given time and trouble to the solution of the problem have done so under all the restrictions that lack of data can bring, but I also see that too close a proximity with traffic experts and the greed of the Southern Railway may lead to results that fall still further below the best solution of the problem.

*

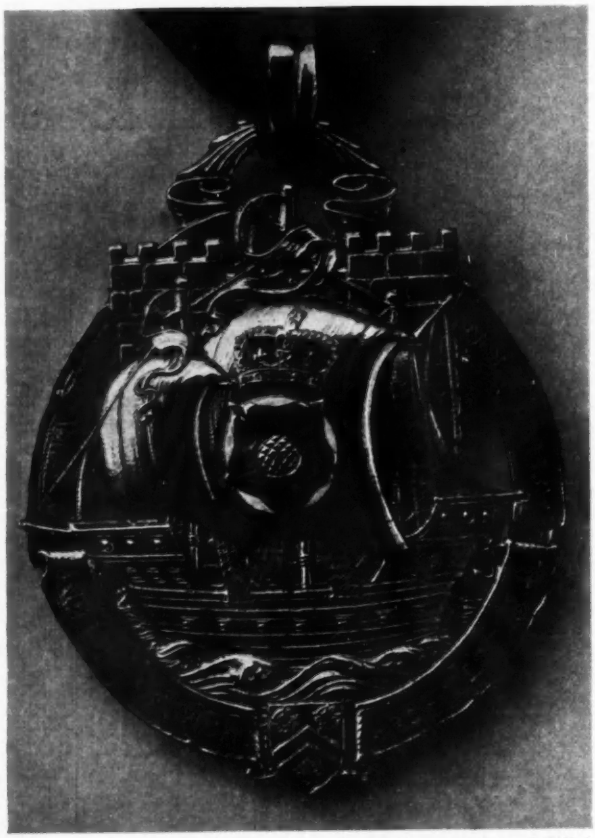
For the architect is not a servant of his master, but a superior agent, and at his best an artist. The men who worked out the official scheme were not artists, and had no thought above the problems, the facts, the circumstances, and the Southern Railway, with which they were surrounded. What profit they expected from the architect who did his best when their masters were served, none of us can know. It has not been very much, for nobody could accept a lovely station front when the back was a riot of ugliness and bad thinking.

ERIC MENDELSOHN, ENGLAND'S GUEST

Eric Mendelsohn, whom England is honouring next week, is the youngest of four or five German *Baumeister* who have done much to give expression to the individuality and significance of our century. With the single exception of Peter Behrens, he is the greatest architect whom Germany has produced. The dinner, on May 22, to him, therefore, is fraught with importance for the enfranchisement of the modern spirit in Great Britain. As so often before in our history, we have been won over in despite of ourselves by sheer power of imagination and quality of workmanship.

*

Eric Mendelsohn was born in 1887 at Allenstein, in East Prussia. He studied architecture and civil engineering in Munich and Berlin, where he now lives. His name first acquired international prominence with the observatory tower he built for Einstein at Potsdam in 1921. This revealed him as a man who had dared to forget all he knew about architecture, with an academic capital "A," in order to obtain the fullest scope from a new material like concrete in meeting the baffling, and, in a technical sense, anything but "relative" requirements of an observatory. That the "Einsteinturm" was (and still is) violently decried goes without saying. But it made the sort of people think, and think again, whom Le Corbusier's pile-foundation villas and rhetorical prose have left unmoved. Actually, Mendelsohn's first building in Berlin was the reconstruction of Messrs. Hausleben's premises in the Dorotheenstrasse, behind Unter den Linden, begun in 1919. Indeed, one of the many directions in which his influence has been most widely felt is in the "planing down" of exuberant nineteenth-century façades so as to leave bare, well-proportioned wall spaces and rational fenestration.



*

In 1928 came the remarkable and now universally famous "Universum" Cinema on the Kurfürstendamm, together with blocks of dwellings (notable for the continuous sweep of the rather Dutch-looking brick and concrete balconies which stress their horizontality) in the Lehniner Platz in rear of it. Mendelsohn has already planned a hotel to complete the transformation of this site. The interior of the "Universum" showed that Mendelsohn could build with light and shadow with the same audacity, resource and originality as with brick, concrete, steel and glass. It is one of the few masterpieces of modernism.

THE STATUS OF THE ARCHITECTURAL ASSISTANT

That the case of the architectural assistant presents difficulties has already been recognized in a practical manner by this JOURNAL, which is holding its pages open gratuitously to those seeking employment. The "Memorandum on the State of the Profession," recently issued by the R.I.B.A., provides evidence that an important change has gradually come over the ranks of architects. The

proportions of "assistants" and "draughtsmen" to private practising architects has increased very much during the last twenty-five years and is destined to increase still further. We seem to be now tending towards a state where architectural offices will get ever larger and the work be divided between fewer private practitioners, who will need to engage larger staffs. This result is partly due to the fact that in our modern towns the units of building seem to be constantly growing in size and a considerable staff is required to enable an architect to prepare the more extensive working drawings entailed.

The new Presidential badge of the Hampshire and Isle of Wight Architectural Association.

An architect working by himself, or perhaps engaging one or two assistants, has not the smallest chance of being commissioned to design the large type of office building now in vogue, for the directors of the companies which are destined to be housed therein naturally apply to some firm which provides evidence of a capacity to handle a big job. Moreover—and this is an important consideration—architectural students who are anxious to equip themselves in the best manner, and to become acquainted with the most modern building methods, often prefer to seek experience in the great offices where there is better scope for their talents. The R.I.B.A., ever seeking to take a realistic view of the circumstances in which its members work, is therefore giving particular attention to the conditions which govern the employment of the enormous number of "assistants" now on its rolls.

*

A Salaried Members' Committee has been formed which will endeavour to safeguard the interests of these "assistants" and "draughtsmen," many of whom are now obliged to accept ludicrously inadequate payment in offices of Government departments, or County and Municipal Authorities, and in the employment of commercial and industrial undertakings. The numbers in this latter category have greatly increased during recent years, and it is particularly desirable that every commercial firm which employs architects on its own staff should be made to realize their professional status. A difficulty experienced by this Committee is the lack of response of the architectural assistants themselves. In order to ascertain the approximate numbers of Associates of the R.I.B.A. who hold salaried appointments, a questionnaire was issued in which every member was asked to state in general terms the nature of his employment. Unfortunately, however, only a quite inadequate number of replies has been received.

*

We here encounter a psychological problem, to suggest a solution of which is, I must confess, quite beyond my capacity. Is this lack of response a sort of sensitiveness, which unkind critics might designate opprobriously as snobbery, or is it a relic of the old-fashioned feeling that an Englishman's home is his castle and that nobody is therefore entitled to inquire into his private affairs? I had thought that in this age of officialdom most people had long ago been obliged to abandon such an idea. But, whatever the reason for this lack of communicativeness on the part of architectural assistants, it may be hoped that some means will be found of persuading them to collaborate with the R.I.B.A. in a matter which so closely concerns their own interests.

HISTORY IN GOLD

One of the most interesting presidential badges of the allied societies is that made this year for the Hants and Isle of Wight Architectural Association, which held its annual meeting [reported on a later page] on Saturday last. It is in nine-carat gold and has been designed and executed by Mr. Omar Ramsden, of London. The coat of arms of Hampshire, picked out in enamel, occupies the central position on the badge. Hampshire, of course, was noted in mediæval days for shipbuilding: it is therefore appropriate that its coat of arms should be represented as being carried on the mainsail of an old wooden ship, sailing the seas of Southampton Water, Spithead and the Solent, for many such ships were built for England from the oak of the county's forests. The Isle of Wight is represented by Carisbrooke Castle, the home of Princess Beatrice, the Governor of the island. A ribbon bearing the title of the Association surrounds this device, and at the bottom is a shield bearing the arms of William of Wykeham, the earliest known architect in the area and the founder and builder of Winchester College, who may justly be regarded as the Father of the Association.

UNDERGROUND SLEEPING ROOMS

One would hardly expect in these days to find a need for legislation in order to prevent the building of underground rooms to be used for sleeping places. But such things do happen in places as little remote as Holborn, and the Borough has resolved to ask the Ministry of Health for legal powers, requiring architects and others proposing to build such rooms to deposit full plans and particulars with the Local Authority before doing so. There is at the moment no means either of preventing the construction of such rooms or of ensuring that they are really fitted for sleeping in.

ASTRAGAL

STYLE *v.* STYLE

From Which Side Should the R.I.B.A. Jury be Picked?

Why I think the Jury should respect the English tradition

BY A. TRYSTAN EDWARDS

THE majority of the R.I.B.A. Jury should have an understanding of the English tradition of urban architecture. Why should anyone seek to make such a stipulation as this? it may be asked. Because the English tradition of urban architecture is the best that there has ever been. Neither the Italians, nor the French, nor the Germans, nor the Swedes have either during the Renaissance period or up to modern times developed the same genius for street architecture as the English people showed at certain periods in the past.

I am not suggesting that a majority of the Jury should necessarily favour a building in the Georgian or Regency style, but that they should show either by their own executed works or written expressions of opinion that they have *an understanding* of these great achievements in urban architecture. For the new R.I.B.A. Building is going to be in the town and therefore it should express the qualities of urbanity. These are qualities of character and they have little to do with any question of style. For instance, in the city of Oxford we find mediæval buildings cheek by jowl with Classic ones, yet they harmonize wonderfully well because they were urban Gothic and urban Classic.

It is far more important to insist that the assessors should appreciate this point of view than that they should be definitely addicted to the Classic or any other style. Rather than that the new R.I.B.A. Building should be designed in the "country bumpkin" Classic of the school of Norman Shaw, it would be infinitely preferable for it to be Gothic, provided that it was urban Gothic with parapet walls and low roof in the late mediæval collegiate manner.

But better still would be a twentieth-century building which showed that its architect had mastered the lessons which are to be derived from the mature accomplishment of the Georgian period. The use of steel or reinforced concrete cannot render out of date those principles of architectural manners which are the expression of the civic aspect of building—the subordination of street façade to the design of street as a whole and the subordination of the street to the city as a whole.

If a "modernist" assessor of "cubist" persuasions helps to cut out the gables from the R.I.B.A. Building and saves it from the ravages of Garden Suburbia, he will be doing a good work. But, on the other hand, the "modernists" have hitherto distinguished themselves by a reckless individualism, so that the "modernist" buildings appear to express an even more poisonous hatred of each other than they have of the traditionalist work. Therefore I would urge that at the present stage in the development of the "modernist" movement its representatives should be in a minority in the Jury of Assessors for the new R.I.B.A. Building.

Why I think the Jury should be essentially modern

BY FREDERIC TOWNDROW

BEFORE, reader, I get your sanction to the kind of jury which I think we ought to have, I should of course explain the whole purpose and goodness of the modern movement; but the Editor has restricted me to 500 words; so I must assume that either you know all about its underlying philosophy, or that you are open-minded enough not to be frightened by the idea of a reasonable development in architecture. This being so, I had better describe the sort of building I hope we shall get for a headquarters, and, having first got your agreement upon this, it will be a simple matter to think about the kind of jury which would *suit the building*.

This is the sort of building I hope we shall get:

1. It would have to be well planned, but we should not regard the plan as the most important part of it, because it is the outside of the building which will be judged by the public.

2. The building should not be in any particular style, either old-fashioned or newfangled.

3. Any such building should be able to stand up to the future. Consequently, we must keep in mind the following points:

a: The younger a man is, the more he will use the building: the older he is, the less he will be able to use it; therefore this really belongs to young men and future generations.

b: So we must resist at all costs that typically British suggestion that because a building will be standing a hundred years hence, it must be designed in the style of a hundred years ago.

c: Consequently, it would not be wise to introduce such features as Classical or Gothic columns, cornices, friezes, swags, Roman shields, whatnots, lovers' knots or funereal pots; for strange to say, these things are going out of fashion, and though we older ones may find a certain sentimental pleasure or grace in them, future generations will only sneer, for they will always be able to see the sources from which we "cribbed" them.

4. To sum up. Our headquarters must be beautiful, as a creation by itself, without any of the superficial aids of the past or the present. It must be so pure and so simple as to offend no one—except the profligate or voluptuary—and so sincere that it does not matter whether we like it or not. To reach sincerity, its designer must stand firmly on his own feet in the twentieth century and work out every detail. He must take nothing for granted. He must have a reason for everything.

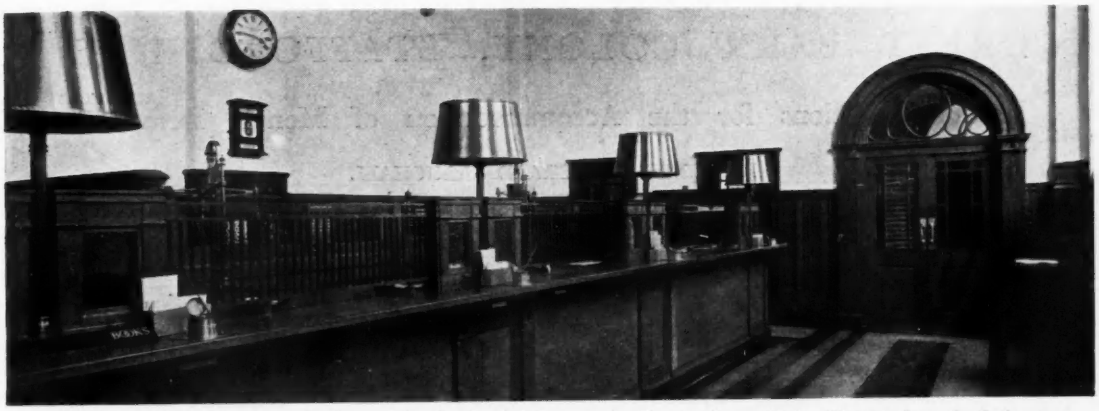
Now, to get such a building, what sort of jury will we require? It will be necessary to have men absolutely immune from the stylistic poison, whether the English or foreign poison or the ancient or modern.

BRANCH BANK: BEXLEY HEATH

DESIGNED BY DARCY BRADDELL AND HUMPHRY DEANE

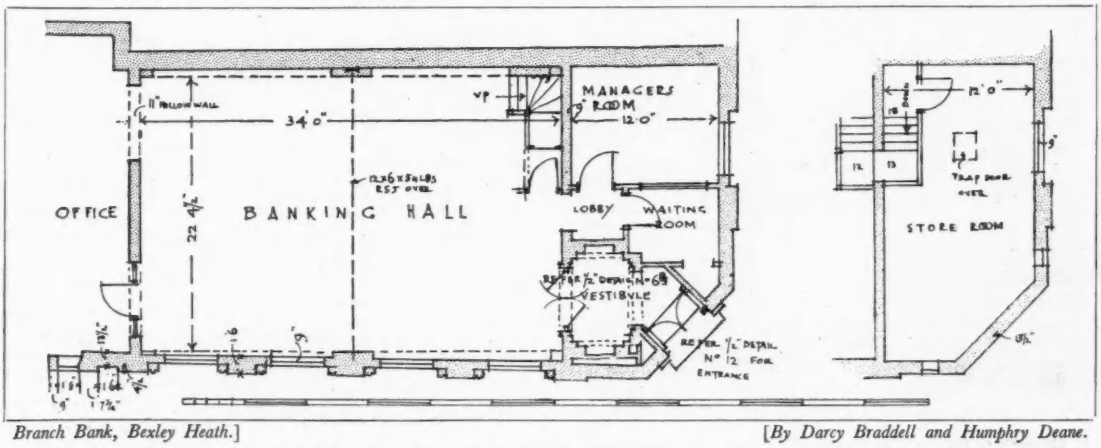
A view of the façades to Woolwich Road (left) and Market Place. The four semicircular-headed windows on the left light the banking hall; that on the right lights the manager's room on the ground floor and the store room above.

THESE new premises are built on the site of an old branch of the bank. The elevations express the form of the greater part of the inside of the building, which is but a lofty hall. There was no wish to put any premises above the bank. The height of the small shops adjacent along the main street was kept to for the new façade. Externally, the walls are faced with a brindle-coloured hand-made brick, with cornice, stringcourses and other dressings in a dull red brick. The architraves to the windows are formed in specially-made tiles about 1 in. thick, moulded on plan and pointed with a weathered joint.



At the wish of the bank the entrance is planned on the corner, and is carried out in Portland stone, as is the plinth round the base. The gilt grasshopper which hangs over the doorway is the trading sign of Martin's Bank, and has been in use since its foundation in the sixteenth century.

Entrance to the building is through a vestibule, the walls of which are faced in brick and the ceiling boarded in oak. In the banking hall the treatment is as simple as it well can be—a wide barrelled ceiling in cream-washed plaster, a panelled dado, counter and other fittings in grey oak, with skirtings and door architraves ebonized. The floor to the public space is in fawn and black, with the grasshopper in green. All these make up a cool and dignified whole.



Views of the corner, the only entrance to the bank; and of the entrance vestibule, looking through the doors leading to the banking hall. The sign of Martin's Bank, a grasshopper, is seen hanging above the Portland stone surround of the entrance, and emblazoned in the floor of the brick vestibule. The bank has used this trading sign since its foundation in the sixteenth century.

The banking hall, looking towards the semicircular-headed doorway leading to the vestibule, illustrated on the facing page.

The banking hall, looking from the entrance vestibule. The doors at the far end lead to the clerks' office. On the left are the windows overlooking Woolwich Road. The ceiling is cream-washed plaster, and woodwork is grey oak.

Branch Bank, Bexley Heath.] [*By Darcy Braddell and Humphry Deane.*

Plans of the ground and mezzanine floors. To the left of the banking hall are the clerks' office, cloak room and lavatory accommodation. The mezzanine floor contains a store room and is planned immediately over the vestibule and the manager's room. The vestibule, with its brick walls and oak roof, is a particularly interesting feature.

GREAT BARR COLONY, STAFFORDSHIRE

Recent Additions for the Accommodation of Mental Defectives

DESIGNED BY GERALD McMICHAEL

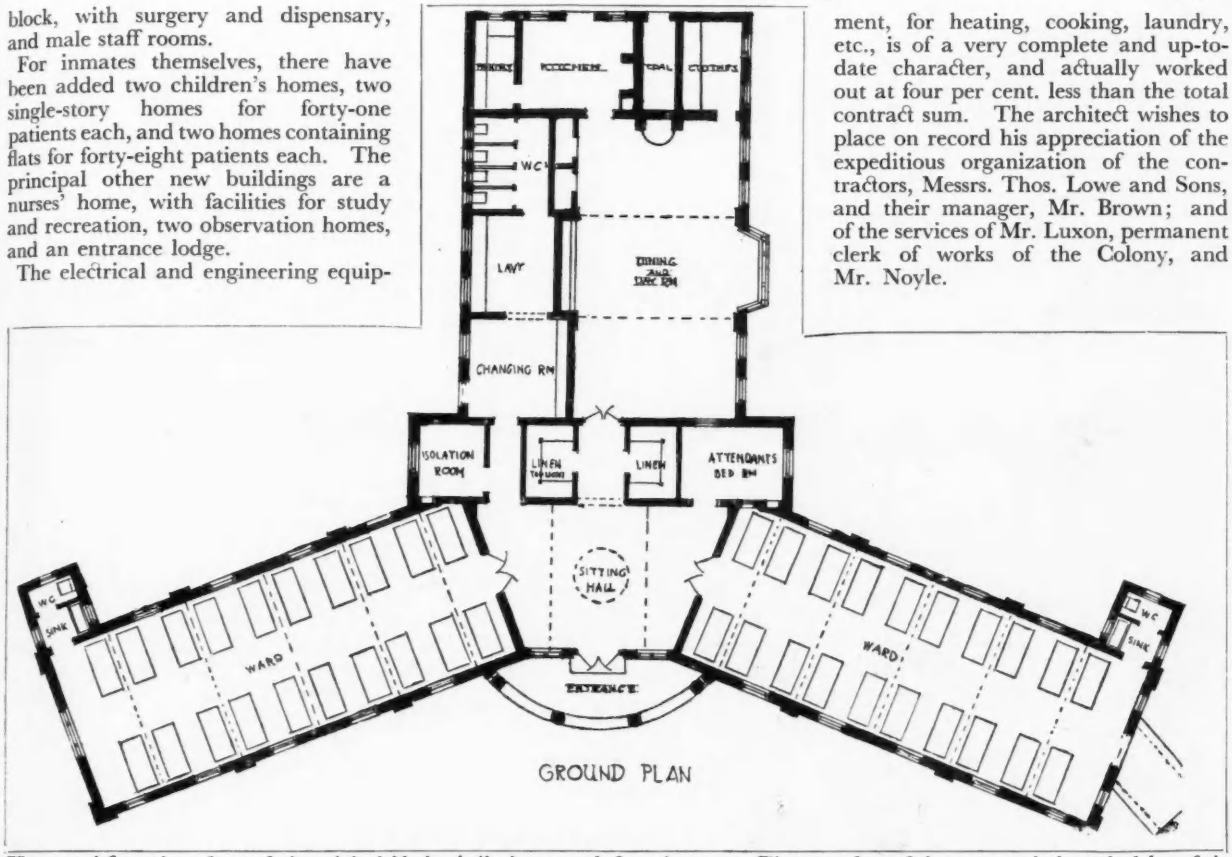
Units, new and old, grouped about Assembly Hall Workshops

Nurses' Home Observation blocks

An aerial view of the colony, taken flying northwards after passing over Birmingham. The new buildings stand out by reason of their whiteness; the four older blocks, darker in colour, are seen to either side of the central group of three buildings up to which the road leads. On the left are extensive lakes, spanned by bridges.

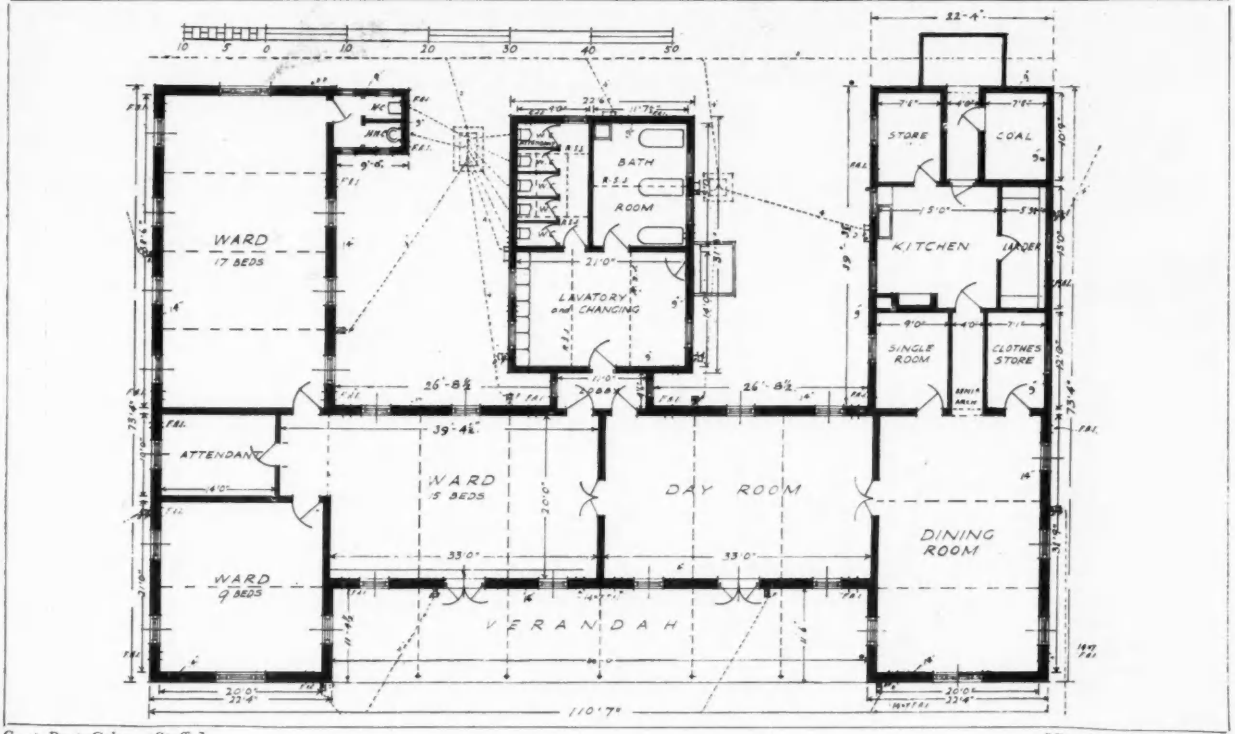
IT was towards the close of 1911, some years before recognition of the growing need for measures to protect and control mental defectives found expression in the passing of the Mental Deficiency Act, that the Guardians of West Bromwich and Walsall decided upon the purchase of the estate of 413 acres known as Great Barr Park, near Birmingham.

The architect was instructed, at the outset, to prepare plans providing accommodation for 500 patients, and the necessary administrative buildings. Four homes, with a total accommodation of 228, were commenced in 1913. The war interrupted the scheme, and it was only in 1924 that operations could be actively resumed. The provision of a further 342 beds, together with the necessary administrative buildings, was then decided upon.



For the older buildings a preference for stucco had been expressed by the joint committee who then administered the affairs of the colony; they were eventually formed of York stone pitch face screeds. By the time the extensions with which we are now concerned were undertaken, building costs had increased, and to meet the difficulties thereby created, the architect suggested the employment, for facing, of white cement and Leighton Buzzard sand, finished with a wooden float. This treatment, then, was adopted as standard for the new work, in combination with sills and dressings of artificial stone, and roofs of Buttermere slates.

The photographs show how agreeably the new blocks group and blend with the old, both types of elevation deriving from a common tradition. It is interesting to compare the older winged plan, somewhat suggestive of an aeroplane, with the new, strictly rectangular treatment. The assembly hall block, which, with its clock tower, is sited centrally on the apex between the male and female sides and dominates the whole, provides a hall, about 45 ft. by 80 ft., to seat over 400 people, with cloakrooms and a cinema box. Flanking it on one side is the matron's block, with a flat for her use, a sewing-room for patients, and rooms for the female domestic staff; on the other, the medical officer's



block, with surgery and dispensary, and male staff rooms.

For inmates themselves, there have been added two children's homes, two single-story homes for forty-one patients each, and two homes containing flats for forty-eight patients each. The principal other new buildings are a nurses' home, with facilities for study and recreation, two observation homes, and an entrance lodge.

The electrical and engineering equipment, for heating, cooking, laundry, etc., is of a very complete and up-to-date character, and actually worked out at four per cent. less than the total contract sum. The architect wishes to place on record his appreciation of the expeditious organization of the contractors, Messrs. Thos. Lowe and Sons, and their manager, Mr. Brown; and of the services of Mr. Luxon, permanent clerk of works of the Colony, and Mr. Noyle.

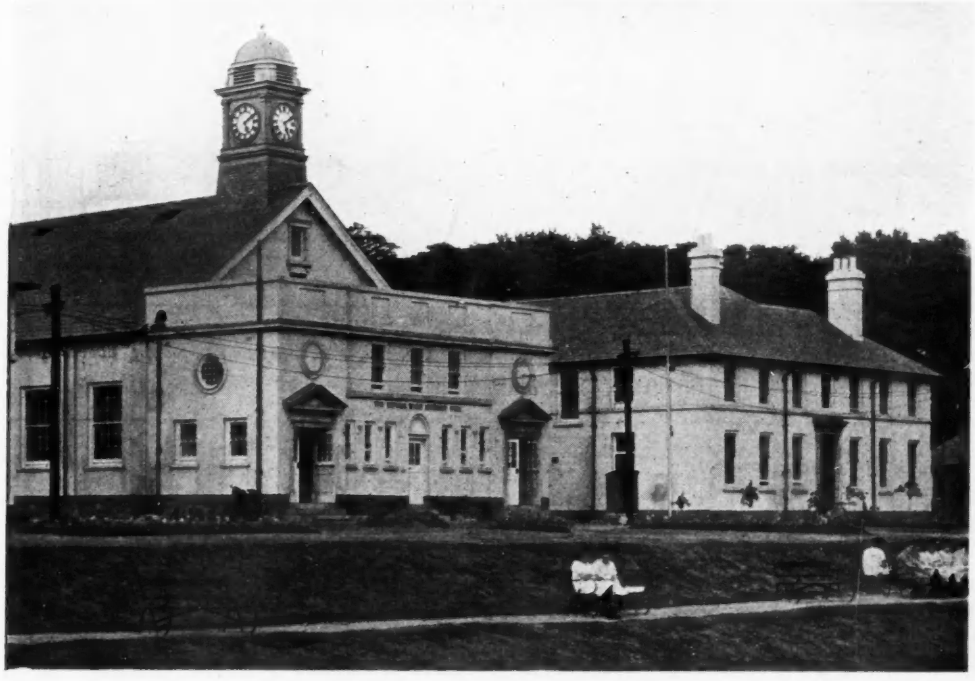
The ground-floor plan of one of the original blocks, built in stone before the war. There are four of these, grouped about the lobes of the heart described by the access roads. They are the darker blocks appearing in the aerial view reproduced on the facing page.

Great Barr Colony, Staffs.] [*By Gerald McMichael.*

The ground-floor plan of a new ward block, to accommodate forty-one patients, reproduced to the same scale as the above drawing. The new structures are economically built in brick, with artificial stone sills and dressings, the walls being faced with white cement and sand.

In this view, on the right, is the original "James Home" for women; on the left, the new children's block, known as the "John Smith Home," of which a plan appears on page 754.

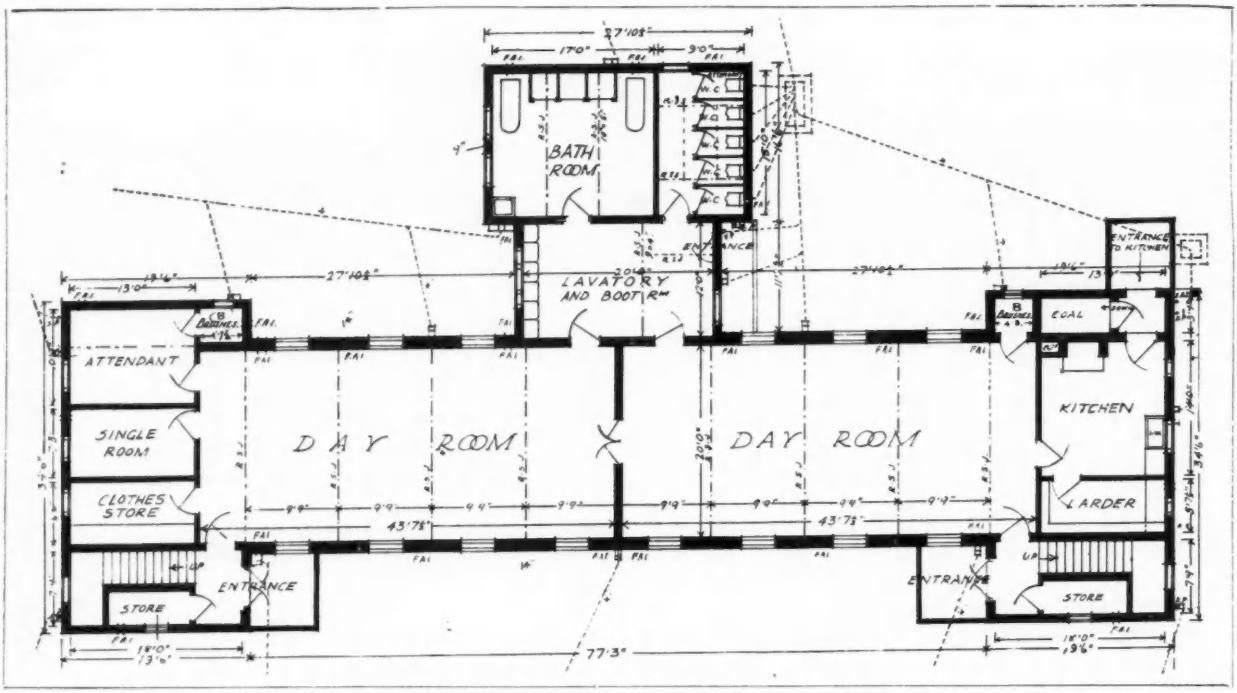
This group of three blocks, consisting of the assembly hall in the centre, with quarters for the matron (left) and medical officer (right), occupies a commanding position at the head of the heart-shaped drive in which the main avenue terminates. The group is flanked on either hand by two of the older winged blocks, as may be seen from the photograph immediately above, and from the aerial view reproduced on page



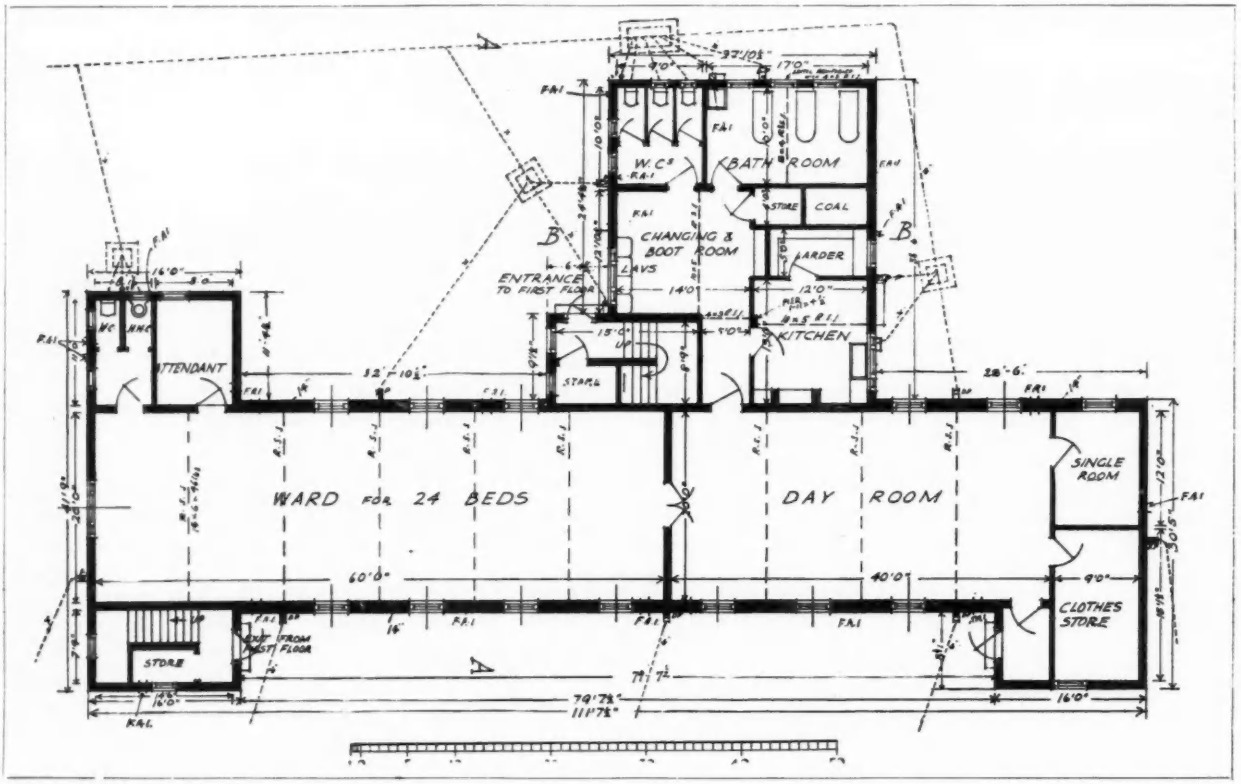
Great Barr Colony, Staffs.]

The entrance lodge and gates, erected where the private avenue, running the length of the Colony's estate, connects with the road to Perry Barr. The piers are of Portland stone, the lodge itself of the same materials as the remainder of the new work.

This companion photograph shows, on the left, the "Lavender Home," another of the original blocks (for girls) and, adjacent, the new matron's block, also illustrated immediately below.



748. The new work is faced with white cement and sand, has artificial stone sills and dressings, and is roofed with Buttermere slates. The assembly hall seats over 400 persons, and has facilities for the projection of films, and for other forms of recreation. The photographs reproduced at the head of these two pages show how the new work, which appears lighter in tone, falls into position and groups with the old.

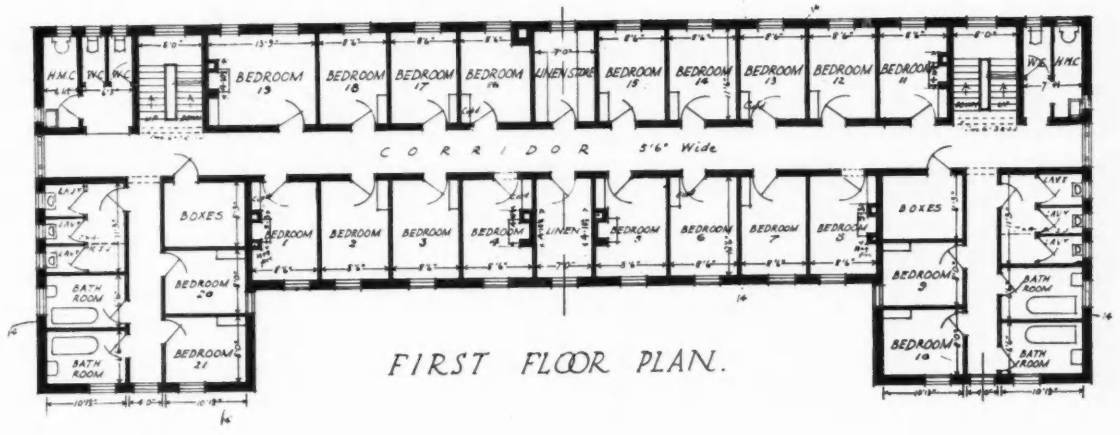


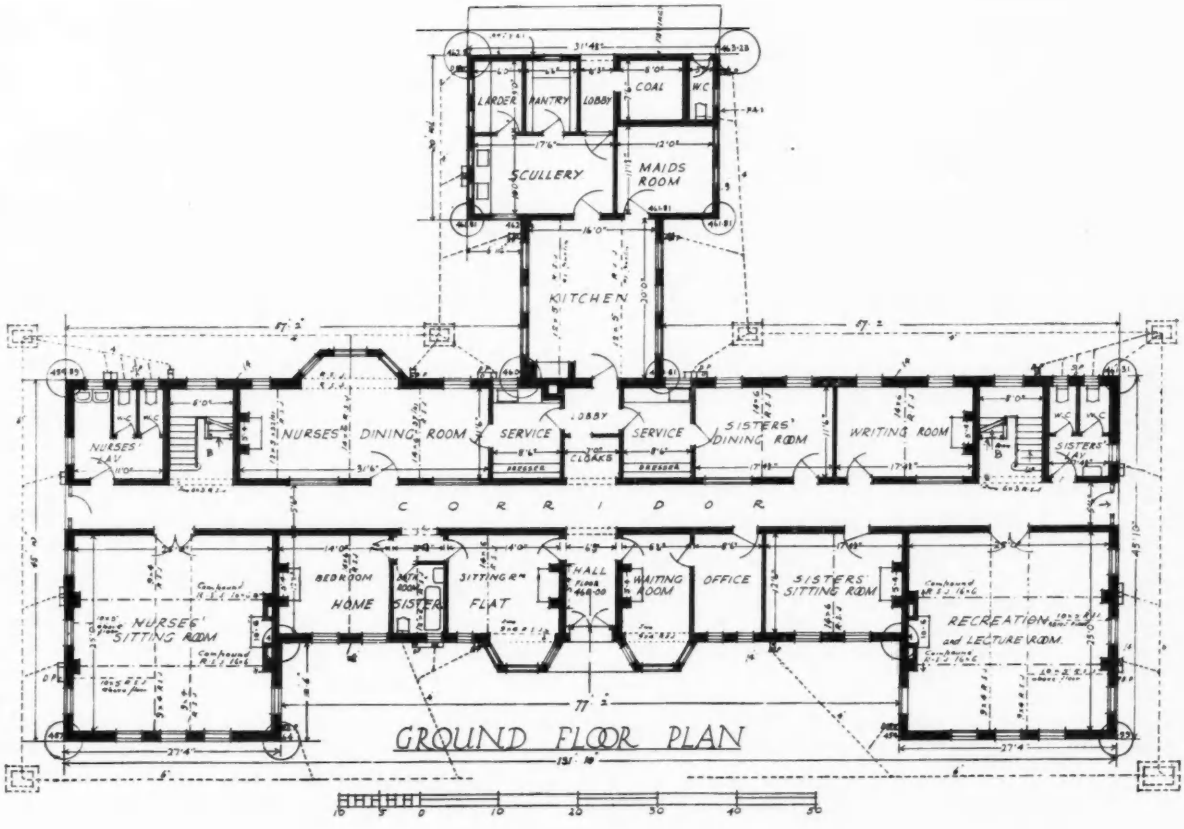
[*By Gerald McMichael.*

The new nurses' quarters, known as the "Hayley Nurses' Home." From the plans of ground and first floors, reproduced on page 753, it will be seen that the accommodation is comprehensive, including rooms for study and recreation, with bedrooms on upper floors.

C

The ground-floor plan of the children's, or "John Smith Home," of which a photograph appears on page 750. In accordance with the prevailing policy, the block is self-contained, having its own kitchen, lavatories, stores, and attendant's room; above are two dormitories, each of twenty-five beds.





Great Barr Colony, Staffs.]

This is the ground-floor plan of a building designed as two flats, each to accommodate twenty-four patients. The arrangement in the upper flat varies only in minor details. As in the case of the other buildings of which plans are given, it will be seen that the lavatory accommodation is isolated in a wing.

GREAT BARR COLONY.

THE NURSES' HOME.

[*By Gerald McMichael.*

The ground- and first-floor plans of the Nurses' Home, of which a photograph is reproduced on page 751. Corridors run the length of the building on every floor, with branches, at right angles, on the bedroom floors. The site is well away from other buildings on the estate, as will be seen on reference to the aerial view on page 748.

HOW WERE THE PYRAMIDS BUILT?

BY D. DAVIDSON

Approximately 2¼ million blocks of stone were used to build the Great Pyramid, an approximate total weight of 6 million tons. This gigantic mass of masonry was built in twelve years. How was it done? In a paper from which extracts appear below on "Pyramid-building Problems: Man-power Organization in the Pyramid Ages," read before a recent meeting of the Institution of Structural Engineers, Mr. D. Davidson finally dismisses the popular theory, which has been held for more than 2,000 years, that an inclined embankment led up to the Pyramid and was heightened as the Pyramid was raised.

IN a previous paper I dealt with the problem of the design and construction of the Great Pyramid from the standpoint of the engineer designing the structure. The study now presented is an attempt to deal with the infinitely more perplexing problems that concern the working organization of the Pyramid builders for the quarrying, working, lifting, and transporting of stone. I do not advance any dogmatic claim in this relation, in view of the fact that previous engineering investigations have failed to produce satisfactory conclusions.

My contribution is, in consequence of certain material facts of fundamental importance having emerged since previous investigations were undertaken, conducted in the light of them. Since the latter relate chiefly to the time-element of the pyramid-building problem, and, since time is the essence of any organized sequence of building operations, I will deal first with this fundamental element.

The three principal Pyramids of Gizeh were built during the reigns of the first three kings of the Fourth Egyptian Dynasty—respectively known as Khufu, Khafra, and Menkaura. Khufu is the Cheops of Herodotus. The Great Pyramid was built during the reign of Khufu or Cheops, and contained approximately 85 million cub. ft. of masonry. The Second Pyramid was built by Khafra, and contained about 78½ million cub. ft. The Third Pyramid was built by Menkaura, and is much smaller than those of his two predecessors.

The Egyptian priest, Manetho, who wrote in the third century B.C., attributes excessively long reigns to our three Pyramid kings—sixty-three years, sixty-six years, and sixty-three years respectively for Khufu, Khafra, and Menkaura.

Until recently these were generally accepted, together with the statement of Herodotus concerning the operations for and on the Great Pyramid having occupied thirty years. Sir Flinders Petrie put the older opinion in a nutshell when he stated that the "proposal to reduce the period would involve the greater difficulty of the building of the Pyramids in a shorter time." The "proposal" to which Petrie refers is one that has been advanced by a number of eminent Egyptologists for over thirty years. That is that overlapping records of the pyramid-building period and documentary statements, from a period about a thousand years earlier than Manetho, agree in showing that the total period covered by the reigns of Khufu, Khafra, and Menkaura was between sixty and seventy years, or about one-third of the time given by Manetho. This reading of the facts from the contemporary records and from the earliest documentary sources has been established as true by the records in the two tombs recently discovered at Gizeh by the Boston-Harvard Expedition under Dr. Reisner.

This air photograph is by Brigadier-General P. R. C. Groves, C.B., C.M.G., D.S.O., by whose kind permission the reproduction appears. The south slope of the Great Pyramid reveals, on the photograph, a structural feature that does not, so far as is known, occur on any other pyramid. This is a shallow V-shaped depression—only three feet deep maximum horizontally—of the surface of the slope. It occurs on all four slopes, and its form was first inferred by the author, from Sir Flinders Petrie's survey, to be as is now shown on the photograph.

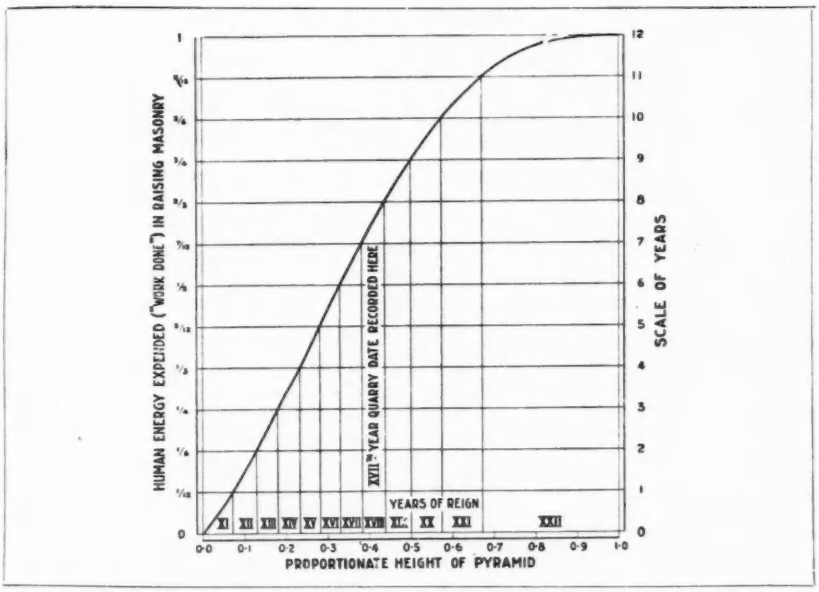


Diagram of human energy expended in raising the Pyramid's masonry to successive levels.

Apart from all this, it is now known that Sneferu, who preceded Khufu, built two pyramids totalling 88½ million cub. ft. of masonry—a quantity greater by 3½ million cub. ft. than Khufu's Great Pyramid. Manetho, however, gives only twenty-six years for Sneferu as against sixty-three years for Khufu. Here, then, is an anomaly in the data from which the time-element of the previous pyramid-building investigations had been derived. It is clear, therefore, that we must accept the evidence of the contemporary inscriptions and of the other early records, difficult as this may be to reconcile with the older accepted time basis for pyramid building; and involving, as it does, what Petrie calls "the greater difficulty of the building of the Pyramids in a shorter time."

Archæological data, from records belonging to periods from 1,000 to 2,500 years earlier than Manetho, all agree in fixing the duration of Sneferu's reign as twenty-four years, and of Khufu's reign as twenty-three years. These, indeed, are the actual durations given for the two respective reigns in the Nineteenth Dynasty List of Kings, known as the Turin Papyrus List. Sneferu's rate of pyramid building—88½ million cub. ft. within a maximum period of twenty-four years—agrees with Khufu's 85 million cub. ft. of masonry built within a maximum period of twenty-three years, and gives Khafra's 78½ million cub. ft. of masonry built within a maximum period of twenty-one years. The duration of Khafra's reign has been erased from the Turin Papyrus, but several lines of independent data from the Pyramid period agree in giving twenty-one years for the reign. One series of data, indeed, yield a total period of years in which all the reigns are known except Khafra's, whose reign requires to be twenty-one years to complete the total.

The Turin Papyrus gives eighteen years for Menkaura's reign. This was more than sufficient for the building of Menkaura's Third Pyramid of Gizeh, which contained only 8⅔ million cub. ft. The four successive reigns from Sneferu to Menkaura inclusive therefore cover a period of eighty-six years, the average reign being twenty-one and a-half years. This accounts for Sneferu's queen—Mertitefs—being alive in the reign of Khafra, as her tomb inscription states. A prince, Sekhemkara, who held office under Khafra, died in the reign of Sahura, the second king of the Fifth Dynasty. By Manetho's absurd chronology, Sekhemkara held office for at least 150 years and lived at least 170 years. By the contemporary inscriptions he held office for more than thirty years and lived for more than fifty years, but not more than seventy-two years.

The essential facts for our investigation are that Khufu, in whose reign the building of the Great Pyramid was commenced and finished, reigned twenty-three years; and that the rate of pyramid building was the same in three successive reigns — those of Sneferu, Khufu, and Khafra. This means that approximately 18 million tons of masonry were quarried, transported, dressed and built in sixty-eight years. Our special problem relates to the building of the Great Pyramid—about 6 million tons in a maximum period of twenty-three years. It would appear that the preliminary works occupied the first ten years of Khufu's reign, that the building work began in his eleventh year and continued for twelve years to the beginning of his last or twenty-third year. A dated record in an originally hidden part of the masonry over the King's Chamber in the Great Pyramid confirms these conclusions precisely, as the following considerations will show.

The total weight of the Great Pyramid's original mass is approximately 6 million tons. The total human energy expended in raising the Pyramid course by course is approximately 1,000 million foot-tons. To obtain a curve of successive stages of human energy expended, I have, however, taken the total energy expended, in raising the whole structure, as unity, and have taken the completed height as unity (see diagram herewith). The equation to the curve is as follows:

Proportion of total human energy expended

$$= 1 - 3a^3\ 1 + 2a^4$$

where a = the fraction of the completed height (taken as unity) that remained to be built to the apex.

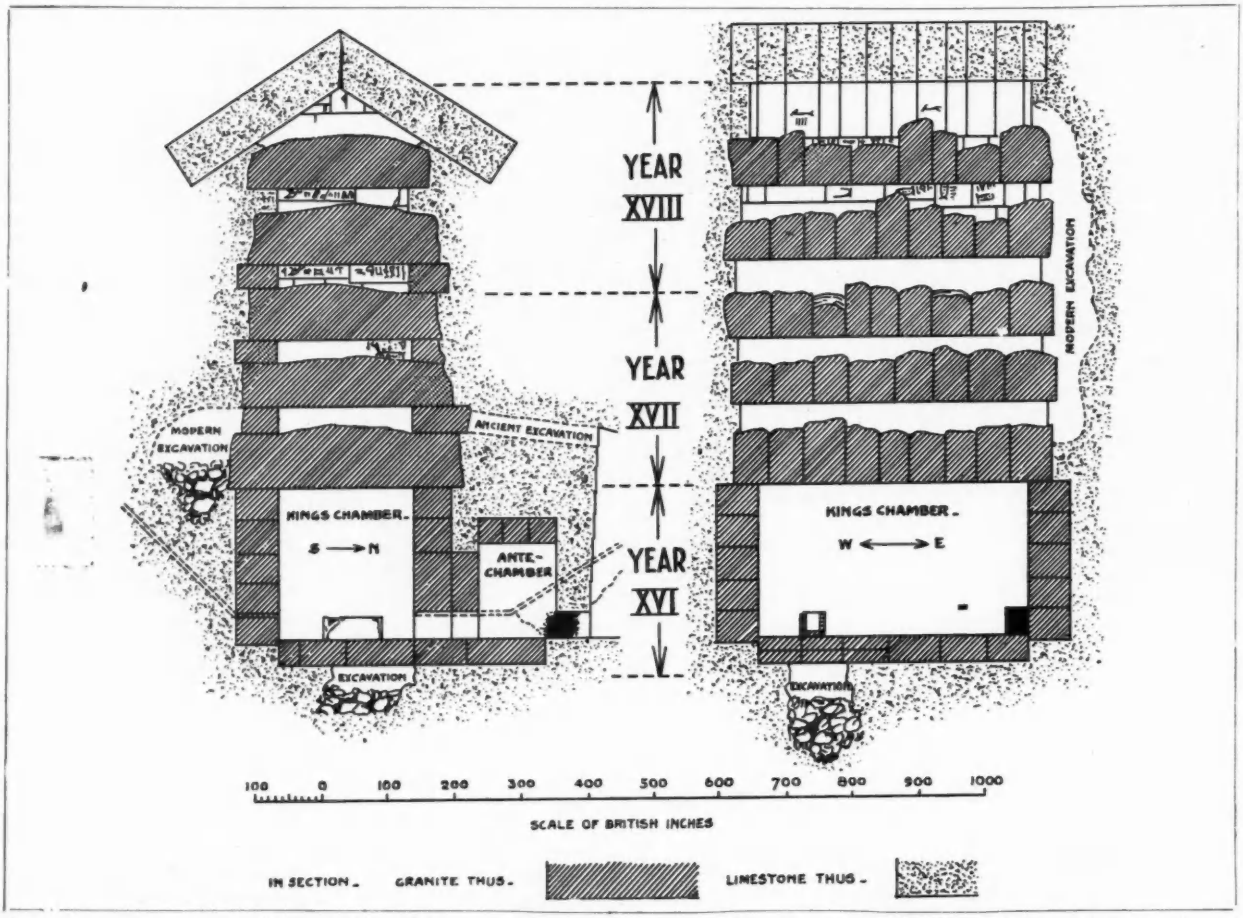
Hence, $1 - a$ = the fraction of the completed height to which the masonry had been built.

Thus, when the Pyramid was built to half height, $a = \frac{1}{2}$, and three-quarters of the total human energy for completing the Pyramid had been expended.

Again, when the Pyramid was built to one-third height, $a = \frac{2}{3}$, and 0·506, or practically one-half, of the total human energy for completing the Pyramid had been expended.

These two facts elucidated by our equation—namely, that half the total labour of raising had been done at one-third height, and that three-quarters of the total labour of raising had been done at one-half height—shed a flood of light upon many structural peculiarities of the Great Pyramid.

Since we have seen that the work was carried out with equal intensity on four successive pyramids in three successive reigns, we are safe in adopting the same continuous intensity of labour in each successive year in which a pyramid was being built course by course. This means that during the twelve years of the Great Pyramid's construction approximately the same amount of "work done"—as measured in foot-tons—was performed in each successive year. We may, therefore, on our diagram of "Energy Expended," divide our vertical line of total energy into twelve equal parts for our twelve successive years, and, through the points thus obtained, draw horizontal lines to our curve. From the points at which the latter lines intersect our curve we may then draw vertical lines to the horizontal base line of the diagram. The points thus obtained on our base line give us approximately the elevation attained



at the end of each successive year's work. The apex-height of the Great Pyramid, as this is indicated by the existing definition of a base side of 755 ft. 9½ ins., and of casing slopes of 51°, 51°, 14″, with the horizontal, was 481 ft. 2 ins.

From our equation or our curve of "Energy Expended" in building we find that the eighth year of construction began at slightly over three-eighths pyramid height, and that this year's work raised the courses by 28 ft. This increment lies between 184 ft. and 212 ft. above the base level, and approximately represents the work done during the eighteenth year of Khufu. It is within the depth of this year's work that the only known dated inscriptions in the Great Pyramid occur (see diagram on this page). These inscriptions are on limestone blocks in the chambers of construction over the King's Chamber, and are merely rough identification markings that were made at the quarries. They mention the names of Khufu and his co-regent, and are dated in the seventeenth year of Khufu's reign. This agrees with these special blocks having been quarried in the year preceding their building into the chambers of construction over the King's Chamber. For these blocks were not regular blocks of the Pyramid's courses, but were a special consignment of variable sizes suitable for cutting and dressing down to fit between the plane under-surfaces, and the extremely variable upper surfaces of the successive layers of huge granite beams that relieve the pressure over the King's Chamber. The isolated inscriptions here do not therefore of necessity prove that the blocks for the masonry courses of the Great Pyramid were still being quarried in Khufu's seventeenth year, but rather indicate, by the necessity for identification, that the limestone quarries were already in extensive use for constructional work other than the Great Pyramid.

However this may have been, our investigation has shown that special blocks, quarried in Khufu's seventeenth year, were built into the Great Pyramid in his eighteenth year, between the two levels fixed by our investigation as the limits for the masonry courses laid during that year. The internal evidence of the Great Pyramid therefore confirms the time-basis of our investigation.

It must be obvious that a prearranged scale of building must have been designed to govern the size and number of blocks for progressive stages of quarrying; in other words, that the supply was designed in successive stages to meet a designed sequence of successive stages in building. Evidence of such designed relationship between rate of demand and rate of supply is provided by the fact that none of the first seven years' stages of building is more than a course under or over ten courses. The eighth year's work completed eighty-two courses—or two courses over the average of ten per year. Five-sixths of the Pyramid's volume was completed at this stage, and from this stage upwards each successive year's work contains an increasingly greater number of courses.

(To be concluded.)

Successive years' work in building the Pyramids masonry from the base course below the King's Chamber to the apex of the chambers of construction over the King's Chamber. The levels of successive years' work are obtained from the diagram on page 755. The inscriptions on blocks laid in year XVIII of Khufu's reign are quarry inscriptions and contain a record of Khufu's year XVII made at the quarry

ENGLISH PRECEDENT No. 115

ENTRANCE PORTICO, NATIONAL GALLERY, TRAFALGAR SQUARE, S.W.1

William Wilkins, R.A. (1778-1839), who built, besides the National Gallery, University College, Gower Street, and St. George's Hospital, was a scholar whose work showed more of refinement than adaptability.

His selection of mouldings was always appropriate and distinguished, as this portico on the Trafalgar Square front abundantly proves, and though the National Gallery exhibits a certain stiffness, this is counterbalanced by the general massing, especially as seen from Pall Mall.

He was handicapped to some extent by having to re-use columns taken from Carlton House.

—[E. MAXWELL FRY.]

LETTERS FROM READERS

MODERNISM AND THE MAN IN THE STREET

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I was interested in the letter of "Layman" on the attitude of the public towards modernist architecture. But I cannot help wondering if he is in any way representative of public opinion, which, I am disposed to think, is on the whole inclined to be conservative.

I would suggest we call it "stunt" architecture. For there is this objection to such architecture being called "modernist"—it tends to bring saner work into discredit by leading the unsophisticated to suppose that architects with a broader culture who base their work upon tradition are nothing more than fossilized conservatives.

But is this the case? Doubtless all architects who base their design upon tradition are in some sense conservatives. But there are conservatives and conservatives. Those of a broader culture accept tradition as a whole, and because they do accept it as a whole they find it very flexible, capable of adapting itself to a variety of conditions, for their aim is always to fuse the new with the old. But the younger generation have for the most part been trained in the schools. They have not been taught to accept tradition as a whole, but to identify the idea of architecture exclusively with the Classic tradition, which they apprehend not so much æsthetically as by a rigid system of rules and proportions. When they go out into the world they find that this rigid scholastic architecture, which is all they know, refuses to adapt itself to modern conditions, and they come therefore to feel that any acceptance of tradition is cramping and paralysing, a barrier to expression. Thus they become rebels, and thus arises modernism in architecture. It is the twin brother of pedantry. Pedantry and modernism are obviously two aspects of the same disease. And it is not without significance that they both find their spiritual home in the schools.

But why do we designate modernism as a disease? Because its progress is from absurdity to absurdity. It is in the nature of things that this should be so because once an architect breaks with tradition he loses his sheet anchor. He comes to feel himself under an obligation to produce something new every time, and as it is simply impossible to produce something new and sane and untraditional every time, it follows that the architect who proposes to himself such an end will tend to become more and more peculiar and eccentric, until reaction sets in and common sense reasserts itself.

Since the nineties so much good architecture upon traditional lines has been done that I cannot see any excuse for the modernist movement of today. There was certainly room for rebellion. But sanity suggests it should have been rebellion against the narrow and restricted attitude towards tradition assumed by Classicists rather than against tradition itself, for such a rebellion would have resulted in a broadening of the conception of architecture, whereas the form it has taken is anarchic and suicidal.

PONDERIVO

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—If one may use the term "General Public" in place of "The Man in the Street," I have no hesitation in saying that the modern trend of design is undoubtedly appreciated.

The term "Man in the Street" conveys to me the impression of one who is merely an onlooker, uninterested save from a mildly æsthetic point of view, which is quite valueless. The "General Public," on the other hand, comprises everyone, and the shopman, theatrical manager or hotel keeper are all increasingly showing their keen appreciation, by the fact that they have definitely accepted the new order of things.

I do not believe for one moment that the great change in feeling throughout the civilized world for simpler and more direct design, in all branches of art, has come from any one man or set of men. The demand came from the "General Public" more or less unconsciously, and it has naturally followed that the designers of the younger generation have leapt to meet it and provide what was being called for.

Hygiene, the servant problem, reinforced concrete construction, economy, and the stark realities of the war are a few of the many causes of this demand by the "General Public" for greater simplicity.

MAXWELL AYRTON

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—My own experience, so far as it goes, is that the layman is rather sympathetic to the simpler kind of modern work; that is to say, work which is not too strained and mannered and which carries on the face of it a due sense of its proper function in its relation to himself—work, in fact, that he can, on the whole, understand.

It is the esoteric which frightens the layman, and he is just as likely to be frightened by an exaggerated cubism (which can be just as unreal and illogical as any other style) as by the subtleties of classical proportions.

CHARLES HOLDEN

R.I.B.A. BUILDING COMPETITION

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I happened to see last week's issue of THE ARCHITECTS' JOURNAL, and the fact that it contains a letter written by a layman has given me the courage to suppose that you may not think it over presuming of me, as a layman, to offer a comment on the Architectural Competition which the R.I.B.A. is instituting in order to find a designer for its new building.

I may be all wrong in my ideas, and what I am going to say may be the purest nonsense, and rank heresy into the bargain. All the same, it occurs to me (as I think it will occur to many other laymen) that, whatever architects are selected to judge the designs submitted in the competition, there will remain one very big drawback to the whole scheme.

Assuming that the jury is selected by a concensus of opinion of the rest of the profession, and is composed of five members, each of these five may be taken as the best man in his own sphere of thought. In other words, he is exactly the man who should be himself competing and submitting a design. Which is tantamount to saying that you are automatically debarring the best men from taking part in the competition!

Now this is where my heresy begins. Would it not be a reasonable thing to select the jury from the other nations whose architectural style is acknowledged to be scholarly and fine—one from Sweden, one from America, one from France, one from Germany, and so on?

In this way all the men of recognized ability and prestige throughout the British section of the architectural profession would be eligible to compete; and at the same time a careful selection of foreign architects would ensure just the same catholicity of general outlook as would the scheme which you have outlined in last week's JOURNAL.

ANOTHER MAN IN THE STREET

ROYAL ACADEMY EXHIBITION

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—From illustrations in last week's issue of the JOURNAL I note that architectural perspectives have been included in this year's Exhibition.

Some time ago, hearing that perspective drawings were to be excluded, I wrote to the Secretary of the Royal Academy and received the enclosed notice. When I applied for labels in

March, a similar notice was included with the labels. In view of the issue of these notices, the inclusion of perspective drawings in the Exhibition would appear to be very unfair to many members of the profession who, on account of these notices, refrained from submitting perspective drawings for this year's Exhibition.

C. B. WILLCOCKS

Following is the notice referred to in the above letter :

ARCHITECTURAL EXHIBITS, 1930

It has been decided that for the Royal Academy Summer Exhibition of 1930 the Architectural Exhibits of Members will be limited to Geometrical Drawings not exceeding ½-in. scale ; and that preference will be given to such Drawings submitted by Non-Members.

"FOOL-PROOF" DOORS

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—In reference to the calamitous cinema fire at Paisley, why do not local authorities model their regulations on lines similar to those of the London County Council, which insists on "fool-proof" doors and devices ?

G. B. J. ATHOE
Secretary, Incorporated Association of Architects and Surveyors.

THE SKETCH CLUB

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I have been a regular and very interested reader of your JOURNAL for some years, and I am delighted to learn that you have formed a Sketch Club. I am an architect and a keen sketcher, and I, with many another fellow architect-sketcher, will now watch with the keenest interest the Sketch Club and what it will bring forward.

An architect's work always shows him with his best behaviour—or it should do. It is when he takes up a pencil, pen, or brush for his own amusement that we see behind the scenes. What a joy this is going to be for us ! Almost it will be as joyous to wait for as was that treasure, *The Honeywood File*.

WILFRID T. QUAYLE

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—As a regular reader of THE ARCHITECTS' JOURNAL, I welcome with the greatest pleasure the introduction of the Sketch Club, and feel sure that a great deal of good will be done as time goes on, especially if the services of an expert could be obtained to give advice and criticism.

CLAUDE J. W. MESSENT

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I was very pleased to read about the Sketch Club. I am an architectural assistant and sketch whenever I get the chance.

FRANK M. COOMBS

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I am very much interested in your Sketch Club and should like to submit one or two sketches.

MAXWELL AYRTON

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—I think the idea of the Sketch Club is excellent and should form an interesting feature of your paper.

F. MORRALL MADDOX

CHARING CROSS BILL REJECTED

BY OUR SPECIAL REPRESENTATIVE

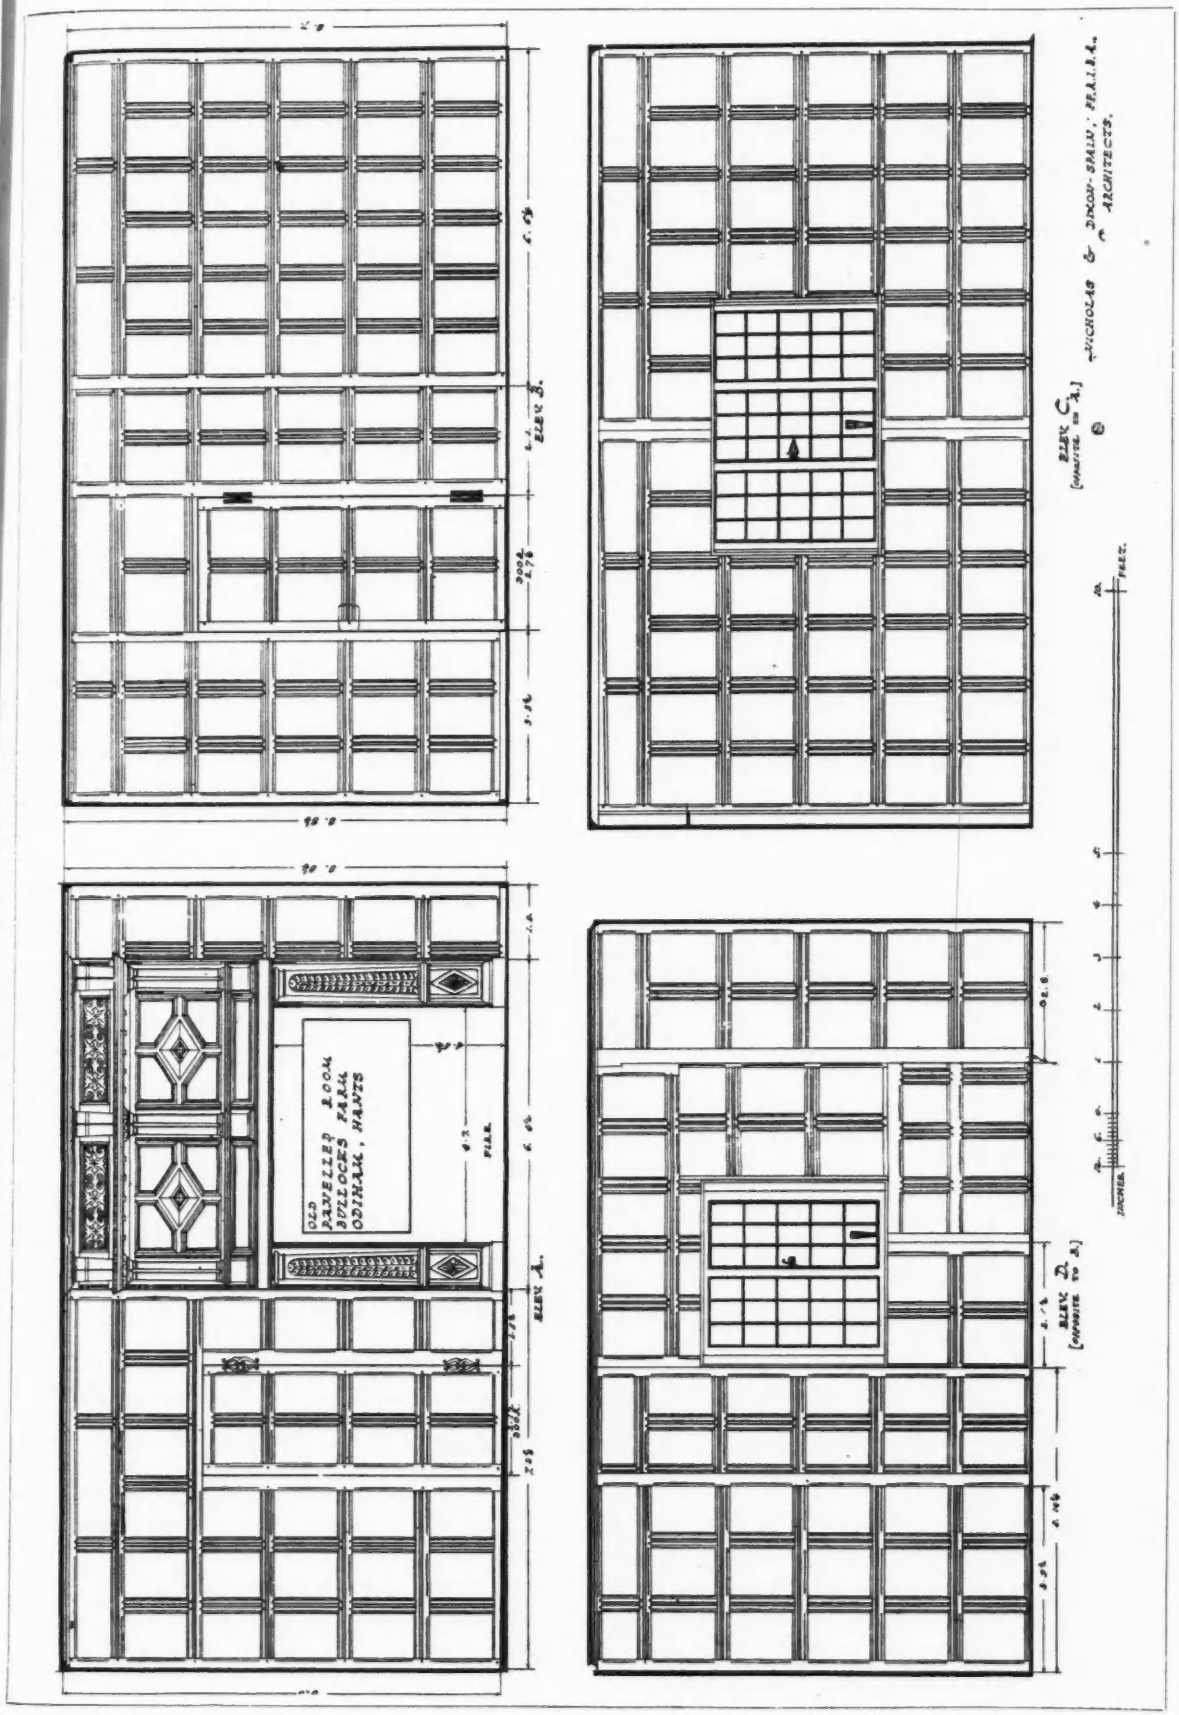
ON Tuesday, May 6, the Private Bill Committee of the House of Commons, which has considered the London County Council (Charing Cross Bridge) Bill, met once more and rejected the Bill. Sir Henry Cautley, the Chairman, said that the Committee remained of the opinion that to put the new station at the bridge-head was a blot that they could not accept. It would stop the development of Lambeth.

Sir Lynden Macassey, K.C. (for the London County Council), gave details with regard to a printed statement put in by the L.C.C., which recalled that when the Committee adjourned on April 10, they requested that a thorough investigation should be made into the possibility of finding some site for the new station on the Lambeth side of the river other than the Lion Brewery site. The L.C.C., in co-operation with the Southern and Underground railway companies, undertook a renewed examination of numerous alternative proposals, including that of the Lambeth Borough Council, for placing the station on the Waterloo Junction site, and instituted a detailed comparison of them with the scheme of the Bill. Of five possible alternative sites for the new station that had been indicated by the Committee, the L.C.C. decided that the best (with the new station south-east of Waterloo Station between Westminster Bridge Road, Oakley Street and Waterloo Road) was definitely inferior to a scheme showing a new station at Waterloo Junction site more or less balancing the existing Waterloo Station about Waterloo Road, which they regarded as the best of four alternative proposals to place the new station on the Waterloo Junction site.

The Council were firmly of opinion that the provision of a new road bridge at Charing Cross was definitely dependent upon the removal of the present Charing Cross railway station to the south side of the river. Accepting that as a fundamental condition, they were convinced that there was no other practicable site for the new station than the Lion Brewery site, which had been adopted in the scheme of the Bill. "This being the considered conclusion of the Council," the statement concluded, "in which the Minister of Transport concurs, the Council think that they would be wanting in candour to the Committee if they failed to convey to the Committee in respectful but definite terms that, should the scheme of the Bill be not accepted, there is no alternative scheme which the Council could accept the responsibility of submitting to Parliament. The Council therefore feel it their duty to state that, if the scheme of the Bill is rejected, they see no prospect of securing the national improvement represented by a new road bridge at Charing Cross."

After the Committee had consulted in private, the Bill was rejected.

The Government's Slum Bill



Slow progress is being made with the Government's Bill for dealing with the slums, and, at the end of the second sittings of Standing Committee "A" of the House of Commons, clause 1 had not been disposed of.

Clause 1 provides for the declaration by local authorities of unhealthy areas as clearance areas, with a view to the demolition of all buildings therein. At the first day's sitting the Government accepted an amendment, moved by Mr. Percy Harris, a Liberal member, designed to make it clear that a clearance area might include buildings other than dwelling-houses. He said that he brought forward the amendment at the request of the London County Council.

An important amendment was then moved by Mr. Chamberlain, limiting the buildings to be demolished in any clearance area to dwelling-houses. He explained that his object in moving the amendment was to obtain from the Government some information as to the intentions of the clause in this respect.

Mr. Greenwood, the Minister of Health, said that a clearance area would not necessarily be a solid mass of buildings. It might have islands in it which would not constitute part of the clearance scheme. There might be public buildings, churches, and so on, which would form no part of the clearance area and would obviously remain. The intention was to make a clearance area an area which consisted entirely of buildings, including houses that were either unfit for human habitation or injurious to the public health,

(*concluded on page 762*)

The four elevations of an old panelled room in Bullock's Farm, Odiham, Hants. Measured and drawn by Nicholas and Dixon-Spain. The room is approximately 15 ft. in length, 14 ft. 6 ins. in width, and 8 ft. 6 ins. in height.

because of their bad management, and entirely to clear that area.

The amendment was still under discussion when the Committee adjourned, but at the second sitting Sir William Jowitt, the Attorney-General, said that by the definition of "area" which appeared in the clause, it was impossible to conceive of an area within the meaning of the Bill which contained in it a good dwelling-house. It must be an area exclusively composed of dwelling-houses or buildings which were either unfit for human habitation, or bad by reason of the narrowness or bad arrangement of the streets.

Mr. Chamberlain said in many cases it would be extremely difficult to determine whether a building should come in or remain out of the clearance area. Great care must be taken to prevent the possibility of local authorities including in a clearance area buildings which ought to be left out, and there was a danger that cleared sites might be left derelict for indefinite periods.

Mr. Greenwood said he was prepared to consider later whether any words could be inserted which, without altering the substance of the clause, would make the position clearer, but he thought the intentions of the clause were sufficiently manifest. He did not believe that any local authorities would allow cleared areas to remain derelict indefinitely, but, if they did, he would rather see a derelict area, unsightly as it might be, than leave slum dwellings on it.

Mr. Chamberlain withdrew his amendment and, after some further debate, the Committee adjourned.

In Parliament

Post War Housing Schemes

Mr. Greenwood, the Minister of Health, in bringing forward the Ministry of Health Estimates recently, referred at some length to the general housing position. He explained that, up to March 31 of this year, there had been completed since the Armistice, in connection with State-aided housing schemes, 939,000 houses. Of these, rather over 174,000 were built under the 1919 Act, 39,000 under the Housing (Additional Powers) Act, 436,000 under the 1923 Act, and 288,000 under the 1924 Act. At the end of March this year there were, under the Act of 1924, over 28,000 houses actually under construction, between 17,000 and 18,000 definitely arranged for but not actually started, and a further 13,000 or more authorized but not yet definitely arranged for, making over 59,000 in course of erection or in process of arrangement. In addition, a considerable number of houses had been built without State assistance of any kind, and, up to March 31 last, this private building without Government assistance accounted for about 520,000 houses. So that, since the end of the war, the total number of houses actually completed in England and Wales amounted to 1,459,000. There had been a fall during the last year or two in the cost of house building, and that reduction in prices had up to the present been generally maintained. For non-parlour houses, the price in March of this year was £338. Since 1923 no less than £68,000,000 had been sanctioned as loans for the purchase or erection of houses under the Small Dwellings Acquisition Act. Slum clearance had gone on slowly, but that situation would be met by the new Bill. Although not enough had been done to cope with the housing problem, since the war we had spent, from the Exchequer, on housing no less than £85,000,000.

At question-time, last week, Mr. Greenwood stated that the total number of houses completed in England and Wales since the termination of the war up to March 31 last, including houses of a rateable value not exceeding £78 (or £105 in the Metropolitan Police District) erected by private enterprise without State assistance, was approximately 1,463,000. The number of houses erected by local authorities was 527,769, and the great majority of these were built for letting.

Hadrian's Wall

Sir Kingsley Wood asked the First Commissioner of Works whether he could make a statement in relation to the present position with regard to Hadrian's Wall.

Mr. Lansbury said that the whole of the questions connected with the proposed quarry were under his active consideration. The House would be glad to know that the quarry was not in being, and that there was no immediate danger to the surroundings of the Wall.

Mr. Hacking asked the First Commissioner of Works whether he would make a statement to the House regarding his proposals to alter the environment of the monument in Trafalgar Square.

Mr. Lansbury said it was not proposed to make any change in the appearance of Trafalgar Square, but his department had agreed in principle to the construction of an underground transformer station beneath the Square, provided adequate measures were taken to safeguard the Nelson monument, and subject to the approval of Parliament to the Bill which would be necessary.

Calton Jail Site

Mr. Mathers asked the First Commissioner of Works if he could now inform the House whether the suggested design of the buildings to be erected upon the Calton Jail site, in Edinburgh, had been approved or rejected by the Scottish Fine Arts Commission; if approved, could he indicate when building was likely to commence; if rejected, would he state what further action he proposed to take; and would the existing model be submitted to the Edinburgh Corporation for consideration.

Mr. Lansbury said that the Report of the Royal Fine Arts Commission for Scotland was unfavourable to the scheme which was submitted: the whole question was now receiving his careful consideration.

LAW REPORT

SEALED BILLS OF QUANTITIES: COSTS

Willcocks and Barnes v. *Paignton Co-operative Society. King's Bench Division. Before the Lord Chief Justice, Lord Hewart*

THE action of Willcocks and Barnes, builders and contractors, of Paignton, Devon, against the Paignton Co-operative Society was mentioned to his lordship.

The case was heard by his lordship at the last Exeter Assizes, the builders claiming damages for alleged breach of contract by the Society to employ them to do certain work.

They alleged that the Society called for tenders and sealed bills of quantities, promising not to open the sealed bills unless the tender was accepted. The Society's representative, the plaintiffs alleged, opened the bills of quantities and then gave the tender to another firm. They contended that the Society had in consequence broken a contract to employ them.

The Lord Chief Justice, however, found for the Society, holding that the opening of the sealed bills of quantities could not be implied as an acceptance of the tender.

The present application was in regard to the costs of the litigation.

Mr. du Parcq, K.C., for the builders, argued that his clients should have the costs. His lordship would recollect that he said that the plaintiffs had been shabbily treated. In the circumstances, he asked that plaintiffs should have the costs.

Mr. Croom Johnson, K.C., for the Society, argued that his clients should not be deprived of their costs.

His lordship said he agreed that plaintiffs had been shabbily treated, and he would have been glad to have deprived the Society of costs if he was entitled to do so. But he would resist the temptation because plaintiffs had misconceived their remedy. They might have succeeded in a different class of action. In the circumstances, the Society, successful in the action, would get the costs.

LEIPZIG'S NEW CLOCK-JACKS

THERE is nothing petty about the two clock-jacks that crown Dr. Bestelmeyer's new bank building in the Augustusplatz, Leipzig; their elevated position, above the twelfth story, calls for an exaggeration of size. Dignity and robustness in the design have clearly been the aim of the sculptor, Prof. Wackerle, but in judging their accentuated physique this remoteness has to be remembered. Eyes and mouth have a stark hollowness, emphasized to convey to those below a semblance of human expression.

When the moment for striking arrives these 12-ft. giants each give a quarter turn, from the hips upwards, their hammers then pointing out to the street. On the command of the mechanism that swiftly returns them to their original position, the 6-f. hammers, weighing 1 cwt., come crashing against the bells, and the sound of the hour flies down to the busy city below. The bodies are of wrought copper, and up through the legs come the impelling shafts that turn their trunks about the axes, a horizontal toothed wheel within playing its part in this action.

A general view of the bank, the Hochhaus, in the Augustusplatz.

(Above)
A detailed view of the two clock-jacks, 12 ft. high, that strike the clock bells, mounted above the twelfth story of the Hochhaus.

(Left)
This photograph illustrates the hanging of the three bells, one within another, and also the moon-ball, another medieval motive, above the 14-foot clock dial.

These Hochhaus bells are cast in bronze; they are disposed in an original manner, concentrically and partly within each other. The largest and uppermost strikes the hours; the middle one is struck every quarter-hour by the younger giant, on the left; the third, by means of a hidden hammer, is made to give an echo of the quarter-hour bell, a novel and interesting effect.

The gilt numerals of the clock dial are retained in place by two circular bands, having the large diameter of 14 ft., and set on the level of the eleventh story. The hands are of copper-gilt. The weight that drives the clock falls through a drop of two floors and has a bed of sawdust beneath, should any untoward incident bring down its half-ton mass. This weight and the two whose sudden drop causes the figures to strike are raised by a 2-h.p. motor. The movement is a 30-hour one, but as the electrical rewinding is done every hour there is always power in reserve.

Two ornamental balls rising from the corners of the roof find an echo in the stone relief balls upon which rest the paws of the two carved lions. The eye then passes to another feature: the moon-ball in blue and gold, equally a revival of a medieval idea.

J. N.

READERS' QUERIES

ILLUMINATION OF A SWIMMING BATH

A. E. F. writes: "*I am the architect for a swimming bath, 80 ft. long, 24 ft. broad and 22 ft. high from water level to joists, and 31 ft. 6 ins. to apex of roof. It is intended to use the bath after dark for water polo, etc. The problem of deciding upon the best method of lighting is difficult, and one on which I should value your expert's opinion. The building is in steel construction; there are six bays, joists being spaced at intervals of 13 ft. 4 ins. from centre to centre. The problem is to avoid the casting of shadows from the joists and at the same time to place the lights high enough to give good general illumination without areas of uncertain lighting. To secure a good overlap, the lights should probably be placed as high as possible, but to avoid the shadows referred to they should probably not be above the level of the joists themselves. Can you tell me how many lighting points would be desirable and approximately what their position should be?*"

The industrial diffusing type of unit, which is marketed as the glass-steel diffuser, has been employed with success in a number of swimming baths, since it enables a comparatively high illumination intensity to be obtained from sources of light diffused in nature, and consequently free from the intense brightness of ordinary direct lighting fittings which give rise to glare. If the structure is taken as indicated by the architect, satisfactory illumination could be provided by the use of 16 500-watt glass-steel diffusers, mounted level with the tie bars and spaced 12 ft. apart on the cross section and 15 ft. apart on the longitudinal section. These units should be installed in between the tie bars on the plan, and will provide an illumination intensity of 10 ft. candles at water level.

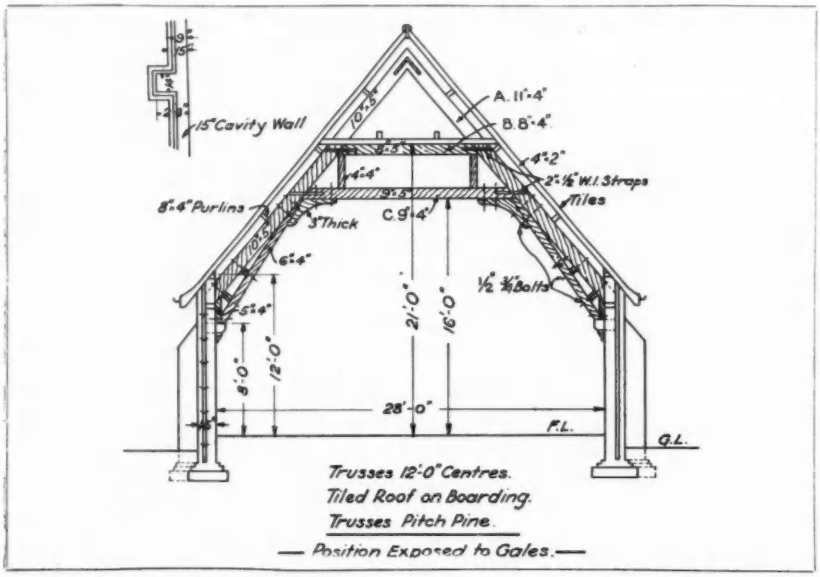
The above scheme, since it employs individual units, will naturally give rise to reflections on the water surface which may prove annoying during the progress of water polo matches.

Therefore, an alternative method of lighting which entirely eliminates the objections indicated in the above comment can be achieved by building a coved ceiling, the top of which comes level with the tie bar. This coved ceiling can be then illuminated on the indirect principle from a series of small lamps installed in the cornice (which should be of suitable dimensions).

To achieve the same intensity of illumination as that indicated in my first suggestion, it will be necessary to install 60-watt Pearl lamps on 9-in. centres in both cornices along each side of the building, which would give an approximate total load of 8,000 watts.

This system is particularly effective for bath lighting, due to the fact that the ceiling becomes a source of light and is of comparatively low brightness. It does not prove objectionable to the eyes, while the effect rather resembles an open-air bath, since the evenly-lighted ceiling gives the effect of an open sky. R. W. M.

MISSION HALL ROOF TRUSS



G. C. writes: "*I should be glad if you would kindly give me your opinion on the following three questions regarding the mission hall roof truss shown in the accompanying illustration: (1) Is the design faulty? (2) Are the timbers strong enough; if not, what sizes do you suggest? (3) Is the design extravagant in any way? If so, how can it be cheapened, without spoiling the appearance? I do not wish to use tie-rods if they can be avoided.*"

The mission hall roof truss is quite reasonable in design, in view of the desire to avoid the use of tie-rods. The timbers shown are quite strong enough, but because of the necessity of a large safety factor it would be undesirable to reduce the stress.

A difficulty with this type of truss is that, although there is ample strength when first made with all the joints close and sound, the inevitable shrinkage in timber of such width alters the ultimate points of contact and bearing somewhat, and upsets fine calculation of stresses.

The cost of the truss would be considerably lessened by making the main members *A* of 11 ins. by 4 ins. instead of 10 ins. by 5 ins., the former being a market size, which 10 ins. by 5 ins. is not. In addition to the lower cost of these members there is a distinct advantage in the deeper section in its resistance to bending. Since the members *B* and *C* are only in tension, they can quite as well be 8 ins. by 4 ins. and 9 ins. by 4 ins. respectively, 8 ins. by 5 ins. and 9 ins. by 5 ins. being expensive sizes.

The iron straps, however, are essential. I would also suggest the use of $\frac{1}{2}$ in. instead of $\frac{3}{4}$ in. bolts. A. H. H.

A mission hall roof truss designed to avoid the use of tie-rods. [*See* answer to G. C.]

A SUBSTITUTE FOR LEAD FLASHING?

A. R. T. writes: "*Is it safe to use cement mortar in place of a lead flashing on a cottage with a 50° tiled roof and parapet gables? Most people, I believe, seem to consider mortar in this position to be unreliable and liable to cracks, but I see that Mr. Penty in his extremely interesting book,* The Elements of Domestic Design, *advocates the use of cement mortar in preference to lead flashing. I should, of course, prefer to use mortar if possible.*"

I have used cement listing instead of flashings for chimney-stacks on a number of jobs.

Only on one occasion had I trouble, and that was due to the fact that the cement was put on during hot weather. I may add that I first used cement listing at the suggestion of a builder for the sake of economy.

It may be that lime mortar gauged with cement would be preferable as being less liable to cracks. But I have never made the experiment.

A. J. PENTY

CONSTRUCTION OF DEW PONDS

L. H. C. writes: "*Can you give me any information respecting the construction of dew ponds, giving, especially, particulars of position, size, and materials used?*"

[The Editor invites readers to reply to the above inquiry.]

NAMING THE FIVE ASSESSORS

THE response to the invitation of the Editor of THE ARCHITECTS' JOURNAL to his readers to suggest the names of the five assessors for the competition for the new R.I.B.A. premises in Portland Place has been most gratifying. Two days, however, still remain before the invitation closes, and for the benefit of those readers who have not yet recorded their views the nomination form is reprinted on page xl of this issue.

The competition for the new building will be open to all members of the R.I.B.A. or of any allied society, and will be assessed by a jury of five men, to be selected by Sir Banister Fletcher, the President. In making his selection the President will be largely guided by the suggestions placed before him by members of the profession.

Obviously, the competition is no ordinary one; it is an event the result of which will vastly influence the future of the profession for many years. It is, therefore, of vital importance for everyone to record his *reasoned* suggestions for a really representative jury, one able to represent the different trends of opinion that are found in architectural circles today. This question of the jury is one of the most serious the profession has ever had to answer.

Any reader who has not already filled in the Editor's nomination form should do so now : before doing so he should consider carefully the following questions :

What kinds of parties do you want to see represented ? What sort of attributes will you look for in this bench of judges to whom so much is being entrusted ? One elderly, experienced, slow to enthuse, accurate in his judgment ? One young, keen, plucky, willing to consider and even accept the unusual and untried ? Would you wish to see learning and tradition given their place ? Do you feel that the great provincial towns, and even the Empire, may have a point of view which differs from that of London men, and which should find expression on the jury ? You will have your views on all these matters and on many others of equal importance, perhaps. From Le Corbusier to the woman architect, your mind will range over the whole of modern theory and practice. Which five outstanding ideas or qualities will you select ?

Pick the five. Put the ideas down in the appropriate spaces on the form which appears on page xl of this issue of THE ARCHITECTS' JOURNAL. Then, and then only, fill in the names of the persons best capable, in your view, of representing these sections and of making a wise and sensible choice on their behalf. Cut out this form and send it to the Editor, THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W.1, not later than first post on Friday, May 16. The views submitted by our readers will be analysed in THE ARCHITECTS' JOURNAL. They are meant to be directly useful, and will be placed before the President of the R.I.B.A. without delay. It is expected that the President and Council will discuss the composition of the jury some time in June.

SOCIETIES AND INSTITUTIONS

ARCHITECTURE AS AN AID TO TRADE AND COMMERCE

MR. J. R. LEATHART, F.R.I.B.A., delivered a lecture on the above subject at a meeting of the City of London Tradesmen's Club, held at the Cannon Street Hotel, E.C., on Thursday last.

Mr. Leathart began by saying that the title of his lecture did not imply that architecture was a panacea for trade depression; its aid to trade and commerce was a financial one, of course, but at the same time it was also a psychological one too. The axiom that building activity followed an era of industrial and trade activity had not been entirely substantiated during recent years. The spasmodic trade boom which followed immediately upon the Armistice faded by the end of 1921, and was not sufficiently fundamental to create the abnormal expenditure on buildings throughout the whole of the United Kingdom which had been incurred since then. The reverse of this state of affairs was to be expected, for the building trade usually acted as a most delicate barometer, and depression in industry should be reflected, with but a short interval in acute depression in building. In point of fact a halt had already been called in provincial work, especially in the industrial districts, although there was yet no indication of any easing off in building in London, particularly in the City.

He said he added the adjective "modern" to the title of this address, as the examples he had selected as illustrations were all indicative of the determined attempts being made at the present time both here and abroad to create new and simpler forms of architecture as distinct from the traditional means of expression which were rapidly becoming sterile with over-use.

The definitions of architecture were so many and so diverse that it was becoming increasingly difficult for an architect to give a satisfactory explanation of the art which he practised. It was usually assumed that architecture was concerned solely with the embellishment of building. If this were so, he (Mr. Leathart) did not pretend to say how it could be of any assistance whatever to trade and commerce. He would be merely wasting time to tell them that by merely decking the front of a commercial building with columns, cornices, and ornamental windows and doors, the business carried on within the building would be improved. There were many instances in important commercial buildings in the City where this striving for architectural veneer was an actual detriment to the proper functioning of the building. One particular commercial palace the lecturer had in mind had a series of semi-circular windows on one floor actually at floor level with the crown of the arch below eye-level. Now, these windows did not light the offices at all, and the unfortunate occupants of these rooms had been termed martyrs in the sacred cause of Italian Renaissance architecture. It was amazing how the obsession with external appearance on the designer's part had so gravely prejudiced the successful use of this building. He would cite this as an example of bad building and bad architecture, and left to the audience's imagination the effect of this doubtful manœuvre by the architect on the minds of his clients.

We should, he stated, probably look in vain for a modern city building which had not its quota of columns and architectural trappings, that was if we were able to look above the ground story without running the risk of colliding with fellow-pedestrians or being run over in the narrow City streets. We should see, if we were able, valuable space on the façades of the buildings sacrificed to some meaningless piece of architectural design which would have been better utilized by window openings; also unnecessary ledges, recesses and whatnots upon which dust and grime collected and pigeons nested. As modern business methods were evolved from the haphazard system existing in the past, as improvements in centralization, in administration, in staff efficiency and organization, were matters of everyday occurrence, so architectural design must clear itself from the customs and traditions which had bound it since the time of Sir Christopher Wren.

The lecturer divided his illustrations into three groups of commercial buildings—factories, shops, and offices—and showed examples of each group taken from England, America, France, Holland and Germany.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION

The annual meeting of the Hampshire and Isle of Wight Architectural Association was held at Winchester on Saturday last. Mr. J. Arthur Smith, F.R.I.B.A., the President, occupied the chair.

The business meeting was quite short, and the reading of the eighteenth annual report of the Council by the honorary secretary, Mr. A. L. Roberts, F.R.I.B.A., was punctuated by applause.

In the report it was stated that there had been a steady growth of membership, there being a gain of fifty-four members (three honorary members, five Fellows, and forty-six Associates) during the year, making a total membership of 238 (thirty-six hon. members, ninety-four Fellows and 108 Associates). There has been only one resignation, owing to removal, so that the net gain on the year is fifty-three. The President has again been appointed on the Council of the R.I.B.A., and Mr. A. L. Roberts has been appointed representative on the Board of Architectural Education. £33 2s. had been paid out in grants and subscriptions, including £10 10s. to R.I.B.A. maintenance scholarships and £6 6s. to the Architects' Benevolent Society; and £32 out of £52 10s. required had been raised for a special donation towards the same society. The Association is working in connection with the Hampshire Rural Community Council to establish a County Branch of the Society for the Preservation of Rural England, while the Advisory Panel has rendered assistance to the town-planning authorities of Winchester, Christchurch, Basingstoke and Alton, and of the County Borough of Southampton. The report suggested that the Allied Societies Conference would see the wisdom of an annual meeting of secretaries of all allied societies. A President's badge had been provided during the year. Owing to increased activities a paid assistant secretary, Miss Audrey Smith, had been appointed.

The report was adopted.

Mr. A. C. Townsend, A.R.I.B.A., was the Fellow elected to the Council, and Mr. E. E. Brown was the Associate elected to the Council.

Mr. G. C. Lawrence, P.W.A., F.R.I.B.A., Chairman of the Allied Conference, spoke on registration and other matters of live interest to the association, and subsequently the President and Mrs. Smith held a reception for members and friends, amongst them being the Mayor of Winchester (Councillor Harry Collis).

After tea Mr. G. C. Lawrence gave an address on the history of the R.I.B.A. and the Allied Societies.

NATIONAL PARKS

At the Royal Society of Arts, on Wednesday last, Major-General Sir Fabian Ware presided over a lecture on "National Parks" delivered by Mr. S. K. Ratcliffe.

National parks were American in origin, Mr. Ratcliffe pointed out, dating from the reservation of the Yellowstone region nearly sixty years ago.

In England, he said, the proposal of Lord Bledisloe as to the reservation of the Forest of Dean had started an eager discussion, to which the Prime Minister had responded by the appointment of a departmental committee. There was general agreement as to the tracts of wild unspoilt country which should first be considered as suitable for national domains: Dartmoor, Snowdonia, the English Lakes, the Peak, the Cairngorms, etc. A most essential point would be to secure conditions which would maintain the chosen country in its original state, for the sake of the wild life as well as of quiet. This might mean severe restrictions upon motor traffic, and it would certainly involve a measure of control, as regards building development, over the adjoining land.

Mr. Norman Culley, the New President of the West Yorkshire Society of Architects.

The smallness of our territory and the density of our population made it imperative that a national parks policy should be based upon a right relation to the new activity in regional planning, and in this regard some of the regional committees, such as that of the Lake counties, were moving on the right lines.

The lecture was illustrated with slides, the most interesting of them being examples of the parks and parkways of New York State.

WEST YORKSHIRE SOCIETY OF ARCHITECTS

The annual general meeting of the above Society was held at the Society's rooms in Leeds. Mr. G. H. Foggitt, F.R.I.B.A., the retiring president, presided.

Mr. Norman Culley, F.R.I.B.A., of Huddersfield, the incoming president, presented to Mr. Foggitt, on behalf of the council, an inscribed address expressive of his valuable services to the Society during its last two sessions.

The council's report for the last session was submitted to the meeting and approved. The report showed an increase of members, the total now being 319.

THREE COUNTIES ASSOCIATION'S ELECTION OF OFFICERS

At the annual meeting of the Berks, Bucks and Oxon Architectural Association, held at Abingdon, the following officers were elected: President, Mr. H. Hutt (Berks); vice-presidents, Messrs. T. T. Cumming (Berks), E. A. L. Martyn (Bucks), and T. L. Dale (Oxon); hon. secretary, Mr. E. Steward Smith (Reading); hon. treasurer, Mr. T. T. Cumming; hon. auditor, Mr. C. B. Willcocks (Berks); members of the Council, Messrs. J. T. Saunders, J. R. Greenaway, A. Saxon Snell, W. R. Morris, A. B. West, F. E. Wapshott, W. J. Freeman, and S. E. Burrett (Berks), C. S. Kimpton, H. J. Stribling and W. D. Hartley (Bucks), H. W. Smith, G. L. Taylor, and T. Rayson (Oxon).

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS

At the fifty-seventh annual general meeting of the above Society, the hon. secretary reported that the membership of the Society now numbered 151, an increase of seven over last year's total.

The following members were elected to serve for the ensuing year:

President, Mr. Walter Brand, A.R.I.B.A.; ex-president, Mr. Albert Herbert, F.R.I.B.A.; hon. treasurer, Mr. A. F. Bryan, A.R.I.B.A.; hon. secretary, Mr. C. F. McL. Keay. Council: Full members, Messrs. E. T. Allcock, F.R.I.B.A., W. Keay, F.R.I.B.A., W. K. Bedingfield, F.R.I.B.A., T. T. Sawday, A.R.I.B.A.; associate members, Messrs. W. Cartwright, A.R.I.B.A., and A. E. Smith, A.R.I.B.A.

NEW PRESIDENT OF THE R.I.A.S.

At the last monthly meeting of the Council of the Royal Incorporation of Architects in Scotland, held at Edinburgh, Mr. John Watson, A.R.S.A., F.R.I.B.A., of Glasgow, was nominated as president for the ensuing year.

The following were elected as Associates: Messrs. Ian H. M'Laren (Cults); R. H. Morrison, W. W. C. Shewan, and E. F. Davies (Aberdeen); and W. L. Taylor (Huntly).

STREET TRAFFIC SIGNALS

At a meeting of the Illuminating Engineering Society, held at the Royal Society of Arts on Tuesday of last week, Mr. T. Austin read a paper on "Luminous Traffic Signals."

Mr. Austin, referring to automatic or semi-automatic signals, pointed out

that the adoption of these signals was a practical proposition, and took as an example the fact that automatic signals had been in successful use for several years in many towns of the United States and Canada, and also in Germany, South Africa and other countries.

One of the reasons in favour of automatic signals, he said, was the economic aspect.

The Architects' Journal Prize

The annual competition for THE ARCHITECTS' JOURNAL measured drawing prize, open to students at the Liverpool School of Architecture, has been won by Mr. A. G. Martinez, a second-year degree student, for his drawing of the front of Sir Christopher Wren's Chapel of Emanuel College, Cambridge.

OBITUARY

CHARLES T. MILES : 1852–1930

We regret to record the death of Mr. Charles Thomas Miles, F.R.I.B.A., at seventy-eight years of age.

He was one of the oldest practising architects in Bournemouth, and was joint architect with John Aldridge Scott of St. John's Church, Boscombe, and architect of All Saints' Church, West Southbourne, St. Andrew's, Boscombe, and the libraries at Winton and Boscombe.

His son, Mr. S. C. Miles, who joined him in business thirty-seven years ago, will continue to carry on the practice.

DANE SINCLAIR : 1852–1930

We regret to record the death at Weybridge of Mr. Dane Sinclair. Born at Caithness in 1852, he started his electrical career in 1872 in the telegraph department of the North British Railway. After spending five years in Japan he was appointed engineer to the National Telephone Company for the Glasgow district, and after the amalgamation of the three principal telephone companies became London manager of the new National Telephone Company. He became general manager of British Insulated and Helsby Cables, Ltd., in 1902; a director of the company in 1923, and chairman in 1927. He retained the positions of chairman and managing director until 1928, when, in view of his many years of strenuous work, he relinquished the duties of managing director to Mr. G. H. Nisbett. He was instrumental in promoting the use of the Strowger automatic telephone system, now in extensive use throughout the world, and was the inventor of many devices and methods in general use today. He leaves a widow, four daughters and a son, Mr. D. Johnstone Sinclair, who is a director of British Insulated Cables, Ltd.

COMPETITION CALENDAR

May 16.—Messrs. Ewart and Son, Ltd., in conjunction with the Association of Architects, Surveyors and Technical Assistants, invite designs for a lock-up hangar for an aeroplane. The competition is divided into two classes, for those over and under 25 years of age at midnight, May 15–16, 1930. Assessors : William H. Hamlyn, A.R.I.B.A., and Chas. McLachlan, A.R.I.B.A., with A. N. Cathcart as technical adviser with regard to roofing, ventilation and hot-water supply. Two prizes will be awarded in each class, namely, free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. Messrs. Ewart and Son, Ltd., reserve the right to publish or make use of any of the designs for which a prize is awarded, but do not reserve the right to build in accordance with any of them. Particulars of the competition, etc., are obtainable from A. Seymour Reeves, Secretary, A.A.S.T.A., 26 Buckingham Gate, S.W.1. Latest date for submission of designs : May 16, 1930.

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs : June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor : J. Ernest Franck, F.R.I.B.A. Premiums : £300, £200, £100 and £50. Particulars, etc., obtainable from A. W. Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs : June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor : Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor : H. V. Ashley, F.R.I.B.A. Premiums : £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs : July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall, which is to be built on the site of the old town hall at an approximate cost of £250,000. Assessor : Sir Brumwell Thomas. Premiums : £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs : July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitiv designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor : Herbert T. Buckland, F.R.I.B.A. Premiums : £150, £100, and £50. Applications for conditions of the competition, etc., should be made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs : July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor : Professor Patrick Abercrombie, F.R.I.B.A. Premiums : £150 and £50 for first and second places, respectively. Copies of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs : September 1.

No date.—The Carlisle Corporation invites British architects to submit designs for the façade to English Street and the Victoria Viaduct, suitable for shops and business premises. The site was previously occupied by the Prison. The total length of the frontage is approximately 358 ft. Assessor : Francis Jones, F.R.I.B.A. Premiums : £300, £200, and £100. Particulars of the competition, etc., may be obtained from Percy Dalton, A.M.INST.C.E., A.R.I.B.A., City Engineer, 18 Fisher Street, Carlisle. Deposit, £1 1s.

No date.—The General Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums : £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

12400. Allen, J. W. Devices for attaching slates, etc., to buildings. April 22.

12860. Bauer, B. Reinforcement of concrete columns. April 25.

12813. Hughes, C. M. C., and Rubberphalte, Ltd. Materials for construction of roofs, etc. April 25.

12922. Ness, G. Fireproof floor construction. April 26.

ABSTRACT PUBLISHED

326266. Cameron, H. G. Slated roofs.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

The Great Barr Colony, near Birmingham (pages 748–753). General contractors, Thos. Lowe and Sons. Sub-contractors : Adamite Co., Ltd., Atlas white Portland cement stucco; Charles Wade & Co., steelwork construction; Haywards, Ltd., pavement lights; W. Freer, Ltd., plumbing; Stourbridge Glazed Brick Co., sanitary fittings; Walker and Worsey, Ltd., locks and ironmongery to cottages; Griffin Foundry, ranges and fireplaces in observation blocks; Gibbs, Ltd., kitchen hoods and glazing over stairs; Mellowes & Co., verandah roof glazing ; James Gibbons, Ltd., locks; Buttermere Green Slate Co., Ltd., slates; Pearson, Ltd., iron balustrading to staircases in nurses' house and matron's and surgeons' blocks; George Prince, Ltd., plastering; Val de Travers Asphalte Co., external flat roofs; Hobart Manufacturing Co., Ltd., some of the kitchen equipment; General Electric Co., Ltd., electric cooking; Jackson Boilers, Ltd., steam kettle; Jackson Electric Stove Co., electric fish-fryer; Moorwood, Ltd., steam ovens, vegetable and porridge boilers and steam hot closet; Brightside Foundry and Engineering Co., kitchen contractors; Jones and Attwood, and Couzens and Akers, heating and hot water services in blocks; Couzens and Akers, central heating and hot water service plant; Wright's Forge and Engineering Co., calorifiers; Kennicott Water Softener Co., Ltd., water softeners.

Martins Bank, Ltd., Bexley Heath (pages 746–747). General contractors, Frederick Smith & Co.

TRADE NOTES

Messrs. Langley, London, Ltd., have issued a catalogue of all the roofing tiles of which they are the sole sellers. These are the Courtrai - du - Nord, Beauvais diamond, Beauvais rib, Gilardoni Marne, Beaucour. Cloister, Priory, Gilardoni Essones, and Marseilles roofing tiles, interlocking improved pantiles, and ridge and hip tiles. In the catalogue are illustrations showing some of the colours in which the tiles are made, and useful particulars concerning their size, weight, the number of tiles required to cover various size roofs, etc. There are also valuable draft specifications on the laying of the various tiles which may readily be incorporated into an architect's specification for the erection of any type of building.

*

Messrs. Allen-Liversidge, Ltd., have declared a dividend on the preference shares at the rate of 6½ per cent. per annum (less tax) for the six months ended April 30, 1930. Warrants will be posted on May 30, 1930. The preference share transfer books will be closed from May 16 to 30, 1930, both days inclusive.

*

An exhibition of Scottish Art, modern Japanese colour - prints, and animal sculpture, is being held at Parson's Galleries, 315-317 Oxford Street, W.1, until May 31. The exhibitors are James Wright, R.S.W., Andrew Gamley, R.S.W., M. Watanabé and Phyllis M. Bone. It will be recalled that Miss Bone executed all the animal sculpture on the Scottish National War Memorial, Edinburgh, for the architect. the late Sir Robert Lorimer.

*

The United Steel Companies, Ltd., realized ten years ago the benefits of large-scale organization of industry, whilst preserving the individuality of grouped productive works. With the various constituent firms which form the group many steel users are already closely in touch, but it is not always realized how much further use can be made of the companies as a group. An interesting booklet has therefore been issued to enable customers to find out something more about the firms, to look at them, as it were, from the inside. It is claimed that the new Templeborough Works, with its fourteen 60-ton furnaces, is a great advance on anything which existed in this country. They have, it is claimed,

Church Hall, Westminster, one of the large number of buildings heated by the Unity electric system and illustrated in Heating and Ventilating by Electricity, *published by Young, Osmond and Young. The book may justifiably be called a standard work on the subject, showing, as it does, the greater uses and benefits of electricity as a means for heating and ventilating. It contains much data of a nature that could rightly be regarded as " trade secrets."*

achieved a record output of over 4,000 tons in a single week, and can turn out 30 tons of strip and 40 tons of bars an hour. It is claimed that the Appleby Works, which only came into operation very recently, is in many ways ahead of American and Continental ideas. The steel-melting shop contains four furnaces of up to 300 tons capacity; they are charged with molten pig transferred direct from the blast furnaces, and the mill can roll plates up to 11 ft. in width and up to 90 ft. in length.

*

"Electro-Vapour" radiators are the subject of a new leaflet, illustrated in colour, just issued by Messrs. Benham and Sons, Ltd. These radiators can be used for complete electric heating schemes for private houses, offices, cinemas, shops, factories, etc. They can also be used for supplementing existing heating systems and as individual units. They are self-contained and are claimed to be economical, fireproof, and absolutely safe; they are also of British manufacture throughout. "Electro-Vapour" radiators are passed by the L.C.C. and other authorities for public buildings, explosives factories, film rooms, petrol stores, and places where extra precautions are necessary. For purposes of economy most sizes are fitted with three-heat control—full, half and quarter heat. The radiators are manufactured in several types, of which there are three standard classes—Plain, Classic and Royal.

*

Messrs. G. A. Harvey & Co. (London), Ltd., have inaugurated a works' magazine, under the title of *The Harco Magazine*. No words could explain its value better than those of Mr. Sydney Harvey, in the foreword to the first issue. He says: "Intensive mechanization is inclined to dehumanize industry, and in an age of machinery we tend to lose sight of the individual man and woman, who, after all, are the principal factors in industry. The old friendly and intimate relations of a firm with every one of its employees are becoming increasingly difficult. Organization and modernization have come between them and formed an ever-widening gulf. Our magazine will help to bridge that gulf, and form a link between our works in London and our offices in the provinces, in Glasgow, Cardiff and Belfast, in the Dominions—Australia, New Zealand and South Africa—in South America and in the Far East. It will bind us together as members of one large family." The first issue contains a wealth of literary and artistic talent. Among the more interesting features is a departmental ditty, "The Song of the Perf. Machine," by "Gnats." The first verse runs:

> Thump! Thud! Thump! Thud! sings the
> Perf. Machine,
> Punching holes in oily sheets,
> Countless holes by countless beats,
> Thump! Thud! Thump! Thud!
> Oblong holes and circled holes,
> Simple holes and patterned holes,
> Thump! Thud! Thump! Thud! sings the
> Perf. Machine.

THE ARCHITECTS' DIARY

WEDNESDAY, MAY 14

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Drawings of 1800–1850. 10 a.m. till 8 p.m. Saturdays 10 a.m. till 5 p.m. Exhibition closes on May 24. **10 a.m.**

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Exhibition of Wall Papers. 10 a.m. till 10 p.m. Until May 17. **10 a.m.**

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition open to the public. **10 a.m.**

ARCHITECTS' BENEVOLENT SOCIETY, 9 Conduit Street, W.1. Annual General Meeting. Sir Banister Fletcher, F.R.I.B.A., will preside. **5 p.m.**

LONDON SOCIETY, Lancaster House. St. James's Street, S.W.1. Annual Dinner at the Hotel Victoria, Northumberland Avenue, W.C.2. The Earl of Crawford and Balcarres will preside. 7.30 for 7.45 p.m. (Tickets 12s. 6d. each.) **7.30 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

PARSONS' GALLERIES, 315-317 Oxford Street, W.1. Exhibition of Scottish Art. 10 a.m. to 6 p.m. Until May 31. **10 a.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art, to be opened by the Archbishop of Canterbury.

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

LONDON UNIVERSITY Presentation Day. Albert Hall. **2.30 p.m.**

THURSDAY, MAY 15

R.I.B.A., 9 Conduit Street, W.1. Annual Dinner to be held at the Guildhall, E.C.

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Special visit to Tilbury Docks. Meet at Superintendent's Office at 3 p.m. Early application to the Secretary for tickets is advisable. **3 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual General Meeting, 6 p.m. Irish Centre (Dublin). At the Physical Laboratory, Trinity College, Dublin. Annual General Meeting, 7.45 p.m. Hampshire Sub-Centre. At Southampton, Summer Meeting. **6 p.m.**

FRIDAY, MAY 16

INSTITUTION OF ELECTRICAL ENGINEERS. Scottish Centre. At the Technical College, Dundee. The twenty-first Kelvin Lecture. "Some Recent Advances in the Electron Theory of Metals." By R. H. Fowler, F.R.S. **7.30 p.m.**

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Visit to Dr. Saleeby's House in Kilburn. Assemble in Booking Hall, Kilburn Park Station (on Bakerloo Tube), at 2.40 p.m. **2.40 p.m.**

SATURDAY, MAY 17

Sunrise, 5.6 a.m. Sunset, 8.47 p.m.

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Visit to the Fishmongers' Hall, London Bridge, E.C. **2.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. London Students' Section. Second visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. **2.30 p.m.**

MONDAY, MAY 19

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. General Meeting. "Architecture of Our Own Times." By Eric Mendelsohn. (Lantern Illustrations.) Exhibition of Architecture of Bloomsbury; also work of Eric Mendelsohn. Until June 14.

WEDNESDAY, MAY 21

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

THURSDAY, MAY 22

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee. **4.30 p.m.**

ARCHITECTURE CLUB. Dinner to Eric Mendelsohn, Savoy Hotel. **7.30 p.m.**

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Visit to the First Clubland Church, 54 Camberwell Road, S.E.5. **3 p.m.**

FRIDAY, MAY 23

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. **4.30 p.m.**

SATURDAY, MAY 24

Sunrise, 4.57 a.m. Sunset, 8.57 p.m.

MONDAY, MAY 26

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Executive Committee. 4 p.m. General Meeting. "Recent Excavations at Ur." By C. Leonard Woolley, M.A., HON.A.R.I.B.A. 8 p.m. **4 p.m.**

TUESDAY, MAY 27

ST. BARTHOLEMEW'S HOSPITAL. A ball, in aid of the Reconstruction Fund, is to be held at the Locarno Dance Hall, 158 Streatham Hill, S.W.2. The price of the tickets are: Gentlemen 10s. Ladies 7s. 6d.

WEDNESDAY, MAY 28

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Father of English Pottery—Josiah Wedgwood, F.R.S., Potter, Inventor and Man of Science." By Harry Barnard. Frank H. Wedgwood will preside. **8 p.m.**

FRIDAY, MAY 30

R.I.B.A., 9 Conduit Street, W.1. Intermediate Examination. Until June 5.

SATURDAY, MAY 31

Sunrise, 4.50 a.m. Sunset 9.5 p.m.

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. In connection with the Bicentenary of Josiah Wedgwood, a special exhibition of Wedgwood ware will be opened in Room 136. **10 a.m.**

MONDAY, JUNE 2

INSTITUTION OF ELECTRICAL ENGINEERS. Summer Meeting at the Irish Centre. June 2–6, inclusive. Assemble in the evening at the Gresham Hotel, Dublin.

TUESDAY, JUNE 3

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. Annual Meeting. **7 p.m.**

GARDEN CITIES AND TOWN PLANNING ASSOCIATION, 3 Gray's Inn Place, W.C.1. Whitsun Housing and Town Planning Tour. June 3–14 inclusive. Visit to Northern Capitals of Europe. Full particulars on application to the Secretary of the Association.

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Motor trip in Co. Wicklow, including inspection of overhead transmission lines. Lunch and tea at Glendalough.

WEDNESDAY, JUNE 4

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Proceed by special train to Limerick for visit to the Shannon Scheme.

THURSDAY, JUNE 5

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Visit to the brewery of Messrs. A. Guinness, Sons & Co. Lunch by invitation of the Company. Afternoon: Leave Dublin by special train for Belfast. Evening: Reception by the Lord Mayor of Belfast, Rt. Hon. Sir William Coates, at the City Hall.

SATURDAY, JUNE 7

Sunrise, 4.45 a.m. Sunset, 9.12 p.m.

WHIT MONDAY, JUNE 9

THURSDAY, JUNE 12

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual Conversazione, to be held at the Natural History Museum, South Kensington, S.W.

SATURDAY, JUNE 14

Sunrise, 4.43 a.m. Sunset, 9.18 p.m.

COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND. Gloucestershire Branch. At the Town Hall, Cheltenham. Conference under the chairmanship of Major-General Sir Fabian Ware, K.C.V.O., K.B.E. 11 a.m. Opening address by the Mayor of Cheltenham, followed by "Regional and Town Planning," by Captain J. H. Trye, C.B.E., R.N. Discussion on the subject to be opened by G. L. Pepler. 12.45 p.m.: Lunch. Afternoon Session, 2 p.m.–4 p.m.: "The Traditional Building of the Cotswold and surrounding Stone Districts." By H. Stratton Davis, F.R.I.B.A.; and "Modern Building and the Use of New Materials," by Thomas Falconer, F.R.I.B.A., followed by discussions to be opened by Sir Philip Stott, Bart., and J. W. Robertson Scott, respectively. **11 a.m.**

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Annual General Meeting and Annual Dinner. Particulars will be announced later.

MONDAY, JUNE 16

R.I.B.A., 9 Conduit Street, W.1. Election of Council and Standing Committees: Election of Members. **8 p.m.**

WEDNESDAY, JUNE 18

R.I.B.A., 9 Conduit Street, W.1. British Architects' Conference, to be held at Norwich. Until June 21 inclusive.

FRIDAY, JUNE 20

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. At the Royal Society of Arts, John Street, Adelphi, W.C.2. Provisional date for a lecture on "Beautification of our Arterial Roads." By Thomas C. Adams.

Moore; dwelling-house, Canford Cliffs Road, for Mr. E. de Wilde Holding; extension to garages, West Quay Road, for the Anglo-American Oil Co., Ltd.; conversion of dwelling-house into shop, 151 Ashley Road, for Mr. E. de Wilde Holding; dwelling-house, Ringwood Road, for Mr. H. J. Rogers; pair semi-detached dwelling-houses and one dwelling-house, Dorchester Road, for Mr. C. R. Symonds; dwelling-house and garage, corner Elmstead and Newton Roads, for Mr. T. F. Ingram; alterations and additions, 130 High Street, for Mr. H. J. Vick; two dwelling-houses, Haskells Road, for Mr. H. Ventress; four dwelling-houses, Gloucester Road, for Messrs. Philpotts and Manners; dwelling-house and garage, Salter Road, for Messrs. Rumsby and Rodd, for Miss Page-Wilson; dwelling-house, Canford Cliffs Road, for Mr. E. F. Knight; dwelling-house, Harbour Hill Road, for Mr. F. W. Spratley; dwelling-house, Woodlands Avenue, for Messrs. Bartlett and Whiffen; dwelling-house and shop, Ringwood Road, for Mr. F. E. Warry; garage, Pinewood Road, for Messrs. Jackson and Greenen; pair semi-detached dwelling-houses, Stanley Green Road, for Mr. E. de Wilde Holding; dwelling-house, Mayfield Avenue, for Messrs. Philpotts and Manners; dwelling-house, off Links Road, for Messrs. Seal and Hardy; dwelling-house, Martello Park Road, for Mr. J. Allner; pair semi-detached dwelling-houses, Sunnyside Road, for Miss M. Best; dwelling-house, Whitefield Road, for Messrs. Watton Bros.; dwelling-house and garage, Hatherden Avenue, for Mr. R. B. Padmore; pair semi-detached dwelling-houses, Gorse Hill Crescent, for Messrs. Corbin and Clark; pair semi-detached dwelling-houses, Enfield Road, for Messrs. L. J. Newell and Sons; dwelling-house, Twemlow Avenue, for Mr. C. J. Barfoot; dwelling-house and shop, corner Gloucester and Binnie Roads, for Messrs. Philpotts and Manners;

House at Gregynog, near Newtown, Montgomery. Designed by T. Alwyn Lloyd. The main front (left) and the garden side (right). The walls are of 11-in. brickwork, cement roughcasted and colour washed; and wood casement windows are fitted. The roof is covered with North Wales green slates, with chimney-stacks of Goitre rough facing bricks. *For ground- and first-floor plans, see page 771.*

House at Gregynog, near Newtown, Montgomery. Designed by T. Alwyn Lloyd. Ground- and first-floor plans. The entrance hall gives on to the drawing-room, studio, dining-room and "coats." The "coats" adjoins the staircase, and gives access to the kitchen quarters. The floors of the hall and reception rooms are of 1¼-in. pitch-pine blocks, the kitchen and sculleries being tiled. On the upper floor are four bedrooms, bathroom and boxroom.

dwelling-house, Harbour Hill Road, for Mr. J. Jagger; dwelling-house and garage, corner Island Road and Twemlow Avenue, and dwelling-house, Island Road, for Mr. Colin R. Maggs; dwelling-house, Sandbanks Road, for Messrs. Baker, Son and Baker; factory, rear of Morrison Avenue, for Mr. F. G. Nutt; dwelling-house, Canford Cliffs Road, for Mr. N. G. Shears; dwelling-house, Gordon Road, for Mr. R. E. Taylor; dwelling-house, Brudenell Avenue, for Mr. W. B. Chinchen; dwelling-house and garage, Elms Avenue, for Mr. R. J. Bishop; dwelling-house, Ringwood Road, for Mr. H. Ventress; pair semi-detached dwelling-houses, off Coles Avenue, for Messrs. Stokes and Whittle; offices and workrooms, Upton Road, for Mr. F. G. Pearcy; three dwelling-houses, Lincoln Road, for Mr. D. Thomas; two dwelling-houses, Churchfield Road, for Mr. C. J. Barfoot.

Plans passed by the TORQUAY Corporation: House, St. Katherine's estate, for Mr. R. E. Narracott; alterations, Shedden Hall Hotel, Shedden Road, for Mr. W. R. Cutchey; alterations, 21 Victoria Parade, for Mr. E. D. Cox; alterations and additions to shop, St. Anne's Road, Babbacombe, for Mrs. A. Ford; conversion into flats, "High View," Avenue Road, for Messrs. Peeke Bros.; bungalow, Manscombe Road, Livermead, for Mr. J. F. Lancaster; bungalow, Lower Audley Road, for Mr. C. Stevens; house, Ilsham Marine Drive, for Miss E. C. Baker; house, Manscombe Road, Livermead, for Mr. A. B. Frame; bungalow, Shiphay Lane, for Mrs. M. I. Wooler; layout, Shiphay Manor estate, for Messrs. Easterbrook and Gilley; bungalow, Barton Road, for Mr. A. Powell; bank premises, Fore Street, St. Marychurch, for Barclays Bank, Ltd.

MIDLAND COUNTIES

The NORTHAMPTON Education Committee has obtained a site in Kettering Street, for the erection of an elementary school.

The NORTHAMPTON Electric Light and Power Co., Ltd., is to erect an electricity sub-station in Birchfield Road.

The WALSALL Corporation is to adapt premises in Bridge Street as electricity offices and showrooms, at a cost of £7,800.

The WALSALL Education Committee has selected a site in Darwell Road, for the erection of a technical college.

NORTHERN COUNTIES

The BIRKENHEAD Catholic authorities have forwarded to the Board of Education plans for the erection of a Catholic elementary school in Challis Avenue.

The Board of Education has approved the sketch plans of the BIRKENHEAD Education Committee for the erection of a central school at Tollemache Street, and the Committee has instructed the architect to prepare complete plans so that tenders may be invited.

The BOLTON Corporation Housing Committee is considering the layout of Hall-in-the-Wood estate, providing for the erection of 550 houses and 10 shops.

Plans passed by the BOLTON Corporation: Six houses, Sharples Avenue, for Messrs. A. H. Price and Groves; streets, off Sharples Avenue, for the executors of Sir John Holden; stores, Green Lane, for Bolton Cricket Club; two houses, off New Church Road, for Messrs. T. P. Smith, Ltd.; two houses, Wilmot Street, for Mr. H. Craig; house, New Church Road, for Mr. J. H. Sharples; streets, Marshdale Road, off Markland Hill Lane, for Lady Beaumont; house, Marshdale Road, for Mr. J. Whittingham; two houses, Old Kiln Lane, for Mr. W. Varley; seventeen houses, Chorley Old Road, Doffcocker estate, for Mr. S. Main; seven houses, New York Road, for Messrs. Dobson and Tierney; extensions to shop, 122 Blackburn Road, for Mr. Thomas Relph; alterations, 110 Bury Old Road, for Mr. James Shuttleworth; transformer sub-station, back Green Lane, for the Electricity Committee; house, Regent Road, for Mr. J. Latham; house, Barrow Bridge Road, for Mr. J. Cecil Lomax; four houses, Plodder Lane, for Mr. W. Reddyhough; six houses, Duchy Street, for Mr. Ernest Howarth; two houses, St. Helens Road, for Mr. R. Stott; nine houses, Bromwich Street, for Mr. James E. Paiton; streets, Woodbine Road, for Sir W. R. Hulton, Bart.

The CHESTERFIELD Corporation has asked Messrs. Jackson and Fryer, to prepare plans for fifty houses to be erected on the Newbridge estate.

The CHESTERFIELD Education Committee is purchasing land for the extension of the Derby Road elementary school.

The Board of Education Committee has approved the plans of the CHESTERFIELD Education Committee, for extensions at the central school.

Plans passed by the CHESTERFIELD Corporation: Additions to new cellulose department, Walton Works, for Messrs. Robinson and Sons, Ltd.; alterations, Red Lion Inn, Whittington Moor, for Messrs. Duncan Gilmour and Co., Ltd.; two houses, Newland Pond Road, for Messrs. Collis and Sons, Ltd.; alterations to Falcon Café, Low Pavement, for Mr. J. Boden; additions to mixed junior school, Jawbones Hill, for the Education Committee; two houses, Cutthorpe Road, for Mr. A. E. Needham; Adult school hall, Storforth Lane, for the trustees of the Hasland Adult school; alterations to schools at Brushes and Whittington, for the Education Committee; two houses, Fidler's Corner, for Mr. A. E. Needham; extensions, St. James's Mission, Vicar Lane, for the Churchwardens of St. Mary and All Saints Church; alterations to premises, Knifesmith Gate and Packers' Row, for Messrs. Swallow and Sons, Ltd.; shops and showrooms, Packers' Row, for Mr. E. Lotery; additions to Church Street infants' school and the girls' school, for the Education Committee; amended plan of shops, Vicar Lane, for Mr. A. Swale; two houses, Rhodes Avenue, for Mr. A. Needham; alterations and extensions, Packers' Row, for Messrs. J. K. Swallow and Sons, Ltd.; two houses, Derby Road, for Mr. F. Beardow.

The Durham County Education Committee has purchased a site at CROOK, for the erection of an elementary school.

The Durham County Education Committee is to erect an elementary school at EAST RAINTON, with accommodation for 300 pupils.

The Durham County Education Committee has decided upon the erection of an elementary school for 400 pupils at EDEN CASTLE, at an estimated cost of £11,000.

Plans passed by the ILKESTON Corporation: Two houses, Corporation Road, for Messrs. D. Roberts and Son; bungalow, Heanor Road, for Mr. G. V. Pattinson; special subject school, Bennerley Avenue, for the Education Committee.

The LEEDS Corporation has approved the scheme of the city engineer for the erection of eighty houses and twenty cottage flats on the York Road and Selby Road estate, and decided to undertake the work, by direct labour, at an estimated cost of £34,370.

The LEEDS Corporation Improvements Committee is in communication with Mr. Samuel Scott with respect to the proposed erection of a cinema in The Headrow.

The LEEDS Corporation has sold land in New Briggate and The Headrow to the Shaftesbury Trust, Ltd., for £110,000, subject to the buildings conforming to designs to be approved by Sir Reginald Blomfield.

The LEEDS Corporation has asked Messrs. Bowman and Son, architects, to obtain tenders for adapting premises in South Street, as offices for the Assessment Committee.

The LEEDS Corporation has approved a scheme for widening the bridge over Wyke beck at Selby Road.

The LEEDS Corporation has considered a scheme for the extension of the Meanwood Mental Colony, and decided to carry out the first portion of the scheme, comprising the erection of three adult blocks, two children's blocks, low-grade block, school and entrance lodge.

The MANCHESTER Corporation has passed plans for the erection of the new Wilbraham Road branch library.

The MANCHESTER Education Committee has approved plans for alterations and additions at the Birley Street municipal school.

The MANCHESTER Education Committee has approved plans for the erection of a senior mixed department at the Gorton Mount municipal school.

The MANCHESTER Education Committee has approved plans for the erection of a new building to provide a school for junior mixed and infants, to replace the temporary premises of Collyhurst municipal school.

The Leeds Education Committee is to erect a temporary elementary school in King Road, MOORTOWN.

The NEWCASTLE Education Committee is to erect an elementary school for 1,400 children in Wharrier Road.

The OLDHAM Corporation has referred the question of erecting additional houses which could be let at rentals within the means of the working classes to a sub-committee for consideration.

Plans passed by the OSSETT Corporation: New street and forty-two houses, Spa Street, for Mr. J. Illingworth; warehouse, Runtlings, for Mr. D. H. Archer.

The SALFORD Corporation is being asked to prepare a scheme for the construction of slipper baths and washhouses in Clarence Street, Broughton.

The SALFORD Corporation is to borrow £15,150 for reconstruction of the drains and alley surfaces and repair of the pen surfaces of a portion of the cattle market, required for the sale of livestock.

Plans passed by the SHEFFIELD Corporation: Two houses, Kingfield Road, for Messrs. Dyson and Morgan; four houses, Whirlowdale Crescent, for Mr. W. W. Plant; two houses, Whirlow Court Road, for Mr. W. C. Mander; two houses, Canterbury Crescent, for Mr. J. W. Sivil; four houses, Gisborne Road, for Messrs. Wm. Malthouse, Ltd.; three houses, Dalewood Avenue and Folds Lane, for Messrs. Bingham and Worthington; two houses, Montrose Road, for Mr. J. E. Marchinton; six houses, Haugh Lane, for Mr. C. M. Taylor; two houses, Abbey Crescent, for Mr. J. V. Auckland; two houses and six garages, Garry and Upwood Roads, for Mr. M. Simpson; 226 houses, Shiregreen estate, for the Sheffield Corporation; two houses, Whirlowdale Road, for Mr. C. H. Leadbeater; four houses, Haugh Lane, for Mr. G. M. Taylor; six houses, Halesworth Road, for Mr. J. R. Cambe; two houses, Shirlow Grove, for Mr. E. Walker; two houses, Richmond Road, for Mr. V. L. Ward; six houses, Dalmore Road, for Messrs. Plant Bros.; two houses, Abbey Lane, for Mr. J. Harold Stevens; two houses, Hoober Road, for Mr. W. Green; house, Queen Mary Road, Stand House School, for the Education Committee; school and house, Crowder Avenue, for the Education Committee.

Plans passed by the SHIPLEY U.D.C.: Alterations to shop, Commercial Street, for Thrift Stores, Ltd.; alterations and additions, Commercial Street, for Mr. W. Rimmington; extension to stone sawing shed, Bolton Hall Road, for Messrs. Waterhouse, Denbigh & Co., Ltd.; three houses and shops, Leeds Road, for Messrs. Mellor and Booth; eleven houses, Aireville Avenue, for Mr. J. Chippindale; layout, Nab Wood estate, for Messrs. Wm. Pitts and Sons.

The STRETFORD U.D.C. has approved plans submitted by the surveyor, for the construction of a canal bridge at Moss Road, at an estimated cost of £12,000.

THE PUBLISHER'S PAGE

MR. AUMONIER'S book on *Modern Architectural Sculpture* will shortly be seeing the light of day. It will be going to press about the 20th of this month. Readers, therefore, who wish to order the book at the special subscription price of £2 15s. and to have their names printed in the list of subscribers which will appear in the book, should send in their names at once to the publishers,

William Aumonier, author of Modern Architectural Sculpture, *shortly to be published by the Architectural Press.*

the Architectural Press. The book will contain nearly five hundred illustrations of the best work which has been executed during the last few years throughout Europe and America, much of which has not hitherto been illustrated. The list of sculptors whose work is represented in the book will contain about 120 names, and while some of these, such as Meštrović, Maillol, Bourdelle, Milles, etc., are household words, others of them are as yet almost unknown except in their own countries. The use of the word "modern" in the title should not be understood as implying that the book contains the work of the modernists only, for it has been Mr. Aumonier's aim to include in it the whole range of architectural sculpture of every type. The announcement of the book has created enormous interest all over the world, and orders for it have been received from almost every conceivable country.

MR. H. B. CRESWELL, the author of *The Honeywood File*, has always had the reputation of being a most uncompromising opponent of advertising and advertisers in any shape or form. It is, therefore, a rather delightful accident that *The Advertising News*, in its review of *The Honeywood File*, should refer to it as "a model of chaste, refined, and yet wellnigh perfect advertisement of a profession." Whether Mr. Creswell will be pleased or hurt by this suggestion, the fact remains that it is well deserved. The work of educating the public to the value of the architect's services is one that cries out to be done. Mr. Creswell's book is helping along the good work in a subtle and indirect way, and the more architects can do to spread its sale among laymen and among their clients, the more they will benefit the cause of the architect.

By the way, the Editor, I hear, will shortly have an announcement to make concerning some further doings at Honeywood.

IT is interesting to note that while many appreciative letters have been received from architectural associations up and down the country regarding the free advertisement scheme for architectural assistants, the Hampshire and Isle of Wight Architectural Association have gone a step farther and circularized their members in the following manner:

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION

The Castle,
Winchester,
May 3, 1930.

Important.

DEAR SIR,

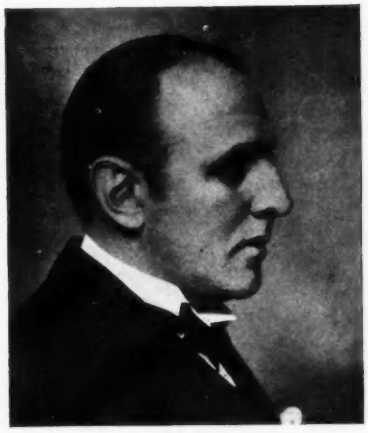
Free Advertisements for Architectural Assistants

On and after May 1, 1930, notices from architects requiring assistants, and from assistants seeking positions in architects' offices, will be printed in THE ARCHITECTS' JOURNAL free of charge.

Notices should be addressed to the Advertisement Manager, THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W.1, and should reach there by first post on Saturday morning for inclusion in the following week's paper.

The above information appears on page xxxviii of THE ARCHITECTS' JOURNAL for April 16, 1930.

Members are advised to read the article upon this subject on page 597 of the same issue, and to show their appreciation by making full use in the future of this most generous and valuable help offered by THE ARCHITECTS' JOURNAL.



Yours faithfully,
A. L. ROBERTS,
Hon. Secretary.

Active support such as this calls for warm commendation, and it is only hoped that for the success of the scheme other associations will see their way clear to follow the same example.

LAST week there appeared in our correspondence columns a letter from the Association of Architects, Surveyors and Technical Assistants, also commending this new policy of ours. In this connection we should like to draw our readers' attention to the work that is already being done by this Association towards solving the economic problems, not only of architects' and surveyors' assistants, but of all salaried men; problems which the A.A.S.T.A. has discovered affect not only the section with which they are directly concerned, but the whole profession, and which can only be solved by that co-operation which has been the object of their endeavours for the past ten years.

The Association has a Benefit Fund for Sickness and Unemployment; a Benevolent Fund and an Employment Bureau for the use of its members.

Upon the problems arising from its activities the Association has at various times made representations to the R.I.B.A. Council with convincing results. Under this head its outstanding items are the "Outline Course of Study for the Guidance of Architects who accept Pupils in districts where Professional School Education is not available" (issued by the R.I.B.A.

William H. Hamlyn, A.R.I.B.A., President of the A.A.S.T.A., and Hon. Secretary, R.I.B.A. Salaried Members Committee.

Council in 1926), and the Salaried Members Committee R.I.B.A., which was set up two years ago, following a memorandum from the Association of Architects, Surveyors and Technical Assistants, when the policy suggested by the Association was in the substantial sense adopted by the R.I.B.A. Council.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

*** In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.**

The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.
IF left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. . . 0 2 10
PUDDLING, per yd. cube 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube . 1 7 0
DO. in lintels, etc., per ft. cube . . 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. . . 0 4 3
DO. 6 in., per ft. 0 5 6
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6

TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ½ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super.	0	11	0
York templates sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2

DO. for every 10 ft. above 30 ft. add 15 per cent.

PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

	Med. Grey			Med. Green		
Portmadoc Ladies				£14	0	0
Countess				23	0	0
Duchess				32	10	0
Old Delabole	*Med. Grey*			*Med. Green*		
24 in. × 12 in.	£42	11	3	£45	1	0

BUILDING CONTRACTS OPEN

Unless the contrary is expressly stated, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district. Application for plans and particulars should be made to the address given at the end of each entry.

HELSTON, CORNWALL: SCHOOL

May 17.—For the erection of a proposed new Sunday School at Godolphin Cross, Helston. P. Smitham, Godolphin Cross.

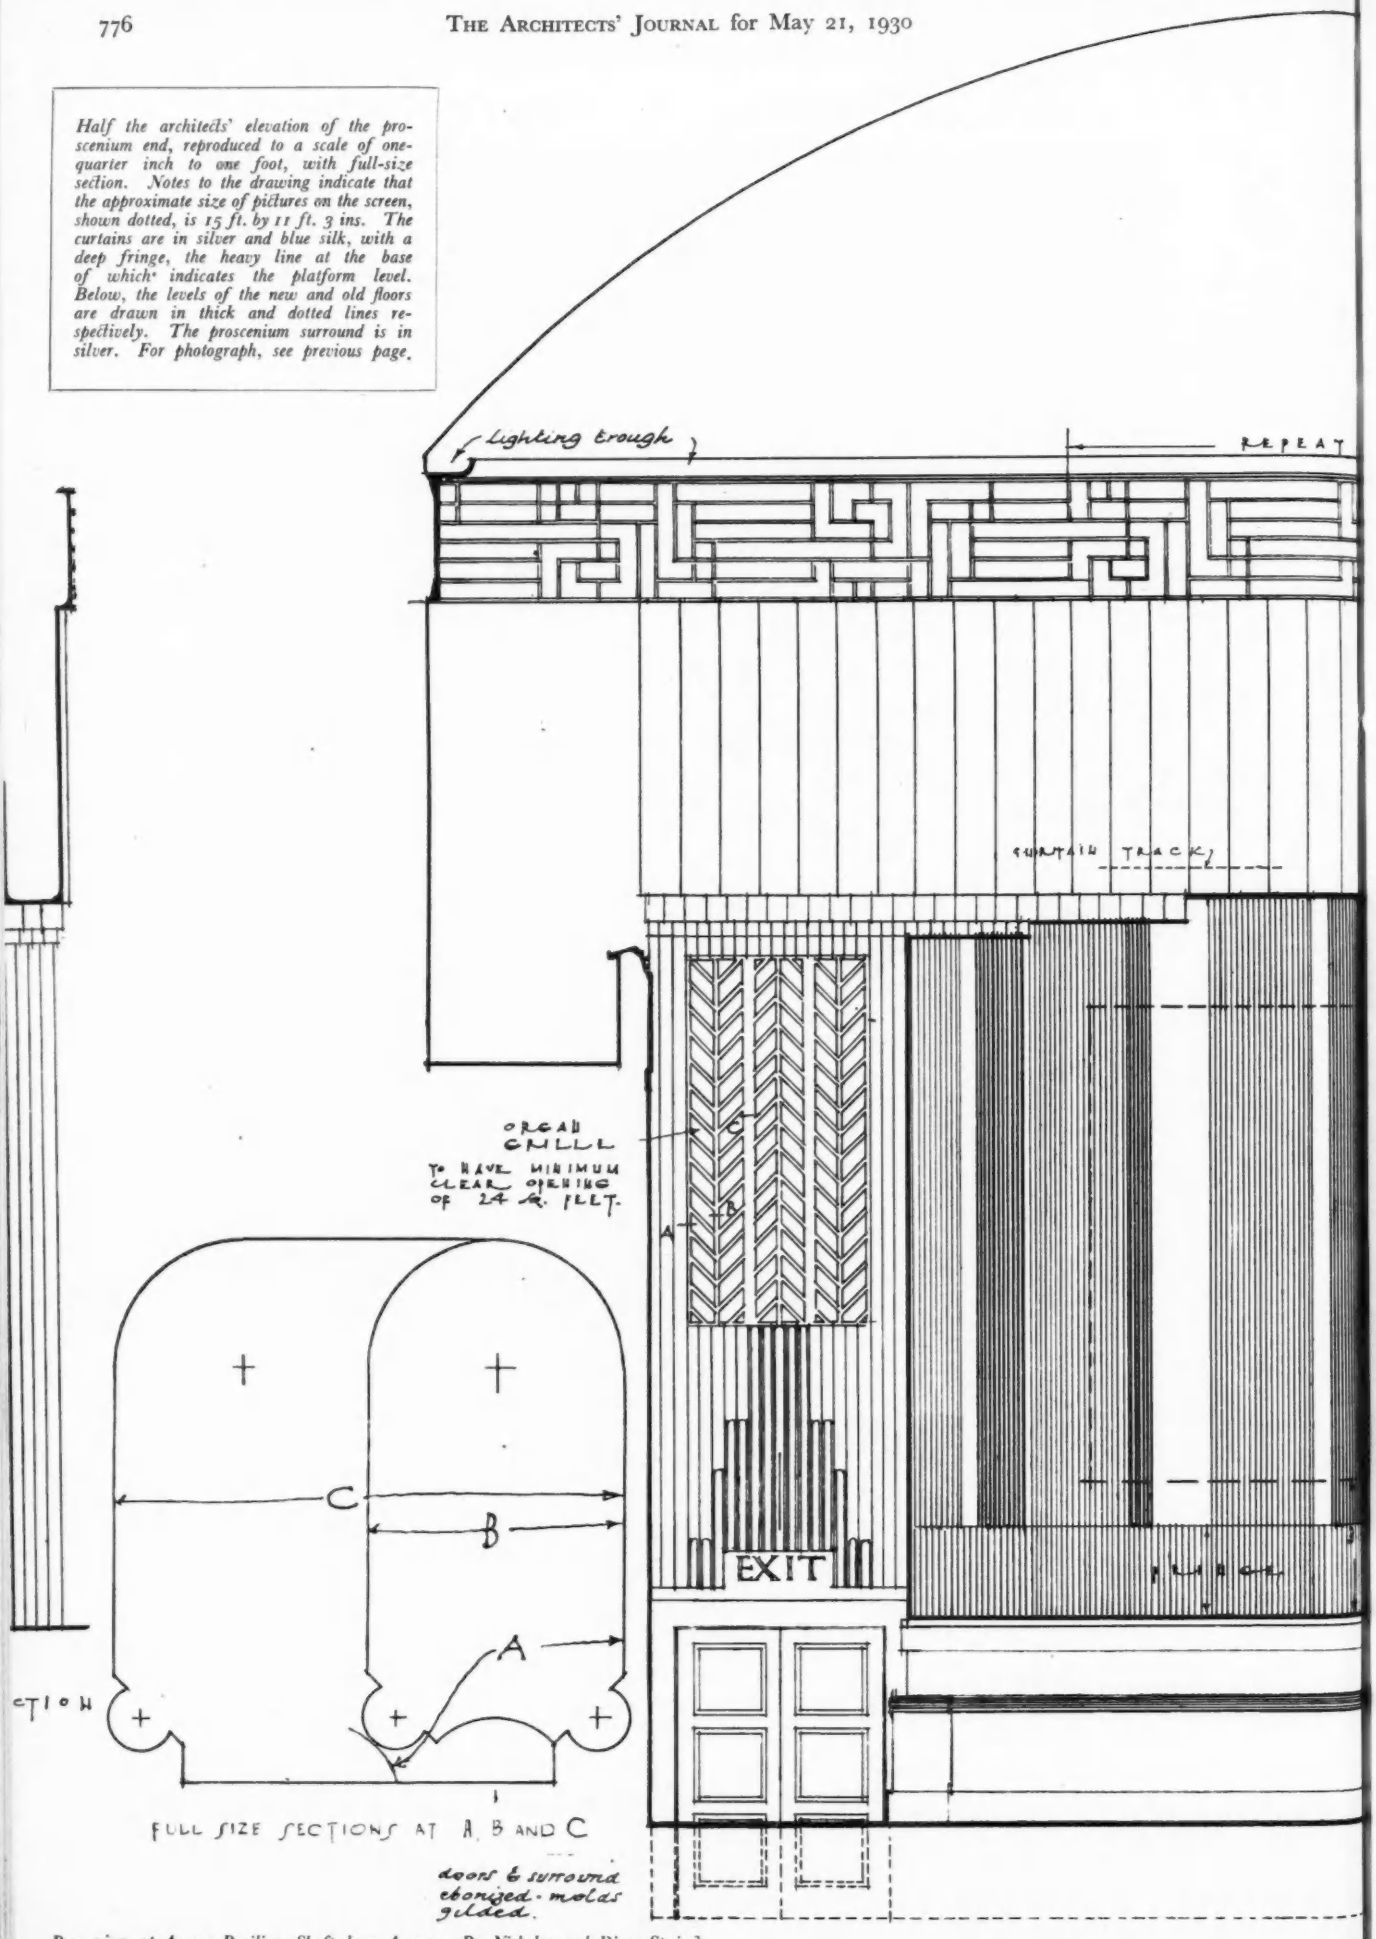
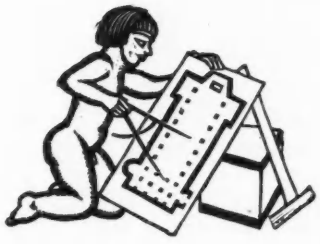
SOUTHWARK STREET, LONDON, S.E.



AUDITORIUM AND PROSCENIUM, AVENUE PAVILION CINEMA, SHAFTESBURY AVENUE, W.

Designed by NICHOLAS & DIXON-SPAIN

THE original Avenue Pavilion was about eighteen years old, and was one of the earliest cinemas to be erected in London. The interior has now been remodelled, adapted for "talkies," and entirely redecorated on restrained modern lines. Sight lines have been adjusted by alterations to the floor level, etc., and new seating accommodation has been installed and somewhat increased. In the auditorium are nine panels containing figures, specially modelled by Arnold Auerbach, the sculptor. Two of these are illustrated on page 802.



Details and particulars of the proscenium appear on the following page. The cinema was reopened on Monday of last week.

Half the architects' elevation of the proscenium end, reproduced to a scale of one-quarter inch to one foot, with full-size section. Notes to the drawing indicate that the approximate size of pictures on the screen, shown dotted, is 15 ft. by 11 ft. 3 ins. The curtains are in silver and blue silk, with a deep fringe, the heavy line at the base of which indicates the platform level. Below, the levels of the new and old floors are drawn in thick and dotted lines respectively. The proscenium surround is in silver. For photograph, see previous page.

Proscenium at Avenue Pavilion, Shaftesbury Avenue. By Nicholas and Dixon-Spain.]

CONDEMNED HOUSES

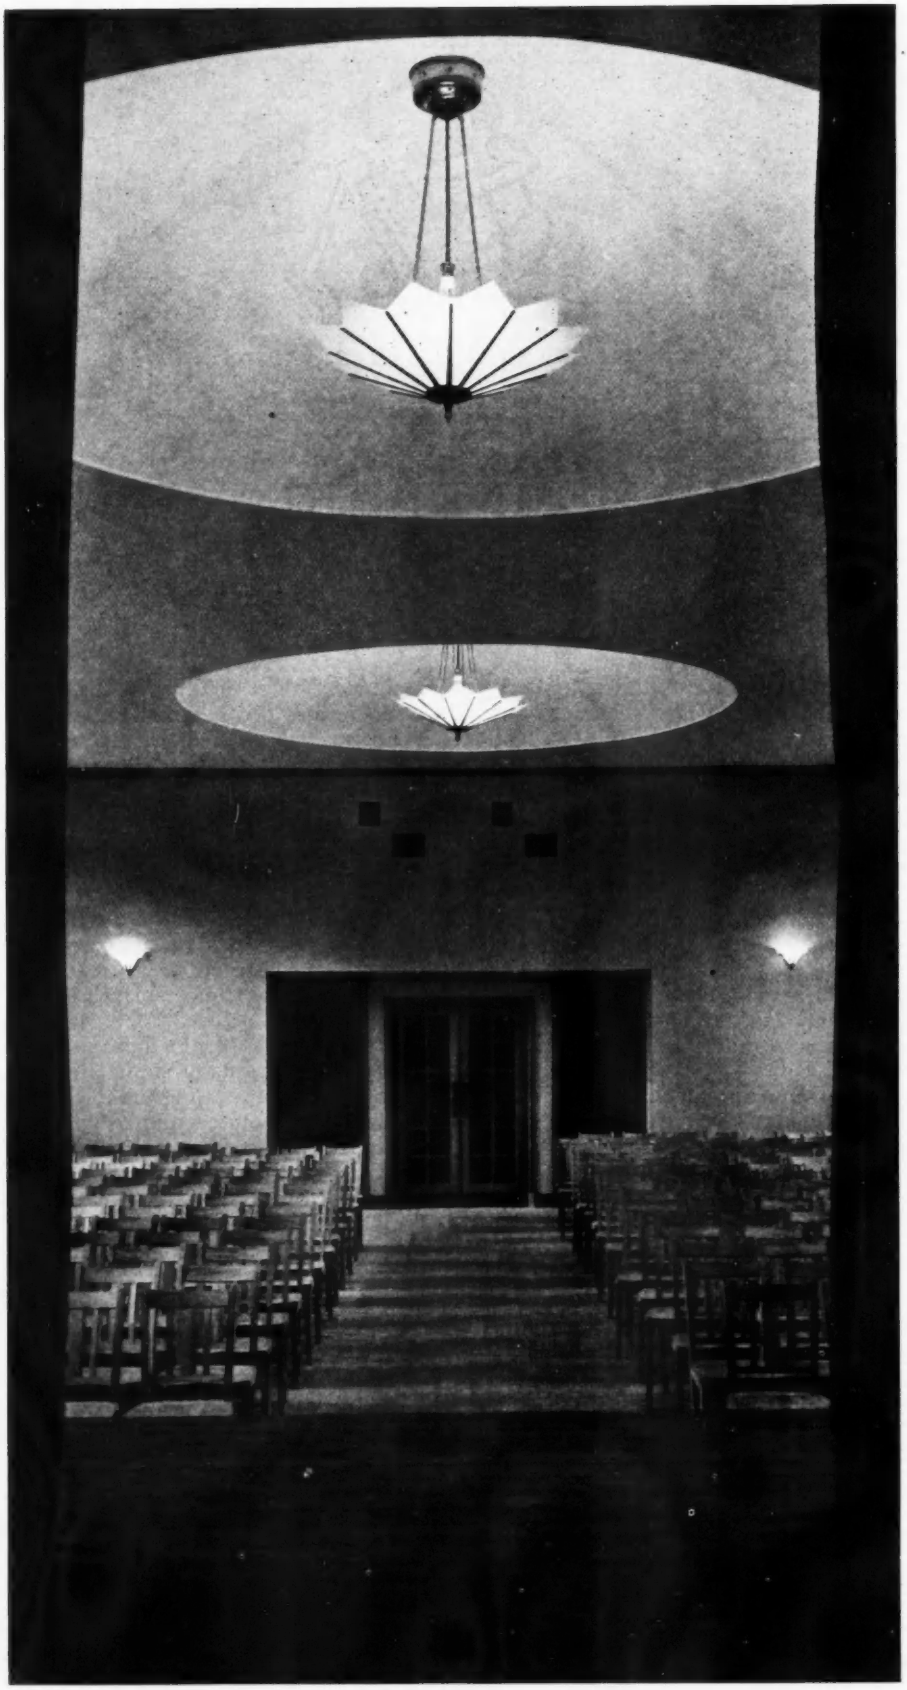
Grievances under the Rent Restriction Act

IT is quite time that the Rent Restriction Act put its own house in order. The dilemmas which have arisen under it are numerous, and of all sorts, and of varying importance, but the case, typical of many, recently narrated in *The Times*, has its own interest for architects.

The protection of tenants under the Act virtually ceases in the event of the sanitary authority condemning a house as unfit for human habitation; unless its insanitary faults are rectified, an eviction order can be enforced. But before that sad condition is reached, a state of things may arise equally threatening to the inhabitants: the house may become a dangerous structure according to the local surveyor, and a notice to that effect may be issued. Then the fun begins.

The owner has to repair, and almost certainly has to rebuild, one, at least, of the walls. It is expensive work, necessitating in some cases professional advice and in every case the employment of a builder who is used to such dubious operations. A lump sum price cannot be obtained. The work goes on from day to day very slowly, with the costs mounting rapidly and out of all proportion to pace. Money which the owner had saved for rebuilding in due course is swallowed without increasing the amenities of the house, or to any great extent the value of the property. The presence of the tenant in the house swells the cost of the repairs.

The owner is justifiably annoyed, for if there were no Act he would have given his tenant notice, pulled down the house, and rebuilt with up-to-date conveniences, using the old materials as far as possible. It is not fair to say that the dangerous state of the house is due to the owner's former neglect; it is more probably due to the passing of heavy traffic, or the effect of a long drought on clay soil.



Is there not a case here for an exception to be made to the operation of the Act? The owner thinks so, and considers that he should be allowed to submit a scheme for rebuilding to the local authority, and, on its approval, the tenant should be liable to quit.

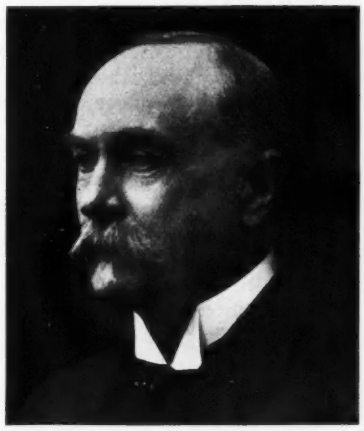
Let us now look at the matter from the tenant's point of view. He has a house which, however picturesque with age, has been noted as a dangerous structure. The tenant wishes to leave, before his house-front falls into the street, a happening promised when the next steam lorry passes, probably at dead of night. Also, his wife is disturbed in mind at the thought of the discomfort, the dust, the rain and the draughts which will accompany the almost endless work of reconstruction. She supposes the children will choose that time for measles or influenza (and they are sure to). But the tenant can find nowhere else to go. The Council houses are "booked up," the family is too large for lodgings, and all the other sitting tenants are sitting tight. So the tenant, though his interest is quite compatible with the landlord's, has to stay and go through with the dust and measles.

Obviously the matter has to be taken a step farther, to the third party involved, who is the local authority. Landlord and tenant must combine and demand of their Council—the landlord that he be allowed temporarily to shore up the dangerous structure; the tenant that he be provided with another dwelling as early as possible and at a rent which he can afford to pay.

At first sight this seems making a large demand on the local authority. But, after all, the surveyor must have had his eye on the old house for some months. Even motor lorries and droughts do not bring down walls without warning. He has had plenty of time in which to warn his Council that there will be a call for a dwelling within a short period, and that the Council will be morally liable to provide it.

We think, then, that this problem of the dangerous structure, inhabited by the protected tenant, is capable of solution, and that, on the scheme of rebuilding being approved, the local authority must provide other accommodation for the tenant. We hope some such amendment to the Act may become law.

A MODEL VILLAGE HALL: STEWARTBY, BEDFORD



Designed by E. Vincent Harris

Looking between curtains of silvery-brown velvet, partially drawn across the stage, there are revealed a maple floor, buff walls, with doorway woodwork painted grey, and a white ceiling—a colour-scheme dominated by the domes and hanging lights. The cinema projection-box openings are the visible signs of adaptability to a number of social uses that have been foreseen. Further illustrations and a description appear on pages 782–5.

NEWS & TOPICS

William J. Locke, the famous novelist, who died in Paris last week, wrote several of his early stories during the ten years when he was acting as secretary of the R.I.B.A. An appreciation appears below.

Sir Reginald Blomfield who, referring to Charing Cross in his last week's speech at the Annual Dinner of the London Society, advocated the retention of the present station and the formation of a new road bridge.

THE R.I.B.A. BANQUET

THE annual banquet of the R.I.B.A., held at the Guildhall last Thursday, provided an appropriate setting for the first of these functions to be presided over by Sir Banister Fletcher, who is as well known for his public work on the Corporation of the City of London as he is to architects. The evening was a thoroughly successful one and the ovation which greeted the President was a sincere and spontaneous testimony to his popularity. But the Guildhall has one defect: it is impossible for the majority of any audience to hear speakers who are unaccustomed to its peculiarities. This prompted some of those present to ask whether it might not be better to curtail the flow of post-prandial eloquence and devote part of the evening to a dance.

★

The main purpose of this annual function is to provide an occasion for friendly intercourse between members of the Institute, to give them an opportunity of entertaining their patrons, distinguished personages in the world of art and letters, and their wives, sisters, aunts, cousins and other members of the fair sex. I think that a dinner of modest length followed by a limited amount of oratory and a longer period for social intercourse would add to the popularity and usefulness of this annual function.

WILLIAM JOHN LOCKE, HON. ASSOC. R.I.B.A.

Responding to my request, Sir John Simpson sends me the following brief appreciation of the late W. J. Locke. Locke (he writes) was a celebrity both in the Old World and the New. Details of his life and his literary work have been given in the entirely admirable obituary of *The Times* and in countless other Press notices at home and abroad. It is needless to repeat them here. But in THE ARCHITECTS' JOURNAL it is fitting to record that the retirement of W. J. Locke, in 1908, from the post of secretary to the Royal Institute evoked such expressions of regret as few officials can have received or merited. To those who are now senior members of the architectural profession, and had the privilege of knowing and working with Locke, his death comes as a personal bereavement. When he became secretary, the younger men, who had not before been much encouraged to interest themselves in the debates and government of the Royal Institute, found themselves welcomed at Conduit Street by a friend who placed a mere Associate as high in his regard as any Fellow or Member of Council.

His attitude brought new life and vigour to the Institute. Serving under the Consulships of Aitchison, Emerson, Webb, Belcher, and Collcutt, his delicate courtesy, his tact and his shrewd ability, made him in his ten years of office the friend of the whole profession. A scholar, and man of the world to boot, he had a real affection for architects and most helpful sympathy for those who sought his advice in the troubles incident to their calling. His influence with Presidents, Councils, and Members was consequently very great, and their trust in him implicit.

★

At the Continental meetings of the "Comité Permanent" he was greeted with affection by the architects of every nation, and was himself a member of many of the foreign professional societies. But France was the country of his choice. There he lived, and had rare knowledge of its people, who were his friends. There he ended his days.

★

Born in 1863, he had lived sixty-seven years when the months of pain ended which he had borne with courage and sweet temper. He was cheered in his illness by the success of his last book, *The Town of Tombarel*; a fantasy of France, with architects and other artists haunting its pages, as he loved to have them. Was not the "Beloved Vagabond" himself an *architecte manqué*? By all who knew him (concludes Sir John) Locke was beloved, and he returned their affection. *Eheu, perniciosam jacturam!*

CITY ARCHITECTURE IN THE NORTH

London is apt to imagine, with its Kingsway and Regent Street, that wisdom will die with it alone. Not at all. The best modern commercial architecture, taken in the mass, is in Manchester and Liverpool. Work of character is more to be found there than in London. Nor is this surprising when one considers how powerful has been the effect of the Liverpool School of Architecture upon current work.

★

I have by me a description by Professor Reilly of an exhibition of architecture and its allied arts that has been held in a small public gallery that is of its kind unique, since it gives regular prominence to the work of local architects, sculptors, painters and craftsmen.

★

What is so heartening in this exhibition is to see the designs for churches, art galleries and, of nearly equal

importance to a city's street architecture, public-houses—and all by past students of the Liverpool School. And coupled with these the fine craftsmanship of men like Tyson Smith and Mr. Burdon, artists without whose help the growing tradition of Liverpool architecture could not hope to reproduce itself.

THE INFLUENCE OF THE LIVERPOOL SCHOOL

This is something to say for this school and for the whole system of school training, whenever it may be challenged. The prospectus of the Liverpool School (it is, by the way, one of the few schools that print a prospectus and illustrate students' work) shows that the training a man receives there does really qualify him to go forth and *design to build.*

★

Also, I think that the association with America gives a body of reality to the teaching that many other schools lack. To come into close contact with American organization, as some ten students from the school do every year, is to be fired by the desire to be an architect in every little detail, and not merely upon a drawing-board. That, and the extraordinary spirit of adventure that Professor Reilly brings to it, explain how it is that from a small and dingy little building by the University there spreads a mighty vista of fine buildings.

LIVERPOOL'S CIVIC CENTRE

Though Liverpool has the nucleus of a fine civic centre in the public buildings that were erected after St. George's Hall had been built on a wonderful site, one side of the great open space has never caught the reflection of the civic grandeur it faces: it still straggles uphill in a series of pubs and mixed property. Two things are going to change all this. One is the building of the entrance to the Mersey Tunnel at one end of the open space and facing the rear elevation of St. George's Hall; the other is the development of part of St. John's Lane, the street which never rose to the occasion. A syndicate has been formed to develop a large site for commercial buildings, and in order that it may have every chance of being worthy of its magnificent opportunity, the building is to be put up to open competition, the announcement of which was made in last week's JOURNAL.

ARCHITECTURE'S GROWING RECOGNITION

It is evidence of the growing popularity and social standing of architecture as an art that the *Journal of the Society of Arts* should, in one volume, report upon the Royal Academy architectural room, on a lecture read to the Society by Mr. Howard Robertson, on Dublin's architecture by Katherine Tynan, and on the preservation of rural England and West Wycombe in particular, work with which the Society has definitely associated itself.

★

It seems to prove that education is going to be the big stick to belabour the jerry-builder and the spoiler, and that taste will once again become a force strong enough to curb the loathsome vulgarity of the half-educated.

THE THEATRE OF THE FRIEZE

I called at the studio of Mr. Gilbert Bayes a week or so ago and saw him busily engaged in putting the final touches to his frieze for the exterior of the New Saville Theatre, Shaftesbury Avenue. This frieze is an interpretation of "Drama through the Ages," and would be unique even if only from the fact that the architects for the theatre, Messrs. T. P. Bennett and Son, have placed it

These three photographs of a portion of the frieze designed by Mr. Gilbert Bayes for the New Saville Theatre were expressly marked by him, as shown by white lines, to indicate how joins should fall.

only 15 ft. above street level. It is 115 ft. long and 6 ft. high, and consists of two main portions, divided by a big circular-headed doorway, and two smaller pieces returned at the end.

★

The accompanying photograph shows a portion of the left-hand frieze. Here are St. George and the dragon, with Cupid holding a shield, the Chester players in the background and, at the left end, a minstrel and the stage manager of the period with his staff of office. The right-hand frieze shows the Greek masked players, Roman gladiatorial shows, the Roman triumph and the Bacchanalia (20 ft. of which is on exhibition at the Royal Academy), the mediæval jester and the more modern harlequinade, Shakespeare, Marlow, a Punch and Judy show, and characters from modern crook and other plays. Mr. Bayes told me that the greatest relief on any part of the frieze is only about 1½ ins. Nevertheless, it seems to me that its carrying power will be much more than many reliefs of considerably greater depth. The frieze will be specially lighted at night.

LONDON BECOMING A BRICK CITY

It was a layman who observed, contemplating Grosvenor House and the new Gamages, that London was fast

becoming a brick city. If so, what is it but a reversion to the days before the eminent builder who found it all brick and left it all stucco?

A striking record of Old London appears in Canaletto's view of the city from the terrace of Richmond House, which lately hung among the Italian pictures at Burlington House—in which Wren's steeples soar up in a sunlit haze above a low and thickly-built city of dull-coloured brick. Other laymen confess themselves puzzled by the prevalence of plain wall-spaces in the new brick architecture. Restrained and simple wall surfaces are probably an acquired taste, which will come.

YORK MINSTER'S GLORIOUS WINDOWS

The society called the Friends of York Minster, which numbers about 1,200, is pledged to support the work of restoration and preservation of that venerable fabric. All those architects who visited York with the R.I.B.A. Conference last year will know that the glory of York is in its windows. The Friends, when they assembled in the Chapter House lately for their annual meeting, were surrounded by the monuments of their own munificence, for of the seven tall windows which London experts twenty-five years ago placed beyond repair, five now shine with all the radiance of coloured glass, as though they had but just left the artificers' hands. But of 111 windows that needed renovation ninety-four have been done or are doing, and still the work goes on.

FITTINGS FROM ARCHITECTS' OWN DESIGNS

My note in the May 7 issue, under the above heading, has brought in letters so numerous and interesting that I have handed them over to the Editor to publish in the much greater space at his disposal. It remains to thank my correspondents and to congratulate several of them, and the British manufacturers concerned, on their close and happy relationships. ASTRAGAL

The Moral of Charing Cross

LETTER FROM SIR BANISTER FLETCHER

To the Editor of THE ARCHITECTS' JOURNAL

SIR,—In the interesting leading article in your issue for May 14, you invite your readers to offer suggestions for the formation of "a town-planning authority for the whole of London, whose members will have authority to decide all the major questions of urban development in so far as these concern the co-ordination of traffic routes, the provision and preservation of open spaces, and the general control of street architecture in the Metropolis."

As Chairman of the Greater London Regional Planning Committee, may I point out that that Committee has worked out a scheme for the formation of precisely such an authority, which is set out in their first report, recently published? (Obtainable from Knapp, Drewett and Sons, Ltd., 30 Victoria Street, S.W.1. Price 5s.)

It is suggested by the Committee that the proposed body should "consist mainly of persons appointed by, but not necessarily members of, the authorities which would be financially responsible for the regional proposals, namely, County and County Borough Councils within the region, with the addition of the Corporation of the City of London, and should be empowered to elect its chairman from within or outside its own body."

The Committee is pressing its 130 constituent authorities and also the fourteen "sub-regional committees" within the region to express their views upon these proposals. I may say that the response received up to the present is most satisfactory, the large majority of the authorities which have replied approving the proposals as they stand. Among suggestions for modification is one for empowering the body elected in accordance with the Committee's recommendation to co-opt a certain number of persons recognized as having expert knowledge in the subjects with which the new authority would have to deal. No doubt further ideas on the subject will be evolved, and the Committee will be glad to receive any advice and assistance in the matter.

It is to be remembered that the Greater London Regional Planning Committee was appointed for three years from November 1927. The constituent authorities have agreed to extend this period to the end of the financial year—i.e. to the 31st March, 1931. It will then be necessary, if the work so well in hand is to be continued, either to reappoint the Committee or to create a new body to take its place. For the reasons given in its report, the Committee consider the latter the more desirable course. In order to carry out the proposal in its entirety, legislation will be necessary, and it is to be hoped that facilities for this will be given. The Minister of Health, at the deputation on the 26th November, 1929, while clearly in sympathy with its proposals, said, as was to be expected, that it would not be possible to go forward with the idea unless it met with the approval of the local authorities. It is therefore most desirable that the views of these authorities shall be expressed as soon as possible. The Committee will of course take into careful consideration any modifications of its proposals which these authorities may suggest and also any recommendations which may be made by responsible societies which are concerned with the subject. In this connection I shall be greatly interested to see the response to your invitation to your readers, and trust that correspondents will take note of the proposals of the Greater London Regional Planning Committee when they express their views.

BANISTER FLETCHER

[It was only lack of space that forbade our referring to the fact that a detailed scheme for a town-planning authority was contained in the report issued the other day by the Committee of which Sir Banister Fletcher is chairman. We hope to return again to the interesting suggestions made in this report, which was reviewed in these pages on April 30 last. Meanwhile, our readers will be gratified to learn that they have had a sympathetic reception from the authorities constituting the Regional Planning Committee.—ED., *A.J.*]

SETTLING-UP HONEYWOOD

By KARSHISH

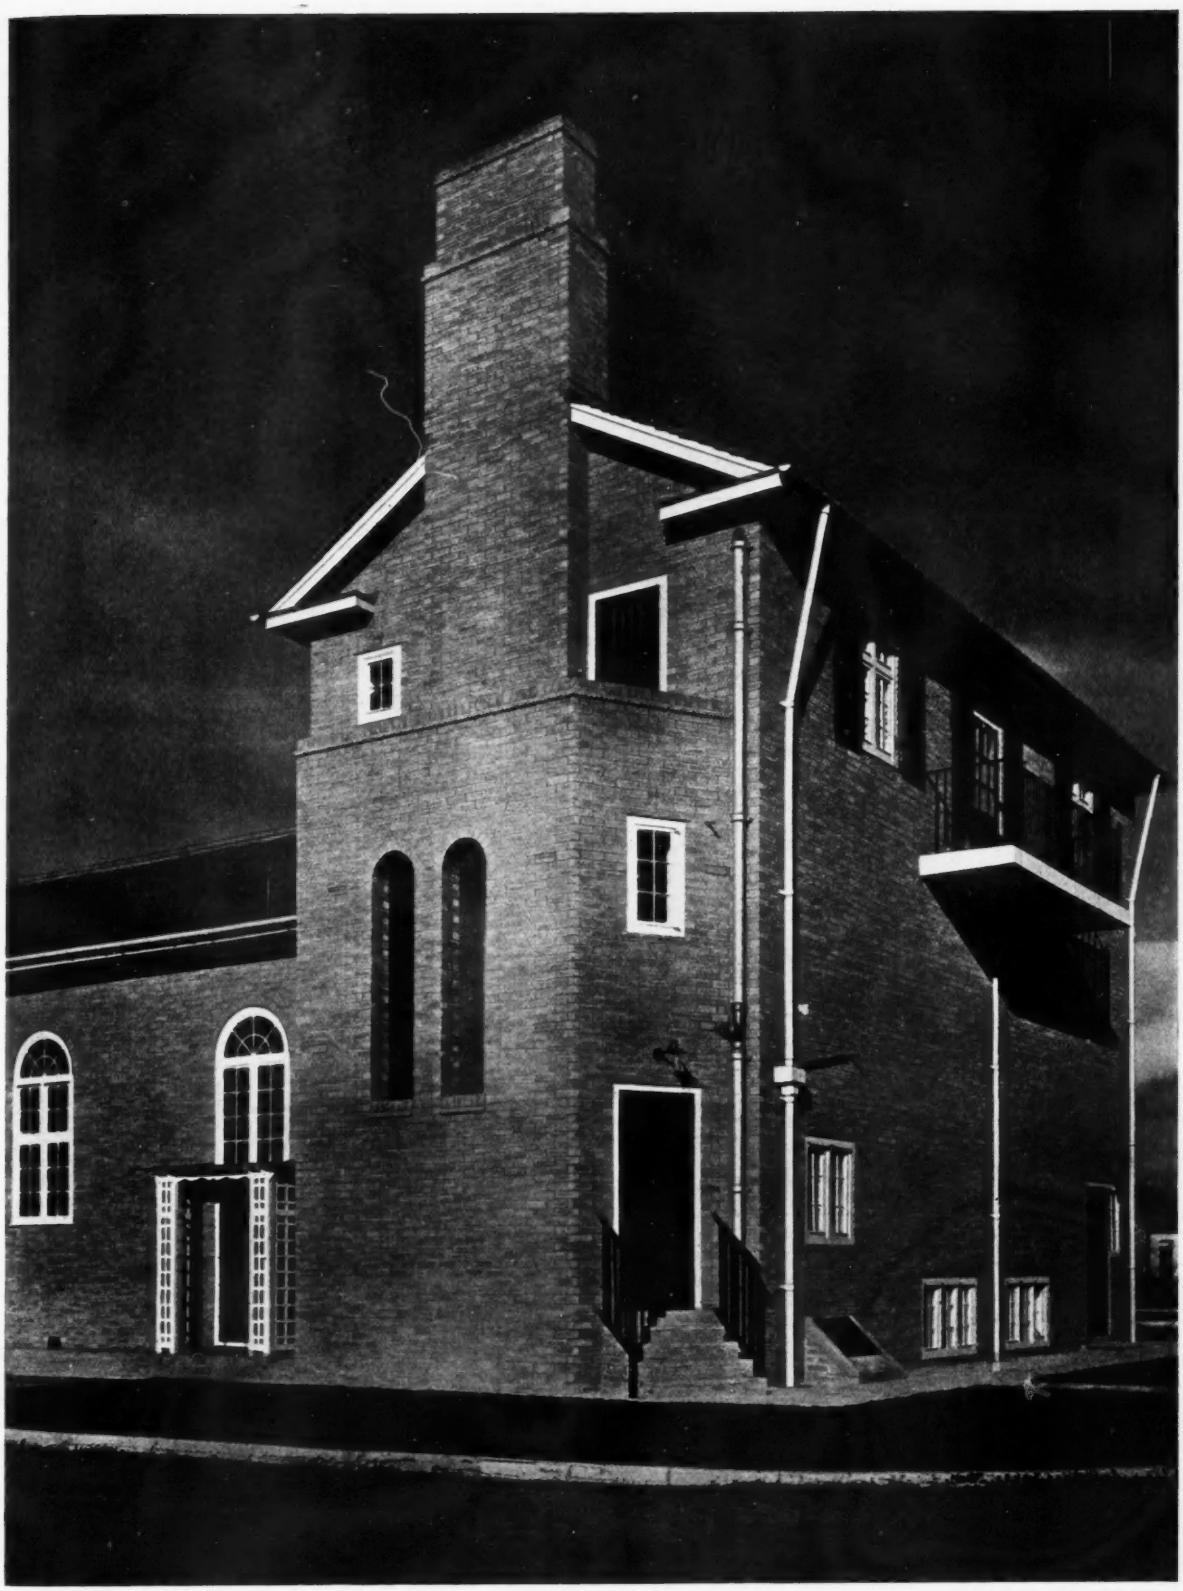
Karshish, in The Honeywood File, *half-promised a sequel. Readers will need no reminder that the super-paint that Sir Leslie Brash coerced his architect, Spinlove, into using, gave early signs of "crawling out of the front door and off home," in the phrase of Grigblay, the builder. In the case of any building adventure there are bound to be many vexed questions of defects, renewals and replacements, of accounts and extras, some of them involving the liability of both architect and builder. They were assuredly not absent from Honeywood Grange, but they were left more or less in the air.* Settling-up Honeywood *is to disclose how matters fell out; the first instalment will appear next week.*

The main entrance front, with its clock turret and belfry, carries emblematic ornamentation in a gilded beehive and a device in full colours on copper over the doorway-opening itself. The walls and pillars, in rustic brick, display fine craftsmanship, further exemplified in the photograph on the facing page. Immediately within is a four-square entrance-hall with tablets on each wall commemorating those employees (of the London Brick Company and Forders, whose workers the village was built to house) who fell in the war.

HALL IN A MODEL VILLAGE

Stewartby, Bedfordshire

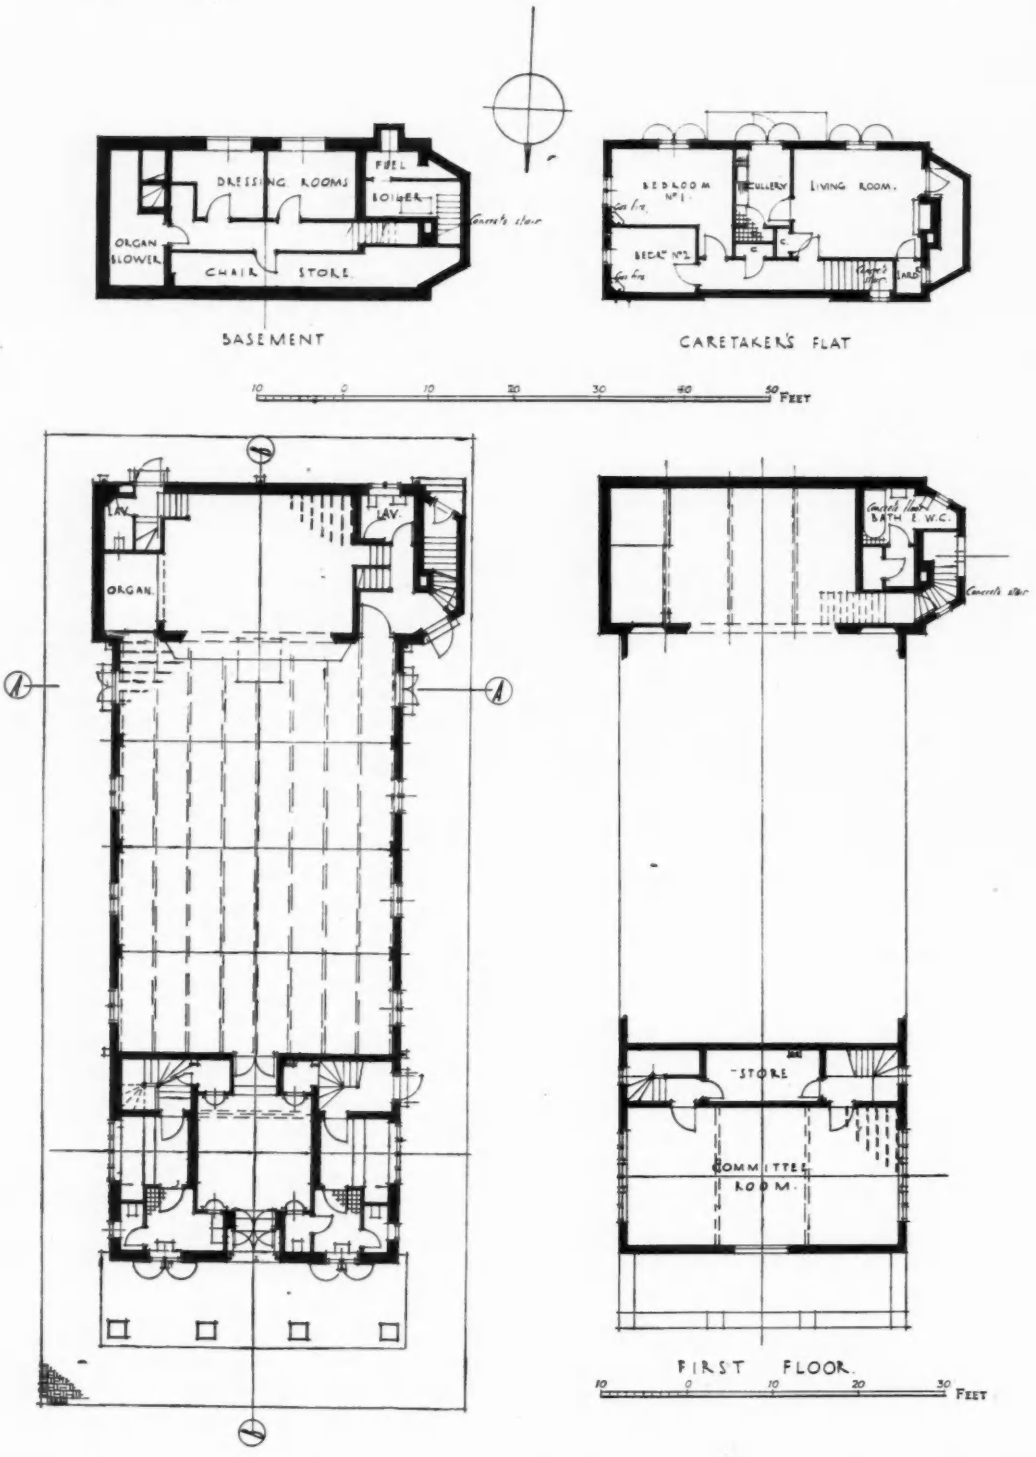
DESIGNED BY E. VINCENT HARRIS



THIS village hall is built in the most prominent position in Stewartby model village, and completes the scheme of it. The name is adapted from that of the chairman of the London Brick Company and Forders, by whom the village has been built for their workers.

Designed to be in keeping with the general character of the village, and intended for meetings and social entertainments, including theatricals and the cinema, the hall has naturally been built throughout of the company's bricks. The interior walls are of cellular Flettons and the exterior walls of multi-coloured rustic Flettons, produced with a rough combed surface which, by reason of special treatment in the burning, are given a variety of warm shades of brown. The facing bricks have been selected to give a pleasant warm, sunny brown effect, which deepens into purple in the shadows.

The timbered gable surmounting the four-square columns of the entrance front is finished in white and decorated with a golden beehive, symbolic of the industry. Above the gable is a clock turret with copper cupola, on which, as a weather-vane, is mounted a golden ship. This ship is the complement of the Stewart arms which are painted in full colours on copper in the tympanum of the entrance doorway. At the other end of the building, above the stage, is a caretaker's flat.

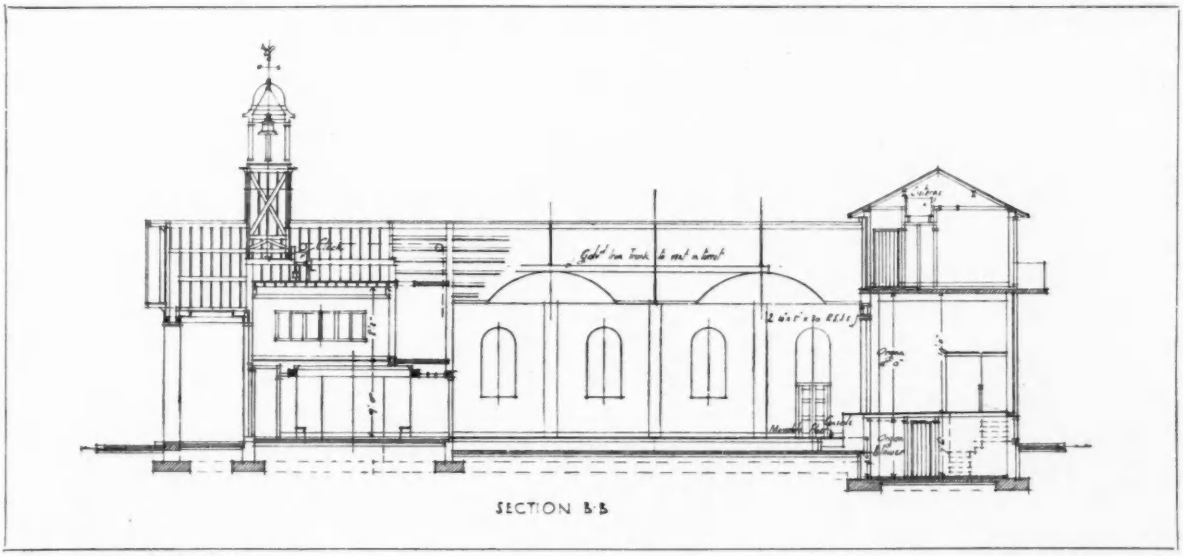


In contradistinction to the red-tiled roofs of the village, the hall is roofed with the finest of Westmorland green slates; and the green note is repeated in the doorways, shutters and external metal work.

The interior colour scheme is very simple. The ceiling is white, and the walls are in a medium buff, which tones well with the maple floor. Grey is used for the doorways and stage woodwork, while the curtains are of silvery brown velvet. The seating capacity is about 300, and the entrance lobby forms a war memorial to the company's employees. The contract price was about £5,300. Mr. Frederick Walker, architect for the estate, supervised the erection.

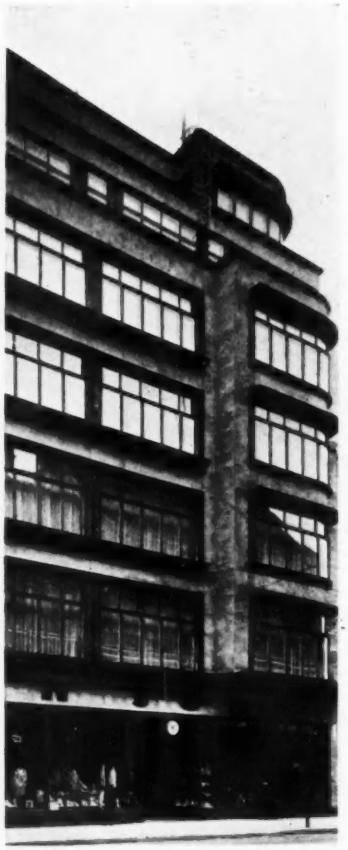
Stewarthy Village Hall, Beds.] [*By E. Vincent Harris.*

The rear of the building, from the south-west. Here is, on the second floor, the caretaker's flat, with its separate entrance doorway on the splayed end, its stairway running up past the pair of deep openings, free to the air, and its balcony. A portion of the hall, with a side entrance, is seen to the left. The windows near the ground light dressing-rooms under the stage, and beyond is the stage door.



Stewarthy Village Hall, Beds.] *[By E. Vincent Harris.*

The front entrance of the hall faces north. At the back end is the basement, under the stage, with dressing-rooms connecting therewith. The hall proper extends through two floors, but room has been found, on the first floor, behind the proscenium line, for stairs and lavatory for the caretaker's flat that occupies a second-floor extension over the stage. On the first floor, also, over the memorial lobby, is a committee-room.

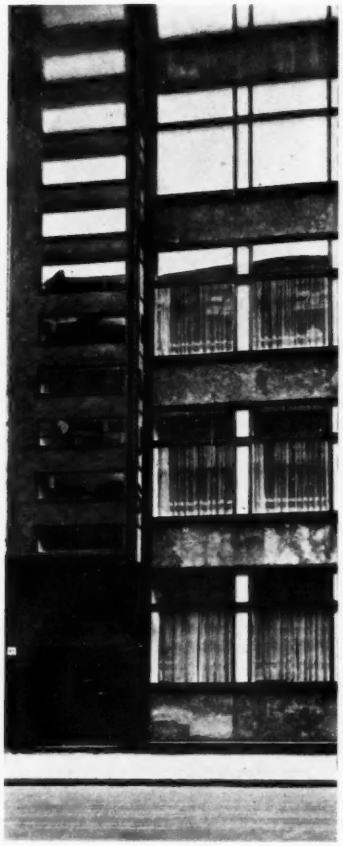


A view of the interior of the hall, showing the stage and one of the ceiling lights. A section of the flooring immediately at the front of the stage is movable, so as to allow of its extension at will. The door on the right gives access behind the scenes; the organ console is made to balance it, on the left. A view taken from the stage forms the subject of the frontispiece of this issue (page 778).

Stewartby Village Hall, Beds.] *[By E. Vincent Harris.*

This longitudinal section is reproduced to the same scale as the plans on the facing page, and shows the two domed lighting recesses in the ceiling of the hall, which also serve the purposes of ventilation, being connected to a trunk communicating with a vent in the clock and bell turret. The organ is housed to one side of the stage, with blowing-chamber in the basement beneath.

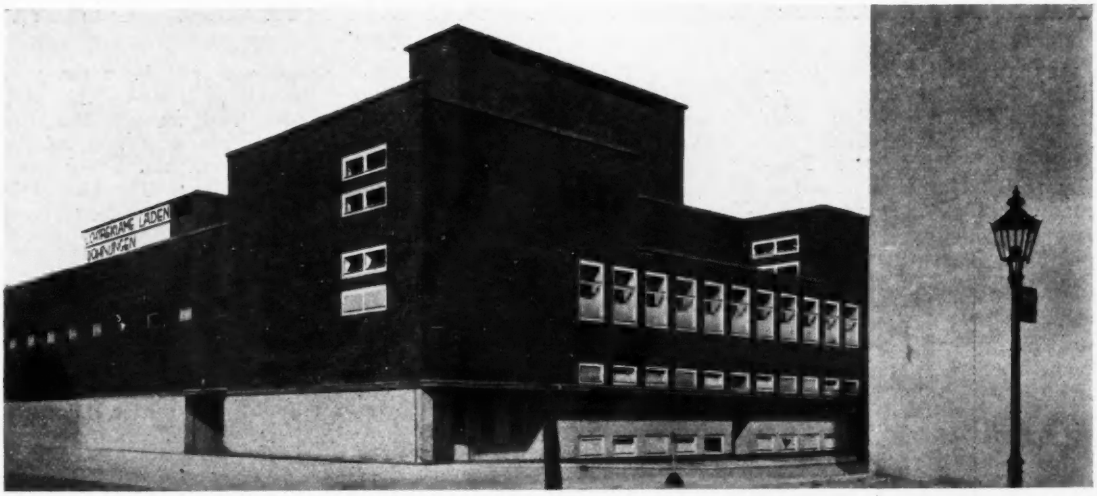
An old building reconstructed on lines of mathematical symmetry, with characteristic cornerwise fenestration: the store of Herpich Söhne, in Berlin.



The Einstein Tower, Potsdam, an early design in concrete, by Mendelsohn.

MENDELSOHN

THE examples here reproduced have been selected as typical of the main aspects of Mendelsohn's art. It was in 1921 that the Einstein Tower drew attention to his arrival upon the scenes.



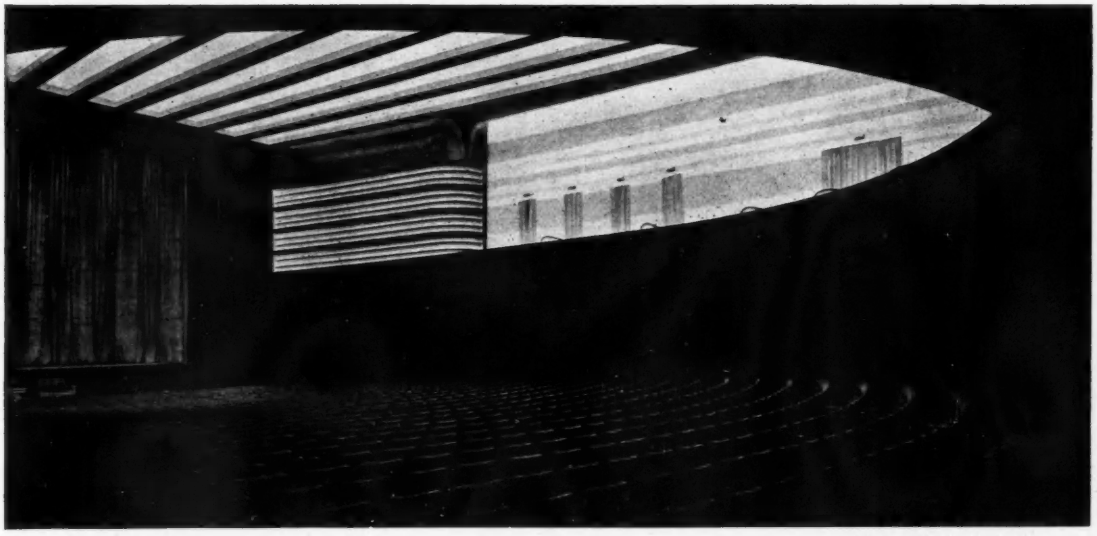
A good many reconstructions marked the years that immediately followed. They began with the enlargement of the "Mossehaus," the headquarters of the newspaper and publishing interests in Berlin. The old twin façades were cleft by a new entrance and staircase well, and topped by a

A new office-block in Berlin. Letters of its name, "Deukon Haus," can be discerned, running down the vertical sign above the entrance.

Another store building with vast curvilinear windows that are made to tell the more by contrast with the comparatively modest horizontality of the main mass: Schocken's, in Stuttgart.

Everyone is familiar with the great curving front of the Universum Cinema, Berlin; the stage end, with its simple play of masses, is less well known but equally impressive.

IN MANY MOODS



belt of new floors above the old attic story, having no stylistic relation with what was retained. Another typical remodelling is here illustrated, together with photographs of several original designs. These are among a large collection now on view at the Architectural Association, as whose guest the eminent German architect is at present in this country. So widespread was interest in his lecture, on Monday, that it was repeated the following day.

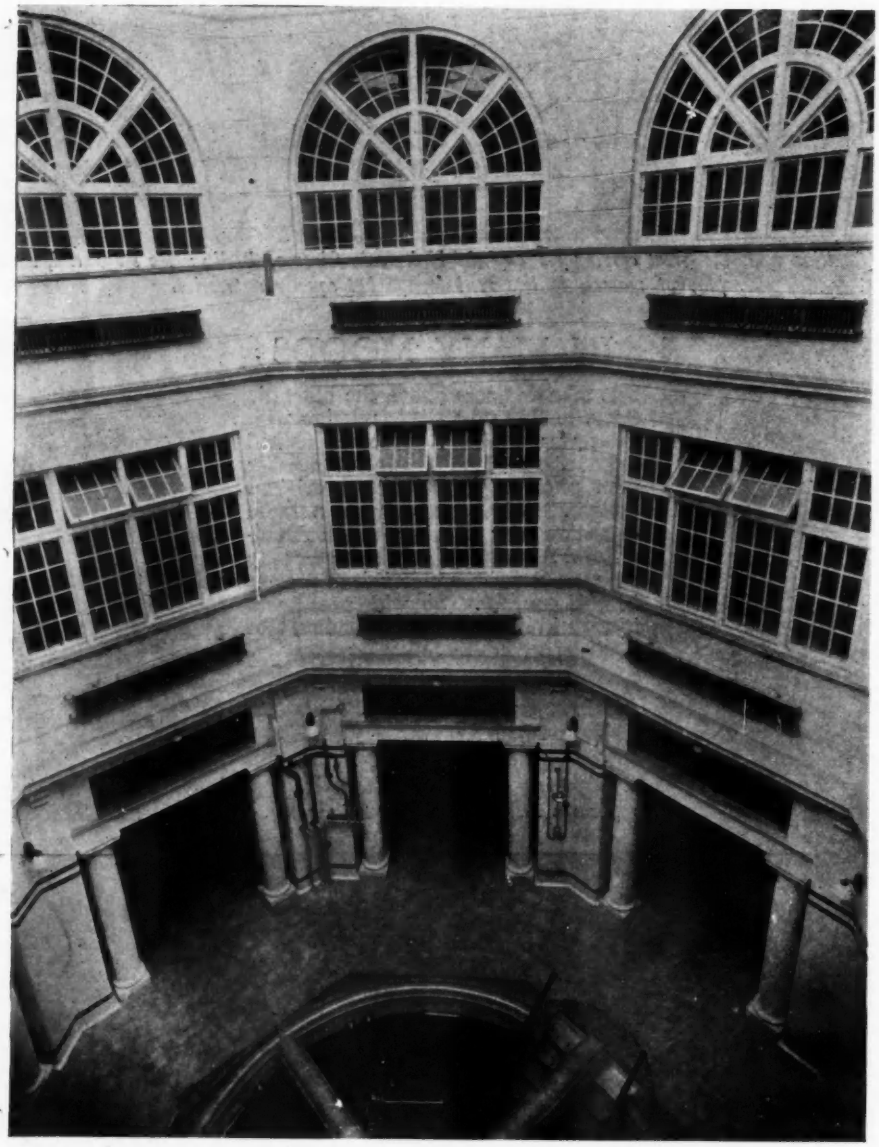
Above the entrance of the Deukon Haus the vertical sign is bent at right angles to form a shelter.

Straight lines and curves figure, in yet another guise, in these flats behind the Universum building.

[*Photographs by F. R. Yerbury.*]

The interior of the Universum, looking towards the stage, has been criticized as offering no solution of the problem of relating the rectilinear proscenium to the sweeping curves of the house.

GREAT BRITAIN'S FIRST RHEUMATISM CLINIC



DESIGNED BY THOMAS A. POLE

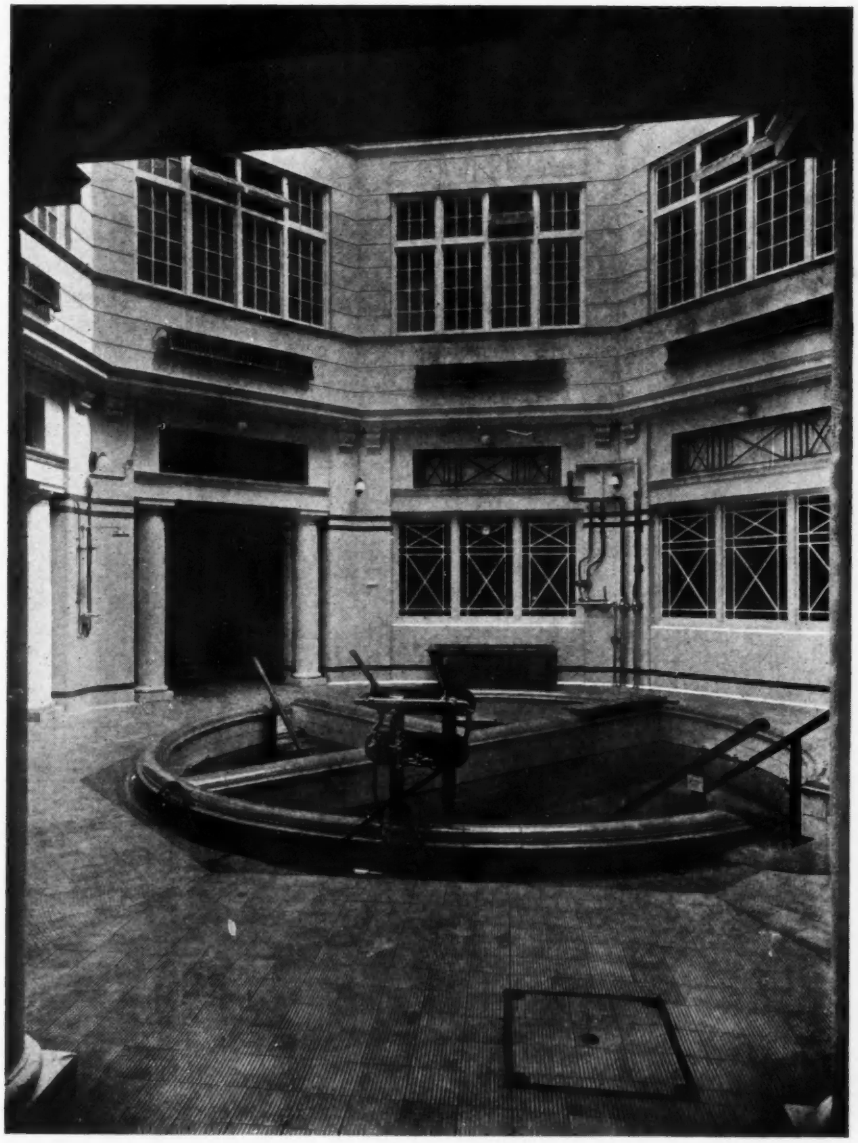
IN 1927 the International Committee of Medical Hydrology approached the British Red Cross with a view to establishing a clinic for the treatment of rheumatism in London. By 1928 all arrangements had been made, a successful appeal for funds resulted, and a representative committee comprising all interests concerned, was formed.

After much investigation the Committee secured a Crown lease of the old Regent's Park Baptist Chapel, 18 Park Square East, and Mr. Thomas A. Pole, the architect, who had previously visited a number of French and German centres and carefully studied the problem from all points of view, was instructed to prepare plans, etc.

The building was originally designed by John Nash in the late-eighteenth century as a panorama, and it was converted into a chapel about 1850. It was extremely irregular on plan, being shaped somewhat like a fan. In the basement were classrooms about 10 ft. high, above this the chapel, about 34 ft. high, and a one-storied annexe attached. Practically all the internal work was gutted for the purposes of the clinic, leaving the main walls only. The annexe has been converted into staff and administration offices, with the boiler and power-house under. The chapel itself was divided into three floors, each about 14 ft. high, and the problem of lighting the building was solved by the introduction of a central octagon 36 ft. across, running through the three floors and crowned with a glass dome.

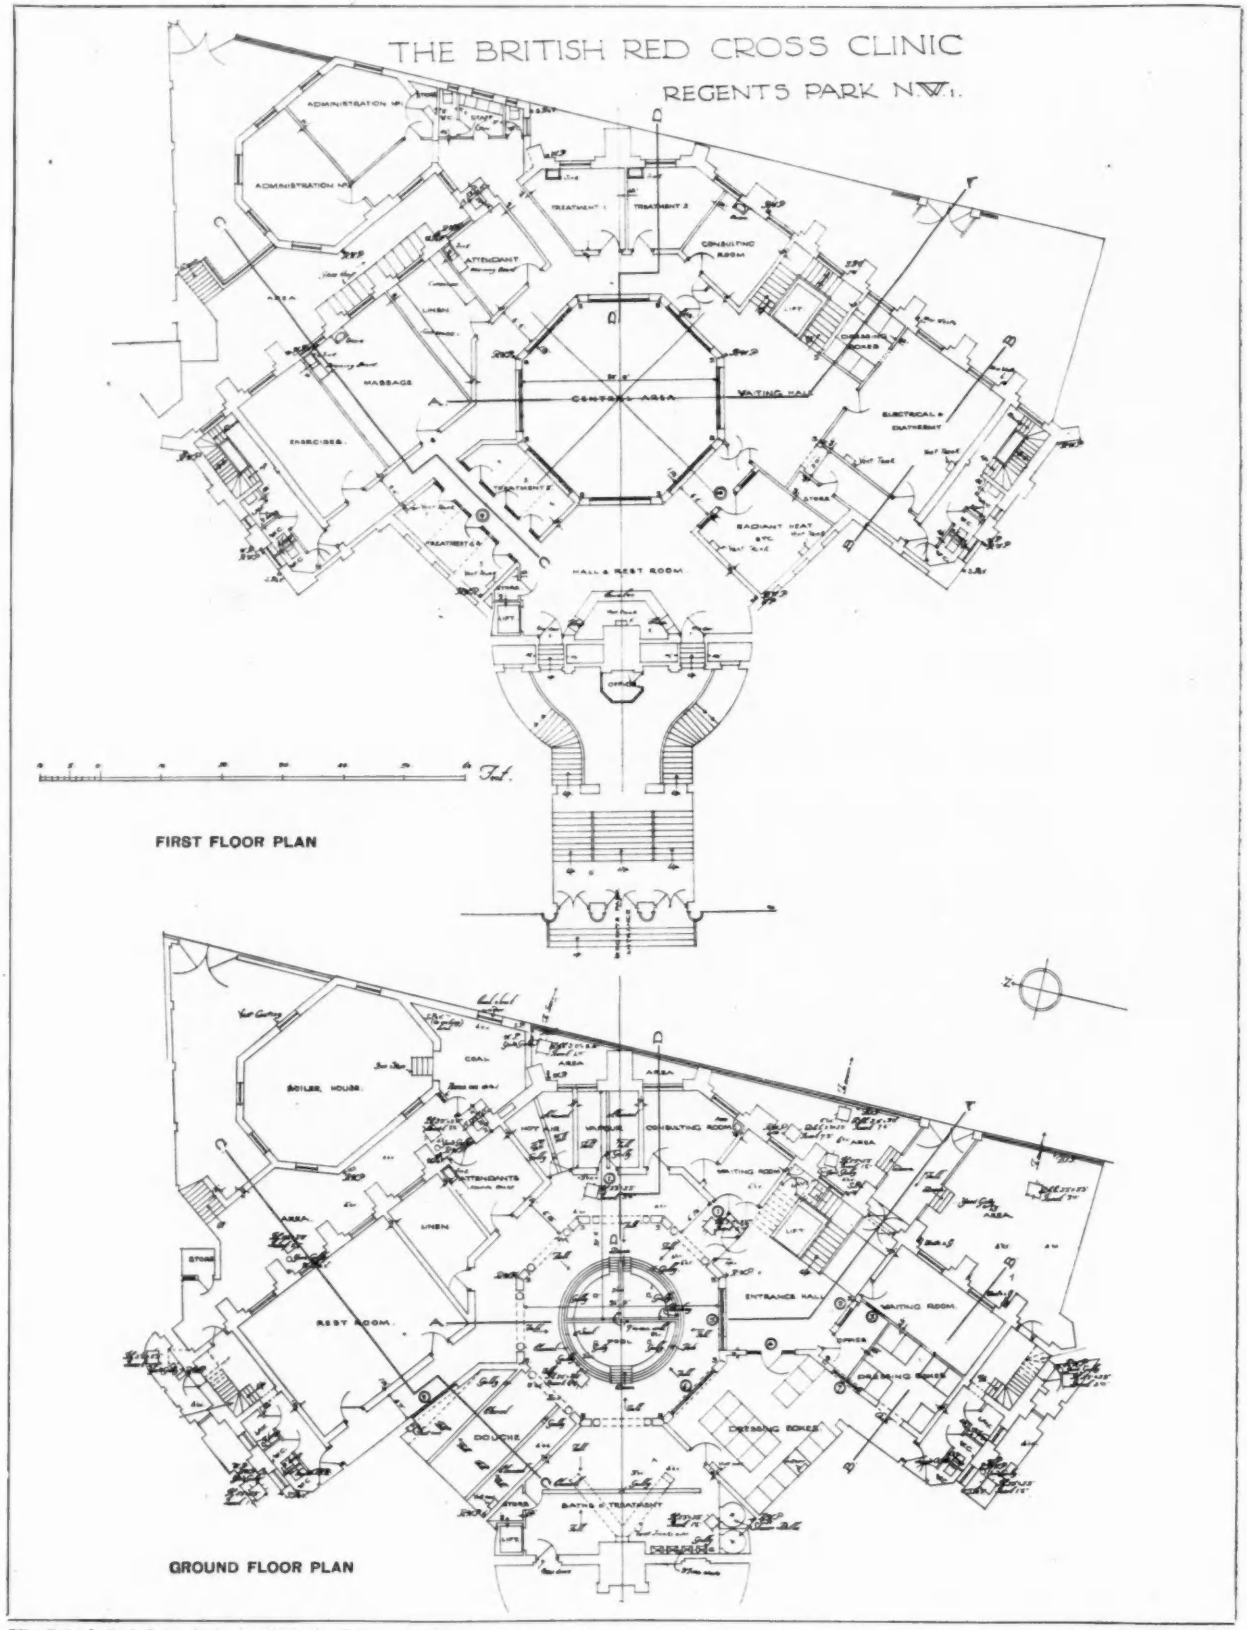
The ground floor is devoted entirely to hydrotherapy treatment. There is a good entrance hall from Peto Place,

The British Red Cross Society's Clinic was officially opened by Her Majesty the Queen. Its most impressive feature is the central octagon, which contains the manipulative pool for the hydro-therapy treatment. The view is taken looking from one of the semicircular windows down towards the pool.



with a main stairs and lift, and on the left is the main waiting-room, inquiry office, etc. The central area is occupied by the manipulative pool. Hot-air rooms, vapour rooms, various douche rooms and baths and treatment rooms are arranged. Dressing-room accommodation, linen rooms, attendants' room, consulting room and small waiting-rooms, together with the necessary lavatories for the staff and patients, and a large general rest room are also provided. There are escape stairs in the north and south angles of the building, and a second lift is provided.

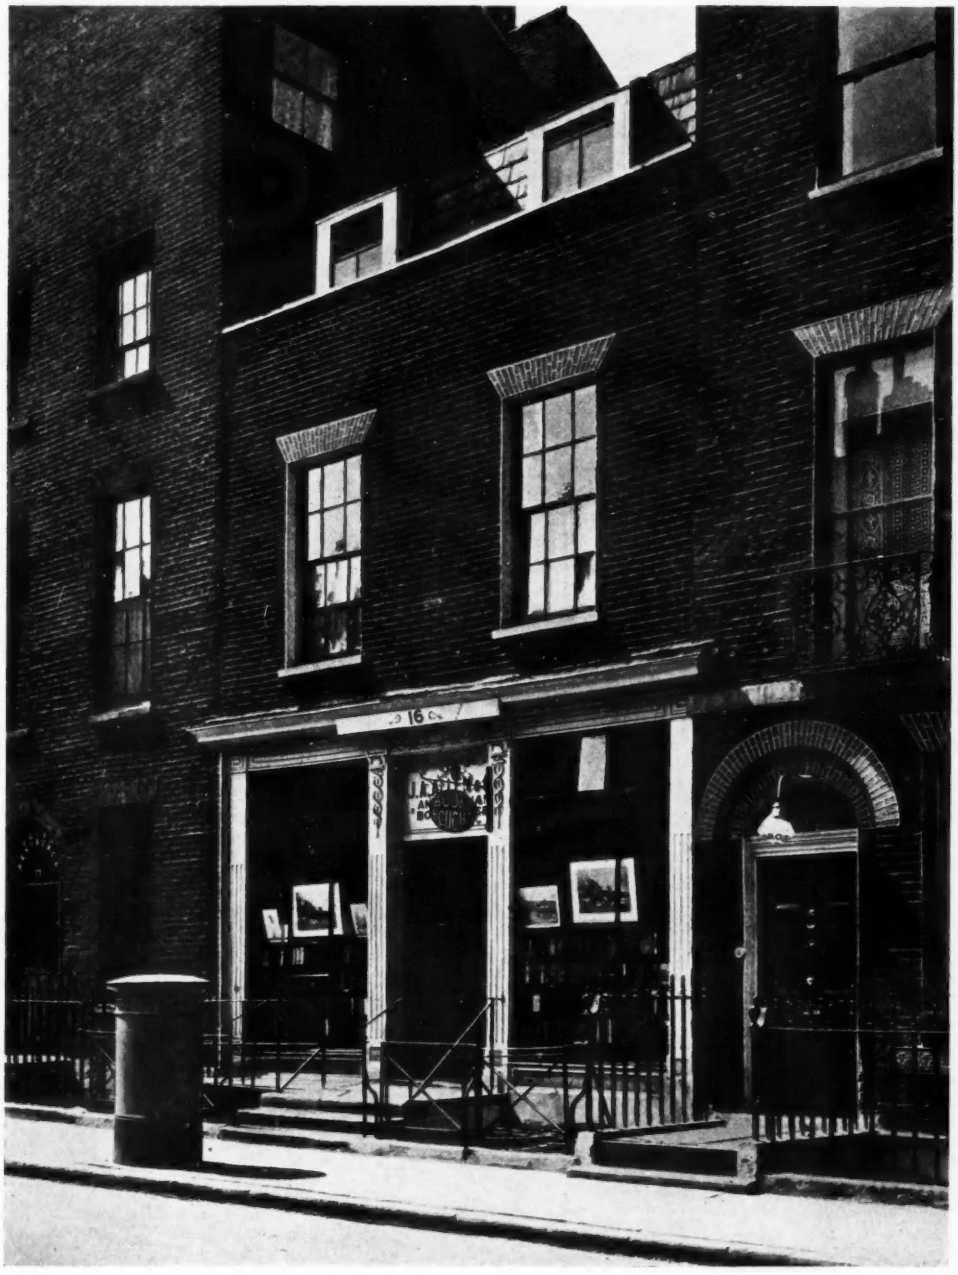
The first floor is devoted entirely to electrotherapy treatment. There are three large rooms fitted up as bio-physical units, a number of smaller rooms for various electrical treatments, and linen room, dressing-rooms, consulting room, and an entrance hall and rest room. Staff and lavatory accommodation is general on all floors.



Both the ground and first floors are intended for the treatment of insured persons, from the trade unions, friendly and approved societies, etc., and the clinic has been officially recognized by the Ministry of Health as being a centre to which the various societies may allocate funds for the treatment of their members.

The second floor is a kind of combination of the two lower floors and provides for both treatments. It is intended for the use of private patients who can afford to pay a little more for their treatment. The completion of this section of the work was made possible by the generosity of Sir Otto Beit, who contributed largely to the funds and success of the clinic.

The building is the first of its kind in Great Britain. Abroad, particularly in Germany, similar clinics on a much larger scale exist in many of the large towns, those in Hamburg, Berlin, Vienna and Amsterdam being conspicuous examples. The cost of the building, apart from furnishing and equipment, was about £36,000.



Another view of the central octagon. The pool is divided into three parts, giving baths of different temperatures. Around the octagon are dressing-boxes and rooms for consultation, vapour and hot-air treatment, and for rest. The semicircular-headed doorway leads to the entrance hall.

The British Red Cross Society's Clinic for Rheumatism.] [*By Thomas A. Pole.*

The ground floor is devoted to hydro-therapy treatment and the first floor to electro-therapy. The second floor is adapted for these treatments in combination. It contains all the necessary rooms, bathrooms, pools, etc., and is reserved for the use of private patients.

ENGLISH PRECEDENT No. 116

SHOP FRONT, No. 16 GRENVILLE STREET, BLOOMSBURY, W.C.

It took a long time for the shop to break away from its association with the house. This example, bold in its day, is hung with every emblem of domesticity: small in scale, windows rather for announcement of what is inside than display, and railings round the imaginary forecourt.

It is rather interesting to mark the enriched motifs over the doorway, on the pilasters flanking it, and on the stall board below the windows—all taken from the beautifully engraved books of Roman restorations then current. One imagines it as being what draughtsmen call a "cold crib," for the pilaster flutings are very coarse.

—[E. MAXWELL FRY.]

LETTERS FROM READERS

MODERNISM AND THE MAN IN THE STREET

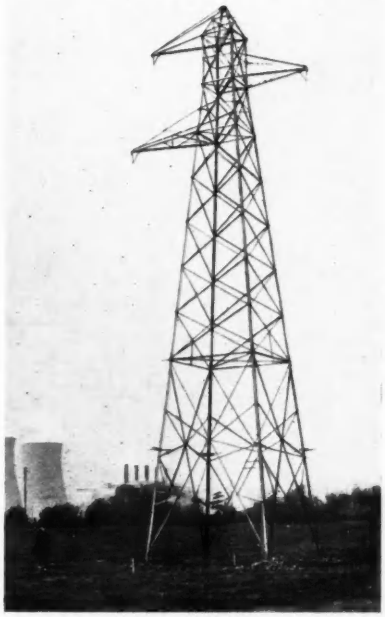
To the Editor of THE ARCHITECTS' JOURNAL

SIR,—The letter from "Quite the Ordinary Man in the Street," published in THE ARCHITECTS' JOURNAL for May 7, expresses an exceptional and not a general point of view. He is fairly answered by your own comment that, if his views were commonly held in this country, the "Modern Movement" would have made more headway than it has.

There are laymen who hold your correspondent's views—I have met one or two myself—but, in my experience, the layman, with a rare exception here and there, would sooner be seen going to his place of business in a burnous or a kilt than be willingly discovered in one of "these new-fangled buildings." I wish I could think otherwise.

JAMES BURFORD

ELECTRIC TRANSMISSION TOWERS



To the Editor of THE ARCHITECTS' JOURNAL

SIR,—In your issue for May 7, page 730, you reproduce an illustration from *The Face of the Land*, showing an extensive landscape with some very obviously faked electric transmission towers and lines defiling it.

Whilst I have every sympathy with the aims of those who would prevent the defacement of the countryside, I feel that nothing but harm can be done to the movement by the publication of such obviously faked propaganda. The towers in the picture are most grossly drawn, are pitched about half the distance apart they would normally be in such a landscape; and the cables, and even the towers themselves, have been drawn in with an inaccurate and exaggerated effect, which achieves nothing but the grotesque. I estimate that the cables shown in the illustration, if properly sketched, would be something like 12 inches in diameter, instead of their actual size, ½ inch or so, which would be quite invisible in the picture.

Honestly, do you consider that if a real transmission line had run across the landscape instead of a faked one, it would have been as noticeable as the railway line in the middle distance? Personally, I think that there can be something very charming about the design of these towers, particularly in the rise and fall of the graceful catenaries as they stretch across the country.

To give you some idea of the proper scale on which the towers ought to have been drawn, I enclose a photograph [reproduced on this page] of

An alloy steel transmission tower at Frodingham, recently supplied to the Central England Electricity Scheme.

FITTINGS TO ARCHITECTS' OWN DESIGNS

To the Editor of THE ARCHITECTS' JOURNAL

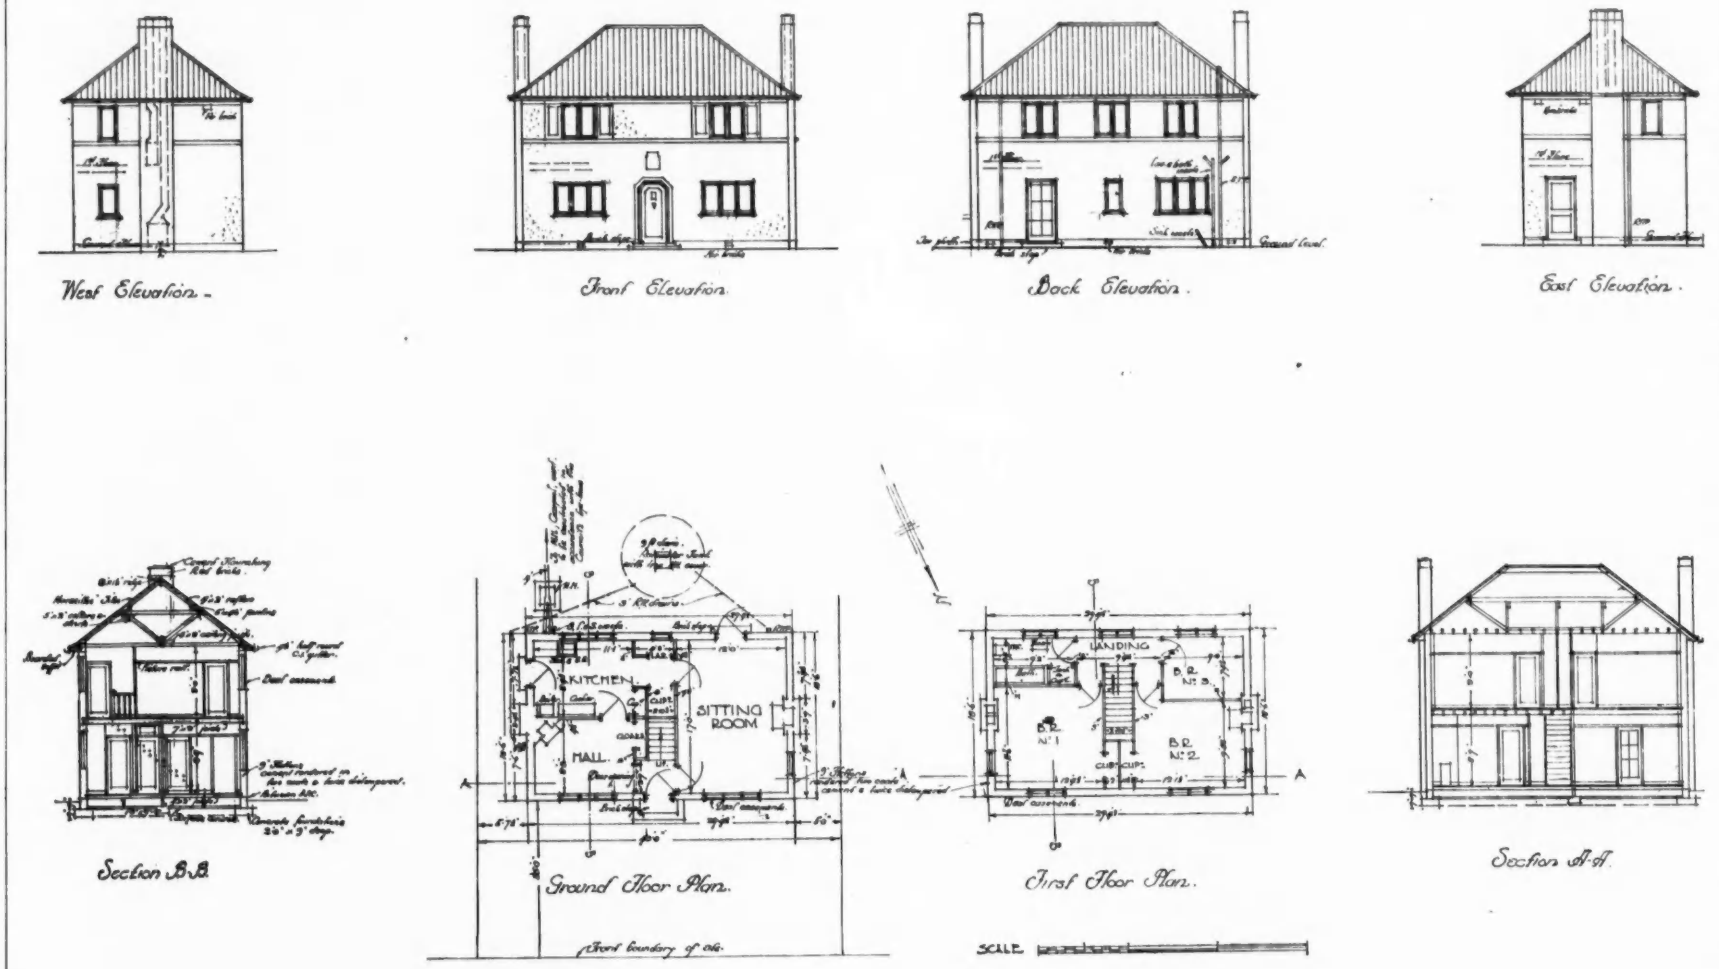
SIR,—The experience of Astragal's architect informant, referred to in your issue for May 7, page 707, interests me very much because the willingness of the Continental manufacturer as stated by him is not in accord with my experience.

Two years ago, when one of the leading English architects asked me to collaborate with him in the design of the electric light fixtures for a new liner, I wished to incorporate in the fittings pressed glass after the French style, but from my models.

As far as my knowledge went at that time there was no firm in this country with experience of modelled pressed glass, so I approached some French glass-making firms and also some Czechoslovakian firms.

Their replies were practically the same in all cases, viz.: if the work were carried out to my models these Continental firms required from £75 to £100 per mould, a guarantee of 500 pieces supplied from each mould, and a period of six months for delivery.

These terms were not a business proposition, so this type of glass for that boat went by the board. But I determined that I would never again be placed in the same worrying position. So I looked round among the English glass manufacturers for someone with whom I could collaborate to compete against the Continental work. I was fortunate enough to meet Mr. W. G. Riley, who had just come into control of the old-established firm of J. Walsh Walsh, Ltd., and we combined his engineering skill and experience and my sculpture and metalwork experience to turn the glass factory for a portion of its work into new channels. It was lucky we set to work so thoroughly and quickly, for twelve months later a sister-ship required electric light fixtures, and this time decorative pressed glass was requested by the steamship line directors.



The designs called for some twenty to thirty models involving a similar number of metal moulds. The whole of the cost of these models and moulds was sunk by us in the fittings, which were therefore produced at a commercial price. The work was executed and delivered in ten weeks from date of order, *and* there was only one breakage between the factory and destination on board ship.

But there is still a point Astragal's informant should consider before he is too severe on manufacturers in this country. Architects are very individualistic in their designs. It is not often that they will agree that fittings which suit the expression for one building are in keeping with what they desire to express themselves. So I have some sympathy with manufacturers who hesitate to spend a few hundreds in producing to an architect's design fittings which can only bring them a profitable return if they turn the full efforts of their selling organization in this direction.

WALTER GILBERT

Will a correspondent who writes from Norwich and signs himself "A Pupil" please let us hear from him giving us, in confidence, his name and address. The names of correspondents are not published in THE ARCHITECTS' JOURNAL *unless permission is given by the writer, but no notice can be taken of unsigned letters.*

A number of letters have reached the Editor in connection with the voting for the R.I.B.A. Building Jury. It is hoped to publish a selection of these letters, but they are being held over till next week when the result of the voting will be dealt with in a special article.

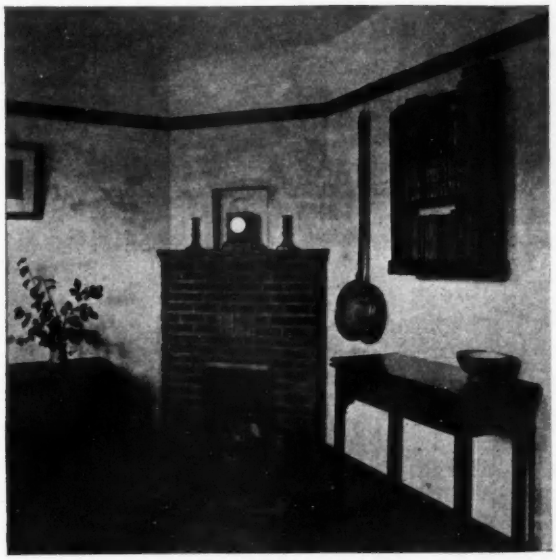
House at Holmer Green, Bucks.] [*By Frank T. Winter.*

The plan takes the form of a rectangle, the sitting- or living-room occupying about one-half of the ground floor and running from the front to the back of the house. The remaining half of the ground floor is devoted to the lounge-hall, which is equipped for hats and coats, and the kitchen, and store cupboards. On the first floor are three bedrooms and a bathroom. Gas and electric services are not available at present, and cooking is done by an oil-stove and oven.

AN ECONOMICAL HOUSE AT HOLMER GREEN, BUCKS.

DESIGNED BY FRANK T. WINTER

The entrance front. The walls are covered with stucco and the roof with tiles. Two slightly projecting bands are introduced to form a frieze. This and the front door surround are dark cream, and a plaque of the same colour over the doorway links the two together. The remainder of the wall surface is light cream.



THIS small house has been economically designed, and built within certain definite limits of cost and size. The plan is arranged within a simple rectangle—an important element where economy has to be considered. It includes an entrance lobby, lounge hall, sitting-room, kitchen, and larder on the ground floor, and three bedrooms (two with built-in cupboards), bathroom and w.c., and linen cupboard on the first floor.

In the lounge hall the furniture is antique and well suited to the character of the room. The sitting-room is 17 ft. by 12 ft., and runs from the front to the back of the house, and has a French door leading to the garden.

An independent boiler provides hot-water service to the various fittings. Gas and electric light services are not at present available, but a supply of water is taken from the company's mains, in addition to a soft-water supply from a rainwater well.

In designing the exterior an attempt has been made to give distinction to an otherwise plain building. Two horizontal bands are introduced to form a frieze, which is linked up with the front entrance by a plaque above the doorway. The horizontal treatment is further emphasized by shutters to the first-floor windows. The two external chimney-stacks are carried up quite plain in stucco and finished at the top with a course of red bricks on end.

The cost of the house worked out at approximately £600.

The fireplaces in the lounge hall and in the sitting-room. The former is in 6 in. by 2 in. multicoloured, sand-faced bricks, and tiles, and has an armour-bright rim and fret. That in the sitting-room is in similar bricks and flat ½-in. tiles. A touch of colour is introduced by a small panel of Delft faience tiles.

QUESTIONS THAT ARISE

ARCHITECTS' CLAIM FOR SCALE FEES

"Architect" writes: "*In 1919 another practitioner and myself were appointed joint architects to carry out the housing scheme for an Urban District Council, and the minute governing the appointment stated that we were to be remunerated on the terms of the R.I.B.A. scale.*

"*Our appointment was not confirmed by a sealed agreement, and the minute of the Council is the only evidence of our engagement. Since our appointment we have been responsible, up to now, for the development of land and erection of nearly 600 houses.*

"*Will the absence of a sealed agreement preclude our suing the Council for fees based on the R.I.B.A. scale, or will we be obliged to accept the reduced scale of fees issued periodically since 1919 by the Ministry of Health? These Ministry fees were never communicated to us, and we were not asked at any time to adopt them.*"

I have no information in the papers now before me as to whether the Urban District Council referred to has erected the houses by virtue of the powers conferred on them by the Housing Acts.

If it be assumed that the houses were so erected, what is then the position of the architect who, in the case now before me, was appointed by the Council to undertake the work, at a remuneration which was to be in accordance with the scale of fees prescribed by the Royal Institute of British Architects, but no contract under the common seal of the Council has been executed?

I am clearly of opinion that if the architect sued for his fees he would be met with a plea that the contract was unenforceable by virtue of section 174 of the Public Health Act, 1875, and further in my view, and I am clearly of opinion, that the defence would succeed, and that the architect would fail on his claim for any remuneration over £50, whether it be the R.I.B.A. scale of fees, the Ministry of Health's scale, or any scale whatsoever.

The matter is so important that it is proposed to explain fully the reasons for the conclusions at which I have arrived.

Section 174 of the Public Health Act, 1875, is as follows: "With respect to contracts made by an urban authority under this Act, the following regulations shall be observed; namely (1) Every contract made by an urban authority whereof the value or amount exceeds fifty pounds shall be in writing and sealed with the common seal of such authority."

It will be observed, therefore, that if the contract falls within section 174 of the Public Health Act, 1875, it is not enforceable if it exceeds £50, unless the contract is in writing and is sealed with the seal of the Council.

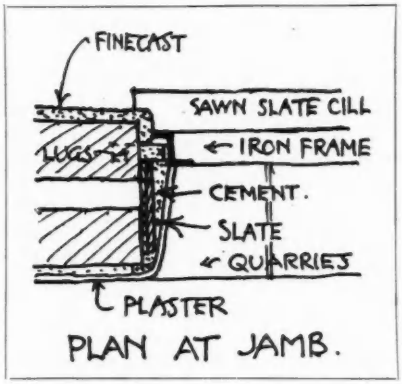
The question, therefore, is whether the formalities set forth in section 174 of the Public Health Act, 1875, apply to contracts entered into under the Housing Acts.

The Court of Appeal in the case of *Nixon* v. *Erith Urban District Council* (1924), 1 K.B. 819, held that section 174 of the Public Health Act, 1875, governs contracts entered into by urban district councils under the Housing Acts.

The Courts do not like extending section 174 of the Public Health Act, 1875, to other Acts so as to enable urban district councils to escape from paying their debts unless the Acts state clearly that the provisions of section 174 of the Public Health Act, 1875, are to apply. (*Lawford* v. *The Billericay R.D.C.* (1903) 1 K.B. 772, and *Douglas* v. *Rhyl D.C.* (1903), 2 Ch. 407.)

If the Council erected the houses under the powers contained in an Act to which section 174 of the Public Health Act, 1875, does not apply, I am asked to advise as to what scale of fees should be paid to the architect.

In my view the R.I.B.A. scale would apply, as it was the scale of fees mentioned in the "verbal" agreement.



In the absence of data before me I am unable to form a final opinion as to whether or not the houses were erected under the Housing Acts, but I feel suspicious that they were, and if this is so in fact the architect cannot recover more than £50.

It is assumed that the Ministry are unaware that the contract was never put into writing and executed under the common seal of the Council, otherwise in my view they would refuse to make any offer.

The architect would be well advised to consider any offer over £50 he might receive. E. F. I.

STANDARD CASEMENTS AT THE SEASIDE

A. H. G. writes: "*Is there any objection to fixing steel-frame casement windows of the modern type in seaside houses, direct into the brickwork? I am contemplating house-building (for myself), and am told here that in the position indicated—about 150 yards back from the sea, facing south (i.e. towards sea)—such windows, even of the very best quality, are useless, as they always let in rain in heavy weather, with rain and wind, if fixed directly into the brickwork.*"

PLAN AT JAMB.

I have used ordinary standard cottage casements in several houses in exposed seaside situations, built in directly to brickwork, without any trouble whatever from rain penetrating the jambs. Hollow walls were used, the jambs built up solid with a vertical slate dampcourse dividing inner and outer skins, and the external face was finecast and distempered (see sketch).

The important point to observe is, I think, that the metal frames should not be built in so close to the jambs that no joint-filling material can enter. I arranged a space of about ¾ in. at the jambs, into which the external rendering was turned, and had the internal jambs undercoated in cement as a slight splay, so that this internal rendering also entered the space, meeting the external coat. As a general principle, where any form of cement joint must be formed, let it be never less than ½ in. to ¾ in. The arrangement described also prevents the casement hinges from being buried in the external rendering. E. G.

Building Practice Today

THE SPECIFICATION WRITER is the title of a department which, from next week onwards, will make its regular fortnightly appearance in THE ARCHITECTS' JOURNAL. The Editor, in deciding to create this permanent section, has been influenced by a view which is heard expressed more and more often nowadays. According to this view the modernization of building methods has gone ahead more rapidly on the drawing-board than it has in the written document. But all buildings have to be described as well as drawn. Notes and figures have to be added to the sheets of drawings. Constructional methods have to be worked out; materials and processes have to be specified. The practical man who does all these things will find the SPECIFICATION WRITER department his most valuable aid.

HOW WERE THE PYRAMIDS BUILT?

BY D. DAVIDSON

Last week's extracts from his paper, "Pyramid-building Problems: Man-power Organization, etc.," recently read before the Institution of Structural Engineers, carried the author's argument as far as establishing the total time and yearly progress of building the Great Pyramid. Upon these and other considerations an interesting conclusion as to the method of raising the stones is now based.

OUR investigation at this stage has introduced us to the pyramid problems of supply and demand. Our sole means of investigating the rate of supply is to study the evidence of the rate of demand. This evidence is provided by the ascertained levels in pyramid building attained in each successive year's work of building.

Examples worked on this basis show why ten years had to be devoted to preliminary work before the actual building work commenced. The same comparative rate for quarrying as for building to the height stated—the blocks being the same in both cases—would give all the blocks for the pyramid quarried in eight and a-quarter years. The preliminary period of ten years, mentioned by Herodotus, therefore seems to be ample for the quarrying of the masonry for the Great Pyramid. This would mean that the majority of the skilled masons and other artificers who were later barracked on the Pyramid site could be employed to advantage in the quarries before the actual building operations began.

Sir Benjamin Baker came to the conclusion that Herodotus' statement of 100,000 men for three months in the year for ten years was quite reasonable for quarrying the blocks and getting them across the Nile.

The limestone quarries from which all the blocks for the Great Pyramid were taken are situated on the opposite bank of the Nile from the Gizeh plateau on which the Great Pyramid stands, and are about seven miles up-river from the latitude of the Great Pyramid. The stones were transported across the Nile on barges or rafts at the time of the inundation, when the river was five miles wide.

Petrie states that it is likely that a year's supply of stone would be kept on hand at the Pyramids, on which the masons would work. . . .

"What the number of skilled masons was we may well guess from the accommodation provided for them in the barracks behind the Second Pyramid. These barracks were used by the workmen of Khafra; but those of Khufu must have been equally numerous and have occupied a similar space, if not, indeed, these identical buildings. The barracks would hold 3,600 or 4,000 men easily, and as about 120,000 average blocks were required to be prepared every year, this would be only one block of stone prepared in a month by a party of four men, which would probably be the number of masons working together. Hence this accommodation is really more than enough; and most likely a good deal of lifting and building work would be going on throughout the year, beside the supply of labour during the inundation."

Our next problem concerns the actual building work on the Great Pyramid. There were approximately 2¼ million blocks of stone, and the approximate total weight was 6 million tons. Our investigation has shown that this gigantic mass of masonry was built in twelve years. How was this done? The popular theory, for more than 2,000 years, has been that an inclined embankment led up to the Pyramid, and was heightened as the Pyramid was raised. Sand, of course, could be the only material available at Gizeh for such a colossal road embankment; but a single sandstorm—a phenomenon normal to Egypt—would destroy in an hour the labour of months or years. Apart, however, from the latter consideration, any earth-embanked roadway would need to be at least 20 ft. wide, and would require side slopes of at least two horizontal to one vertical. It would be useless to construct a roadway of this description at a steeper gradient than 1 in 7, and the road surface would require to be paved, after ample time had been allowed for embankment settlement. The latter requirement alone would require the road surface to be taken up, the embankment to be raised, allowed to settle, and the road surface relaid for each successive stage of the Pyramid's building. Let us, however, dismiss these objections to see what result the embankment theory achieves when carried logically to its illogical conclusion.

To serve its purpose the roadway would have to be at least 350 ft. high at the Pyramid. It would have to approach from the east, and its north side slope would overflow the cliff edge of the Gizeh plateau, to the sandy plain 100 ft. below. The north slope of the road embankment would therefore extend 900 ft. horizontally northwards, and the south slope on the plateau would extend 700 ft. southwards, giving nearly one-third of a mile for the cross-sectional base width of the roadway. Both side slopes would also overflow along the north and south slopes of the Pyramid unless colossal wingwalls were provided to retain them.

At the base of the plateau, on the side of approach from the east, the roadway would be at least 190 ft. high, with a cross-sectional base width of at least 780 ft. The roadway would be at least half a mile long, and the work required to build the road embankment by native labour, and to quarry, transport and build the blocks into the Pyramid, and then to demolish the monumental roadway, that buried the Pyramid and its environment, would occupy the whole period of sixty-three years that Manetho ascribes to the reign of Khufu. This is the single merit that the embankment roadway theory of building possesses—namely, that it agrees with the impossibly long reigns that Manetho gives for the Gizeh Pyramid kings. The fact that the Pyramid masons tipped all their chippings over the edge of the north cliff of the Gizeh plateau, however, proves that no inclined earth embankment was ever built; since these chippings could not have been tipped there if the embankment had existed during the construction of the Pyramid.

In thus dismissing the embankment roadway theory of building we must not, however, assume that we have dismissed the possibility of building by means of inclined planes.

All the known evidence shows conclusively that the ancient Egyptians always employed manual labour, and adopted the simplest of mechanical principles, in moving and lifting enormous masses of stone—masses frequently considerably heavier than any known masses in the Great Pyramid. The evidence is also conclusive that they never adopted other than the simplest of mechanical devices as aids to human labour. These comprised the principle of the lever, the use of skids or sledges, and the principle of the inclined plane.

The majority of the blocks in the Pyramid's masonry courses weighed between 2 and 3 tons. The heaviest

block in the base course does not exceed 20 tons. Several other deep courses may have contained some blocks as heavy as 10 to 14 tons, but the greater number of stones were under 5 tons in weight.

Professor John Goodman has written : "Most of the stones do not exceed 2 to 3 tons each. These could easily be carried by gangs of labourers. I saw stones carried in this way at the Assuan Dam, and Sir Murdoch Macdonald told me that 5 tons was about the limit. It is impossible to get sufficient men on to one block for greater weights.

". . . There are many places on the sides of the rocky plateau on which the Pyramids are built where the rock is worn smooth in wide grooves up the face of the cliffs—and which were probably the places where the stones were hauled up."

The latter statement quoted shows us that if the blocks were hauled up the cliffs they could have been hauled up the sides of the Pyramid as easily on suitable temporary skid-ways or haulage ramps laid at an even gradient ascending across the Pyramid's face slope.

"There is, however, quite a different problem," continues Professor Goodman, "in lifting the big granite blocks over the King's Chamber—about 50 tons each. These, I think, as Petrie points out, were rocked up. On these blocks there are marks of four lugs. The lugs have been cut off, but the ring marks of the trepanning drills are there, evidently made when the stone was in the rough. The surrounding stone was cut away, leaving the projecting lugs. As the blocks were tilted on these lugs (acting as fulcrums) bronze wedges were inserted under the other two lugs, again tilted, and so on. On one occasion Petrie and one man in a few hours lifted (in this manner) a block weighing 8 tons sufficiently for Petrie to crawl under and examine the chisel marks. If these lugs were not used for this purpose, what were they for? Of course the lugs were chipped off when the block was got into position."

What Sir Flinders Petrie has to say in this relation should prove helpful. In his *Arts and Crafts of Ancient Egypt;* he states as follows :

"Where stones needed to be raised for a pyramid or a pylon, some staging was required. Remains of a massive brick slope still stand against each face of the unfinished pylons at Karnak. This, however, is only the general mass of the staging, and the actual steps for the stones must have been of stone, as brick would crumble to powder if any lifting work was done directly upon it.

"For short blocks a cradle of wood was used, of which many models have been found in foundation deposits along with model tools. On tilting this to one end, and putting a wedge beneath it, it could be rocked up the slope, and so gradually raised, first to one end and then to the other. For large blocks, the actual lifting was probably done by rocking up. If a beam be supported by two piles near the middle, a small force will tilt it up clear of one pile; on raising that pile the beam may be tilted the other way, and the lower pile raised in its turn. Thus rocking from pile to pile, a beam can quickly be raised till it is high enough to be moved on to the next step. It was probably thus that the fifty-six granite beams, weighing over 50 tons each, were raised in the Pyramid of Khufu."

While it is possible that the application of the principle of the inclined plane, here noted by Petrie as adopted in erecting pylons at Karnak, may have been adopted in some form or other in building the Great Pyramid, it is impossible to conceive the 2¼ million blocks of the Pyramid being raised by the laborious process of rocking up described. This process might suffice to raise the Pyramid in the sixty-three years that Manetho ascribes to Khufu, but would not suffice to raise it within the twelve years' period established by our investigation.

We have seen, then, that two methods are on record as to how the ancient Egyptians raised stones to a height. By one method they raised the stones, both large and small, by alternately rocking and wedging them up. By the second method the heaviest masses of stone were dragged up an incline. For both methods recorded, temporary inclines were provided. The first of these methods would not have sufficed to raise the Great Pyramid within the known reign of Khufu. We are, therefore, limited to the methods of raising by carrying the blocks up temporary inclines or of raising the blocks by dragging them up temporary inclines.

For carrying up, the load, as we have seen, is limited to 5 tons. Many blocks in the courses of masonry up to over half height were of greater weight than this, although the majority of blocks throughout the Pyramid vary in weight between 2 and 3 tons. In the fourth year's work of building there were many blocks over 10 tons in weight, although the average block for this fourth year's work was 4 tons. The laying of the latter heavy blocks —in the thirty-fifth course of masonry, which is 4 ft. 2 ins. deep—completed the building of half the Pyramid's weight during this fourth year of building.

Again, the blocks over 5 tons weight are so sufficiently numerous that to have rocked them up the temporary inclines or even up the courses would have too frequently broken the sequence of lifting or hauling the lighter blocks up the temporary inclines. There is an exception, however, in the case of the larger granite and limestone beams over the King's Chamber. These were only fifty-five in number, and each weighed over 50 tons. The evidence cited by Professor Goodman is conclusive that these huge beams were raised by rocking. From this two facts emerge. One is that the rocking up of only fifty-five blocks could be organized so as not to disorganize more than one or two haulage routes temporarily out of many haulage routes for the blocks of the courses. The other fact is that the gradient for these routes was considerably steeper than the 1 in 20 gradient required for the raising of the colossi of Ramessu IV, as otherwise our roofing beams could have been hauled up the routes for the blocks of the masonry courses.

We cannot logically conclude that blocks from 1 to 5 tons were carried up the same inclines as those provided for dragging blocks from 5 to 15 tons. Nor can we imagine separate inclines for carrying and separate inclines for dragging. We can only logically conclude that all the blocks for the masonry courses were dragged up inclines of a gradient considerably steeper than 1 in 20. The reason for a flat gradient not being adopted is obvious. A flat gradient would have "cork-screwed" too many times in ascending round the Pyramid's side slopes. Now, the angle of repose of limestone on limestone gives a gradient just under 1 vertical to 2 horizontal. On this account, and on other accounts, this is too steep for rapid and economical haulage by manual labour. Again, any gradient flatter than 1 vertical to 4 horizontal unduly crowds together parallel ascending routes when successive arris edges are turned by these parallel routes. Every time the routes turn a right angle from one face slope on to another the routes are drawn closer and closer together.

With a gradient of 1 vertical to 4 horizontal, a route starting at a base corner of the Pyramid had traversed the half width of one face slope of the Pyramid when it had attained the height for laying the thirty-fifth course of masonry, with the laying of which course half the weight of the Pyramid had been built. The same route reached the first arris edge at one-third total Pyramid height, at which height seven-tenths of the Pyramid's weight had been built, and one-half of the total human energy necessary to build the Pyramid had been expended. This was at the base level of the sixtieth course, the level at which the first series of massive roofing beams over the King's Chamber were laid, and

also completed the sixth year's work of building. The same route, continued, reached the second arris edge at 0·56 total Pyramid height, completing nine-tenths of the Pyramid's weight, and four-fifths of the total human energy. The same route, continued, performed a complete circuit of the four face slopes of the Pyramid at four-fifths the total Pyramid height. At this level 0·99 of the total Pyramid weight had been built.

The route taken as an example is only one of many parallel routes that would be laid temporarily, beginning from each base side. The width of the lowest stage of a route—before it turned the first arris edge—would be fixed by the width required to drag the widest block for that stage. The same would hold for the next stage, and so on. The width of the lowest stage would therefore determine the maximum possible number of routes that could be built. The narrower they could be, the less masonry, or other material, would be required to build them.

The probable provisions, as I have outlined them, suggest that the best means of dragging for human labour would be provided by a shoulder and torso harness for each labourer so that the effort would be part lift and part pull. This method of organization would require a sledge to carry the stone, skids up which the sledge would slide, and treads of shallow steps on both sides of the skid-way for the labourers. The sledge would require to be open on the haulage end, but would need to be provided with high sides and back; and precisely such a sledge is shown on the illustrations, from the Pyramid period, of sledges for conveying stones. Rope, stone, and gypsum, for bedding and jointing, were the three materials that Egypt provided in abundance.

Other materials for construction had to be imported. The inclines were, therefore, probably of mud brick cores with stone paving, and one retaining side of stones built on the courses. It is obvious that this means the casing stones had to be laid when the core masonry courses of the Pyramid were laid; as otherwise the original temporary haulage routes would have had to be demolished to permit the laying of the casing stones, and a second series of temporary haulage routes would have had to be laid to build the casing. For the casing stones to provide a grip or bed for the temporary haulage routes, they would require to be left stepped or rock faced. This is the manner in which the casing stones of the Third Pyramid of Gizeh were built, since many of the granite casing stones of this pyramid are still left rock faced, showing the original surfaces of the water-worn granite boulders from which they were cut.

With this method of building, the demolition of the temporary haulage routes would begin from the top downwards, the casing sides being dressed to a smooth surface as the covering haulage routes were removed. This is in accordance with the account given to Herodotus. Herodotus states that "The upper portion of the Pyramid was finished first, then the middle, and finally the part which was lowest and nearest the ground." This, it will be observed, gives three stages of demolition of temporary work and finishing off of permanent work. Now, the average number of stages for all temporary haulage routes at our gradient of 1 in 4 is precisely three.

We have not yet succeeded in proving, however, that the 2¼ million blocks of the Pyramid could be hauled up the Pyramid and built in twelve years. The haulage problem is best approached by studying the building problem. From the level of each year's work and the depth of the courses we can obtain approximately the total number of stones that had to be laid in each year. I have divided the work into levels of twelve successive years, and for analysis have taken stages of two years. The completed square area of the first year's work of each stage of two years' work I have taken as the average bedding area for the two years' work. I have divided this area into squares of equal area in which one block had to be laid per hour to build the ascertained number of blocks in two years. For the first two years' work this method gives one block laid in a square 81 ft. by 81 ft., and in the last two years' work, in which the blocks were of considerably less weight, one block was laid in a square 35 ft. by 35 ft.

These figures are based on a working year of 300 days, and a working day of 10 hours, which I have adopted merely for purposes of comparative analysis. The data disclosed by the analysis show that the building work could be done even in a quarter or a third of the time allowed, providing that the haulage organization could supply the blocks.

In the first two years' work seventy-six blocks, averaging 4½ tons, had to be supplied per hour; and in the last two years' work fifty-seven blocks averaging 1½ tons had to be supplied per hour. From two to four of the latter blocks could be dragged in a single sledge. I have shown that the bulk of the problem of haulage lies in the lower stages. From the standpoint of the number of blocks supplied per hour, the first two years' work is the worst. If we take six haulage routes per side or twenty-four for the whole circuit of the Pyramid, the available width for the construction of each inclined roadway is about twenty-five. The road need not be so wide as this, since the builders would have to consider economy in building up the retaining wall side between parallel routes.

This layout of temporary routes for lower stages would give slightly more than three blocks per hour per route supplied for building. More and narrower routes could be supplied with less expenditure of material. From all of which it is obvious that, even if my working year and working day are considerably reduced, the work of haulage could supply the builders with material that the builders could lay, within the twelve years' building period established by this investigation.

(*Concluded*)

A Plea for Wood Carvers

Mr. H. E. Taylor, General Secretary of the London Cabinet and Upholstery Trades Federation (Employers), and Mr. B. Rockman, London Secretary of the National Amalgamated Furnishing Trades Association (Operative Carvers), write to us as follows: "May we ask for a little of your valuable space to call attention to the enclosed copy of a letter which is being sent out to a considerable list of appropriate addressees?

"It is certainly no part of our mission to decry the beauty and simplicity of twentieth-century furniture and architectural work, which relies for its undoubted charm and effectiveness on applied rather than incised ornamentation. It would surely be as grievous a mistake, on the other hand, to regard all carving as merely 'dust-traps' (involving unwarranted extra labour) as it would be to condemn it merely because an earlier and more leisurely generation gave it too much prominence."

The letter enclosed reads as follows:

DEAR SIR,—We venture to appeal for your assistance in a matter which we are sure cannot fail to strike a responsive chord.

Owing partly to general industrial conditions, but even more to "changes of fashion," unemployment among wood carvers is exceptionally heavy at present. This is not only serious to these men (and their families) personally, but also from the point of view of their skill in an ancient and honourable craft.

It would surely be most regrettable if, owing to lack of opportunity, these men's "hands" should "lose their cunning."

We ask you, therefore, as we are asking furniture manufacturers, to consider the propriety of endeavouring, wherever possible, to introduce *some* wood-carving, at any rate, into any schemes on which you are engaged, to which it would be appropriate.

Thanking you in anticipation of your most valued assistance,

(Sgd.) H. E. TAYLOR,
General Secretary, London Cabinet and Upholstery Trades Federation (Employers).

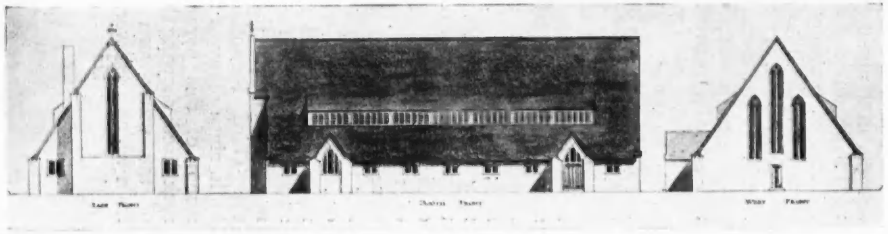
(Sgd.) B. ROCKMAN,
London Secretary, National Amalgamated Furnishing Trades Association (Operative Carvers).

THE SKETCH CLUB: THIRD SESSION

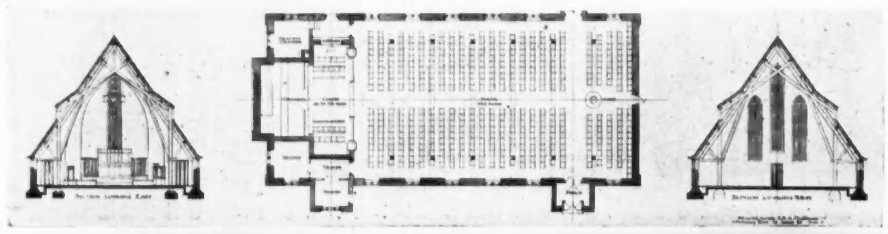
"The Academy has come and (with this session) goes—long live the Academy!" Such is the cry that may be heard wherever SKETCH CLUB *members congregate today. With characteristic enterprise they are preparing a special entertainment for their next session. An important item is to be a competition which can best be described in the words Shakespeare puts into Falstaff's mouth in praise of sherry: "It ascends me into the brain." To disclose more at the present moment would be decidedly impolitic.*

The Church of Saint Christopher, Cove, Farnborough.

THIS building shows the influence of the Continental modernist school. In particular its fenestration has the characteristics which may be expected of it, for whereas, in the architecture of past ages, the designer always strove to balance the vertical and horizontal emphasis so that neither obtruded itself at the expense of the other, it seems to be one of the distinguishing marks of modernism that the emphasis is either markedly vertical or markedly horizontal. Here the architects have plumped for verticality.



By Herbert O. Ellis and Clarke [R.A. Exn., No. 1360.]



IT is a somewhat strange twentieth-century development that commercial buildings frequently have towers or spires, while churches which, according to the convention of former days, were adorned with these emblems of architectural state, are now, as often as not, designed like plain barns. Accepting this condition, indicative of modern economic circumstances, Messrs. Curtis Green and Partners have devoted themselves to the task of making the barn look interesting. To impart interest to the barn was not, however, sufficient, for it was also necessary to give it an ecclesiastical air. The often-quoted dictum that if we allow the plan of a building to find logical expression the correct architectural character will result may be a true guide in the design of a factory, but it does not suffice for a church; for an ecclesiastical hall need not differ in shape from many other types of hall used for public assemblage. Therefore the architect must resort to symbolism. The symbol of the spire, now being fast corrupted by misuse, was in this instance abjured, perhaps for economic reasons. The employment of lancet windows, however, reminiscent of church architecture of the past, helps to create the religious association here needed.

By W. Curtis Green, A.R.A., and Partners. [R.A. Exn., No. 1385.]

The composition is vigorously conceived and the lateral façades of repetitive design have a pleasing simplicity. The arcade on ground-floor level provides a satisfactory base to the building, while the plain top without a cornice, bald though it may seem, is in keeping with the rectilinear shape of the tower itself. This latter feature, by virtue of which the building takes full advantage of the corner site, gives to the design a slightly ecclesiastical air, which was probably far from the intention of the building owners.

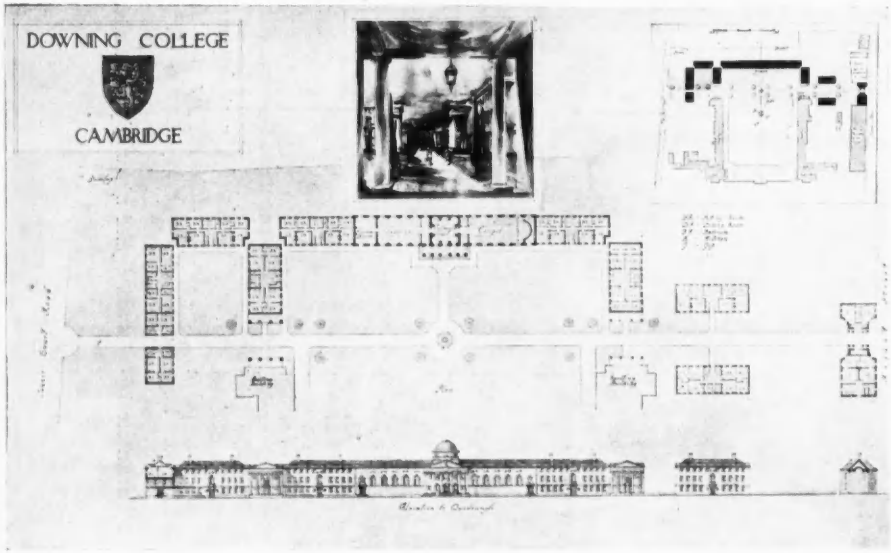
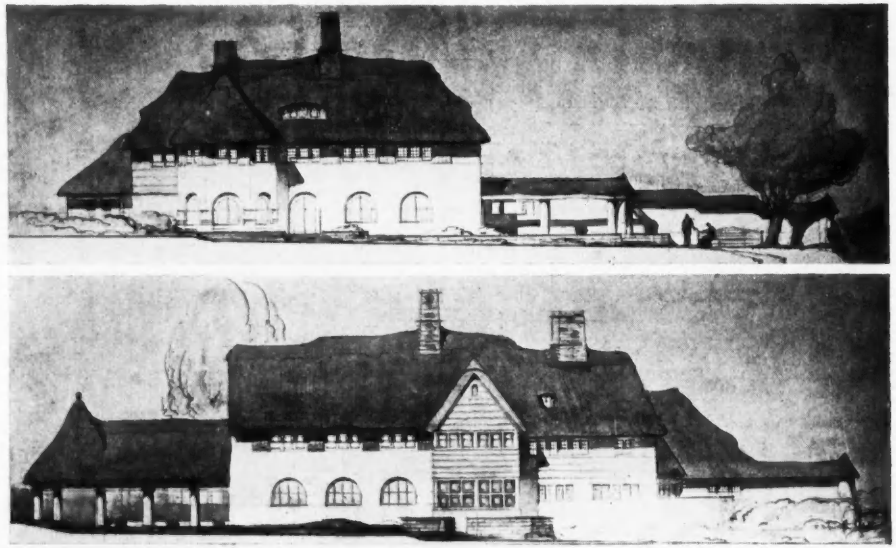
By E. B. Musman. [R.A. Exn. No. 1275.]



House at Esher, Surrey.

By Oliver Hill, [R.A. Exn. No. 1460.]



WHEN architects have discovered, or think they have discovered, a new principle of design, it is just as well that occasionally the principle should be carried to extremes, for by this means we are better able to judge of its validity. The long, continuous window, without any apparent vertical supports to the wallage above, is becoming very much the fashion these days, as is also the window which goes round the corner of a building. The result, here, in which both of these expedients are seen to be exemplified, is worthy of critical study.

A GARDEN elevation to a fairly large house provides an excellent opportunity for attractive architectural treatment, especially when the client decides to incorporate a loggia in the house. In this case the loggias, being in duplicate, take their place harmoniously in a symmetrical façade, to which they impart interest and breadth of scale. The layout of the garden, with its spacious lawn and the trees in the background, suggested in Mr. J. D. M. Harvey's rendering, are necessary to the pictorial effect desired by the architect.

Downing College, Cambridge. [R.A. Exn. No. 1379.]
By Sir Herbert Baker, A.R.A.

THE English collegiate tradition represents one of the finest architectural achievements which this country can show, and it is especially remarkable in that it belongs to both the Gothic and Classic periods. It is surprising therefore that this tradition, so clearly defined, should constantly be ignored in modern work both in Oxford and Cambridge. At Downing College, however, Sir Herbert Baker has designed a range of buildings which can be harmoniously associated with the existing college. Here the Classic convention is successfully employed and the long façades have a suavity and an air of restfulness peculiarly satisfying.

Two thatched houses at Worplesdon and Gifford. [R.A. Exn. No. 1449.]
By Philip D. Hepworth.

THESE houses, so similar in style that they deserve to be neighbours, show that thatched roofs, which in former days were generally employed in cottage work, can quite suitably be used in larger habitations intended to be set in a rustic environment. In these charming designs the character of the thatch is admirably brought out in the shapes of the roofs themselves, which have a softness of outline exactly suitable to the material. It will be observed also that the façades have the interest which is derived from contrast: the ground-floor or "reception" rooms are well differentiated from the bedrooms above.

LITERATURE

CHURCH AND CASTLE BUILDINGS IN THE MIDDLE AGES

THE latest volume of *The Cambridge Mediæval History* contains an important chapter on ecclesiastical and military architecture, the twin sections of which have been written respectively by the Dean of Norwich and Professor Alexander Hamilton Thompson, of Leeds University.

Dr. Cranage gives a compact and scholarly architectural epitome of the period in which "the principles of arcuated construction, so long groped after, became understood," and Gothic emerged out of Romanesque. Indeed, his only serious omission in a survey which ranges from Portugal to Cyprus and Trondhjem to Cefalù is in regard to those magnificent brick Gothic churches of the Baltic seaboard, like the grandly austere Marinekirche in Lubeck (the largest vaulted brick church in the world), summarily dismissed as "barn-like," which have had such a marked and wholesome influence on the design of modernist churches in Germany and Scandinavia. It is humbling to our own civilization to read that the Black Death and the Wars of the Roses, which synchronized with the erection of some of the finest English parish churches, caused less interruption of building activity than the late "war to end war."

Professor Thompson gives an absorbingly interesting account of the evolution and decay of the mediæval castle. The first English castles, properly so called, were built by Norman favourites of Edward the Confessor to overawe their Saxon neighbours, and represented an entirely alien type of military engineering. The old Anglo-Saxon *burhs* were simply either moated and palisaded rallying points for communal defence, or garrisoned centres of population; while the Danish *geweorcs* were entrenched base camps and ship-repairing depots situated on the banks of tidal rivers.

The private fortress was unknown until well into the tenth century. It was the logical, as well as the structural, expression of the rise of feudalism, and the symbol of that domestic anarchy which it was the hardest task of a feudal monarch to suppress. By a typical transference of meaning from the abstract conception signified to a concrete object identified with it, of which etymology furnishes many examples, the French term *donjon*, like the English word "dungeon," is derived from *dunio*, a Late Latin corruption of *dominio* = overlordship, the liege suzerainty of vassals.

The earlier form of Norman stronghold, known as the "motte-and-bailey" castle, was a wooden tower ("bailey") standing on an artificial mound (*motta* or *motte*), surrounded by a stockade which constituted its outer line of defence. After square stone towers were adopted it was found that their blind corners offered vulnerable points for mining and escalading attacks. Thus the rectangular *donjon*, or, as it was afterwards called, the "keep," gave place to a circular or elliptical strong point. Next, the curtain wall, formerly only an outwork, became the main defensive bulwark, and was transformed into a ring of projecting towers linked by a continuous parapet from which the besiegers could be enfiladed in every direction. Later still, the *donjon* was superseded by a heavily fortified gatehouse, whence "missiles as effective as, and more economical than, the molten lead of popular fiction" could be rained on assailants. With the concentric castle—a type of plan largely copied from Byzantine precursors of Vauban during the Crusades, of which the famous Krak des Chevaliers built by the Knights of St. John in the Lebanon is the most complete example—structural fortification reached its zenith.

Two of the nine figures specially modelled by Arnold Auerbach for the Avenue Pavilion, Shaftesbury Avenue, W. They are ivory-finished and are placed in amber-lighted niches of fluted aluminium.

Fortified houses with stoutly walled-in courtyards and dependencies continued to be built in turbulent frontier Marches like the Scottish Border. But though "it is probable that the invention of gunpowder and the use of cannon worked no very sudden change," the castle had seen its day and military engineering began once more to have recourse to earthworks. Hurstmonceaux's "mimicry of defence" marks the transition from military stronghold to English manor house. "The Wars of the Roses were fought in open field, not against castle walls." Blois and Amboise, once as redoubtable fortresses as Chinon and Loches, were gradually transformed into ornate palaces.

THE PROJECTS OF NIKODEMUS TESSIN

THE name of Nikodemus Tessin, Sweden's most illustrious architect of the seventeenth century, has received less recognition than it deserves. This is probably due to the fact that, like Inigo Jones, his most ambitious projects had the misfortune to remain projects and were never built.

Professor Ragnar Josephson, in this volume, deals almost exclusively with Tessin's unrealized designs for the Louvre and Versailles. Political rather than artistic considerations drew the two kingdoms together, but Tessin, long before his appointment as Superintendent of Buildings to Charles XII of Sweden, had visited France and made many personal friends at the Court of Louis XIV, among them Le Nôtre, Girardon, and Mansart. The influence of the first of these is strong in the layout of the gardens at Drottningholm.

Tessin's first design for the Louvre, if executed, would have ruined Perrault's new east front, and the central circular court carried out in Palladian detail, but obviously inspired by Vignola, is an attempt to reintroduce the strict Italian style into France. But the French Academy, which had condemned Bernini's designs, were equally uncompromising when they found these foreign features creeping in again by the back door in the drawings of the Swede. Mansart was immovable, and the design was rejected.

Louis XIV died before Tessin was able to submit fresh plans. Mansart also was dead, but it is unlikely that these new designs would have been more successful than the first. Under Louis XV the Louvre scheme was dropped. As for the Temple of Apollo at Versailles, that scheme was foredoomed from the start. A gayer spirit

was spreading over the Court, and the taste which approved the new Chapel and Watteau's "Embarquement pour Cythère" found Tessin's sober Italianate detail démodé. The book is well indexed, and the illustrations, besides reproducing the finished designs, include many preliminary sketches from Tessin's own hand.

LL. E. WILLIAMS

L'architecte de Charles XII, Nicodème Tessin à la Cour de Louis XIV, par Ragnar Josephson. G. van Oest. Paris et Bruxelles. Price 150 francs.

SOCIETIES AND INSTITUTIONS

ARCHITECTS' BENEVOLENT SOCIETY

THE annual general meeting of the Architects' Benevolent Society was held at the R.I.B.A. on May 14. The President, Sir Banister Fletcher, P.R.I.B.A., occupied the chair.

The President, in moving the adoption of the report, drew attention to the fact that the great event during the year had been the appeal to the allied societies, who had responded very generously both as regards contributions from the societies themselves and contributions from new donors and subscribers. This had been largely due to the efforts of the local honorary secretaries who had brought the Society to the notice of architects in their areas who were not contributors. The scheme had only started and the full effect of the appeal had not yet been felt. They hoped in time to have representatives of all the societies on the Council and had already nominated two members, Mr. Francis Jones, from Manchester, and Mr. C. M. Hadfield, from Sheffield. Canvassing was still going on. By next year, he hoped, they would be able to welcome a very large number of new representatives on the Council.

The annual report was adopted and the election to the Council for the year resulted as follows: President, Sir Banister Fletcher, F.S.A.; vice-presidents, Messrs. Walter Tapper, A.R.A., and H. S. E. Vanderpant; ordinary members, Messrs. C. H. Brodie, Maxwell Ayrton, H. D. Searles-Wood, Sydney D. Kitson, Percy B. Tubbs, H. Austen Hall, L. G. Pearson, W. Curtis Green, E. C. P. Monson, E. P. Warren, F. R. Hiorns, R. Dircks, Francis Jones (representing the Manchester Society), C. M. Hadfield (representing the Sheffield, South Yorkshire and District Society), E. Stanley Hall (representing the Architectural Association), and Arthur Crow (representing the London Society).

The following were re-elected to the same offices: Mr. Maurice E. Webb, honorary treasurer; Sir Charles Nicholson, honorary secretary; Messrs. C. H. Brodie and Osborn C. Hills, honorary auditors.

The annual report states that the total sum given away was £1,947 in grants, and £593 10s. in pensions. With the donations received and the falling-in of stock the Society has been able to invest £1,500.

R.I.B.A. COUNCIL MEETING

Following are notes from a recent meeting of the R.I.B.A. Council:

British Architects' Conference, 1931. It was decided, on the recommendation of the Allied Societies' Conference, to accept the invitation of the Royal Institute of the Architects of Ireland to hold the British Architects' Conference at Dublin in 1931.

The Grissell Gold Medal. It was decided, on the recommendation of the Board of Architectural Education, to abolish the minimum age limit of twenty-one and to make the competition open to those who have not been in practice for a longer period than ten years and who have passed the R.I.B.A. Final or equivalent examination, or have produced certificates from responsible architects to the effect that they have reached the required standard. This revision will not take effect until next year.

The officers of the Board of Architectural Education were appointed as follows for the session 1930–31: Chairman: Mr. L. Sylvester Sullivan. Vice-chairmen: Mr. W. H. Ansell (Chairman of the Examinations Committee); Professor A. E. Richardson (Chairman of the Schools Committee); Professor A. C. Dickie (Chairman of the Prizes and Scholarships Committee). Hon. secretary: Mr. A. H. Moberly.

It was reported that the Institute of Builders had appointed Major F. A. Wallis, M.C., to represent them on the Board of Architectural Education.

The Restoration of St. Paul's Cathedral. It was decided to hold, on a suitable date in June, a special Council dinner at which all the architects who have been concerned with the restoration of St. Paul's Cathedral should be invited as guests of honour, and to have a special general meeting on the same day at which a lecture, illustrated by lantern slides, on the work of restoration should be given.

Higher Buildings in London. The following members were appointed to represent the R.I.B.A. at a conference which is being convened by the London Society to consider the growing tendency to relax the conditions governing the height of buildings in London: Professor S. D. Adshead, and Messrs. Charles Holden, Arthur Keen, and W. Harding Thompson. It was decided to ask the representatives to support the previous policy of the Council in this matter, viz., that the Council are not in favour of any general relaxation of the present conditions as laid down in the London Building Act.

The South Wales Architecture Medal. Mr. G. C. Lawrence was appointed as the R.I.B.A. representative on the jury for the award of the South Wales Architecture Medal.

The Salaried Members Committee—Memorandum on the State of the Profession. A memorandum on the state of the profession, prepared by the Salaried Members Committee, was approved for circulation to members.

R.I.B.A. Grants for Libraries of Schools of Architecture and Allied Societies. It was decided, on the recommendation of the Board of Architectural Education, to make a grant of £100 for the year 1930, viz., £50 to the Board and £50 to the Allied Societies' Conference for the provision of additional textbooks for the use of students of schools and allied societies which have an inadequate supply of such books.

The Fellowship. The council, by a unanimous vote, elected Mr. Allan George, of Toronto, to the Fellowship under the powers defined in the Supplemental Charter of 1925.

Membership. Applications for membership were approved as follows: As Fellows, fifteen applications; as Associates, fourteen applications.

Reinstatement. The following ex-member was reinstated: As Licentiate, Mr. V. V. Vadnerkar.

One application was approved for election as Licentiate under Section III (f) of the Supplemental Charter of 1925.

Resignations. The following resignations were accepted with regret: Messrs. Claude Paterson, A.R.I.B.A., and F. Chapman Clemeshaw, L.R.I.B.A.

Election of Students. The following probationers were elected as students of the R.I.B.A.:

Collie, R. A. (Glasgow School of Architecture).
Cornelius, K. E. (Architectural Association).
Dunn, H. G. (Edinburgh College of Art).
Foley, J. (Northern Polytechnic).
Hall, A. E. (University of London).
Heathcote, E. R. (Cambridge University).
Herbert, P. B. (Birmingham School of Architecture).
Knight, C. A. (University of London).
Miller, A. (Glasgow School of Architecture).
Roberts, R. E. (Liverpool School of Architecture).
Robinson, D. D. (Architectural Association).

FRANCO-BRITISH UNION OF ARCHITECTS

The tenth annual meeting of the Franco-British Union of Architects will be held at Oxford from July 11 to July 14, 1930. The programme for the meeting includes visits to buildings of interest in Oxford, and a whole-day motor excursion to the Cotswold district with visits to Burford, Blenheim,

Bourton - on - the - Hill, Broadway, Stanton, Stanway, Bourton-on-the-Water, Moreton-in-Marsh, etc. The annual dinner, when a number of French architects will be the guests of the British Section of the Union, will take place on Saturday, July 12.

Members of the Union who wish to take part in this meeting are requested to notify the Secretary-General (Lt.-Col. H. P. Cart de Lafontaine, A.R.I.B.A.), 11 Suffolk Street, Pall Mall, London, S.W.1, as soon as possible.

THE SLUM BILL

[BY OUR PARLIAMENTARY REPRESENTATIVE]

STANDING Committee "A" of the House of Commons still continues to make slow progress with the Housing (No. 2) Bill, which contains the Government's slum clearance proposals, and at the end of the fourth sitting clause 1 had not been disposed of.

Clause 1 provides, among other things, that before passing a resolution declaring a clearance area, a local authority shall satisfy itself that alternative accommodation for members of the working classes who will be displaced exists, or can be provided by the authority, and that the resources of the authority are sufficient for the purpose of carrying the resolution into effect.

Lieut.-Col. Fremantle moved an amendment designed to enable the alternative accommodation to be provided by the owner of the property or by a public utility society.

Mr. Greenwood, the Minister of Health, while not able to accept the amendment as it stood, agreed that it contained a point of substance. He promised to consider before the Report stage whether he could bring forward some form of words which would widen the field from which the new houses could be drawn.

The amendment was therefore withdrawn.

Dr. Davies moved an amendment requiring a local authority to transmit to the Minister a description of the accommodation existing or to be provided for re-housing persons displaced.

Miss Lawrence, the Parliamentary Secretary to the Ministry of Health, said the amendment raised the whole question of the policy of housing replacement. As everybody knew, that had led to a disastrous holding up of housing schemes. Clause 7 of the Bill was sufficient to secure replacement. To bring in replacement at this stage might create complications.

The amendment was negatived by 30 votes to 16.

Mr. Chamberlain moved an amendment to ensure the early development by owners on suitable lines of areas which might have been cleared, so as to prevent these areas remaining derelict.

Mr. Greenwood said the amendment would have the effect of giving an advantage in certain circumstances to the owners, and the local authority would be left to "hold the baby." The amendment would make the situation far more difficult for the local authorities.

The amendment was negatived by 23 votes to 13 and the Committee adjourned.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

ABSTRACT PUBLISHED

326678. Sorensen, H. Fireproof buildings.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Avenue Pavilion, Shaftesbury Avenue, W. (pages 775–776). General structural alterations, A. G. Goodchild and Son, Ltd. Sub-contractors : Marc-Henri and Laverdet, decoration and fibrous plaster work; Archibald D. Dawnay and Sons, Ltd., steelwork; W. W. Turner & Co., seating; Jeffreys, alterations heating and ventilation; Kinematograph Equipment Co., proscenium curtains; Gaumont British Picture Corporation, Ltd., electrical work.

Stewartby Hall, Stewartby, Bedfordshire (pages 782–785). General contractors, Stanford and Clark, who were also responsible for the reinforced concrete, glass, joinery and plumbing. General foreman, S. Clark. Sub-contractors : Permanite, Ltd., asphalt and waterproofing materials; London Brick Co. and Forders, Ltd., bricks; Bath and Portland Stone Firms, Ltd., stone; Archibald D. Dawnay and Sons, Ltd., structural steel; Frank Burkitt, fireproof construction; Ellis and Everard, Ltd., slates; S. F. Goodwin, central heating and electric wiring; Standard Range and Foundry Co., Ltd., stoves, grates, sanitary fittings and door furniture; National Radiator Co., Ltd., boilers; Baxter and Caunter, Ltd., electric light fixtures; British Electric Transformer Co., Ltd., electric heating; Standard Range and Foundry Co., door furniture; Crittall Manufacturing Co., Ltd., casements and window furniture; David Rowell & Co., iron staircases; Jones Bros., plaster; G. and A. Brown, decorative plaster; F. Gamman and Sons, furniture; Gillett and Johnston, clocks; G. Alexander, lettering of stonework and signs.

The British Red Cross Clinic, Park Square and Peto Place, N.W.1 (pages 788–790). General contractor : E. H. Burgess, who was also responsible for the demolition, excavation, foundations, dampcourses, plaster, joinery, stonework, marble, plumbing and gasfitting. Sub-contractors : Ragusa Asphalte Paving Co., Ltd., asphalt; Redpath, Brown & Co., Ltd., structural steel; Carter & Co., Ltd., tiles and patent flooring; Gardiner, Sons & Co., Ltd., patent glazing, casements, iron staircases, metalwork and window furniture; Thos. Potterton, Ltd., central heating and ventilation; Cochran & Co. (Annan), Ltd., boilers; W. J. Furse & Co., electric wiring, electric light fixtures and bells; Shanks & Co., sanitary fittings; James Gibbons, Ltd., door furniture; Waygood Otis, Ltd., lifts; Becco Engineering and Chemical Co., Ltd., water-softening plant.

House, Holmer Green, Bucks. (pages 794–795). General contractor, Cecil James. Sub-contractors : W. T. Lamb and Sons, fireplace bricks; Langley-London, "Marseilles" tiles; Speirs & Co., stoves and grates, door and window furniture and bells, and sanitary fittings; Rippers, Ltd., casements and joinery.

TRADE NOTES

The directors of Messrs. Saml. Haskins and Bros., Ltd., manufacturers of shopfronts and fittings, rolling shutters and metal and woodworkers, wish to thank the large number of persons who sent expressions of sympathy and valued offers of assistance in connection with the fire that occurred at the firm's head office and works. The directors would also like it to be known that arrangements have been made to complete all contracts and that inquiries will be dealt with as heretofore. A new factory and executive offices will arise as

quickly as modern speed methods of construction permit. It is claimed that the company's products will, in the very near future, be manufactured under conditions that are the last word in highly-specialized efficiency. It should be noted that orders for display fittings, window fittings, etc., are not affected, and will be promptly executed from 4-5 Domingo Street, Old Street, E.C.1, as usual.

*

We have received a booklet concerning Heraklith, a new building slab made of petrified wood-wool and concrete, compressed and impregnated with a chemical compound. The principal use of the slab is for partition walls, but it is claimed that it can be used to great advantage for exterior walls of buildings of any kind, such as outbuildings, sheds, factories and workshops, cold stores, cinema studios, hangars, dance halls, garages and bungalows. It is also said to be suitable for ceilings, roofs, floors and wall panelling. Eighteen advantages are claimed for the slab. It is claimed to have special heat-insulating properties, and to be fireproof, soundproof, and one of the lightest building materials. It is said that the slab can be sawn, cut, chiselled, bevelled, morticed, screwed, nailed and drilled with the greatest ease and without the risk of splitting. The sole distributors and licensees are Messrs. Newman and Holt, Ltd., 24 Holborn, London, E.C.1.

*

Messrs. Treloar and Sons have for some time been conducting investigations with a view to eliminating the liability of linoleum to buckle and rot, when laid on newly screeded cement floors. Until recently the trouble was deemed insurmountable, and the firm made it a rule never to cover cement floors with linoleum unless the screeding had been completed at least three months. They tried many devices in order to overcome the difficulty in dealing with "rush" jobs, and the most successful was three-ply bitumen sheeting, laid direct on the cement, and then fitting the linoleum on top of it; but even so, the linoleum often buckled badly and became foul. As an experiment, a plain brown linoleum, one-eighth inch thick, was made in the usual way, complete with painted canvas backing, but to this canvas backing was fixed mechanically a backing of bitumen. This experimental roll was laid in a room having a newly screeded floor, and although eight months passed, the bituminous backed linoleum did not shrink or buckle, and there was no foulness. The firm have now sent us a sample of this linoleum. It had been scored through, and then deliberately broken, in order to show how firmly the backing was fixed. Plain and inlaid linoleum, and cork carpet, it is said, can be made in the same way. The new linoleum is primarily intended for large contracts, where delay would be a serious matter, but the firm will be very glad to undertake small trial jobs for demonstration purposes.

THE ARCHITECTS' DIARY

WEDNESDAY, MAY 21

R.I.B.A., 9 Conduit Street, W.1. Exhibition of Architects' Drawings of 1800–1850. 10 a.m. till 8 p.m. Saturdays 10 a.m. till 5 p.m. Exhibition closes on May 24. **10 a.m.**

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Exhibition of work of Eric Mendelsohn. Until June 14. 10 a.m. till 6 p.m. (Saturdays 5 p.m.) **10 a.m.**

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition open to the public. **10 a.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

PARSONS' GALLERIES, 315-317 Oxford Street, W.1. Exhibition of Scottish Art. 10 a.m. to 6 p.m. Until May 31. **10 a.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art, held in the North Court. 10 a.m. to 6 p.m. (Thursdays, 10 a.m. to 10 p.m.) **10 a.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

THURSDAY, MAY 22

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee. **4.30 p.m.**

ARCHITECTURE CLUB. Dinner to Eric Mendelsohn, to be held at the Savoy Hotel, W.C. **7.30 p.m.**

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. Visit to the First Clubland Church, 54 Camberwell Road, S.E.5. **3 p.m.**

FRIDAY, MAY 23

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. **4.30 p.m.**

SATURDAY, MAY 24

Sunrise, 4.57 a.m. Sunset, 8.57 p.m.

MONDAY, MAY 26

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Executive Committee. 4 p.m. General Meeting. "Recent Excavations at Ur." By C. Leonard Woolley, M.A., HON.A.R.I.B.A. 8 p.m. **4 p.m.**

TUESDAY, MAY 27

ST. BARTHOLEMEW'S HOSPITAL. A ball, in aid of the Reconstruction Fund, is to be held at the Locarno Dance Hall, 158 Streatham Hill, S.W.2. Tickets:—Gentlemen 10s. Ladies 7s. 6d.

WEDNESDAY, MAY 28

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Father of English Pottery—Josiah Wedgwood, F.R.S., Potter, Inventor and Man of Science." By Harry Barnard. Frank H. Wedgwood will preside. **8 p.m.**

FRIDAY, MAY 30

R.I.B.A., 9 Conduit Street, W.1. Intermediate Examination. Until June 5.

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, S.W.1. "Town Planning Economics." By J. Macaulay. **6 p.m.**

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS. At the Institution of Civil Engineers, Great George Street, Westminster, S.W.1. Annual General Meeting. An address will be given by Professor W. R. Lethaby. The Most Rev. Lord Davidson of Lambeth, D.D., D.C.L., LL.D., G.C.V.O., will preside. Tea 4 p.m. **4.30 p.m.**

SATURDAY, MAY 31

Sunrise, 4.50 a.m. Sunset, 9.5 p.m.

SOUTH EASTERN SOCIETY OF ARCHITECTS. Visits to Hampton Court and Richmond, organized by the Croydon and Guildford Chapters. It is proposed to visit Hampton Court at 10 a.m., and proceed to Richmond for lunch (5s.) at 1.30 p.m., followed by a tour of the Richmond district. **10 a.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. In connection with the Bicentenary of Josiah Wedgwood, a special exhibition of Wedgwood ware will be opened in Room 136. **10 a.m.**

MONDAY, JUNE 2

INSTITUTION OF ELECTRICAL ENGINEERS. Summer Meeting at the Irish Centre. June 2–6, inclusive. Assemble in the evening at the Gresham Hotel, Dublin.

TUESDAY, JUNE 3

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. Annual Meeting. **7 p.m.**

GARDEN CITIES AND TOWN PLANNING ASSOCIATION, 3 Gray's Inn Place, W.C.1. Whitsun Housing and Town Planning Tour. June 3–14 inclusive. Visit to Northern Capitals of Europe. Full particulars on application to the Secretary of the Association.

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Motor trip in Co. Wicklow, including inspection of overhead transmission lines. Lunch and tea at Glendalough.

WEDNESDAY, JUNE 4

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Proceed by special train to Limerick for visit to the Shannon Scheme.

THURSDAY, JUNE 5

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Visit to the brewery of Messrs. A. Guinness, Sons & Co. Lunch by invitation of the Company. Afternoon: Leave Dublin by special train for Belfast. Evening: Reception by the Lord Mayor of Belfast, Rt. Hon. Sir William Coates, at the City Hall.

SATURDAY, JUNE 7

Sunrise, 4.45 a.m. Sunset, 9.12 p.m.

WHIT MONDAY, JUNE 9

THURSDAY, JUNE 12

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual Conversazione, to be held at the Natural History Museum, South Kensington, S.W.7.

SATURDAY, JUNE 14

Sunrise, 4.43 a.m. Sunset, 9.18 p.m.

COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND. Gloucestershire Branch. At the Town Hall, Cheltenham. Conference under the chairmanship of Major-General Sir Fabian Ware, K.C.V.O., K.B.E. 11 a.m. Opening address by the Mayor of Cheltenham, followed by "Regional and Town Planning," by Captain J. H. Trye, C.B.E., R.N. Discussion on the subject to be opened by G. L. Pepler. 12.45 p.m.: Lunch. Afternoon Session, 2 p.m.–4 p.m.: "The Traditional Building of the Cotswold and surrounding Stone Districts." By H. Stratton Davis, F.R.I.B.A.; and "Modern Building and the Use of New Materials," by Thomas Falconer, F.R.I.B.A., followed by discussions to be opened by Sir Philip Stott, Bart., and J. W. Robertson Scott, respectively. **11 a.m.**

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Annual General Meeting and Annual Dinner. Particulars will be announced later.

CHELMSFORD PUBLIC LIBRARY COMPETITION. Latest date for submission of designs.

KINGSTON-UPON-THAMES PUBLIC BATHS COMPETITION. Latest date for submission of designs.

MONDAY, JUNE 16

R.I.B.A., 9 Conduit Street, W.1. Election of Council and Standing Committees: Election of Members. **8 p.m.**

WEDNESDAY, JUNE 18

R.I.B.A., 9 Conduit Street, W.1. British Architects' Conference, to be held at Norwich. Until June 21 inclusive.

FRIDAY, JUNE 20

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. At the Royal Society of Arts, John Street, Adelphi, W.C.2. Provisional date for a lecture on "Beautification of our Arterial Roads." By Thomas C. Adams.

SATURDAY, JUNE 21

Sunrise, 4.42 a.m. Sunset, 9.21 p.m.

ROYAL SANITARY INSTITUTE. Annual Congress to be held at Margate until June 28 inclusive. Various lectures, discussions and visits will be held throughout the week. **12 noon.**

WEDNESDAY, JUNE 25

ROYAL SANITARY INSTITUTE. At Margate. Meetings of the Architectural and Engineering Sections. **10 a.m.**

FRIDAY, JUNE 27

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor: H. V. Ashley, F.R.I.B.A. Premiums: £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs: July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall, which is to be built on the site of the old town hall at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor: Herbert T. Buckland, F.R.I.B.A. Premiums: £150, £100, and £50. Applications for conditions of the competition, etc., should be made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs: July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor: Professor Patrick Abercrombie, F.R.I.B.A. Premiums: £150 and £50 for first and second places, respectively. Copies of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs: September 1.

No date.—The Carlisle Corporation invites British architects to submit designs for the façade to English Street and the Victoria Viaduct, suitable for shops and business premises. The site was previously occupied by the Prison. The total length of the frontage is approximately 358 ft. Assessor: Francis Jones, F.R.I.B.A. Premiums: £300, £200, and £100. Particulars of the competition, etc., may be obtained from Percy Dalton, A.M.INST.C.E., A.R.I.B.A., City Engineer, 18 Fisher Street, Carlisle. Deposit, £1 1s.

No date.—The General Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums: £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2.

THE PUBLISHER'S PAGE

"MESSRS. Tunstall Small and Christopher Woodbridge are like recording angels whose industrious pencils snatch from oblivion the deeds of obscure but worthy witnesses to the genius of the Georgian tradition." So wrote a reviewer of Messrs. Small and Woodbridge's books, *Houses of the Wren and Early Georgian Periods*, and *Mouldings of the Wren and Georgian Periods*. These brilliant young authors have now turned their recording pencils towards the activities of an earlier period, and their new book, *Mouldings of the Tudor Period*, published today by the Architectural Press, will enhance the high reputation which they have already won for themselves by their previous books. Their latest production is a portfolio of full-size sections of mouldings selected from the best small domestic work of the Tudor Period, which has been taken broadly as including Elizabethan and Jacobean work, and as they have borne well in mind the fact that the book's usefulness will lie mainly in the sphere of domestic design, they have excluded from the book all mouldings taken from the larger examples of Tudor work.

The portfolio is in every respect a companion volume to *Mouldings of the Wren and Georgian Periods*, except that in the case of the Tudor volume a small measured drawing to a scale of three-eighths of an inch to one foot has been included with every set of mouldings, in order to show their position and relationship. This arrangement will add greatly to the value of the book, particularly as it will thus contain a great deal of useful information about the details of Tudor domestic work in addition to its comprehensive survey of the mouldings of the period. The portfolio is published at the modest price of 8s. 6d., and so comes under the same category as their previous books, of which another reviewer wrote: "We must be thankful that there are those who will undertake the labour of measuring, recording, and photographing what examples remain with us from an age of fine house-building, and doubly thankful that the volume that contains them is not one of those ponderous tomes for which guineas are paid, but something slimmer and more companionable, a book to keep in the office rather than in the library."

Mr. Tunstall Small.

ON the 28th of this month there will be published in this JOURNAL the first number of a new serial, entitled *Settling-up Honeywood*, by the author of *The Honeywood File*.

In the last page of that book it was hinted that a second Honeywood file probably existed. It now appears that the supposition was perfectly correct, and, after being subjected to that clarifying process which is the special secret of Karshish, that file is being presented to our readers.

The form of *Settling-up Honeywood* is identical with that of its predecessor; the manner is the author's, and the matter comprises the vexed questions of accounts, charges, extras, defects, renewals and replacements, and of liabilities of architect and builder; together with the unexpected and perplexing problems which may arise after a house is occupied and before all is finished and paid for.

That unexpected and puzzling problems will come into evidence at Honeywood there is good reason to suppose; for James Spinlove, the architect, has shown that he lacks technical experience and ordinary gumption; Grigblay, the builder, is a just but masterful man who will not brook being put upon; and the good-heartedness of Sir Leslie Brash, the owner, is not likely to obscure his self-importance so far as to reconcile him to paying more than the minimum or being satisfied with less than the best; but besides this, *The Honeywood File* told of various matters which, though they passed into oblivion for the time being, are certain to claim attention before the whole story of Honeywood is told. The failure of the paint, which began to show defects even before the house was occupied, is particularly to the fore. Many old friends, it appears, will come on to this new stage, as well as characters we have not before met. Spinlove, Grigblay, Sir Leslie and Lady Brash, their inscrutable daughter who calls herself "Pud," and Tinge, the quantity surveyor, we may certainly expect to meet again and, among others, we devoutly hope, Ned Bloggs, the foreman, one of the most lightly touched but most vivid characters of the earlier book.

MOST publishers are semi-mythical personages (how often do we meet a self-confessed publisher face to face?), and the publisher of THE ARCHITECTS' JOURNAL is no exception to this rule. Hence, although he is "by no means a negligible person" (*vide* THE ARCHITECTS' JOURNAL for May 7), he is unblushing enough to confess that he is but human and can err, as is attested by the following letter which he recently received from an architect-subscriber:

The Publisher,
The Architectural Press, Ltd.

DEAR SIR,

THE ARCHITECTS' JOURNAL

I am in receipt of your letter of the 17th instant, and at first sight thought I needed new lenses. On cleaning my glasses, however, I find that I read your letter correctly and that you have arrived at the astonishing conclusion that I no longer take THE ARCHITECTS' JOURNAL. Who in the profession could possibly live without it, and who has started this terrible tale?

To show how utterly untrue this malicious slander is, I may add that the JOURNAL has arrived as usual this morning.

I can only conclude that a public apology will now appear in your columns.

Yours faithfully,

G. H. W.

This letter seems to indicate that all architects are not afflicted with Mr. Spinlove's ungracious method of correcting errors.

Mr. Christopher Woodbridge.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

Cart and horse	£1	3	0	*Trailer*	£0	15	0

Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.
If left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. . . 0 2 10
PUDDLING, per yd. cube 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube . 1 7 0
DO. in lintels, etc., per ft. cube . . 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* BRICKLAYER, 1s. 8½d. *per hour ;* PLUMBER, 1s. 8½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0

Portland cement and sand, see "Excavator" above.

Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. . . 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3
Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour ;* LABOURER, 1s. 3½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0

Cement and sand, see "Excavator" above.

Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in. per roll*	0	4	9
DO. *14 in. per roll*	0	7	6
DO. *18 in. per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra .	0	0	3

BUILDING CONTRACTS OPEN

Unless the contrary is expressly stated, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district. Application for plans and particulars should be made to the address given at the end of each entry.

IRLAM, LANCS: HOUSES

May 24.—For erection of 140 houses—seventy at Cadishead and seventy at Higher Irlam—for the U.D.C. W. G. Codling, Surveyor. Deposit £2.

MALDON: HOUSES

May 24.—For erecting fifty houses in Mundon Road, for the T.C. The Borough Engineer, Municipal Offices, Maldon.

LUTON: SCHOOL

May 24.—For erection of a Council school in Denbigh Road, Luton, for 1,315 children, for the T.C. The Education Secretary, 3 Manchester Street, Luton. Deposit £3.

ILFORD: HOUSES

May 24.—For erection of 146 houses, together with the necessary house drains, at the Fencepiece Road housing estate, Barkingside, for the T.C. L. E. J. Reynolds, Borough Engineer, Town Hall, Ilford. Deposit £5 5s.

BOLTON: BUILDINGS

May 24.—For the erection of (1) new sessions hall and police building: (2) library, museum and art gallery; (3) extensions to the existing town hall, proposed to be erected on land in Victoria Square, Bolton, for the Bolton Corporation. Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit £5.

WOLVERHAMPTON: COLLEGE

May 24.—For the erection and completion of a large new technical college in Wulfruna Street, Wolverhampton, for the Wolverhampton and Staffordshire Technical College. The building will be a three-story block, having an aggregate floor space of approximately 58,000 feet super. T. A. Warren, Clerk to the College Governors, Education Office, North Street, Wolverhampton. Deposit £10 10s.

WHEATLEY, DONCASTER: HOUSES

May 26.—For the construction of twenty-three houses at Wheatley, for the Doncaster R.D.C. F. O. Kirby, Borough Engineer, 2 Priory Place, Doncaster. Deposit £5 5s.

LONDON (PADDINGTON): DEMOLITION

May 26.—For demolition, etc., works and reconstruction of wharf building and contingent works at the southern end of No. 26 wharf, 175 Harrow Road, W.2, for the Paddington B.C. The Borough Engineer, Town Hall, Paddington, W. Deposit £1 1s.

LIMERICK: BRIDGE

May 26.—For the construction in reinforced concrete of a new bridge, 187 ft. between abutments and 36 ft. between parapets, carried on piled foundations, together with the construction of an embankment of approximately 250 lineal yards of approach roads and other contingent works, for the Limerick County Borough Council. J. J. Peacocke, Town Hall, Limerick; or J. J. Roughan, 7 and 8 Lower Abbey Street, Dublin. Deposit £5.

LONDON (CHELSEA): TELEPHONE EXCHANGE

May 27.—For erection of "Kensington" telephone exchange in Draycott Avenue, Chelsea, S.W., for the Commissioners of H.M. Works, etc. The Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

CLEVELEYS: LIBRARY

May 28.—For erection of a branch library at Cleveleys, for the Lancashire E.C. Stephen Wilkinson, County Architect, 16 Ribblesdale Place, Preston. Deposit £2.

BOSTON: HOUSES

May 30.—For the erection of 112 houses on the Fenside Road housing site, for the T.C. D. G. Cockrill, Borough Surveyor, Municipal Buildings, Boston, Lincs. Deposit £2 2s.

WINCHESTER: HOUSES

May 30.—For erection of 132 houses at Milland Road, Bar End, Winchester, for the T.C. P. H. Warwick, City Engineer and Surveyor, Guildhall, Winchester. Deposit £2 2s.

STROUD: COTTAGES

May 31.—For erection of sixteen non-parlour type cottages at Cashes Green, and eight cottages of the same type at Brimscombe, for the Stroud R.D.C. R. Bird, Surveyor, Council Offices, Kendrick Street, Stroud, Glos. Deposit £2 2s.

ALTON: BUILDINGS

May 31.—For the erection of new hospital (timber and corrugated iron) and covered way and alterations to existing buildings, and preparation of site and construction of foundations for same, for the Alton Joint Hospital Committee. G. H. Webb, Surveyor, Town Hall, Alton. Deposit £1 1s.

LOCKERLEY AND BRAISHFIELD, HANTS: COTTAGES

June 2.—For erection of sixteen pairs of non-parlour-type cottages in the parishes of Lockerley and Braishfield on the following sites, for the Romsey R.D.C.: Four pairs on the site adjoining the East Dean Road, Lockerley; two pairs on the site opposite Butts Green, Lockerley; three pairs on the site adjoining Cooks Lane, Lockerley; four pairs on the site adjoining the Carters Clay-Newtown Road, Lockerley; and four pairs on the site at Common Hill Road, Braishfield. C. W. P. Dyson, Surveyor, Porters Bridge Street, Romsey. Deposit £2 2s.

ORPINGTON, KENT: HOUSES

June 5.—For erection of sixty-four houses on the following sites, for the Bromley R.D.C.: Pratts Bottom, Chelsfield, twelve houses; Jail Lane, Biggin Hill, Cudham, eight; Cudham Village, four; Westerham Road, Keston, eight; Upper Ruxley, North Cray four; Homefield Rise, Orpington, eight; Millfield, St. Mary Cray, eight; and Crabbs Croft, West Wickham, twelve. The Building Surveyor, Council Offices, Orpington. Deposit £2 2s.

HEMEL HEMPSTEAD: HOUSES

June 10.—For erection of seventy-two houses, in pairs, in St. Paul's Road, for the Corporation. A. Murray-Smith, Borough Surveyor, Market Square, Hemel Hempstead. Deposit £7 7s.

CAIRO: PUMPING STATIONS

August 17.—Tenders are invited by the Mechanical Department, Ministry of Public Works, for supply and erection in the Isolated Basins, Aswan Province, of fifteen electric pumping stations, complete with all the necessary building work, pumps, motors, switchgears and pump-houses, etc. The Chief Inspecting Engineer, Egyptian Government, 41 Tothill Street, S.W.1. Copies of the conditions, etc., are obtainable at £10 5s. per set, which sum is not returnable.

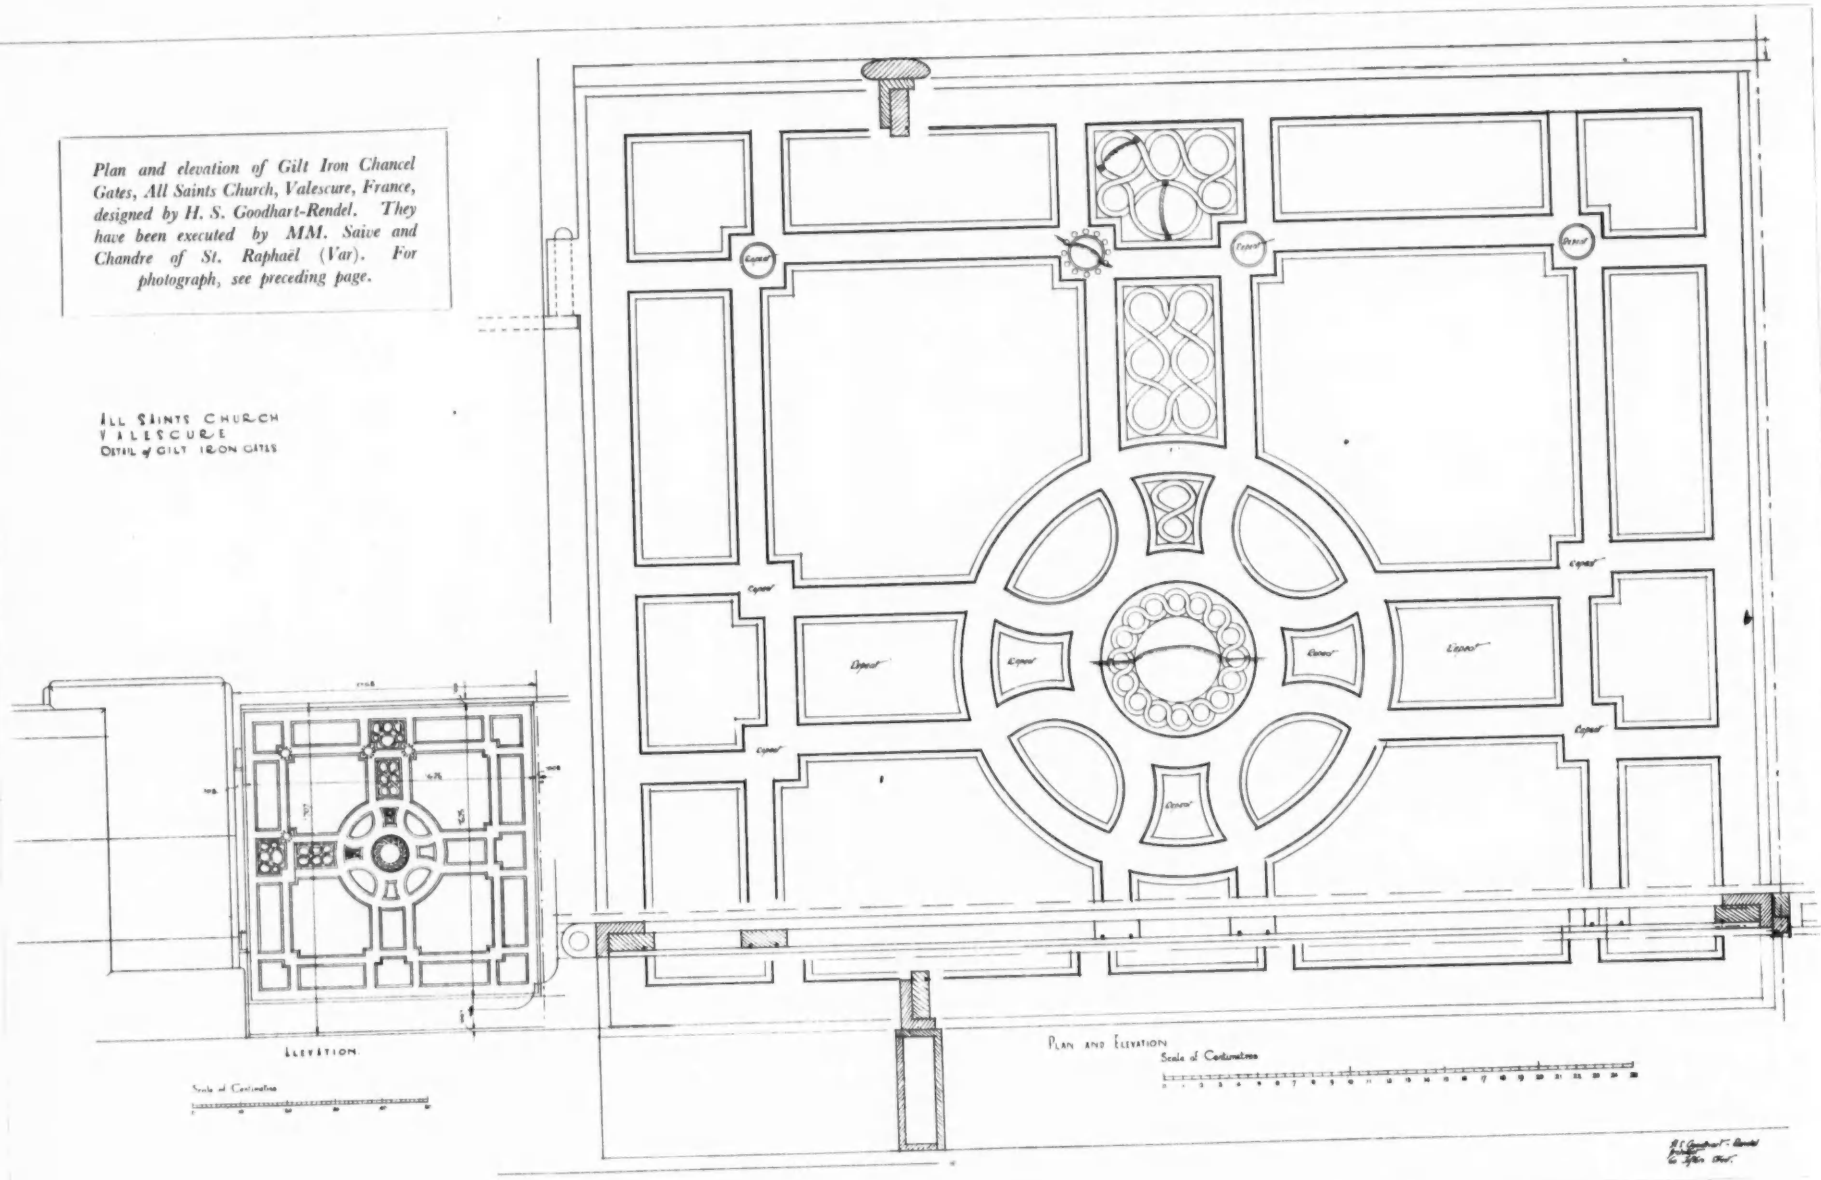
CHANCEL GATES IN WROUGHT IRON, GILT
AT
ALL SAINTS' CHURCH, VALESCURE, FRANCE

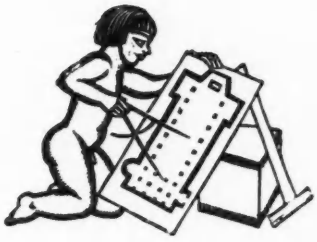
Designed by
H. S. GOODHART-RENDEL



THESE gates close the opening in a marble wall that connects the ambones at the entrance to the chancel of All Saints' Church, Valescure.

The church was built about thirty years ago in a semi-Byzantine style; and in the recent remodelling of the chancel a Byzantine flavour has been given to the modern style in which the new work has been conceived.

Each gate is made from a pierced plate of iron, filled in and ornamented as shown by the photograph and the large- and small-scale drawings reproduced overleaf. They are gilded all over.



They were made by MM. Saive and Chandre, of St. Raphael (Var), from full-size drawings by the architect.

Plan and elevation of Gilt Iron Chancel Gates, All Saints Church, Valescure, France, designed by H. S. Goodhart-Rendel. They have been executed by MM. Saive and Chandre of St. Raphaël (Var). For photograph, see preceding page.

From next week onwards architects' details published on this page will be specially drawn and reproduced to scale. This will enable the reader to place his office scale on the page and read it like an ordinary drawing, instead of, as with the present series, using a pair of dividers.

THE ARCHITECTS' JOURNAL

WEDNESDAY, MAY 28, 1930

THE IDEAL R.I.B.A. JURY

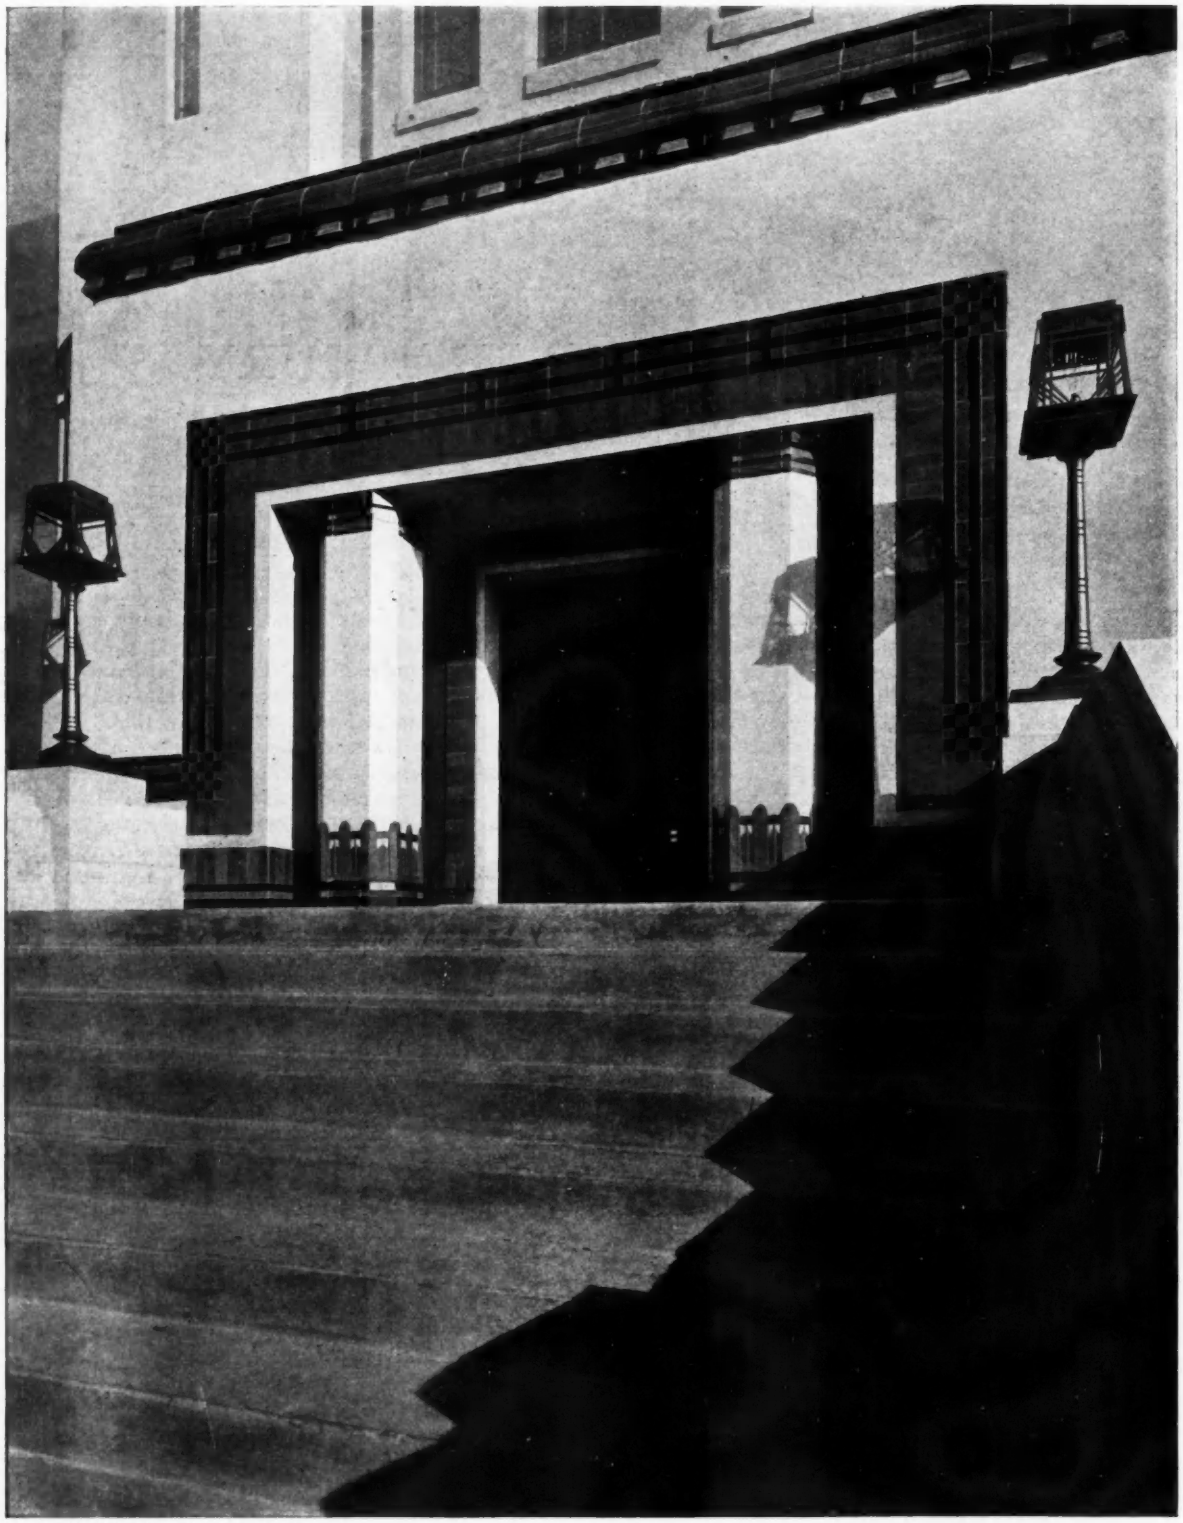
Five Assessors, to Stand for:

Experience in Competitions — *The English Classic Tradition*
The Imperial Point of View — *An Essentially Modern Outlook*
Distinguished Lay Opinion

IN no foreign country has the competitive system for architects attained such popularity or worked so well as it has in England. And it is shortly to be put to the supreme test. Is it capable of giving us an acceptable design for the new home of the Royal Institute of British Architects itself?

This building, to be erected in Portland Place, is going to be much criticized, not only by Englishmen but by our professional brothers from abroad; so we may be excused if we are all feeling very nervous about it. What if we make a laughing-stock of ourselves by accepting a design which is so conservative, so *timid*, that none of the most original and vigorous-minded architects in the country will have pleasure in it?

On the other hand, we may imagine an even worse situation—one in which the lust for novelty has found a most improper expression, with the result that a design, acclaimed this year as of the latest fashion, is, five years hence, utterly *passé* and condemned not only by defenders of tradition but by the "modernists" themselves, who by that time will have passed on to something more "fashionable" still. Let there be no mistake about it; if by any chance the new R.I.B.A. building were to be designed in a style which did not "wear," the R.I.B.A. would retire from that building *broken*. If, therefore, any architectural occasion demanded caution, this is the one. The penalties for too much caution would undoubtedly be severe, but the penalties for launching rashly upon an uncharted architectural sea would in this instance be disastrous.



Everything rests with the assessors of the competition. As the choice of these is all-important, it seemed to us desirable to issue a questionnaire to our readers in order to have the benefit of their judgment upon this matter. The response has exceeded our best expectations, and on another page we analyse the nomination forms which those especially interested in this competition have been good enough to fill in. We are now in a position ourselves to make, with all respect to the Competition Committee of the R.I.B.A., a suggestion which embodies some of the proposals put forward by our correspondents.

Of the five members of the jury, it seems desirable that one should represent competition experience, a second, the Imperial point of view, a third, a respect for the English Classic tradition, and a fourth, an essentially modern outlook. This leaves one vacancy on the jury, which might usefully be filled by a distinguished layman. Several advantages might accrue from this last appointment. Certainly, it would be counted an act of grace, inasmuch as it would symbolize a respect for public opinion and a desire to establish genial relations between the architects who are destined to use the new R.I.B.A. building and that much-abused but often very distinguished person, "the man in the street," who has to look at it from the outside.

What kind of a building do we want? The answer is generally given in platitudes—we want a good building, a logical building, a "modern" building, and so on. It is in the interpretation of the word "modern" that acute differences of opinion arise. If to be modern means to break altogether with tradition, many of us will oppose this kind of modernity; but if it means that we are to stand on top of the ages and add something new and true to what is old and true in our architectural knowledge and experience, then we can all be "modernists."

Of one thing we may be certain. The new R.I.B.A. building will be excellently planned. Nobody can have surveyed the result of recent architectural competitions without being aware that the standard of planning achieved by English architects today is admirable. In questions of style, however, we are still at sixes and sevens. We must try to find relief in accepting "the greatest common measure" of the most reputable styles now current, and hope that if the R.I.B.A. building represents no less than this, its design will at least deserve the intellectual respect of our successors.

From time to time we shall ask the reader to place his office scale on the page and read it like an ordinary drawing, instead of, as with the present series, using a pair of dividers.

A GATEWAY OF INDUSTRY IN A RAINBOW OF COLOUR.

The main entrance to the new factory for the Pyrene Company on the Great West Road, like the principal façade itself, is a striking essay in white cement and highly-coloured faience. It is approached by a double sweep of steps and surmounted by a tower, the whole forming the dominant feature of the main front. The factory is designed by Wallis, Gilbert and Partners, and will be officially opened today by Lord Brentford. Further illustrations, the ground-floor plan, and a description, appear on pages 818–820.

NEWS & TOPICS

Erich Mendelsohn, lecturer and dinner-guest in London last week.

G. Grey Wornum, new President of the A.A., Dr. Mendelsohn's hosts.

P. G. Freeman, Liverpool student and new Fellow of Yale University.

THE MENDELSOHN DINNER

THE Seventeenth Dinner of the Architecture Club, given in honour of Dr. Erich Mendelsohn at the Savoy Hotel last Thursday, was as memorable for an unusually excellent menu and much accomplished after-dinner oratory as for Dr. Mendelsohn's plucky address in English. To watch the impassivity of the real authors of the re-decoration of the Abraham Lincoln Room —and most notably of the lady to whose deft touch so much of its soft harmony and discreet gaiety is due—when the Chairman blandly attributed its transformation to Mr. Clough Williams-Ellis was as fine a display of British *sang froid* as one could wish to see. Mr. J. C. Squire has seldom been in happier or racier vein than when he described the profound resentment with which old-fashioned mortals like himself heard blatant Youth knocking at the door : smashing off the lock and kicking in the panels would perhaps be a more accurate, if less literary, metaphor. After him, Sir Banister Fletcher, typifying all that is most officially academic about " the door," and suavely ignoring its splintered condition, was positively conciliatory to " the raw, unformed young creature."

★

Sir Owen Williams, who began by declaring that he wanted to talk about nothing but concrete, strained altruism to the point of entirely avoiding the subject, except for saying that it would be impossible to construct any building he had designed in it in any other material. This, rather than any personal preference of Professor Einstein's, was the reason why Dr. Mendelsohn, and not himself, had been chosen to build the Einstein Tower. The definition of architecture as " a lithic language " had resulted in shams like those rusticated stone arches in Regent Street, which would fall down were it not for the support of the steel girders they cloak (an assertion that was flatly controverted by an eminent engineer on my right).

★

He next proved incontrovertibly that the ratio of bricklayers to architects (surveyors, auctioneers and estate agents were presumably included in the latter category) was now three to one ; while in the case of masons it was approximately one to one. Seeking for an explanation of the mystery of how architects managed to live—since the profession, with impressive solidarity, has always denied that they either can or do—he had found it in the frenzied zeal with which at, or about, superannuation age, they hurl aside the T-square to snatch up the pen. Sir Owen might have continued his devastating statistics by showing the ratio of writers on architectural subjects to publishers of architectural books. It was with an audible sigh of relief that the Principal of the A.A. saw this speaker sit down. I left buoyed up with the realization of the highly remunerative nature of architectural criticism, and kicking myself for my crass stupidity in never having so much as suspected it. I rather fear Dr. Mendelsohn may carry away the impression that as a nation we are never more incurably flippant than when nominally engaged in the technical discussion of burning problems of the day.

WHAT WE CELEBRATE IN WEDGWOOD

At this time we celebrate the bi-centenary of Josiah Wedgwood, most famous of English potters. As architects we remember that he completed the full circle of eighteenth-century taste by giving to the beautiful tables, the niches and cupboards of the period, pottery suited exactly to its refined classical figure. Wedgwood found pottery in Staffordshire a rough home-made affair of salt glazes, and left it, after a life of terrific and minute energy, a world-known industry making a great variety of the loveliest common crocks we have ever known, and, of rarer objects the less lovely but more remarkable pieces of jasper and basalt ware, closely modelled upon the classical vases which contemporaneous discovery had presented to his interested world.

★

What should be particularly important to us today is the fact that Wedgwood was a business man who exploited the taste of the time *by co-operating with the best artists and sculptors he could find.* In this he was an artist himself as some few—but as yet too few—business men are today. We shall find our Wedgwoods today among the men who

make fabrics and furniture. Let us honour them by making their wares fashionable. Let us also honour the present representatives of Josiah Wedgwood, for they make new wares that are beautiful but cheap.

ROBES FOR ARCHITECTS ?

Events like the yearly Presentation of Degrees by the University of London take on a brilliance and decorative effect which perhaps only academic robes can provide. In considering the psychological value of robes, one wonders whether, when the R.I.B.A. move into new and more impressive headquarters, the subject of a distinctive dress for architects will be brought up again. At public functions the architect cuts a comparatively neutral figure, while other professions express their status and their corporate dignity by special robes. It has been hotly argued that architects do not need dressing-up, and that it would be out of keeping with their notoriously modest character. Yet the fact remains that in the public mind " dress does make a difference "; and while gaudiness may be out of place, some distinctive form of robe may yet be evolved for ceremonial occasions which would be at once quiet, distinguished and in accordance with the characteristic attributes of the profession.

SCHOOLBOYS' ARCHITECTURAL CLUB

From Stowe, the newest of the public schools, comes a copy of the rules and aims of a society that calls itself The Vitruvians. The member's ticket, decorated after a charming eighteenth-century architectural manner by Mr. Rex Whistler, discloses that the members of the society give themselves to the study and appreciation of architecture. That such a society should be formed among the boys of this public school is another indication of the renewed interest in architecture among intelligent people, and an example that might well be followed by other schools. This society will find, if it is careful to keep the boundaries of its study as wide as possible, that it has opened the door upon limitless inquiry, packed with interest and long enjoyment.

The cover of the member's ticket of the new Architectural Society at Stowe School, designed by Rex Whistler.

THE CALTON JAIL SITE

Lord Londonderry's rash words at the Architecture Club last year are bearing their fruit in due season. News has come from Scotland that the Office of Works has decided to drop its plans for the development of the Calton Jail site in face of a very critical attitude adopted by the Royal Fine Arts Commission for Scotland. Mr. Lansbury explained in December last how the decision to entrust the plans to the Chief Architect had been made by his predecessor, and that there was no other alternative but to allow the work to proceed. He promised, however, that the drawings and a model should be placed before the Royal Fine Arts Commission for Scotland and the Edinburgh Corporation. This has now resulted in an adverse report from the Commission, and a decision to reconsider the matter in principle. It seems likely that the plans will be thrown open to public competition, and we may congratulate ourselves that for once the weight of the architectural profession has been applied at the right moment. An early decision will be arrived at in view of the pressing need for accommodation for Government officials in Edinburgh.

HENGISTBURY HEAD DEVELOPMENT SCHEME

Bournemouth is not likely to lose by spending over twenty-five thousand pounds on the acquisition of Hengistbury Head. Although the generosity of Mr. Gordon Selfridge has already saved the town some part of the real value of the site, the figure is a large one to spend upon the purchase of an open space. It is stated that some seventy or eighty acres out of the 400 odd will be available for building development, and the rest of the fine heather-covered head, with all its dim historic association with Hengist the invader, and with its memories of smuggling, will be given over to public use. What development is allowed should be made under the strictest possible control. Half-timber would be defeat after victory.

THE CAUSE OF SHEFFIELD'S " TAME " ARCHITECTURE

Mr. Charles M. Hadfield of Sheffield and his colleagues are so concerned—and not without reason—about the problem of " tame " architecture as it has arisen in that town that they have gone to the trouble of examining the causes of Sheffield's artistic barrenness in detail. From a written statement of great pertinence and some length, which he has sent me, I extract the cardinal point. It is, he thinks, the nearly complete official monopoly of architectural work over a long period of time that is one of the dominant factors. This monopoly has tended, he says, to increase to such an extent as to make Sheffield unique among provincial towns, where, generally speaking, a certain amount of co-operation between officialdom and private practice is possible, and there are certain limitations to the scope of a city architect's activities.

★

It is, of course, perfectly true of many towns that whatever can be given to the official architectural department is looked upon as saving the town money, quite apart

Raeburn's portrait of John Rennie, sold last week by auction for 650 guineas.

from any considerations of quality; and the practice of adding a few more low-paid " ghosts " to do the added work keeps the wheels sufficiently oiled to make everything appear in order.

★

It is to be doubted whether the town really saves money by these methods. It undoubtedly gets as much as it gives in poorly designed, *tame* architecture, adequate but uninspired, and far, far removed from such lofty expression of free citizenship as one might expect to find in a public library or, indeed, in any building erected for the use of a democratic age.

RAEBURN'S PORTRAIT OF RENNIE

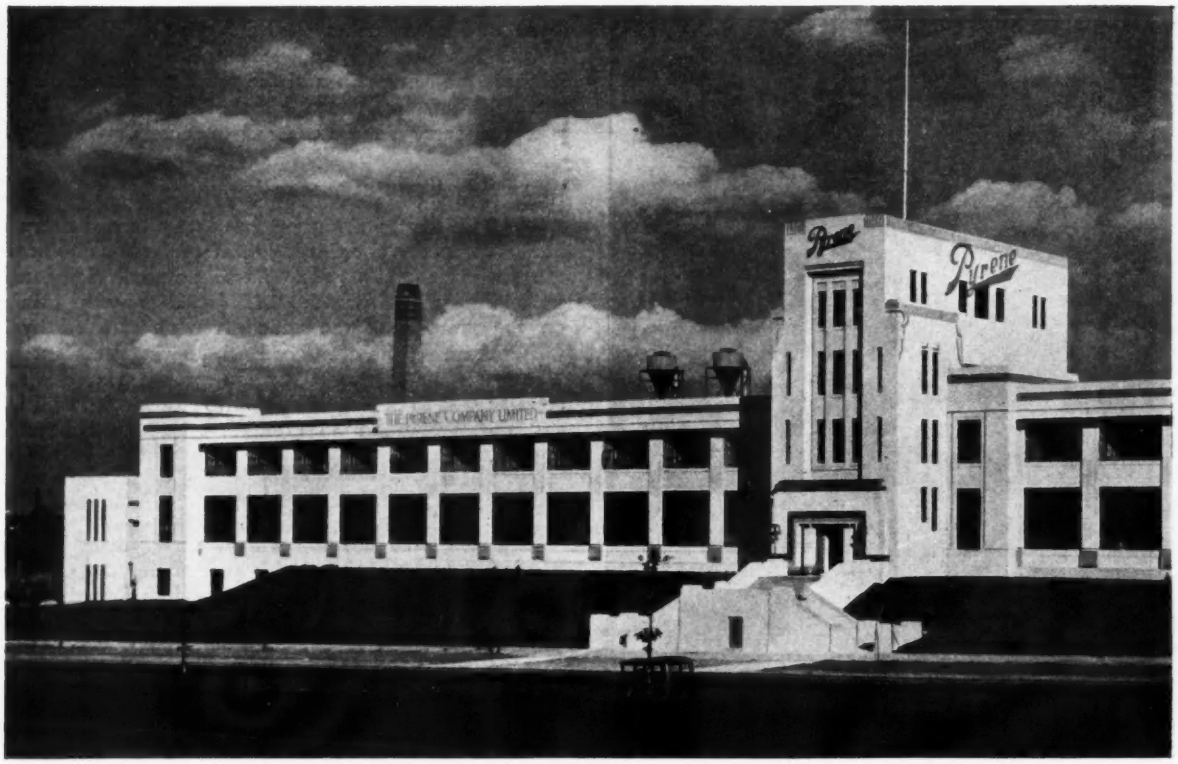
The advances made in the science of engineering during the last hundred years only heighten the experiment of the pioneers. Strange as it may seem, the real advance was the initial step, as for example the invention of the locomotive or the first iron bridge. Subsequent developments are but variations of what in the first place was a revolutionary project.

★

I am led to such thoughts by Raeburn's portrait of John Rennie, the celebrated civil engineer who built Southwark Bridge in iron as early as the year 1809. The story of his works in stone and granite is well known. He it was who designed the harbours of Kingstown, at Holyhead, the breakwater at Plymouth, and other works of vast scale. The portrait was sold by auction on Friday last. I do not know its destination, but anything painted by Raeburn is sure of a good home. Raeburn in his direct way caught the engineer in a typical mood. He is shown in full face, head and shoulders, a very civil-looking, broad-shouldered engineer. And a wealth of ideas was contained in that fine head. Primarily a millwright, he had intuition for machinery : as a mason he could cut stone and turn arches across narrow streams or wide rivers. His was the knowledge of inspiration bred of folk-lore craftsmanship and the hard necessity of his early life. Yet few questioned his skill in stereotomy or his power to carry a large contract to success.

TRAFFIC AT " THE ELEPHANT "

The Ministry of Transport has lately turned down the L.C.C. proposals for dealing with the traffic problem at the Elephant and Castle. These proposals suggested a wide circular road, which was objected to by the Minister on the grounds of the wide diversion suffered by the traffic from Walworth Road to Newington Causeway. The Minister's counter-suggestion proposed a wide semi-circular road to the west of these two roads, at an additional cost of £37,000 on an estimate of nearly two million pounds.



FELLOW OF YALE UNIVERSITY

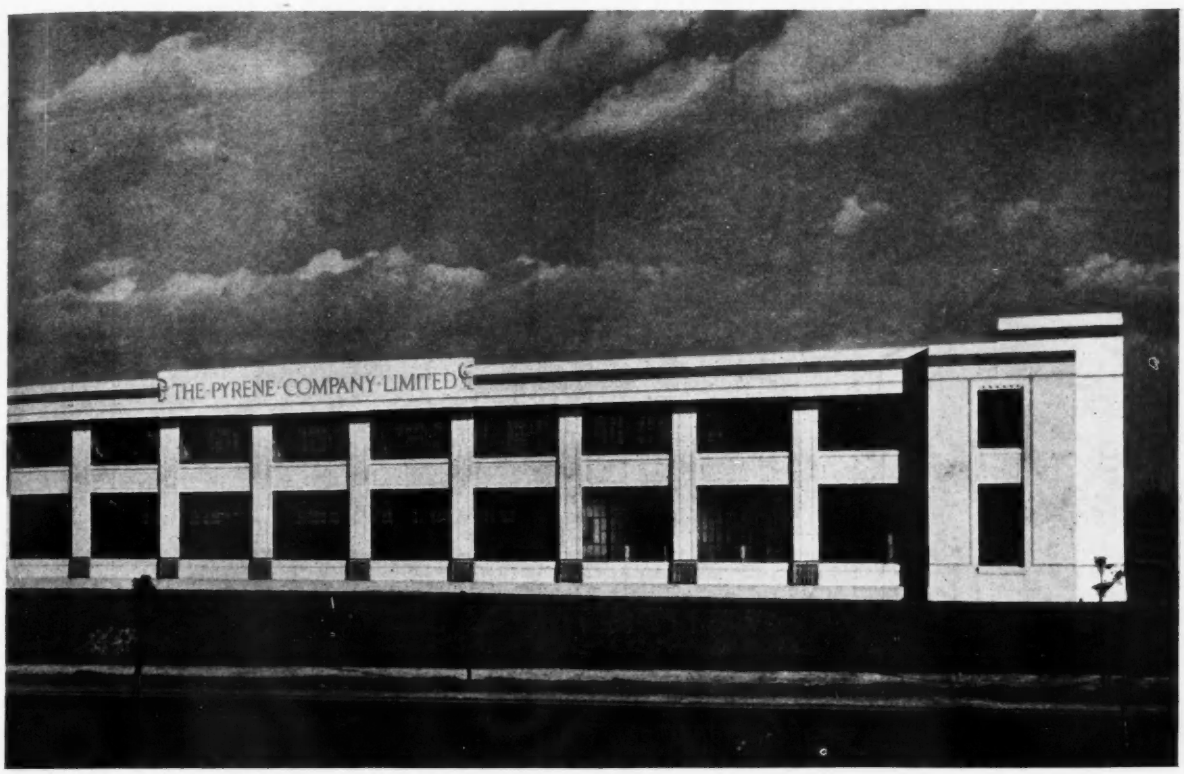
Philip Garforth Freeman, winner of the only architectural fellowship to be awarded this year under the Commonwealth Fellowship Fund, which provides for scholarships tenable at certain American universities by candidates of British descent, has opened his career brilliantly. Winning a Derby County Council scholarship to the Liverpool School of Architecture, he proceeded to carry off the Holt Travelling Scholarship, the Rankin Prize and the White Star Prize, besides taking the degree of B.Arch. with first-class honours in design, and being finalist in the Tite Prize and Soane Medallion Competitions. Most of Professor Reilly's fourth-year students go to America; he went, instead, as assistant to Sir Herbert Baker. Upon leaving the Liverpool School he assisted Minoprio and Spencely, two ex-students of Liverpool, and is at present with Joseph Emberton, designer of the new Olympia. By the award of a fellowship in architecture at Yale University, he now has the opportunity of repairing the transatlantic gap in the curriculum normal to Liverpool schoolmen.

WHO IS LORD BENBOW ?

A correspondent wants to know whether there is any relationship between the present Lord Benbow, who has suddenly sprung into fame, and the Admiral who distinguished himself at St. Malo and Dunkirk. Frankly, I do not know. I know very little about Lord Benbow, except what I have read in the May *Architectural Review*. The barony is, I believe, a recent creation—very. In fact, I don't mind admitting, if you really press me, to a suspicion that it was created on May 1 last—by the Editor of that famous journal. The question whether Lord Benbow is a real or an imaginary person does not, however, seem to count for very much with the architects and decorators with whom I have recently been discussing the decoration of his flat " not far away " from Curzon Street. I must mention no names, but three or four of the very first rank appear to be at work on schemes for that big double room, the contents of which are to be exhibited at Messrs. Waring and Gillow's. If all their colleagues are equally keen (and I have no reason to doubt that they are) the competition promoted by the *Review* will turn out to be the biggest stimulus the modern movement has yet received in this country.

ASTRAGAL

A general view, taken from the forecourt of the Firestone factory, an earlier achievement of Wallis, Gilbert and Partners. The focal point in the design of the new building is the central entrance tower, with the name Pyrene emblazoned on its summit. The façade is decorated in faience in the gayest



In the central tower are the main entrance, and, above it, the windows of the staircase, which gives access to the administration offices, etc. A photographic study of the main entrance appears on page 814.

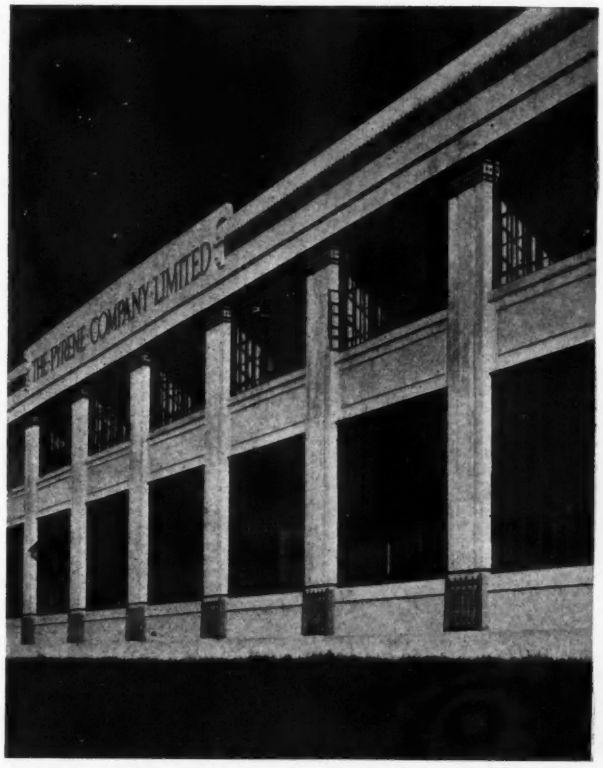
THE PYRENE FACTORY:

DESIGNED BY

TODAY the new factory erected for the Pyrene Co., Ltd., on the Great West Road, will be officially opened by Lord Brentford. It is the first modern building to be specially designed mainly for the manufacture of fire extinguishers and such-like appliances. The employees enter by a spacious hall on the lower ground-floor, and situated at the end of the building near the works entrance gates. From this hall a staircase provides the approach to all works departments. This staircase opens into a straight wide corridor serving the whole of the building, and incidentally effecting substantial economies in time-saving and supervision. An adjustment of the floor levels by the architects has made it possible to light and ventilate the big ground-floor units on both sides. There is not a dark corner in the whole building, and there is no single section which is not smoothly organic in its individual layout and its relation to adjoining units.

Many details have been incorporated in the building to facilitate service and add to amenity; the provision, for example, of chromium-plated drinking fountains at intervals along the corridors, and a system of call bells enabling calls for individuals to be transmitted simultaneously to all parts of the building. A healthy and comfortable atmosphere is maintained by a constant supply of fresh air, drawn in through a number of intakes, producing a cooling effect in hot weather. In winter the air can be warmed by steam-heated coils fitted within the ventilation ducts. Central

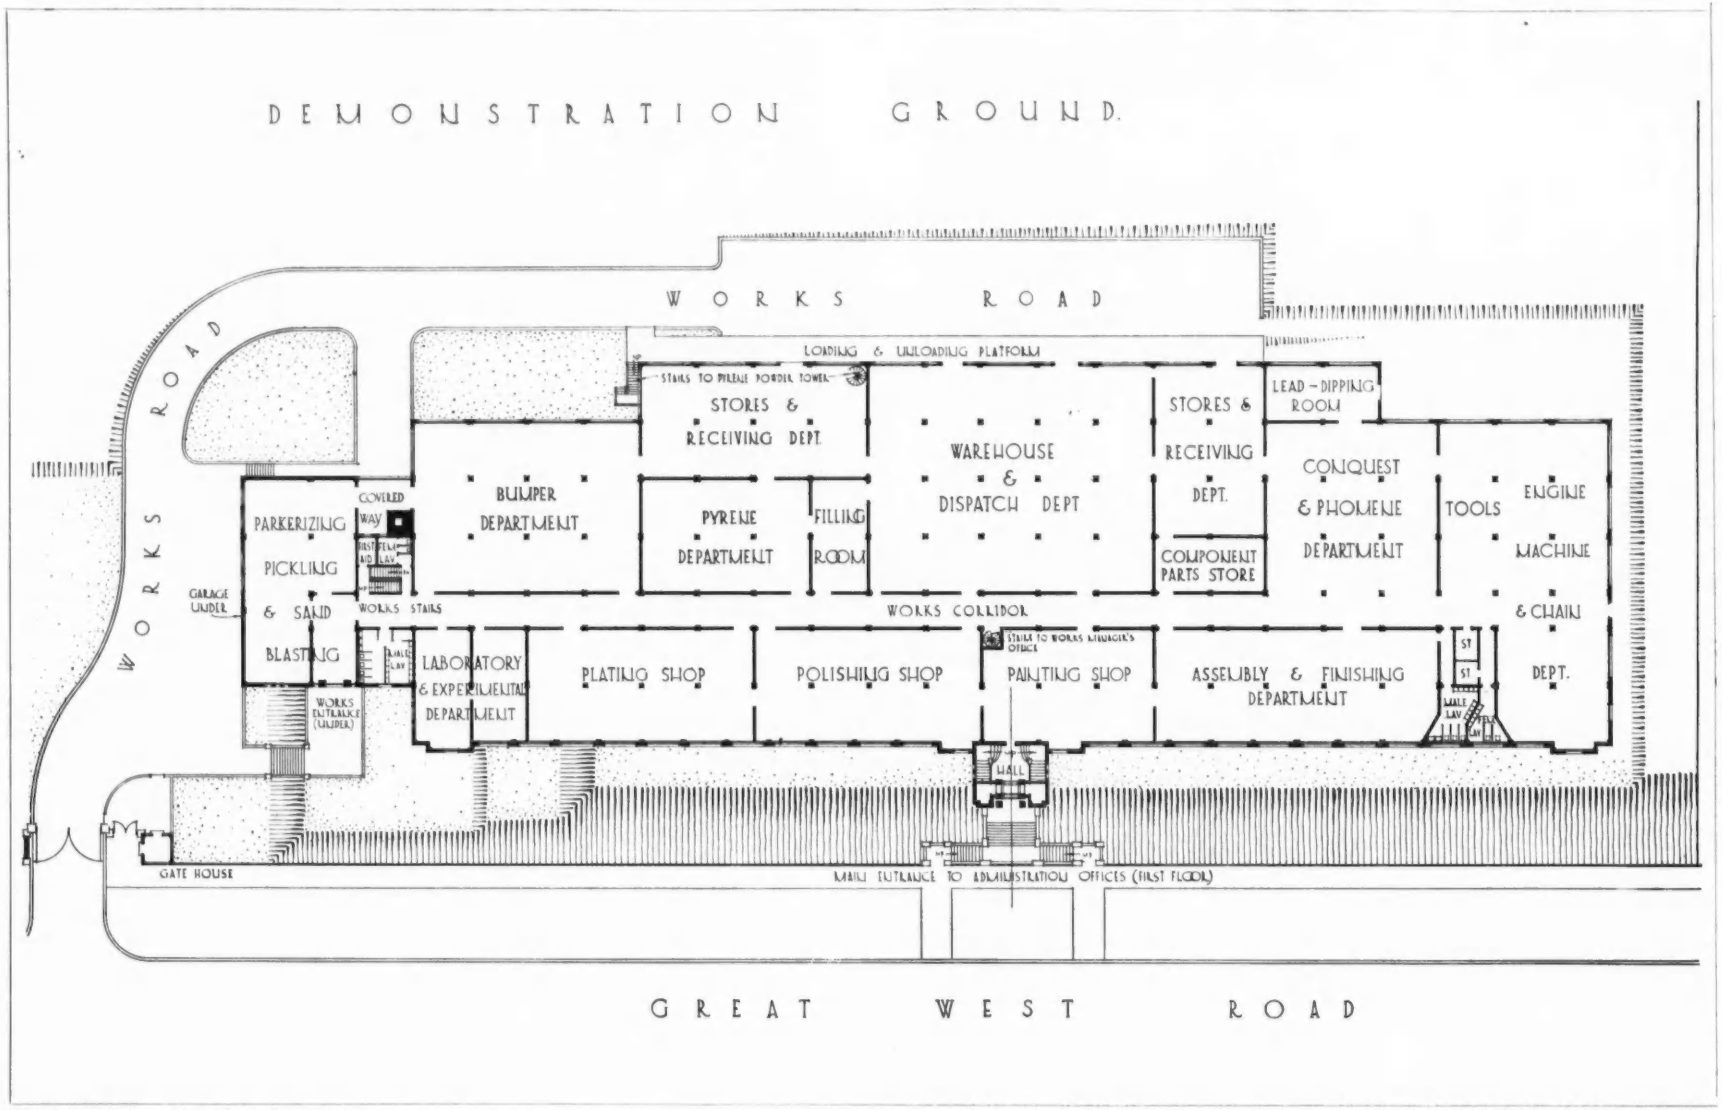
contrasts of green and red: green to respond to the colour of the sloping front lawns; and red, the symbolic colour of the company, whose productions are largely devoted to fire protection. The employees enter through a pair of gates, overlooked by a small lodge, at the easterly, the left, end of the building.



GREAT WEST ROAD, W.

WALLIS, GILBERT AND PARTNERS

heating is supplied throughout the building from boilers, which also provide the steam necessary for the various manufacturing processes.



The principal staircase leads direct to the first floor from the entrance hall and vestibule, which are themselves at a considerable elevation above the Great West Road, and are approached by a double sweep of steps. The staircase hall is enriched by a modern chandelier of moulded glass, and is decorated in a note of modernity. On the far side of the first-floor vestibule, and commanding the approach from the main staircase, are the telephone exchange and enquiry office. From this central point, stretching away to either end of the building, is the long administrative corridor, painted in green and grey. At the western end is the board room, decorated and inlaid with selected woods.

On the first floor also is a spacious tiled canteen with a silveroid buffet. Here, at the eastern end of the building, is provided dining space for over 200 employees. Although the windows occupy a large portion of the wall space in this canteen, they may be darkened in a few seconds by mechanically-operated blinds, when the hall is converted into a cinema. The kitchens and services are fitted with the latest appliances of hotel and restaurant type, and communicate by pantry, not only with the staff canteen, but with the directors' private dining-room. Among the important safety devices used in the building is a non-slipping tile inserted in the treads of the staircases.

A portion of the easterly wing, looking from the steps leading up to the main entrance. The factory is provided with an unusual expanse of window space; thus the interior contains no dark corners.

C

The Pyrene Factory, Great West Road, W.] *[By Wallis, Gilbert and Partners.*

Ground-floor plan. The building has a main frontage of 480 ft. and stands on a higher level than the road. The main entrance leads into the hall, in which are the staircases to the administration offices on the first floor. At the easterly end of the site are the gates, with gate-house, giving access to the works entrance and garage on the lower ground-floor, and to the roadway leading to the loading and unloading platform at the rear of the building. The demonstration ground has been laid out to enable the research work carried out in the laboratory to be tested under practical conditions without danger or inconvenience.

A Sequel to the Honeywood File

SETTLING-UP HONEYWOOD

BY KARSHISH
(H. B. CRESWELL)

It is with the greatest pleasure that the editor places in the hands of readers of THE ARCHITECTS' JOURNAL *the first instalment of new building adventures of which Honeywood Grange is again the scene and centrepiece. The new series is, he thinks, likely to be more valuable even than its predecessor.*

Introduction

THE HONEYWOOD FILE, which appeared serially in these pages last year, purported to be a correspondence file from the office of a young London architect, dealing with the building of a house. Although the work, both as regards persons and events, was pure fiction, and presented a picture of which the colours were somewhat brighter than life, its purpose was to enhance verisimilitude; and since the whole of its value and much of its interest depended upon acceptance of the picture as a true one, the author's chief concern was to make it so, and to establish the reader's confidence in the singleness of his purpose.

The same explanation is offered and the same claim is made for the present writing, which is, in fact, a continuation of *The Honeywood File*. That, it will be remembered, ended when the folder would hold no more letters; and the circumstance that the last letter coincided with the completion of the house was merely an example of author's luck : the last sheet of the file was no more than the last page of a chapter, for if the business of building a house ended with the leaving of the workmen, this world would be a much happier place than it is for owners, for architects and for builders, and grey hairs would be fewer in many heads.

In the closing commentary of *The Honeywood File* it was mentioned that somewhere in the architect's office there must certainly be a second Honeywood file; and that file, marked *Honeywood II*, is now before us. Its bulk is ominous. Unless his ineradicable habit of writing unnecessary letters and provoking unnecessary replies, which in turn call for unnecessary answers, is accountable for these bulging contours, James Spinlove, A.R.I.B.A., seems to have had a devil of a time of it.

What this letter-writing is about may readily be guessed. The builder's statement of account has still to be rendered, and this is likely to include unauthorized extras, and to raise questions of fact long gone out of memory. Then, when the architect has settled matters with the builder and agreed a final figure, he has to acquaint the owner with unappetizing facts and reconcile him to those extra charges which are the penalty for his interferences and to those other extras imposed upon him by the oversights, mistakes or afterthoughts of his architect. There is also the vexed question of the defects which, in greater or less degree, manifest themselves in every new building. These, so far as they may appear within a certain time and are due to improper workmanship or materials, the builder has to make good under the terms of his contract; or, so far as they are due to errors of omission or commission amounting to negligence on the part of the architect, the architect is responsible for, under his. Lastly, there is the architect's account for balance of fees due. As this account includes items for expenses and disbursements, and special charges for work additional to that covered by the fee of six per cent. on the total cost (such as the making of new drawings, at the owner's instructions, to replace those already supplied, or negotiating boundaries and so forth), and as these expenses and charges are based on the architect's status and style of living and the cost, to him, in time and trouble, and are to be justified only by their reasonableness, it sometimes happens that owner and architect discover, perhaps for the first and only time, that their ideas of reasonableness differ surprisingly.

One discerns, in fact, that this second file is likely to be more disturbing of peace of mind than was its predecessor : the architect's joy in creation and the owner's in realization can find no place in it; its triumphs can be no more than the overthrow of difficulties. No matter ! The battle—as always—is to the strong; and the record of victory or defeat, and the clash of personalities, is always enlivening. As a poet of my acquaintance once wrote with (for him) unusual discernment :

> Life is the same old life
> That it hath ever been.

When I peep into the bulging folder I notice Sir Leslie Brash, the owner, Marston Grigblay, the builder, and, of course, the irrepressible Spinlove, all hard at it once more. Names new to me bulk largely; but Lady Brash is, I see, again on the job, and a most unkind fate has overtaken Bloggs, the foreman, by adding to his many duties that of précis-writer. Bloggs faces this hardship manfully with a crossed nib on the back of part of an old blue print.

We will not, however, spoil sport by looking ahead. I know only what every reader of *The Honeywood File* knows; namely, that James Spinlove, A.R.I.B.A., is involved in more ways than he is aware of. He has, for instance, given his client light-hearted estimates of the value of various bits of work, one of which—concerning the piping of a ditch—we know to have been quite wildly astray; and although the contract lays down that no extras shall rank unless the claim was made by the builder and accepted as an extra at the time the work was done, it does not appear that our architect has been particular to enforce the builder's observance of this rule. Spinlove is also unconscious that he has fallen into a trap set for him by the people who supplied the facing bricks, and who—with subtle ingenuity acquired by long practice—seem to have established a claim for extra payment in words that Spinlove read as signifying their withdrawal of that claim.

Spinlove certainly warned his client not to give orders direct to the builder's people, and laid such stress on the dangers of the extras that would attend any interferences with the work as to give that warning the character of a threat; but we know that Brash's attention to this excellent advice wandered, and it does not appear that Spinlove kept Brash informed, as he might have done, of the cost of various alterations his client from time to time ordered. We also know that when her Leslie was gunning in Scotland, Lady Brash began pulling down work that afterwards had to be restored—one of the least economical ways of building known to the trade. All things considered, the final statement of account is likely to leave Brash stunned : for the first time since our acquaintance with him he may find himself at a loss

Reading to the loading and unloading platform at the rear of the building. The demonstration ground has been laid out to enable the research work carried out in the laboratory to be tested under practical conditions without danger or inconvenience.

for words. If so, we may feel sorry for the poor man, but he will only have himself to thank.

Grigblay is so competent and honest a man, and in such high repute as a builder, that it is most unlikely any serious defects in his work will reveal themselves. He has, moreover, kept a friendly—if self-preserving—eye on Spinlove, and set him on the right path on several occasions when he was going astray. Both men, however, are aware of trouble promised by Brash's pig-headed insistence on the use of Riddoppo paint against his architect's advice and in face of the builder's objection. It is true that Spinlove, under Grigblay's tactful guidance, categorically dissociated himself from his client's decision, and that Grigblay only consented to use Riddoppo on the understanding that Brash accepted responsibility for the result; but, at the pinch, Grigblay can only escape responsibility by establishing that he used craftsmanlike skill in applying the paint, and Spinlove was remiss in not warning Brash—as, with greater experience, he would have done—of the disasters attendant on experimenting with untried materials. If, therefore, things go seriously wrong and Brash is recalcitrant, both Grigblay and Spinlove are likely to be in difficulties about the paint which, in fact, began to show defects before the house was occupied. Riddoppo, we learnt, is advertised in Tube lifts and elsewhere as a New Novelty Super-Paint, fire- and acid-resisting, proof against assaults of boiling water and superheated steam, and capable of receiving a high polish; but these rare merits have not prevented it from showing such a marked tendency to "creep," or flow downwards, that Grigblay, in a private letter to Spinlove—in which his incorrigible, ironic humour veils a natural annoyance—describes "Riddoppo Super" as getting ready to crawl out of the front door and off home.

Sir Leslie Brash, his wife Maude, and his daughter Phyllis—who for some extraordinary reason prefers to be known as "Pud"—occupied "Honeywood Grange," as Brash christened his new home, on February 10, 1926. The house stands on Honeywood Hill, four miles from Marlford, Kent. It backs upon a spinney through which the entrance-drive reaches the adjoining highway; and looks out over a terrace upon a fine prospect to the south, east and west, marred only by a pump-house chimney two miles away which reacts unfavourably on the nerve centres that serve Lady Brash for brains. It is a brick gabled house, with leaded lights in iron casements hung to solid oak frames; and we gather that the design has affinity to Tudor architecture. The oak floors and staircases, and the oak panelling and open brick hearths and fireplace-surrounds to the reception rooms are in sympathy with the same tradition. Spinlove was sorely galled when his client allowed the "eminent commercial gentleman," by whose persuasion Riddoppo came on the scenes, to direct the decorative scheme of the upper floors, where each room is painted a different colour, turning the house—as Spinlove said with bitterness—into a colour-cure asylum for lunatics. We are informed that the house is handsomely but not extravagantly finished, and that the contract price was £18,440. This does not include a temporary wooden garage, faced with larch slabs, thrust back among the trees, which Spinlove built in place of a reach-me-down bungaloid atrocity that Brash, without consulting his architect, had intended depositing near his front drive.

The last letter in the old file is written by Spinlove in acknowledgment of one from Brash, conveying his warm appreciation of the house and thanking his architect for the skill and forethought with which he has performed. It is dated February 14. The first letter of the new file belongs to the following week.

AUTHOR'S NOTE: *The characters appearing in these articles are without exception entirely imaginary, and are associated in my mind with no real persons, either alive or dead. The episodes are inventions.*

i: Signs of Damp Appear

JAMES SPINLOVE, A.R.I.B.A., TO MARSTON GRIGBLAY, BUILDER

Dear Sir, 23/2/26.

I should like your statement of account at once. When may I expect it?

Yours faithfully,

It is a pity Spinlove—like the rest of us—does not get his deserts, or he would receive by return a postcard bearing the words "Say, Please," and obtain great benefit from the hint. He is on the best of terms with Grigblay, who has taken great trouble to make the house a success and whose friendly help and advice he has acknowledged on several occasions and been indebted to on many more; so that this gracelessness is merely a habit with Spinlove when addressing those under his direction. It is a bad habit and one that has already got him into difficulties he might otherwise have avoided.

SIR LESLIE BRASH TO SPINLOVE

Dear Mr. Spinlove, 28/2/26.

I very much regret to have to intimate that my anticipations anent the windows at Honeywood appear to be now eventuating. You will recall that I previously communicated to you, on behalf of Lady Brash and myself, our strong preference for big sheets of thick glass in place of the little thin sheets all joined together with narrow strips, but you persuaded us to adhere to the present device. The consequent results are precisely what I anticipated. The rain percolates freely through the glass, which is *very thin, cheap glass*, and also, I apprehend, through the joints where it is connected by the little strips which are so weak that *iron bars* have in some cases been found necessary to fortify their strength. Every morning the maids have to remove the accumulated wet that collects on the new oak window-boards, which are exhibiting stains in consequence, and even runs over on to our new carpets! The situation of Honeywood Grange is excessively exposed to the weather, and it is clearly obvious that large continuous sheets of thick glass is the appropriate desideratum, as—if you will permit me to remind you—I previously prognosticated.

We continue to be delighted with the house and to appreciate the anticipatory forethought of its architect. We notice no signs of damp other than that above intimated except in the *boxroom* the outer wall of which was lately found to be *streaming with water*, and the domestic staff complain of wet marks near the ceiling over the fireplaces of their domain on the uppermost story.

I desire that you will intimate to Mr. Grigblay that these matters require immediate attention. There should be no difficulty in cutting the glass to appropriate sizes and effecting substitution of one pane at a time so as to avoid unnecessary exposure to the weather.

Yours sincerely,

Brash certainly takes these disasters in an accommodating spirit. He is evidently well satisfied with the house.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 1/3/26.

It is not possible, I assure you, for rain to beat through the glass quarries, which are not, as you suppose, unduly thin. Iron saddle-bars are essential to leaded lights. Large sheets are made thick for purposes of strength only. It is certainly possible for heavy driving rain to find its way in through the joints with the leadings, but this cannot be the case with your windows. Messrs. Watkins, who did the work, are most reliable people; and it happens that, knowing the house was exposed on the south and west, I spoke to their man on this particular point and found that he was already jointing the quarries to the cames, or leads, with a mastic stopping—a precaution not in ordinary found necessary.

I have no doubt whatever that what you describe is merely *condensation*. In a quite new house the moisture in the walls, due to the large amount of

water used in bricklaying, is continually being evaporated, and the warm air becomes charged with steam, which condenses on the cold surface of the glass. If the windows are left a little open the trouble will diminish, and it will entirely disappear for good and all with the summer.

The wet surface of the boxroom wall is due to the same cause. This is a solid wall, and the plaster was finished with an ordinary steel-faced float and so left. The window and door should be kept open for the next few weeks.

With kind regards,

Yours sincerely,

PS.—You will find that wet will collect on the windows when there is no rain, and moisture on the boxroom wall only pronouncedly when mild, humid weather immediately follows frost.

Spinlove is evidently informed by experience, or he could scarcely write with the assurance he exhibits, which, however, does not extend to the cause of damp in chimney breasts. It will be noticed he says nothing of this. The reasons he gives, and the advice he offers, are sound; but we may suppose that Brash has raised a great shout over a very small matter, for the conditions at Honeywood Grange are such as least favour condensation. The brickwork was built during the summer months and the outer walls are formed by a 4½-in. inner and a 9-in. outer wall, with a 2-in. space between, so that evaporation must be relatively small. In houses that specially favour condensation—such as those built in the winter and stuccoed or roughcast on the outside as well as plastered within, so that water is bottled up in the walls—the evaporation induced by the warmth of the occupied house is so considerable as to produce most disquieting conditions of damp. Water collects in puddles on window-boards and runs down walls to form pools on the floor below; and under such conditions of weather as that described in Spinlove's postscript, wallpapers covering outside walls may become soaked with water. Brash's boxroom is a mild instance of this phenomenon; and when Spinlove speaks of "steam," and mentions that this particular wall is built solid and its plastered face left as finished with a steel float, he gives the explanation of it, though Brash—who probably recognizes steam only as the vapour from boiling water (which is not steam), and has no idea that steam is invisible or that atmospheric air is charged with steam which comes into evidence as vapour or "condensation" only when pressure is reduced or temperature lowered—will not know what he is talking about.

The inner 4½-in. lining of a hollow wall speedily dries out and acquires a temperature approximating to that of the room, so that condensation cannot take place upon it. A solid brick wall, on the other hand, tends to retain its moisture and is therefore a better conductor of heat than a dry one; and, as there is no hollow space and insulating blanket of air, the warmth of the room is dispersed into and through the wall, which, in consequence, remains cold and invites condensation. If this boxroom wall had been papered—and in the degree that the paper was thick and porous—condensation would have been discouraged, and for the reason that explains Spinlove's reference to a steel float. A steel float gives a compact, smooth, polished finish to plaster, which promotes condensation by the abrupt transition of temperature presented at its surface; but a float faced with felt leaves an open grain behind it: the air invades the interstices of the plaster surface; there is a gradual transition from the temperature of the room to the temperature of the wall, and condensation will not then take place under any conditions likely to arise in a house. Incidentally, distemper lies well on a felt-floated wall: it looks "solid," as a house painter would say—a result that can be otherwise got only by papering before applying distemper. In using the ordinary method of finishing with a steel float in the boxroom and other back quarters, Spinlove was observing a right principle of careful economy.

[NEXT WEEK: II.—THE DRAINS ARE SUSPECTED.]

ARCHITECTURE OF OUR OWN TIMES

DR. ERICH MENDELSOHN began his lecture at the Architectural Association, on Monday of last week, by remarking that he appeared there as the representative of a movement that was not at war with the past, but turned to find a separate path towards modern beauty.

After defining, with examples, wall and front, he went on to say that the difference between them was a two-dimensional one. Extending it to the whole of a building, that was, considering it three-dimensionally, we got the contrast between space and surface. The Frank Lloyd Wright building, built twenty years ago in Buffalo, showed a clear separation between masses. It caught the light, and thus gained shadow and depth. In a word, it created space. It made no difference whether this organic synthesis were achieved harmonically or contrapuntally. You had, in some cases, horizontal series of the same element, or very similar elements; in others, vertical ones.

Modern architecture was not, he considered, merely a matter of fashion, a further development of mere form. Its creative impulse was born with the appearance of the new building materials—iron, steel and reinforced concrete.

Next, the lecturer defined the principles of construction of the Greeks—support and load, column and architrave; and of the Middle Ages—pillar and vault, weight and shear being transmitted to the walls, though the main load was here supported by buttresses, the walls being practically eliminated as supporters through being pierced with enormous windows. In both principles only compressive forces were dealt with, whereas the principle of our time was tension. And there was no connection between any of them. The first steel girder meant, for us, nothing less than the same feeling of release as that with which the Middle Ages greeted the first vault as a triumph over the Classic principle of construction.

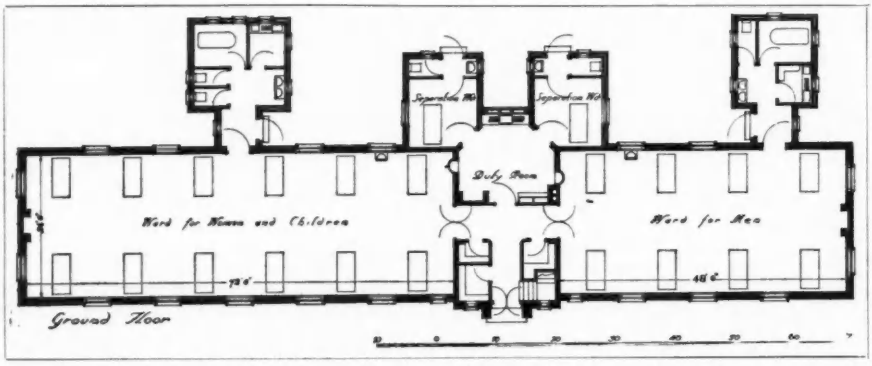
After the interpolation of some remarks on the meaning of the phrase, "utilitarian building," the lecturer proceeded to claim that the introduction into architecture of the idea of standard parts, essential to modern machine construction, rejected the wild, formless growth of former unorganized ages, and organized the technique to arrive once more at primary architectural forms. Skeleton construction replaced solid walls. Works in steel and reinforced concrete replaced the homogeneous mass. The wall that had to support both itself and its load was limited in its openings, both doors and windows. The wall free of load, on the other hand, opened up whole surfaces between the structural supports. With the help of glass they softened the outlines of the architectural masses, making them transparent where formerly they were heavy and solid.

Thus industrial construction was leading the way towards a new style of architecture, and the distinction between utilitarian and non-utilitarian buildings was losing all its meaning. In every building the practical purpose must underlie the plan.

Dynamic architecture and functional architecture were slogans on the Continent chiefly found in art magazines. Dynamic architecture meant individualistic architecture, spiritually, emotionally charged. Functional architecture was collective architecture.

They welcomed every architectural solution which satisfied the real conditions of the problem and provided the unique form it demanded. But they considered it as a lack of character and the sign of a fettered mind to degrade historical forms which, in their own time, had vitality but today were theatrical gestures.

Dr. Mendelsohn concluded by stating his belief that the fire of the new movement had come to warm England and the Scandinavian countries, which, in consequence both of climate and temperament, were essentially moderate.



NEW DIPHTHERIA WARD BLOCK

Clatterbridge — DESIGNED BY CAMPBELL AND HONEYBURNE — Cheshire

The entrance front. The external walls are in Buckley rustic bricks, and the roof is covered with silver-grey rustic slates. Except for the large day-room, the accommodation is all on ground-floor level. The back elevation is similar except for the projecting sanitary blocks and separation wards. The unavoidable lack of symmetry between the wings is hardly noticeable.

PLANNING is based on the latest requirements of the Ministry of Health. No cooking is done in this block, but the duty room is equipped with a small range for warming and tea-making purposes. There are windows in this room overlooking each of the large wards, from which every bed can be seen by the nurse on duty, and these can also be used as hatches for the distribution of food. Heating is effected by a low-pressure hot-water system.

Accommodation is provided for twelve women and children and eight men in the two main wards; there are also two single-bed separation wards. Ventilated lobbies lead to the sanitary blocks.

A view of the ward for women and children. The door on the right connects with the bathroom and lavatories. The floor is laid with granwood blocks on concrete (in corridors and lavatories terrazzo has been used), while the walls are finished in Keene's cement, enamelled (in the lavatories, above terrazzo dadoes). The sliding sash windows embody special hospital experience.

NOMINATING THE R.I.B.A. JURY

Readers' Suggestions Analysed

(Letters from several correspondents on this subject appear on page 829)

THE QUESTIONNAIRE

A FORTNIGHT ago we issued to our readers a questionnaire designed to elicit their views as to how a jury, five in number, should be chosen to assess the designs for the new R.I.B.A. building which will be submitted in the forthcoming competition. It will be remembered that the choice of assessors was to be based upon considerations both of policy and of merit.

THE PROBLEM'S DIFFICULTIES

In the first instance it was suggested that each member of the jury should belong to some clearly-defined section or school of opinion. After determining these divisions to his own satisfaction, the reader was invited to name the individual in each group most fitted to represent it. Obviously the choice of the divisions themselves constitutes the more difficult problem of the two.

In the architectural profession few members have unique qualifications, for nearly all of them, either by virtue of their training and experience or of their artistic predilections, can be said to belong to some class or group. For instance, if it be proposed that one of the assessors should represent the Classic tradition, at least a dozen names, eminent in the profession, immediately suggest themselves to us; and a competitor who intended to submit a design in the Classic style would probably be fairly well satisfied with any one of these assessors. And the same applies to other schools of thought. Thus it is easy to suggest distinguished names for the jury. But to determine the main divisions which its members should represent is a matter of great difficulty.

AN OBJECT OF FIERCE SCRUTINY

For the new home for the R.I.B.A. will be subject to a fiercer scrutiny than any building hitherto erected in this country has had to undergo, and there will be an unholy row if it is not acceptable to certain powerful sections of opinion. Or, at least, if it does not please them, the R.I.B.A. must be in a position to point out that at any rate they were represented on the jury.

The groups to be invited to send delegates to the jury are those who will shout the loudest if they are excluded. It seems impossible for the R.I.B.A. Committee, entrusted with the task of appointing the assessors, to escape from this brutally realistic condition.

Let us then turn to the answers to our questionnaire and consider what are the divisions in the profession which, in the opinion of our readers, are most worthy to be represented on the jury.

OUR READERS' VIEWS

The response to the questionnaire was highly gratifying, and a number of interesting recommendations were put forward. Unfortunately a certain number of architects misunderstood the nature of our inquiry, and submitted names without suggesting what section of opinion they represented, and these answers we are naturally obliged to ignore. Again, some of the divisions suggested are much more helpful than others.

CLASSIFICATION BY FACULTIES

We had not contemplated that anything so debatable as a classification by faculties would be attempted. Yet one of our correspondents proposed the names of five jurors, the first of whom represented Taste; the second, Vision; the third, Imagination; the fourth, Efficiency; and the fifth, Youthful Outlook.

This is to open up endless controversy. For these qualities, at least the first four, are ill-defined; they overlap and, moreover, we like to suppose that they are united in the mind of every good architect. Sir Giles Gilbert Scott, who is credited by our correspondent with the quality of Vision, would not feel it a compliment were he expected to seek advice from Sir Edwin Lutyens in all questions of Taste, from Mr. Thomas S. Tait on the occasion when the quality of Imagination was especially called for, and from Mr. Robert Atkinson when Efficiency appeared to be demanded.

THE POLITICAL ASPECTS

This classification takes no account of the political aspects of the case, which are very important. Architects who claim to possess taste certainly have votes, but they have no sense of solidarity, for what may appear good taste to one architect, to another may represent vulgarity *in excelsis*.

The suggestion, however, that Sir Herbert Baker should represent the Imperial or "Colonial" point of view, is of a far more realistic kind, for obviously, as the R.I.B.A. claims to have at heart the interests of architects all over the Empire, it would be a suitable recognition of this fact if one member of the jury were especially qualified to speak in the name of "England beyond the seas." Quite a number of our readers have signified that they attach great importance to this aspect of the question. This is a matter of politics which has doubtless already engaged the attention of the R.I.B.A. Competition Committee.

THE "MODERNISTS"—

As might have been expected, many of the answers to the questionnaire expressed a desire that the "modernist" view shall be adequately represented. There was, however, more conflict of opinion as to whether "modernity" was not also represented by a number of young men who are content to design in the traditional manner. There is no doubt that the majority of our correspondents favoured the inclusion of one or more assessors who should definitely represent the younger generation. The name of Mr. Berry Webber seems a highly popular one in this connection, and this shows that his competition successes and great gifts as a planner have impressed themselves on the imagination of architectural students.

—AND THE RISING GENERATION

It must be borne in mind that of the rising generation there are still very many who are hostile to the "modernist" movement, and they are not likely to allow the protagonists of the latter to enjoy a monopolistic claim to represent "youth." There is no question, however, that the "modernists" have succeeded in making a great stir in the architectural world, and it would not be politic to refuse them adequate representation on the jury of assessors. Among the "modernists" mentioned were T. S. Tait, Robert Atkinson, Howard Robertson, Joseph Emberton and Charles Holden. These recommendations for a definitely "modernist" assessor occurred in forty per cent. of the nomination forms.

FOREIGN ASSESSORS

Two correspondents were of opinion that *all* the assessors should be foreigners. Such views are certainly interesting, for they provide evidence of the enormous respect for Continental architecture which has been fostered by the exponents of "modernism." The names of two eminent Swedish masters are cited. Ragnar Ostberg was expected to provide "a modernist interpretation of the Renaissance"; Ivar Tengbom, "an appreciation of

traditional form"; the brothers Perret, of Paris, "structure and economics"; Mendelsohn, "brutal modernity, with no fruit or flowers"; while for "planning and efficiency" it would be necessary for us to go to Harvey W. Corbett. In another nomination form it is suggested that Le Corbusier and Bruno Taut should have places on the jury. Of these names, that of Ivar Tengbom is perhaps likely to commend itself to the largest number of English architects, as it is well known that the founders of the modern Swedish movement were respectful students of our own eighteenth-century work and owe to it their chief inspiration.

THE ENGLISH TRADITION

The extremely "Continental" flavour of the "modernist" movement has induced many of our correspondents to stipulate that one at least of the assessors should stand definitely for "the English tradition," which they think can best be expounded by Englishmen themselves. The names of Sir Reginald Blomfield, H. V. Lanchester, Professor C. H. Reilly, Professor Patrick Abercrombie, Professor S. D. Adshead, Sir Edwin Lutyens, and Oliver Hill are mentioned in this connection. Again, the terms "academic" and "scholarly" are employed to designate qualities which some of our correspondents wish to see exemplified in the jury. Arthur Davis, Professor A. E. Richardson, Percy Worthington of Manchester, and J. A. Gotch are included in this category.

Among the "traditionalists," however, there was evinced a desire that a twentieth-century interpretation should be given to the Classic style. Sir John Burnet and Partners were recommended as being in favour of "modernized details" and materials; Robert Atkinson was named by one correspondent because he represented "new ideas founded on sound scholarship in architecture."

COMPETITION EXPERIENCE

The words "competition experience" occur often in the nomination forms; and this is not to be wondered at, for competition architecture is a thing apart, and many years of experience are generally required both as competitor and as assessor before a man can achieve the correct judicial attitude towards a set of competition drawings. Consequently it is not surprising that such highly-trained assessors as H. V. Lanchester, H. V. Ashley, Austen Hall, P. S. Worthington and Vincent Harris are recommended for inclusion on the jury.

We shall discuss, below, the important point as to whether some of these distinguished architects would prefer to compete themselves; for the present we are concerned to record the opinion of some of our readers that ideal assessors are not born but made, and made by experience.

EFFICIENCY, PLANNING AND DESIGN

As the ability to plan and to equip a modern building "efficiently" must be acquired by any architect who attains eminence in his profession, it seems scarcely necessary to insist that one or more of the assessors shall possess it. One correspondent suggests the name of Sir Frank Baines as representing "Commerce and Common Sense," but this is a little hard on the four other distinguished architects mentioned in the same nomination form, who, by implication, must be lacking in this latter quality!

"Efficiency" also is too inclusive a term to be employed in this connection, for *all* the jurors should represent efficiency. For the same reason, to specify the ability to design as necessary in an assessor seems supererogatory. Moreover, those correspondents who have named one or two architects as especially gifted in design have unconsciously insulted the remaining members of the jury who are credited with some inferior quality. It appears, however, that there is no lack of architects competent to form a jury of assessors. Indeed, the principal difficulty will be to know whom to eliminate from a list representing so much varied talent.

ASSESSORS AND COMPETITORS

It has been pointed out in the correspondence columns of this JOURNAL that if a jury of as many as five assessors were chosen, it is extremely likely that we should be excluding from the list of possible competitors several architects who would perhaps be competent above all others to produce the ideal design for the new R.I.B.A. building. Mr. Charles Holden has communicated to us some highly interesting observations on this point. He suggests a means of overcoming the difficulty by allowing the functions of competitor and assessor to be vested in the same persons. His scheme is an ingenious one.

MR. HOLDEN'S SCHEME

In his opinion one assessor should be appointed, who would select a number of designs reaching the level of merit usually required for a second round in two-stage competitions. The number need not be limited to ten or twelve, which is the usual figure for the final "round" in such contests, but might be allowed to go as high as twenty. Next, he proposes that these finalists should be made to vote for the best design, and the result of this vote should decide the competition. In order to get a proper result from this voting, the finalists would either be forbidden to vote for their own design or be given two votes, one of which might or might not be cast for their own designs. This procedure, Mr. Holden observes, has never, to his knowledge, been tried before. It is certainly new to the competition system, though we are reminded that in another sphere of action on an historic occasion it was tried with conspicuous success.

THE CASE OF THEMISTOCLES

When the Athenians wished to give a prize to the most brilliant of twelve generals who had fought a great and successful battle on behalf of their city, they allowed the generals to decide the matter between themselves. But the method of voting was cunningly arranged. Each had two votes, one for the best general and the other for the second best. Every one of the generals voted for himself in the first place, but it so happened that they agreed unanimously in giving the second place to Themistocles. So Themistocles was awarded the prize. This story, which seems to bear the stamp of truth, suggests that it might be unwise to follow Mr. Holden's plan of allowing each competitor to give *both* his votes to himself.

There is undoubtedly something to be said for this policy of allowing the competitors to judge the designs themselves, for, as Mr. Holden points out, by the time the competitor has finished his design, provided, of course, that the scheme is a good and practical one, he probably knows more about the programme in all its aspects than could any assessor in the time and with the means at his disposal.

THE JUDGMENT OF ARTISTS

Unfortunately, however, the success of such a scheme depends not only upon the skill of the finalists, which may leave little to be desired, but also upon their judicial capacity. Artists are not always very generous to each other, and it sometimes occurs that the merits of a design placed first in a competition are more fairly appraised by a layman or by a competitor who was not in the running at all, than by the accomplished persons whose designs were placed second or third.

LAY OPINION

Moreover, it is undoubtedly the case that the critical faculty is sometimes developed to a high degree in those who do not themselves practise any of the visual arts. In the last resort, however, we must trust that on such an unique occasion the assessors, however appointed, would be prepared to spare themselves no intellectual effort in their attempt to hold the scales evenly, recognizing how much depends upon their honourable judgment.

ENGLISH PRECEDENT No. 117

ENTRANCE DOORWAY, No. 34 HIGH STREET, WARWICK

This entrance doorway is plainly moulded in wood, and shows in the design of the fanlight a decided Dutch feeling.

The house has a stone plinth, bolection moulded, above which it is stuccoed.

The oriel window on the first floor of the adjoining house, with its shaped and glazed sides and wrought-iron brackets, is uncommon.

[C. M. G. ARMSTRONG.]

LETTERS FROM READERS

The R.I.B.A. Building Jury

SIR,—I fully agree with a jury of five. The difficulty is that men capable of assessing ought in this case to be competing; this indicates a select competition, but I think the decision (i.e. an open competition) arrived at is the right one.

H. ALDERMAN DICKINSON

SIR,—In my opinion, the best method of assessing would be to appoint a chairman—probably the President of the R.I.B.A. at the time; in any case, one who has not drawn up the conditions—and a jury of five, selected from those who compete.

H. W. HOBBISS

SIR,—In order that competitors should be in possession of as much data as possible, and bearing in mind that very many of them will not be able to inspect the site, and will not know the workings of the R.I.B.A. headquarters, would it not be possible to issue a report on the working of the present premises and its deficiencies? This could be produced by the various heads of departments. I feel that it might be of real value not only to competitors but to the assessors.

E. MAXWELL FRY

SIR,—I return your R.I.B.A. Jury voting form duly filled in, but not quite in accordance with the printed instructions.

It seems to me that to select five distinct ideas or points of view, and link them up with architects whose work exclusively exemplifies each of these preconceptions, rather suggests a jury of delegates, who would certainly, as such, prove blind and deaf to every other aspect of design.

In my view, the profession will only have confidence in a jury composed of men who *all* possess the essential qualifications of judgment, knowledge, and achievement.

Thus only shall we be saved from the inspired young competitor who would house the Institute—or any other learned society—in a building resembling a corset factory, and whose conception of a Council Chamber would reflect the dignity and ease of a hospital operating theatre.

F. CHATTERTON

Modernism and the Man in the Street

My view of "modern stuff" is that, naturally, it all depends on what is meant by this, but I believe that the layman is more sympathetic to it than some of us may like to imagine. Clients or would-be clients, if their architects know how to gain their respect, would allow a good deal of scope for design of modernistic character. I believe that most of the so-called "traditional" work that clutters our streets is there because our architects are unable to do more or imagine more. The task is to design exactly to modern requirements, without any of the dead fruit of the past, such as orders and antefixæ, but with also a certain amount of traditional feeling.

V. O. REES

Fittings to Architects' own Designs

SIR,—The case described by Astragal implies professional infallibility and commercial ineptitude with such brevity that one is forced to assume that: (*a*) The architect did properly inquire of the most competent and actual manufacturers in England before making a special agreement with a foreign manufacturer; (*b*) his design would have been a commercial proposition for mass production or general distribution in England; (*c*) he did not believe it would become commonplace, in England or France, or is indifferent to that possibility; and (*d*) he consulted his client in this matter of reproduction or considered himself under no obligation to regard him as the commissioner and owner of the original design.

The unusual electric fittings were too expensive for special production in England *or France*, but a French manufacturer offered to supply them at a special price, subject to the design becoming his property. We may infer from this evidence that commercial enterprise is a French prerogative, and that unselfishness may be inspired by flattery.

I will answer Astragal's question as a designer who owes much to manufacturers in this country and abroad. It is my experience that many people are unable to discriminate between actual manufacturers of fittings and the more numerous firms who merely sell what they are pretending to manufacture. A colleague has told me he would never deal with a certain manufacturer, but preferred to deal with others, to whom he was unconsciously paying an extra profit on what was being made by the manufacturer he objected to. To plagiarize an old story, one must first catch the manufacturer.

The three great competitive electrical manufacturers of the world are the G.E.C. of England, the G.E.C. of the U.S.A., and the A.E.G. of Germany. These organizations are unrivalled, and it is practically impossible to assert any distinction between them as to their respective efficiency. I know of no such organization in France to which I would entrust a serious contract in which time and delivery happened to be the essence of my clients' interests.

A great electrical manufacturing organization in this country has produced work to my designs, costing some thousands of pounds, at a price below the actual cost of production, as a speculative experiment. No industry can be summed up by individual experience, and the electrical industry in particular is ever dependent on other industries, particularly that of glass manufacture. It is well to remember that English manufacturers of electrical fittings and lighting installations are at a disadvantage with their foreign competitors; architects and designers share that disadvantage when glass manufacturers of Germany, France and Czechoslovakia lead in research and production.

In spite of this impediment, there is no more efficient or reasonable contributor to the interests of architecture in England than the General Electric Company, of which I am obliged to disclose myself as a consultant architect-decorator, and, at the same time, without prejudice.

OLIVER P. BERNARD

A Plea for Wood Carvers

SIR,—All your readers will be sorry that the fact that wood-carving is unfashionable has led to unemployment amongst wood carvers. There certainly is a tendency to omit carved ornaments from buildings and furniture, but I believe it is due to causes which make the position more hopeful for the craft as a whole than would be the case if it were due only to industrial conditions and change of fashion (using the latter term to express the something which makes blue the fashionable colour one year and pink the fashionable colour the next year).

Architects and designers are refusing the "usual way of doing it," and the ovolo does not receive its egg and tongue by right of custom. There is some reaction against the unintelligent use of unintelligent carving to camouflage weak architectural design, and against carving or other practices as habits rather than positive acts of design. One hopes that when the purge is complete, architects and designers will give thought to the right and adequate use of carving in architecture and furniture; but it is not easy and will take time.

Carving is an essential part of complete expression in architecture, but, unfortunately, architectural theory and practice is a little uncertain—the profession is not quite sure whether its inspiration should be derived from a

Meccano set or the Baths of Imperial Rome. Until this point is decided, carving cannot be regarded as a safe way of earning a living because there can be no generally accepted or acceptable way of doing it.

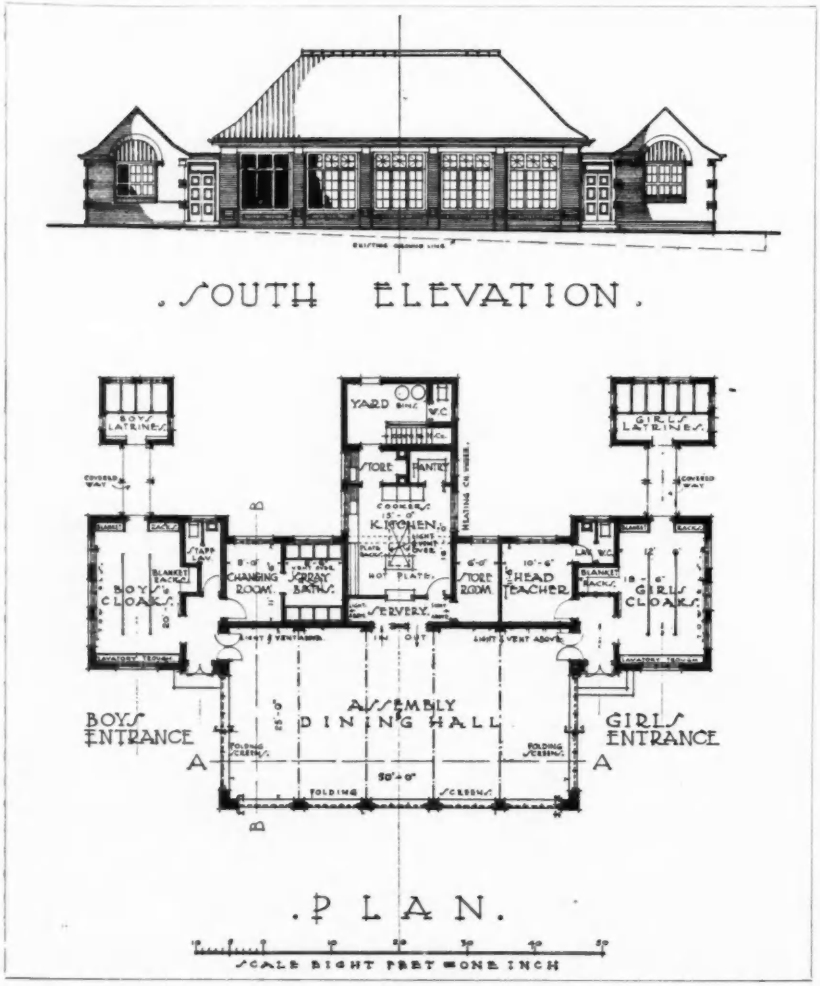
JOSEPH ARMITAGE

SIR,—With reference to the appeal on behalf of wood carvers, signed by Messrs. H. E. Taylor and B. Rockman, which appeared in the last issue of THE ARCHITECTS' JOURNAL, I venture to put forward two points, the consideration of which might result in the amelioration of the present distress among wood carvers.

First, no substitute for carving should be other than valueless in years to come. The reproductive method whereby enrichments are made in plastic materials and pulled out of moulds presents a cheaper bill but ever-increasing regrets. The value is not there; the proper degree of skill is not there; the correct material is not there; for no plastic material can take the place of wood.

Secondly, I have heard expression given to a curious belief that, in these days of rush, carving is too slow a process. It is a creed dear to some in authority that the carver is a dilatory and an unpunctual man. "The artist," say they, "is never to be relied upon." I beg leave to contradict this emphatically. A man's word is as his character, not as his occupation. The carver is as diligent, punctual and reliable a member of society as any other. And I beg that when time is being discussed it should be taken for granted that the carver will run with the team. I have never known him do otherwise.

F. P. MORTON, PRESIDENT, THE MASTER CARVERS' ASSOCIATION.



SIR,—The letter in last week's JOURNAL under the above heading draws attention to the painful lack of support the art of the wood carver has received for many years past.

One can trace the decline to the war years, when the craft fell naturally behind, and for some unknown reason has never regained its former position in the decorative arts, while, on the other hand, stone carving has been for many years in a particularly flourishing condition. It may not be understood by the general public that wood carving and stone carving are two distinct crafts, and unemployment in one is not compensated by prosperity in the other.

Wood carving is one of the crafts that England has been justly proud of in the past, and it would be a tragedy if, for want of a little sympathetic support by architects and others, such a great craft with such great traditions were allowed to fall into decay. It only requires to be realized by those with the power to influence work how great is the need for some revival, however slight, in this fine traditional craft.

All these decorative arts depend very largely upon the support and encouragement of the architect, and it is seriously hoped that the appeal in your last issue, signed by the respective secretaries representing employers and operatives, will bring about some amelioration of the wood carvers' condition today.

W. AUMONIER,
VICE-PRESIDENT, MASTER CARVERS' ASSOCIATION OF LONDON.

Limited Competition for an open-air school at West Hartlepool, to accommodate 150, promoted by the local Education Committee: elevation and plan of the winning design. The assessor, F. Willey, made his award as follows: first, J. W. English; second, Hays and Gray; third, J. H. Garry—all of West Hartlepool. The purpose of this school is medical rather than educational. Dining, staff, bath and cloakrooms were required to be included.

Registration: A Parallel

SIR,—We have so often been told that the Institute of Chartered Accountants wishes to obtain registration, that the following report of remarks by Sir William Plender, Bt., the President, at the recent annual meeting, may be of interest to your readers:

"Passing on to speak of the registration of accountants, he stated that the status of the chartered accountant had greatly improved in recent years, and was more and more generally, if not universally, recognized as being the hall-mark of efficiency and high standing. Registration, as interpreted by those bodies which sought it, was an effort to reach a measure of equality between all practising accountants, irrespective of their training, qualifications, and experience. If registration had to come, he asked that chartered accountants should not be included. Their Royal Charter was their register. They needed none else." OBSERVER

A COUNTRY HOUSE IN HERTS.

DESIGNED BY ALEC SMITHERS

The entrance front of Morleys, Great Hallingbury, near Bishop's Stortford. The house was built by Mr. Alec Smithers, the architect, for his own occupation, with original 2¼-in. eighteenth-century bricks. The roof is covered with old tiles fixed with peg nails.

MANY architects have erected houses for their own occupation, but few, alas! have been able to avail themselves of the opportunity to build their walls of 2¼-in. eighteenth-century bricks. Such a rare opportunity, however, came to Mr. Smithers through the demolition of an old mansion in the neighbourhood.

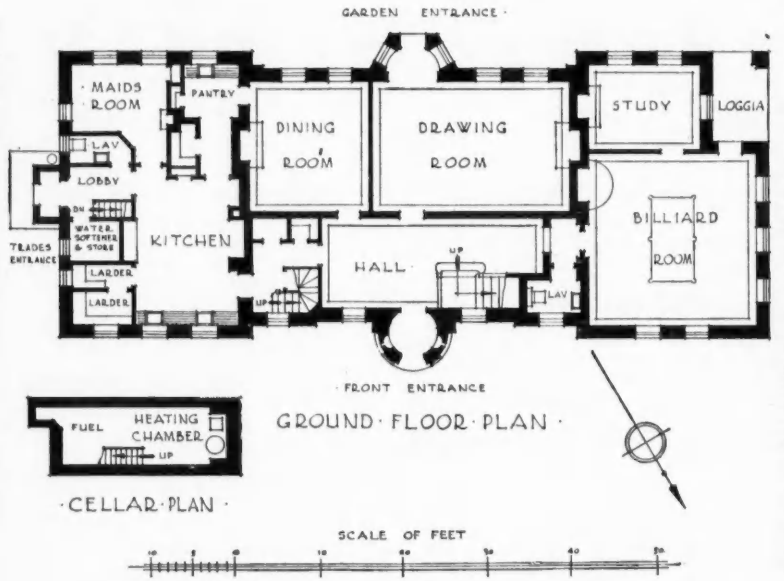
In re-using the bricks he adopted the unusual practice of building his walls 18 ins. thick, with three courses of stretcher bond used alternately with one course of headers. The voids between the stretcher courses above and below the headers were filled with cement and broken brick and gravel concrete, with a wire reinforcement at every 12 ins.

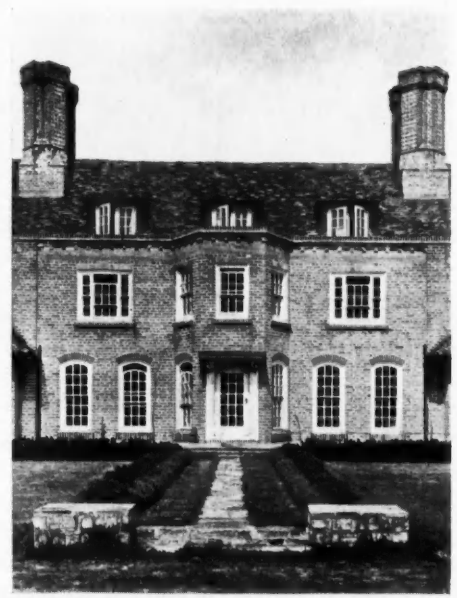
Fortunately, the demolished mansion offered old roofing tiles in addition to bricks, and these also have been re-used, fixed with peg nails on boarding, felting and battening. Many of the old tiles found to be broken were built on edge to form bands on the exterior, window heads and fire-places.

Internally, all the floors are of oak in narrow widths, except the kitchen, pantry, etc., which are of cork tiles. Panel heating is provided throughout. In the principal rooms the panels are finished with a small plaster enrichment by W. Aumonier, who also carved the lime-wood pent and brackets over the drawing-room door to the garden, and the fireplace mantels in the drawing- and dining-rooms.

The fireplace in the drawing-room has a small pattern of rockflower motive, and that in the dining-room a conventional, very small-scale scheme of typical fruits and vegetables. The other fireplaces are of brick with movable fire baskets and oak shelves over.

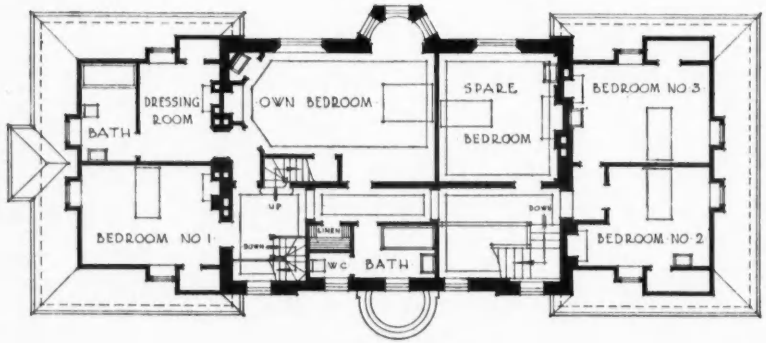
Water is supplied by main from Harlow, and electric lighting is provided by a small plant installed in some sheds in the walled garden, which have been adapted as garage, engine-house, etc.





The garden side, on which the principal apartments are planned, faces nearly due south and provides extensive views to the south-west over the surrounding country. The walls are built in three courses of stretcher bond, alternating with one course of headers, and have joints 1 in. wide in white cement.

A view of the garden side showing the delectable surroundings in which the house is placed. The eighteenth-century bricks and tiles used in the exterior were obtained from an old mansion in the neighbourhood, which had to be demolished.



The front entrance, ground-floor and cellar plan, and garden entrance. Many of the tiles obtained from the old demolished mansion were found to be broken. These were used, built on edge, in the elevations, to form bands and window heads.

·FIRST·FLOOR·PLAN·

The entrance hall, first-floor plan, and first-floor landing. The interior walls are left in the natural plaster and distempered in cream, French grey or biscuit colour, according to the room.

House at Great Hallingbury, Herts.] [*By Alec Smithers.*

The drawing-room, and the dining-room. Heating is provided from panels arranged round the sides of the rooms at ceiling level and finished in the principal rooms with a small plaster enrichment.

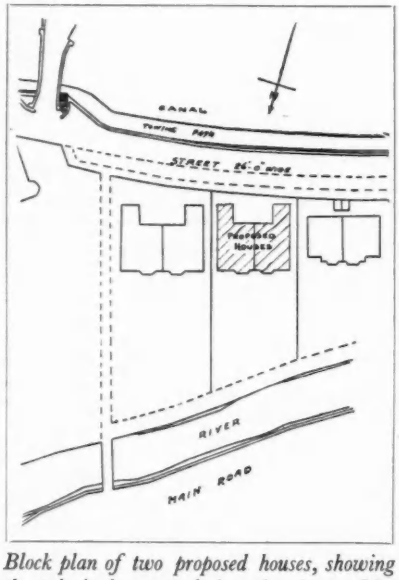
QUESTIONS THAT ARISE

SETTING BACK OF HOUSES

"Subscriber" writes: "*Plans have been submitted to —— Council showing two houses proposed to be erected in the position shown on the accompanying block plan. The planning of the houses shows the principal aspect or architectural front to be the one away from the street and facing the river. The scullery and coal place extensions are between the main wall of the houses and the street giving access to the proposed houses. One bye-law states that 'from the rearmost wall of the building to the boundary of any lands or premises immediately in the rear of the site of the building' a distance of not less than 15 ft. must be provided. It is contended by the architect who has submitted the plans on behalf of the owner that the rear of the building is not the side fronting the street, but that side farther away from it, and therefore the 15 ft. distance mentioned above applies to the space between the houses and the river.*

"*It is also suggested by the architect that there is nothing in the bye-laws to prevent the houses being built close up to the boundary of the 26 ft. street, with the principal aspect either to the street or away from it as he chooses.*

"*The points raised are: (1) Which is the rear of a house for the purposes of the bye-laws? (2) Does the existence of a street or streets affect this question in any way? (3) Assuming the existence of a street does affect the matter, does the first house erected along the line of such street or principal street decide the layout of future houses along that street or principal street? In other words, does it mean that all houses erected thereafter will be considered as having the rear of the houses facing the street or principal street, whatever the architectural layout may be?*"



In the Local Authorities' housing schemes the houses or blocks are always arranged in "open development" and nearly always at least 20 ft. distant from the road and, of course, at an even greater distance from the back fence of the garden.

It seems to me that the real purpose of the bye-law quoted by "Subscriber" is to secure that houses shall not be at a less distance than 30 ft. from back to back, for such a regulation would provide for a certain minimum of light and ventilation for the rooms at the back of the houses, that is to say, having external walls furthest from the street. But there seems no reason whatsoever to insist that there should be a 15-ft. distance between what is usually described as the front of the house and the street itself, for it may be assumed that the whole street or road is itself an open space and should normally suffice to light and ventilate the front rooms of the house.

Thus one might argue that for the purpose of the bye-law the front of the house should be what actually appears to be its front, namely, the wall surface abutting upon the road, and that the back of the house is what is normally described as the back, namely, the wall surface farthest away from the road, and this quite irrespective of the disposition of the rooms within the house itself. Otherwise there would be a continual confusion of terms, and architects and local authorities could argue *ad infinitum* as to whether the presence of a water-closet, for instance, or the sink belonging to a scullery or kitchen, placed on the front wall of a house, altered its character and changed it into a back wall within the meaning of the bye-law.

In fact, such an interpretation of the bye-law might render illegal any house built up to the pavement line of a street if a cloakroom or lavatory or any part of a kitchen were lit from the front of the house. This would be a very burdensome restriction upon domestic planning in urban areas, for in the first place it is becoming ever more common to place lavatories and water-closets immediately adjacent to the entrance hall or vestibule, and secondly the increasing noisiness of public thoroughfares on account of motor traffic will render it highly desirable to place the living-rooms at the back.

In the case of such houses it seems more logical to say that their living-rooms face the back than that their backs face the road. For what determines the front of a house is primarily the principal entrance thereto; and also, if we are to take some account of the architectural aspect of the matter, it should be assumed that as soon as these secondary apartments, which have usually been relegated to the back of the house, have been moved to the front, an effort will be made to give them an appearance which is seemly and decorous and worthy of their position at the front of the house facing the public thoroughfare.

Block plan of two proposed houses, showing the principal aspect facing the river. [*See* reply to "Subscriber."]

The answer to Question 3 involves a question of law rather than of terminology. I can see no passage in the bye-laws of the —— Council which throws light upon the problem. I believe, however, that in certain districts local authorities have passed bye-laws to the effect that once a building has been erected of which the front is at some specified distance from the road, the building line of future houses to be erected on either side of it is thereby determined, quite irrespective of whether such houses are planned with their living-rooms facing towards the road or in the other direction.

A. T. E.

BLACK ROOFING SLATES

With reference to the inquiry, published in our issue for May 7, asking where it is possible to obtain black roofing slates, Messrs. Setchell and Sons, Ltd., have sent us the following reply: "So far as we are aware, no black slates are obtainable in the United Kingdom. But we understand they are supplied by the Vendor Slate Co., Inc., Easton, Pennsylvania, U.S.A."

CONSTRUCTION OF DEW PONDS

In our issue for May 14, "L. H. C." wrote: "*Can you give me any information respecting the construction of dew ponds, giving, especially, particulars of position, size and materials used?*"

Messrs. George Hubbard and Son now write:—

The secret of a successful dew pond lies in placing a non-conductor of heat between the pond and the ground. After hollowing out the ground to the area required—the larger the better—place a non-conductor of straw, mica, cork, etc., on the top of which the impervious material for the pond should be laid (prehistoric man is thought to have used puddled clay). The pond need not be more than 6 ins. deep, and should be placed in a high position away from trees, where the winds have every opportunity of blowing across it uninterruptedly. The dew, when deposited, should be drawn off into a tank so as to prevent evaporation.

For further details of the construction of various experimental dew ponds we should like to draw attention to *Neolithic Dewponds and Cattleways*, by A. J. and George Hubbard, published by Longmans Green & Co.

THE SPECIFICATION WRITER

SPECIFICATION writing is usually regarded as the most strictly utilitarian of all the architect's many functions. Very literally, he who sits down to write a specification is concerned with material facts. Accordingly, it is to be the aim of the department now inaugurated to bring to his notice relevant facts of all kinds.

American Practice

AN important contribution to the art of specification writing has recently been made in America by the publication in book form of the actual document used in the erection of a large hospital erected at West Chester, Pennsylvania, from the designs of York and Sawyer. The specification is too often the Cinderella of an architect's office; great care and thought are expended on the preparation of the working drawings, but these are accompanied by a strange, incoherent document, a

> drawler of old saws
> Distilled from some worm-cankered homily,

a despair to the quantity surveyor, and a source of irritation to the contractor, who constantly has to "look up bills of quantities" to understand what is intended.

Just as the publication of the working drawings of well-known architects has done much to raise the general standard of draughtsmanship, so the hope is expressed that the printing of an actual specification will improve the level of specification writing. It is even suggested by the author of this book, which is published in the Pencil Points Library of Specifications, that the architect might also aim at a literary style in this important part of his professional duties. He enumerates the three principal requirements of a specification as (1) It must give such an adequate description of a given work as will enable a builder to understand exactly what is intended; (2)—in terms so definite as will, when made part of a contract, arm the owner with power legally to compel the contractor to produce precisely what was proposed; (3) "Being the emanation of a member of one of the learned professions, it must be couched in good English, both diction and grammar so well observed that no word is wasted, nothing omitted and no ambiguities existent."

In this country at present we are far from the attainment of such an ideal; nevertheless, the compliment implied in the last clause may fire some architects to clarify their style, if it does not inspire all to write in the rounded periods of Gibbon.

When the specimen specification in the book is examined, it is consoling to find throughout the 360 odd pages a cousinly resemblance to the diction of an English relative, with just those differences of expression and practice that provide valuable comparisons. One is struck by the number of sub-contracts into which the work is divided, and the fact that these are all dealt with by the architect and not left to the general contractor to sub-let.

In the first half of the book, comprising the building trades, the specification is printed on the right-hand page only, while the left remains blank except for an occasional editorial comment. These notes, intended primarily for the guidance of the supervisor (who is the American "opposite number" of the British clerk of works), are full of practical common sense, though some of the procedure advised is unfamiliar. One note suggests that before obtaining tenders from firms of specialists, one of the proposed firms be called in and asked to go through the draft and advise on the wording of the various clauses. In theory this may assist the writer, who obviously cannot pretend to encyclopædic knowledge, but it is open to the objection that it may give one firm an undue advantage over others competing.

The well-known expressions "first-class job" and "in the best manner" hardly appear in this specification, and the note suggests that they should be used with the greatest restraint. Too often in this country they appear as a kind of ballad refrain at the end of every clause.

Another suggestion which is unusual in English practice is that "a stiff-necked prompt rejection policy for all inferior work is not always the best for the owner." Rather than delay the job it may be better to accept second-rate articles at a discount to be determined by the architect later, but for a clerk of works to exercise his judgment in this way he must have the architect's confidence to an exceptional degree.

No such latitude can be given to the plasterer. Defective plastering cannot be accepted in any place. If it is bad it cannot be made good, and simply has to be done over again.

Plasterwork on concrete is to have a patent binder mixed with the scratch coat. The method of painting the shuttering with a patent preparation which preserves the surface cement from the aggregate, in order to expose a key for the plaster, is not used. On the contrary, the concrete is to be pecked over to secure a key, as is the common English practice.

Under "painter" there is a careful note on the painting of new plaster, which suggests that the wall shall first be given a preparatory treatment of a solution of 3 lbs. zinc sulphate to a gallon of water, which shall be allowed to dry before the paint is applied.

A very thorough method of ensuring the floors of the balconies being watertight specifies that the concrete surface shall first be painted with tar, then covered with five thicknesses of roofing felt, and finished with a layer of pitch. Upon this the floor tiles are laid either in cement or in an asphalt compound. Expansion joints are to be left at margins.

Cement expansion is specially guarded against throughout the specification. In the external stucco work the second coat (it is three-coat work) is to have horizontal expansion joints cut in it at intervals. And when we come to terrazzo flooring various methods are suggested in the running commentary to prevent cracking. The best of these is to lay $\frac{1}{4}$ in. sand, covered with tar paper, on the concrete and pour on this 2 ins. of 1 to 4 mortar and on this bed to deposit the $\frac{3}{4}$ in. terrazzo in the usual manner. The writer of the specification relies on brass metal strips placed between the field and the border and at intervals in the field, thus dividing up the floors into a number of rectangles each measuring roughly 24 sq. ft., the assumption being that terrazzo on concrete and steel *will* crack and that it is best to let the cracks occur where they are least noticeable and where they will be least conspicuous when filled.

The work in heating, ventilating and lighting is specified in far greater detail than is usual in this country, and that ambiguous clause "to include everything necessary to render the work satisfactory in all respects" does not appear. On the other hand, less latitude is given to the engineering firms to include their own special fitments, but this is probably offset by the higher standardization of American fittings.

The lifts are specified with the same minute detail as the other mechanical trades, and it is doubtful if this method ensures better results than the English one of selecting one or two reliable firms, submitting to them a general outline of the work required, and trusting to the reputation of the makers to make a satisfactory job.

The special hospital equipment sections, such as sterilizing and refrigerating plant, etc., included in the book, may interest the architect who in this country specializes in hospital work. But he would not write these

in his office, and, although included here, they have been written by the consultant mechanical engineer.

A section from which much useful information may be gained is that on hollow metal work. America makes far greater use of this material than does this country. In the Pennsylvania hospital the external plaster angles of the corridors have steel corner heads. Doors to lifts and stairs and certain other offices, which in English practice are often in wood, are all in steel, and the cubicle partitions in the wards are of drawn steel tubing filled in with sheet-steel lower, and glazed upper, panels.

The great drawback to this book is a lack of illustrations. The small-scale plans and the few details are good, but many points, written as they are in somewhat unfamiliar phrases, would be quickly elucidated by detail sketches. Nevertheless, the chief impression left on the mind is the similarity of the methods of specification writing in America and England.

LL. E. W.

Autogenous Lead-burning

OF late years the autogenous welding of lead, more familiarly known as lead-burning, has made rapid strides, especially on public buildings, cathedrals, and old mansions. Prior to 1914, little was known on the domestic side of the plumbing trade about lead-burning. During the war, however, owing to the scarcity of chemical lead-burners, it was necessary to have sanitary and domestic plumbers taught the art, to cope with the demand.

A recent instance where lead-burning has been extensively used is on the new Singer building in City Road, London. Here a massive dome was covered with sheet lead, 16 lb. per foot super. The dome is constructed of steel framework, covered with concrete. The method adopted in covering it with lead was to cut sheets of lead 4 ft. by 2 ft. 6 ins. These were fitted together on the circular and "butt jointed," enclosed by lead rolls, and capped every 4 ft. by heavy cast lead covering pieces 6 ft. by 8 ins. by 1¼ ins. thick, from apex of dome to base. Where the dome merged into the perpendicular sides the lead was in the form of decorative panels, and finished at the base with lead gutters. The whole of the edges of the sheets had to be lead-burned.

The method used in fastening each sheet of lead is this: Each section of lead is cast with clips attached as illustrated in figure one. These clips are then dressed down over the steel frame where an opening has been left for the purpose. A bolt and iron washer is then inserted through the lead and steel frame and screwed down. It will be readily understood that joining the sheets together by soft soldering would have been useless, owing to the uneven expansion and contraction of the metals, when subjected to heat and cold. By lead-burning the joints this difficulty was overcome, as the expansion of the jointing material and the base metal is the same In figure two is seen the

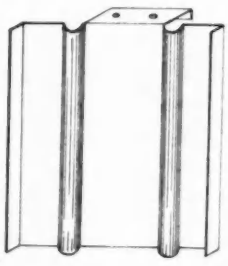


Figure one. A lead sheet forming part of the dome sheathing described on this page. The sheets are joined by means of the oxy-acetylene blowpipe, as shown below

lead-burner in operation on a panel, the blowpipe flame and filling rod (lead) being clearly seen. The joint, when completed, will be flush with the sheets.

Though this special case called for the use of an oxy-acetylene flame, a new system of lead-burning has recently been introduced. This is known

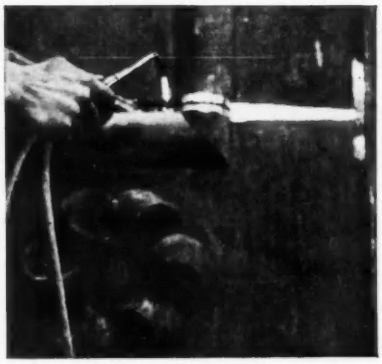

Figure two. Oxy-acetylene lead-welding in progress. By this alternative to soldering, the lead is neither burned nor cockled.

as the "air-acetylene" system, and is one which has proved very satisfactory for any class of work that can be done on the "flat." It is, however, not suitable for upright work, owing to the "sting" of the flame being too large, which causes the heat to spread over too large an area, with fatal results.

In the use of this system, only one gas cylinder is required, namely the fuel gas, which in this instance is acetylene. The temperature attained is approximately 960 deg. Fahr., which is quite suitable when we consider that lead melts at 617 deg. Fahr. This type of burner is capable of penetrating the thickness of lead, should it be ¼ in. thick or equal to 20 lb. per ft. super. The approximate pressure at which these blowpipes work is between 8 and 10 lb. per sq. in., and at these pressures it has been proved that the atmospheric air is induced by the velocity of the acetylene to form a perfect mixture for lead-burning, there being no tarnishing or oxidizing effect on the lead.

Wherever solder has been previously used on roof work, it can be superseded by lead-burning to advantage. Not only does it work out more economically, but it does away with the unequal expansion and contraction that are always experienced when solder is used as the jointing medium between two pieces of lead that are subjected to varied temperatures. E. P.

AS a step towards disseminating the results of practical experience in welding, the Institution of Welding Engineers has devised an interesting competition. Operative welders are offered the opportunity of competing for a prize of ten guineas, and the Institution's gold medal, for the best original paper on "Welding Practices and Methods, based on my own Experiences," which will be read before members some time in the autumn.

EVERY architect will admit that the arrival on the scenes of specialized materials, in ever-increasing variety, has enormously enlarged the possibilities open to him. But that their employment brings with it certain responsibilities is not, perhaps, always clearly recognized. To get the full benefit they offer it is, in many cases, necessary to adapt the traditional methods of building to accommodate them. In general, the old rough-and-ready, rule-of-thumb measurements and calculations are being displaced, all along the line, by the precise methods of science, and success is coming to depend more and more on their adoption.

Should his expectations from a certain material that may be new to his experience not be fully realized, the architect is prone to blame the material. Before doing so, however, he would do well to assure himself that the instructions issued by the manufacturers have, in fact, been faithfully followed. So much is but justice to the maker who may, just conceivably, have an artistic conscience of his own. "It really hurts me," said one of them, "to have people use my product in such a way that it is a disgrace to the material." In these days of publicity no manufacturer can afford lightly to make claims for his product that cannot be substantiated. And he is entitled to fair play for his material.

LITERATURE

NORTH-EAST LANCASHIRE REGIONAL PLANNING REPORT

THE area dealt with in this report, with its bold hills and winding rivers, would be regarded as of more than ordinary beauty but for the facts that a yet more romantic region lies immediately to the north, and that the southern portion, owing to the presence of coal measures, has become industrialized. In the valleys of the Ribble and the Calder are the busy but unbeautiful towns of Blackburn, Darwen, Accrington, Burnley, Nelson, and Colne. These towns grew up from small beginnings during a bad period, Blackburn and Darwen during the middle decades, and the others during the later decades of the nineteenth century. Of late, efforts towards amelioration have been made, but, owing to the stagnation in trade and the population having remained stationary for the last thirty years or so, it has not been practicable to do as much as is regarded as desirable.

It appears from this report that this policy is likely to undergo a change; rather than wait for a possible trade improvement to stimulate development, it would be better to embark on improvement schemes in order to stimulate trade. The statistics show such a rapid increase in road traffic that the construction of new roads and the improvement of old ones naturally take the most prominent place in the programme, though not to the exclusion of other considerations that give point to the value of the report as covering ground rather outside the range of most regional studies. The point which differentiates it arises from the fact that the region is very largely self-dependent for its water supply, and it has therefore been necessary to demarcate the gathering grounds for this in order that they may be protected from possible pollution in the future. While the cities of the plains have had to go far afield for their water, here—owing to the heavy rainfall and the formation of the land—the towns find sufficient water within a few miles, and there is thus a greater risk of pollution if development were to be unrestricted.

Thus, roads and water are the two main features of the programme. While the zoning of urban areas and the study of amenities are dealt with, it is assumed that such questions may be, to a large extent, left to the statutory authorities which will be formed to elaborate and implement the suggestions of the advisory committee. There is little need to explain the allocations made for the purposes of industry, housing and recreation, apart from the very complete and well-arranged regional survey which occupies more than half the book.

One or two points, however, demand special attention. One paragraph deprecates the fact that, as statistics show, many workers are living at places not convenient for their work; but this can often be explained by members of a family having different employments, and also by their changing their workplaces without wishing to disestablish their homes. The references to afforestation are interesting, and also the numerous illustrations of characteristic views and buildings; while the administrative recommendations, with a view to more coordination between the undertakings of the various authorities, seem particularly valuable.

The maps have obviously presented some difficulty; owing to the extent of the area the survey maps in the text are so reduced as only to be readable by the use of a strong magnifying glass, while the supplementary map is on a scale better suited to the lecture-room than the study. Apart from these drawbacks, they illustrate very clearly the points which they are devised to elucidate.

ART AND SCHOLASTICISM

READERS who remember *Three Reformers* will be attracted to this book of M. Maritain's according to the measure in which they share his strongly Catholic point of view and sympathize with the logic and analytical methods typical of the French mind.

The first of these essays on Art was written some ten years ago, and a translation in a limited edition was printed in this country in 1923, under the title, *The Philosophy of Art*. The present translation has been made from the latest edition, and although M. Maritain has enriched it with additional notes, he has in no way modified his original thesis during the last decade. This certainty is at once his strength and weakness; it allows him to explore the field of æsthetics to the boundaries prescribed by his Church, but beyond these limits his sympathy ceases. Art which breaks out beyond the bounds of authority is a sinister manifestation, and the present chaotic condition of the artistic world a sign not of life but of decay.

M. Maritain looks back to the era of established faith as to a golden age from which there has been a steady declension down to the present day. The decline began when the artisan, ceasing to follow the *via disciplinæ*, became a law to himself and claimed the right to serve his art for art's sake. It is this attitude which makes the more technically perfect Art of the Late Renaissance of less æsthetic value than that of the Primitives, in spite of the clumsy ingenuousness of the latter. "A spiritual virtue can be transmitted by a clumsy shape," and it is this endeavour of the artist to work in co-operation with God which imparts the real power to his work. It is not the subject which matters; Fra Angelico's angels are only part of the story. The great artist is to be judged by the attitude from which he paints, and his capacity of depicting evil without conniving at it. So Dürer will be acquitted where Boucher stands condemned.

M. Maritain has little to say directly upon architecture. He condemns nineteenth-century religious ornament, "belched from the cellars of commercial art," and abominates, with Paul Claudel, the ugliness of such buildings as the Basilica at Lourdes. Modern work, such as that of André Lurçat in Paris or the new church at Limburg,

The Abbot's Lodgings, Whalley Abbey.

From The North-East Lancashire Joint Town-Planning Advisory Committee. Regional Planning Report.

he ignores, and one feels that he is really happiest in the shadow of some great twelfth- or thirteenth-century church such as Our Lady of Chartres, where under the solemn porches he can pace to and fro with a volume of the Angelic Doctor.

IN PARLIAMENT

[BY OUR PARLIAMENTARY REPRESENTATIVE]

Charing Cross Bridge Bill

FURTHER Parliamentary action on the Charing Cross Bridge Bill, which was recently rejected by a Private Bill Committee, is, apparently, to be expected. Mr. Morrison, the Minister of Transport, in reply to a question by Mr. Sanders, stated that the action now to be taken in relation to the Bill rested with the London County Council. He could only say that, in the event of the Council deciding to ask for a recommittal of the Bill, in order that Parliament might have a further opportunity of expressing its views, the Government, while leaving the matter to a free vote, would advise the House to adopt that course.

Sir B. Eyres-Monsell asked if Mr. Morrison was aware that, however much one might wish for this bridge, to recommend the House of Commons to overthrow one of its Committees was a very grave constitutional precedent? He hoped the Government would take that into consideration.

Mr. Morrison said that had been taken into account, but the fact could not be ignored, particularly by members of the late Government, that what the London County Council had done in connection with the Charing Cross Bridge Bill and the Waterloo Bridge Bill was at the request of the late Government. The present Government had continued the policy of the late Government in that matter. The Government did not feel that they were entitled lightly to throw an arrangement aside in that way without giving the House of Commons an opportunity further to express its opinion.

Sir A. Chamberlain asked what exactly was the motion which the Minister proposed to make in respect of the Charing Cross Bridge Bill. To what Committee did he propose to re-commit it?

Mr. Morrison said that Sir A. Chamberlain was under a misapprehension. There was no intention on the part of the Government to bring forward a motion for re-committal. His answer stated that in the event of the L.C.C. deciding to ask for the re-committal of the Bill, they would make the re-committal motion in order that Parliament might have a further opportunity of expressing its views. The Government, while leaving the matter to a free vote, would advise the House to adopt that course. The question as to what Committee the Bill would be referred to was entirely premature at this stage. No doubt, the L.C.C. would have to be influenced in its considerations as to the chances of success by the attitude of Members of the Opposition, who urged the Council to go into this question when they were a Government, as well as by the attitude of His Majesty's Government.

DO YOU SKETCH?

Though the Sketch Club has already held three sessions, and in next week's issue will hold its fourth, only the first of these has been devoted to the doings of the private member. It augurs well for the Club's future that this single event should have brought in so many letters of appreciation, and, what is more to the point, such a wealth of material from members eager to be "hung." Upon this the hanging committee are now busy, and their duties, already onerous, will, they hope (and yet dread) be redoubled in response to the announcement, to be made next week, of a novel competition open to sketchers of all persuasions.

Sir A. Chamberlain said he was concerned with the constitutional practice of the House of Commons, and the responsibility they had to their committees. Might he take it that the Government had undertaken to support the motion, if made, and that the Bill would be re-committed to a Committee which could hear evidence, as the previous Committee did?

Mr. Morrison replied that, clearly, that would have to be the case.

Preservation of London Squares

At question time Mr. Greenwood said he had hoped to introduce a Bill for the preservation of London Squares this Session, but in view of the pressure of other business he feared it might not now be possible to do so.

Exchequer Subsidy Value

In reply to Mr. Freeman, who asked the capital value of the Exchequer subsidy under the Wheatley and Chamberlain Acts, and under the Bill now before the House, Mr. Greenwood gave the following figures: £4 for twenty years under the 1923 Act, £50; £7 10s. for forty years under the 1924 Act, £129; £2 5s. per person for forty years proposed under the present Bill on the basis of five persons to a house on average, £193

Houses of Parliament Stonework

Mr. Lansbury, First Commissioner of Works, stated that the expenditure on repairing the stonework of the Houses of Parliament up to March 31 last amounted to £61,475, of which £26,896 was expended during the financial year ended on that date. The estimated expenditure for the present financial year was £31,200.

Domestic Heating

Mr. Simon asked the Secretary for Mines whether the Fuel Research Board had been successful in finding more efficient or more smokeless methods than those now in force in heating working-class houses; and, if so, whether a report would be published, giving practical recommendations that would be of use to local authorities and builders.

Mr. Ben Turner said that the Department of Scientific and Industrial Research, through its Fuel Research and Building Research organisations had conducted a large amount of research on the problems involved in the improvement of methods of domestic heating, and a number of reports had been published. As regarded eliminating the production of smoke, that was primarily a question of the use of electricity or smokeless fuels. Very extensive investigations had been carried out at the Fuel Research Station into the production of smokeless fuels, especially by improving methods of gas manufacture and the manufacture

of coke suitable for domestic use. The best methods of heating in relation to any particular housing scheme depended so much on local conditions that it was not considered practicable, at present, to prepare a report which would contain practical recommendations suited to every case, but the Director of Fuel Research was always ready, if asked in any particular case, to give all assistance and information he could to local authorities and others connected with such schemes.

The Government's Slum Bill

Standing Committee "A" of the House of Commons last week completed the consideration of Clause 1 of the Housing (No. 2) Bill, and then proceeded to discuss Clause 2, which lays down the procedure to be adopted for securing the clearance of slum areas.

Mr. Womersley moved an amendment to extend the period allowed for the demolition of a building from six weeks to three months. Mr. Greenwood, the Minister of Health, resisted the amendment, but later accepted another amendment, which was agreed to, permitting a period of six weeks " or such longer time as in the circumstances the local authority may deem advisable."

Mr. Greenwood moved to add to the clause a proviso to the effect that no land to which a clearance order applies shall be used for building purposes or otherwise developed, except subject to such restrictions and conditions as the local authority may think fit to impose, any aggrieved owner having the right of appeal to the Minister.

The amendment was agreed to, and the Clause, as amended, was carried. Clauses 3 (Purchase by local authority of land surrounded by or adjoining clearance area) and 4 (Treatment of clearance area) were also agreed to.

SOCIETIES AND INSTITUTIONS

A.A. ELECTION OF OFFICERS

At a recent meeting of the Architectural Association, it was announced that the following had been elected officers and members of the council for the 1930–1931 session :

President, Mr. G. Grey Wornum, F.R.I.B.A.; vice-presidents, Messrs. A. B. Knapp-Fisher, F.R.I.B.A. and C. H. James, F.R.I.B.A.; past president, Mr. F. Winton Newman, F.R.I.B.A.; hon. treasurer, Mr. C. Lovett-Gill, F.R.I.B.A.; hon. secretary, Mr. L. H. Bucknell, A.R.I.B.A.; hon. librarian, Mr. Lionel G. Pearson, F.R.I.B.A.; hon. editor, *Architectural Association Journal*, Mr. G. R. Dawbarn, M.A., A.R.I.B.A.

Ordinary members of the council : Messrs. G. W. Home, A.R.I.B.A., W. M. Keesey, A.R.I.B.A., A. W. Kenyon, F.R.I.B.A., J. R. Leathart, F.R.I.B.A., Edward Maufe, F.R.I.B.A., O. P. Milne, F.R.I.B.A., Hon. H. A. Pakington, A.R.I.B.A., Stanley C. Ramsey, F.R.I.B.A., C. D. St. Leger, M.A., A.R.I.B.A., and E. Berry Webber, A.R.I.B.A.

ULSTER SOCIETY OF ARCHITECTS

The annual general meeting of the above Society was held in the Society's Rooms, Belfast. Mr. E. R. Kennedy (President) occupied the chair. The annual report and statement of accounts were both unanimously adopted.

The following members were elected as officers for the year 1930–1931 :

President, Mr. J. A. Davidson; vice-president, Mr. R. H. Gibson; hon. treasurer, Mr. R. S. Wilshire; hon. secretary, Mr. J. McGeagh; hon. auditors, Messrs. T. Callender and J. Scott. Members of council : Messrs. T. R. Eagar, E. R. Kennedy, G. O'Neill, J. Seeds, and K. Edwards. Associate Members : Messrs. B. Couser and C. McLynn.

R.I.B.A. STATUTORY EXAMINATION

At the recent R.I.B.A. statutory examination for candidates for the office of district surveyor, one candidate, Mr. Gordon Welch, presented himself, and was successful in the examination.

BRITISH ARCHITECTS' CONFERENCE, 1930

The annual conference will take place at Norwich on June 18 to 21, at the invitation of the Norfolk and Norwich Association of Architects. All members and students of the Royal Institute of British Architects and all members of the allied societies and of the Architectural Association are invited to attend.

The headquarters of the conference will be at the Stuart Hall, Norwich.

Programme of the arrangements is as follows : Wednesday, June 18, 8 to 11 p.m. An informal reception will be held in the Stuart Hall.

Thursday, June 19.—10.15 a.m. : The conference will assemble at the Stuart Hall for the inaugural meeting. The members will be officially welcomed by the Lord Mayor of Norwich. The inaugural address will be delivered by the President, to be followed by a paper on " Regional Planning, with special reference to Norwich and Norfolk," by Mr. W. Harding Thompson, F.R.I.B.A. 1 p.m. : Lunch. 2 p.m. : Assemble at St. Andrew's Hall, where the conference photograph will be taken. 2.30 p.m. : Alternative visits : (*a*) Elm Hill, Grammar School Chapel, the Deanery, the Cathedral; (*b*) Strangers' Hall, the Guildhall, St. Peter Mancroft, Bridewell (outside), St. Peter Hungate, Princes Street; (*c*) St. George's Colegate Church, Octagon Chapel, Old Meeting House, St. Helen's, Bishop Bridge; (*d*) Market Place, St. Peter Mancroft, Bethel Street, Lady Lane, High School,

The exhibit of Messrs. W. H. Gaze and Sons, Ltd., awarded the gold medal at the Chelsea Flower Show last week. It was designed by H. G. Freemantle, garden architect, and comprised a formal garden with a circular summerhouse, having two bays open. One bay leads on to a pergola, composed of rough stone columns, and woodwork of ash, and the other looks out on to a pool. At the back of the summer-house was an oak-studded door with an iron grille. On two sides of the garden was an old-fashioned wall with a straw-thatched coping. A lawn and flower border completed the lay-out.

St. Stephens, Surrey Street, All Saints Green, Cattle Market; (*e*) St. John Maddermarket Church, St. Gregory's Church, St. Laurence Church, Strangers' Hall, Bridewell, Princes Street. 8 p.m. to 11 p.m.: At the Castle Museum. Reception by the Lord Mayor of Norwich, Mr. H. Harper Smith, J.P., and the Lady Mayoress.

Friday, June 20.—Alternative whole-day tours. Halts will be made at places as follows: (1) Cawston Church, Salle Church; Aylsham [lunch]; Blickling Hall [tea]; (2) Melton Constable Hall, Binham Priory, Blakeney Church, Blakeney [lunch]; Cley Church, Salthouse, Letheringsett [tea]; (3) tour of the Norfolk Broads by motor-launch. The party will be taken to Wroxham and brought back from Barton by motor-coach. There will be a special regatta on Wroxham Broad and visits to Ranworth and Ludham Churches, Horning [lunch], How Hill [tea]; (4) East Barsham Hall, Raynham Hall, Castle Acre Priory [lunch], Swaffham [tea]. Inclusive cost of visit 12s. 7.15 p.m. for 7.30 p.m.: Conference banquet at St. Andrew's Hall, Norwich.

Saturday, June 21.—Informal visits: 9.15 a.m. to 1 p.m.: (*a*) Great Yarmouth (motor-coach tour), 5s.; (*b*) Wymondham and Hingham (motor-coach tour), 3s. 6d.; (*c*) Norwich Cathedral.

Those intending to be present should notify the Secretary, R.I.B.A., 9 Conduit Street, W.1.

A.A. ANNUAL EXCURSION, 1930

The Architectural Association's annual excursion for 1930 will be to Denmark and Sweden.

The party will leave Tilbury on Wednesday, July 16, for Gothenburg, where two days will be spent (July 18 and 19), proceeding afterwards to Stockholm. Four days will be spent in Stockholm, leaving on the night of July 23 for Copenhagen. The party will leave Copenhagen on the morning of July 28, returning *via* Ejsberg-Harwich, arriving in London on the evening of July 29.

During the visit most of the important buildings, old and new, will be visited under the guidance of Swedish and Danish architects, and ample opportunity will be given for visiting the Exhibition of Industrial Art in Stockholm.

Special arrangements have been made for members of the party to travel either 1st or 3rd class (students) at special rates. The inclusive cost will be as follows: 1st class boat, 2nd class trains: £22; 2nd class boat, 3rd class trains: £14. Names should be submitted to Mr. F. R. Yerbury, secretary, Architectural Association, 34 Bedford Square, W.C.1.

Mr. William Henry Kitching, of Barrow-on-Humber, Lincs, architect, left £15,669 (net personalty £8,231).

LAW REPORT

DILAPIDATION CLAIM—NOVEL POINT

Eborall v. *Parminter and another. Official Referee's Court, High Court of Justice. Before Sir Francis Newbolt*, K.C.

THIS was an action by Mr. Eborall against Mrs. Parminter and Mr. Arendt for damages for alleged breach of a covenant to repair Lyndhurst, Hayne Road, Beckenham.

Sir Francis Newbolt, in giving judgment, said this was a landlord and tenant case. The plaintiff sued as lessor; the defendant Arendt was the lessee, for the lease had expired, and the defendant Mrs. Parminter was his assignee. The first defendant had made the second defendant a third party, claiming an indemnity. The parties had consented that an independent witness should value the dilapidations; this had been done, and the dilapidations were agreed at £345. In his judgment the amount in the action must not exceed the amount, if any, by which the value of the reversion was diminished owing to the breach of covenant. The damages could not therefore exceed £345, and that sum must be reduced by its excess over the diminution of the value of the reversion. Evidence was required of the diminution. The defendant Arendt did not dispute that the value of the reversion was diminished, and paid £200 into Court. The independent witness, Mr. Horser, divided the £345 into two parts, alloting £100 to the external repairs. It was not disputed that this sum was due to the plaintiff. As regards the balance, which represented the decorative repairs, plaintiff contended that if that amount had been so expended it would enhance the reversion or sale value by that amount. The house was actually sold for £2,500, and it was said that if the house had been properly repaired it would have been worth about £3,000. Defendant, however, contended that a new tenant would like to do his own repairs and that the value of the reversion was diminished. Having regard to all the facts of the case, he held that the value of the reversion was diminished by £245, owing to the breach, and he gave judgment for plaintiff for that amount against both defendants with costs. He gave judgment for that amount and for an indemnity for the defendant Arendt against the defendant Parminter with costs, and ordered the money paid into Court to be paid out to the plaintiff in part payment of the damages and costs.

COMPETITIONS OPEN

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W.

The premises of Messrs. Mann, George and Co. (S.A.), Ltd., Cape Town. The exterior has been treated with

outside quality Matroil washable water paint, buff colour: a product of Messrs. Lewis Berger and Sons, Ltd.

Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thompson, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor: H. V. Ashley, F.R.I.B.A. Premiums: £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs: July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall, which is to be built on the site of the old town hall at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor: Herbert T. Buckland, F.R.I.B.A. Premiums: £150, £100, and £50. Applications for conditions of the competition, etc., should have been made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs: July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor: Professor Patrick Abercrombie, F.R.I.B.A. Premiums: £150 and £50 for first and second places, respectively. Copies of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs: September 1.

No date.—The Carlisle Corporation invites British architects to submit designs for the façade to English Street and the Victoria Viaduct, suitable for shops and business premises. The site was previously occupied by the Prison. The total length of the frontage is approximately 358 ft. Assessor: Francis Jones, F.R.I.B.A. Premiums: £300, £200, and £100. Particulars of the competition, etc., may be obtained from Percy Dalton, A.M.INST.C.E., A.R.I.B.A., City Engineer, 18 Fisher Street, Carlisle. Deposit, £1 1s.

No date.—The General Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums: £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2.

THE ARCHITECTS' DIARY

WEDNESDAY, MAY 28

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Exhibition of work of Eric Mendelsohn. Until June 14. 10 a.m. till 6 p.m. (Saturdays 5 p.m.) **10 a.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Father of English Pottery—Josiah Wedgwood, F.R.S., Potter, Inventor and Man of Science." By Harry Barnard. Frank H. Wedgwood will preside. **8 p.m.**

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition open to the public. **10 a.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. **8 p.m.**

PARSONS' GALLERIES, 315-317 Oxford Street, W.1. Exhibition of Scottish Art. 10 a.m. to 6 p.m. Until May 31. **10 a.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art, held in the North Court. 10 a.m. to 6 p.m. (Thursdays, 10 a.m. to 10 p.m.) **10 a.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

FRIDAY, MAY 30

R.I.B.A., 9 Conduit Street, W.1. Intermediate Examination. Until June 5.

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, S.W.1. "Town Planning Economics." By J. Macaulay. **6 p.m.**

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS. At the Institution of Civil Engineers, Great George Street, Westminster, S.W.1. Annual General Meeting. An address will be given by Professor W. R. Lethaby. Tea 4 p.m. **4.30 p.m.**

ROYAL SANITARY INSTITUTE. At Blackburn. Various visits of inspection. Also, discussions to take place in the Public Halls. **7 p.m.**

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. At the Town Hall, Cheltenham. Various visits of inspection, and discussion on paper, submitted by the Borough Engineer, on "Cheltenham Sewage Purification Works." **10 a.m.**

SATURDAY, MAY 31

Sunrise, 4.50 a.m. Sunset, 9.5 p.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visits to Hampton Court and Richmond, organized by the Croydon and Guildford Chapters. It is proposed to visit Hampton Court. Meet at Main Entrance to Hampton Court at 10.15 a.m. and proceed to Richmond for lunch (5s.) at 1.30 p.m., followed by a tour of the Richmond district. Tea, 4.30 p.m. Members and guests will assemble at the Kingston Town Hall at 5.30 p.m., where a paper will be read on "Kingston-upon-Thames." Whole day cost of visit, 10s. Students, 5s. **10.15 a.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. In connection with the Bicentenary of Josiah Wedgwood, a special exhibition of Wedgwood ware will be opened in Room 136. **10.15 a.m.**

MONDAY, JUNE 2

INSTITUTION OF ELECTRICAL ENGINEERS. Summer Meeting at the Irish Centre. June 2–6, inclusive. Assemble in the evening at the Gresham Hotel, Dublin.

TUESDAY, JUNE 3

ILLUMINATING ENGINEERING SOCIETY, 32 Victoria Street, S.W.1. Annual Meeting. **7 p.m.**

GARDEN CITIES AND TOWN PLANNING ASSOCIATION, 3 Gray's Inn Place, W.C.1. Whitsun Housing and Town Planning Tour. June 3–14 inclusive. Visit to Northern Capitals of Europe. Full particulars on application to the Secretary of the Association.

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Motor trip in Co. Wicklow, including inspection of overhead transmission lines. Lunch and tea at Glendalough.

WEDNESDAY, JUNE 4

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Proceed by special train to Limerick for visit to the Shannon Scheme.

THURSDAY, JUNE 5

INSTITUTION OF ELECTRICAL ENGINEERS. At Dublin. Morning: Visit to the brewery of Messrs. A. Guinness, Sons & Co. Lunch by invitation of the Company. Afternoon: Leave Dublin by special train for Belfast. Evening: Reception by the Lord Mayor of Belfast, Rt. Hon. Sir William Coates, at the City Hall.

SATURDAY, JUNE 7

Sunrise, 4.45 a.m. Sunset, 9.12 p.m.

WHIT MONDAY, JUNE 9

THURSDAY, JUNE 12

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Annual Conversazione, to be held at the Natural History Museum, South Kensington, S.W.7.

SATURDAY, JUNE 14

Sunrise, 4.43 a.m. Sunset, 9.18 p.m.

COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND. Gloucestershire Branch. At the Town Hall, Cheltenham. Conference under the chairmanship of Major-General Sir Fabian Ware, K.C.V.O., K.B.E. 11 a.m. Opening address by the Mayor of Cheltenham, followed by "Regional and Town Planning," by Captain J. H. Trye, C.B.E., R.N. Discussion on the subject to be opened by G. L. Pepler. 12.45 p.m.: Lunch. Afternoon Session, 2 p.m.–4 p.m.: "The Traditional Building of the Cotswold and surrounding Stone Districts." By H. Stratton Davis, F.R.I.B.A.; and "Modern Building and the Use of New Materials," by Thomas Falconer, F.R.I.B.A., followed by discussions to be opened by Sir Philip Stott, Bart., and J. W. Robertson Scott, respectively. **11 a.m.**

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Annual General Meeting and Annual Dinner. Particulars will be announced later.

CHELMSFORD PUBLIC LIBRARY COMPETITION. Latest date for submission of designs.

KINGSTON-UPON-THAMES PUBLIC BATHS COMPETITION. Latest date for submission of designs.

MONDAY, JUNE 16

R.I.B.A., 9 Conduit Street, W.1. Election of Council and Standing Committees: Election of Members. **8 p.m.**

WEDNESDAY, JUNE 18

R.I.B.A., 9 Conduit Street, W.1. British Architects' Conference, to be held at Norwich. Until June 21 inclusive.

FRIDAY, JUNE 20

LONDON SOCIETY, Lancaster House, St. James's Street, S.W.1. At the Royal Society of Arts, John Street, Adelphi, W.C.2. Provisional date for a lecture on "Beautification of our Arterial Roads." By Thomas C. Adams.

SATURDAY, JUNE 21

Sunrise, 4.42 a.m. Sunset, 9.21 p.m.

ROYAL SANITARY INSTITUTE. Annual Congress to be held at Margate until June 28 inclusive. Various lectures, discussions and visits will be held throughout the week. **12 noon.**

WEDNESDAY, JUNE 25

ROYAL SANITARY INSTITUTE. At Margate. Meetings of the Architectural and Engineering Sections. **10 a.m.**

FRIDAY, JUNE 27

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL SOCIETY, The Castle, Winchester. Excursion to the Joinery Works of Messrs. W. E. Chivers and Sons, Ltd., Devizes, and buildings of architectural interest in the neighbourhood. A General Meeting will be held after lunch.

SATURDAY, JUNE 28

Sunrise, 4.45 a.m. Sunset, 9.21 p.m.

WEDNESDAY, JULY 2

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. Annual Exhibition to be held at Portsmouth until July 8.

FRIDAY, JULY 4

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At Southampton. Joint Meeting with the Hampshire and Isle of Wight Architectural Association. Visits to the new Town Hall (description by E. Berry Webber), the Old Bargate (description by H. P. Cart de Lafontaine), Guildhall, Empire Theatre, and Ocean Liners. Particulars are obtainable from the Hon. Secretary.

SATURDAY, JULY 5

Sunrise, 4.49 a.m. Sunset, 9.19 p.m.

WORTHING MUNICIPAL BATHS COMPETITION. Latest date for submission of designs.

SUNDAY, JULY 6

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At Southampton. Excursion to Romsey and the New Forest.

SATURDAY, JULY 12

Sunrise, 4.56 a.m. Sunset, 9.14 p.m.

Sunrise, 5.13 a.m. Sunset, 8.59 p.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visits to Leeds Castle, Chilham or Bodiam, etc., organized by the Canterbury and Tunbridge Wells Chapters. Particulars of the visits are obtainable from the Hon. Secretaries of the Chapters.

THURSDAY, JULY 31

LUTON TOWN HALL COMPETITION. Latest date for submission of designs.

DUDLEY SCHOOL COMPETITION. Latest date for submission of designs.

TRADE NOTES

H.R.H. the Duke of York recently visited the Rugby works of the British Thomson-Houston Co., Ltd., as President of the Industrial Welfare Society. He was accompanied by the Rev. Robert R. Hyde, director of the Society. After being received by Mr. W. C. Lusk (chairman of the British Thomson-Houston Company), Messrs. G. M. Campbell, F. Fraser, and J. L. Wilson, directors, and Mr. A. P. Young, manager, Rugby works, the Duke made a tour of the works, including the Mazda electric lamp works, fabrication department, motor factory, turbine department, power transformer factory, electrical machine shop, the foundry, ambulance station, etc. A feature of the tour was the presentation to His Royal Highness of employees with long service, there being quite a number who have been with the company for over a quarter of a century.

*

In most buildings where food is prepared for human consumption there is sure to be found one at least of the electrical appliances of the Hobart Manufacturing Company, Ltd. : a meat chopper, coffee mill, a simple or combined washer for dishes and glassware, a mixer, or a potato peeler. Perhaps the most striking testimony to the firms' meat chopper is made by Mr. M. Blenkinsop, of the Butcher Market, Newcastle-upon-Tyne. Nineteen years ago he installed the machine, and it has run continuously, year in and year out, without expense. At the beginning it was the only electric machine installed, and for the first few years was also used to cut meat for other butchers. Now there are well over twenty machines in the meat market in that city. The firms' coffee mills have been on the market for thirty-five years, and the various models lend themselves to the widest everyday use. Many advantages are claimed for all these appliances, including the dish and glasswashers, which the firm claim are recommended by 27,000 users, the mixers and the potato peeler. Interesting illustrated booklets dealing with the various specialities can be obtained on application to the Hobart Manufacturing Company, Ltd., Hobart House, Charterhouse Street, London, E.C.1.

*

The use of explosives in oil and water wells, metal breaking, submarine and demolition work, etc., is the subject of a booklet published by the Explosives Sales Department of Imperial Chemical Industries, Ltd. The booklet is the successor to "Metal Breaking with Explosives and other Uncommon Blasting Operations," and the information given is supplementary to that given in the following three booklets published by the department : "Blasting Explosives and Accessories," "Blasting in Collieries and Hints on Electric Shot Firing," "Explosives in Agriculture." A chapter shows how the demolition of brick and concrete work may be greatly facilitated by explosives. By the proper placing and loading of holes, the solid mass can be broken into material of a size which will permit of easy handling.

*

A means to restore wilted vegetables to their original garden freshness is the latest development of electrical refrigeration by Messrs. Frigidaire, Ltd. Flabby celery and shrivelled lettuce become crisp and dewy after five hours of the "treatment," which merely consists of placing the vegetables in a special compartment of an electrical refrigerator. It is called a "Hydrator." It is understood that many years of research went to the perfecting of this special compartment, the difficulty being to isolate the moist cold suitable for vegetables from the dry cold essential for keeping other foods.

*

Among the London firms who are prepared to manufacture household and hotel furniture from architects' designs and specifications are Messrs. C. and R. Light, of 54 Great Eastern Street. In the showrooms of this old-established firm is a big range of walnut and mahogany furniture for bedrooms, dining- and drawing-rooms. Among the firm's specialities of new design is a wardrobe semi-fitted ; one-half fitted for hanging, with pull-out gown hangers and with boot rails, and the other half with two drawers, shelf and sliding coat hanger. The firm are also patentees of several registered types of tables, etc. The firm, however, collaborate with architects in producing furniture to harmonize with the particular style or period in which any apartment is designed.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Pyrene Factory, Great West Road (pages 814, 818–820). General contractors, Edwards Construction Co., Ltd. Sub-contractors : A. D. Dawnay and Sons, Ltd., constructional steelwork; Henry Hope and Sons, Ltd., steel sashes; British Reinforced Concrete Eng. Co., Ltd., reinforcing steel; Asbestos Cement Building Products, Ltd., roof tiling and asbestos ceiling sheets; Huntley and Sparks, Ltd., slotted inserts; May Construction Co., Ltd., sound damping; J. W. Gray and Sons, Ltd., lightning conductor; H. W. Dutton & Co., Ltd., heating installation; H. and C. Davies, Ltd., Haywards, Ltd., and Dennison Kett & Co., Ltd., iron staircases; Electrical Installations, Ltd., electrical work; Carter & Co., Ltd., faience and wall tiling; Ragusa Asphalte Paving Co., Ltd., asphalt; W. H. Gascoigne & Co., Ltd., plumbing; Crittall Manufacturing Co., Ltd., iron doors; Comyn Ching & Co., Ltd., iron doors and ironmongery; John Tann, Ltd., strong-room door; Wilfley Flooring Co., Ltd., composition flooring; D. Anderson and Sons, Ltd., roofing felt; R. W. Brooke & Co., Ltd., wood-block flooring; Brilliant Sign Co., Ltd., trade mark sign; Tunnel Portland Cement Co., Ltd., Tunnel Portland cement and Tunnelite rapid-hardening cement; E. J. Elgood, Ltd., granolithic paving; Leeds Fireclay Co., Ltd., sanitary fittings; Redalon, Ltd., solution for plaster key and Bulldog clips for floors; Samuel Elliott and Sons, Ltd., special joinery; Mellowes & Co., Ltd., patent glazing; Fredk. Braby & Co., Ltd., pressed steel stairs; Benham and Sons, Ltd., kitchen equipment. Adamite Co., Ltd., "Colemanoid" retaining walls, "Atlas White" Portland cement stucco used for exterior, and "Atlas White" terrazzo floors and stairways (with Alundum non-slipping tile inset into the step treads). British Trolley Track Co., Ltd., Coburn system of sliding-door gear was used.

New Diphtheria Block, Isolation Hospital, Clatterbridge (page 824). General contractors, J. A. Milestone and Son, Ltd. Clerk of works, Mr. R. L. Tickell. Sub-contractors : Trinidad Lake Asphalt Co., dampcourses and asphalt; The British Reinforced Concrete Co., Ltd., reinforced concrete; Buckley Junction Brick Co., bricks; Storeton Quarries, stone; Warrington Slate Co., Tyrch slates; Granwood Flooring Co., Ltd., Granwood flooring blocks; Diespeker & Co., Ltd., terrazzo; Young, Austen and Young, central heating; E. A. Clark, Ltd., grates and mantels; Kissack and Yates, electric wiring and telephones; British Thomson-Houston Co., Ltd., electric light fixtures; R. W. Haughton, plumbing; Robert Dunlop, sanitary fittings; Quiggin Bros., Ltd., door furniture; Adams Bros. (Liverpool), Ltd., plaster.

Morleys, Great Hallingbury (pages 831–833). General contractors, J. L. Glasscock and Sons' Successors. Sub-contractors: G. M. Callender & Co., Ltd., "Ledkore" dampcourses; Hollis Bros. & Co., Ltd., oak boarded flooring; Richard Crittall and Sons, Ltd., central heating and boilers; Geo. Wright (London), Ltd., stoves and grates, and sanitary fittings; Grierson, Ltd., electric wiring; Galsworthy, Ltd., electric light fixtures; J. W. Gray and Son, lightning conductor; Carter and Aynsley, Ltd., and Roanoid, Ltd., door furniture; S. Haskins and Bros., Ltd., rolling shutters; G. I. Green, plaster; W. Aumonier and Sons, carving, decorative plaster and mantels; Art Pavements and Decorations, Ltd., tiling; J. P. White and Son, Ltd., gates; United Water Softeners, Ltd., water-softening plant.

ANNOUNCEMENTS

The Second Convention of the British Glass Industry will be held at Buxton from September 17 to 20, 1930.

Mr. Robert Atkinson, F.R.I.B.A., has removed his offices from 36 Bedford Square, W.C.1, to 126 Wigmore Street, W.1. Telephone number : Welbeck 4116.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BATTERSEA B.C. has obtained sanction to borrow £4,330 for the extension and alteration of the maternity hospital at Bolingbroke Grove.

Buildings are to be erected by Hay's Wharf, Ltd., upon the site of St. Olave's Church in Tooley Street, BERMONDSEY.

Plans passed by the BERMONDSEY B.C.: Drainage, 41 and 43 Tower Bridge Road, for Mr. G. H. Goldsmith (architect); premises, Tower Bridge Road, and building, Caroline Court, Jacob Street, for the superintending architect of the L.C.C.; garages, store and office, rear of 154 to 172 Tooley Street, for the Governors of Christ's Hospital.

Mr. G. W. Peachey is to erect thirty-eight houses on the Croham Valley estate, SOUTH CROYDON.

Messrs. Chart, Son and Reading are to erect approximately 100 houses on the Oak Garden estate, CROYDON.

Mr. W. Newcome Wright, architect, is to prepare plans for the erection of forty shops at Watling Avenue, Burnt Oak, EDGWARE.

Messrs. Adams, Holden and Pearson, architects, are to enlarge the Belgrave Hospital for Children, KENNINGTON.

A row of fifty garages is to be erected in Buckingham Road, KINGSTON.

The POPLAR B.C. Electricity Committee has sold land in Weston Street, BROMLEY, to the Central Electricity Board for the erection of a transformer sub-station.

The governors of the Sir John Cass Technical Institute, CITY OF LONDON, have in view a proposal for the erection of new premises, at a cost of £66,000.

In connection with the reconstruction of Euston Square railway station, the L.C.C. is to widen EUSTON ROAD, at a cost of £26,000.

The London Midland and Scottish Railway Company has prepared a scheme for the remodelling of the Broad Street Goods Station. The proposals provide for the linking up of the Broad Street station with the warehouse on the other side of FINSBURY Avenue, by means of low-level and high-level railway tracks, and for the consequent bridging over of a portion of Finsbury Avenue.

Plans passed by the FULHAM B.C.: Additions, public-house, 37 North End Road, for Mr. G. Barker; new buildings, Ranelagh Gardens, for Messrs. C. and E. Joseph; new offices, Parsons Green Lane, for Messrs. MacLaughlin and Harvey; building, Hammersmith Road, for Mr. W. E. Sanders; additions, 547 Fulham Road, for Mr. C. T. Meacham; new building, site adjoining the Munster Park Wesleyan Church, Chesilton Road, for Mr. J. R. Wills.

The arbitrator has made an award of £49,430 as the purchase price of the Swan Brewery site, which is being acquired by the FULHAM B.C. for a housing scheme. The claim was for £90,000.

The Lambeth B.C. is to erect sixteen flats in Denmark Street, HERNE HILL.

Plans passed by the LEWISHAM B.C.: Shops and flats, Bromley Hill, for Mr. A. Frampton; streets, Crofton Park Estate, for Messrs. H. Cheston and Son; additions, the Foresters' Tavern, Perry Vale, Forest Hill, for Messrs. Hoare & Co., Ltd.; nineteen houses, Malyons Road, for Mr. P. B. Dannatt.

The MARYLEBONE Borough Council is to widen Marylebone Road, near the Hotel Great Central, at a cost of £8,000.

Plans passed by the MARYLEBONE B.C.: Erection of Cumberland Palace hotel, Oxford Street, Great Cumberland Place, Old Quebec Street and Bryanston Street, and building 4 and 5 Marble Arch and 1-5 Great Cumberland Place, for Mr. F. J. Wills; rebuilding, 8-10 Beaumont Street, for Messrs, Pite, Son and Fairweather.

Mr. Robert Cromie has prepared plans for the erection of a cinema at NEW SOUTHGATE.

The Croydon Education Committee is to erect a junior school for 350 at Kensington Street, NORBURY.

The SHOREDITCH B.C. has passed plans, prepared by the borough engineer, for the proposed women's hospital and new dental hospital. The estimated cost of erecting the building, which it is proposed to carry out by direct labour, is £9,000.

The ST. PANCRAS B.C. is to erect new offices for the depot staff storekeeper and deputy borough engineer and surveyor, and construct garages at James Street, at a cost of £4,500.

Plans passed by the ST. PANCRAS B.C.: Motor-coach station, Euston Road, between Chesterfield Street and Belgrave Street; building, 338–340 Gray's Inn Road; building, site at Gordon House Road; additions, 139–140 Tottenham Court Road, abutting upon Beaumont Place; building, 303 and 305 Euston Road.

EASTERN COUNTIES

The Essex Education Committee has approved plans for the erection of an elementary school at CHINGFORD, at a cost of £16,000.

The Essex Education Committee has obtained land for extensions at the High Road Council school, LAINDON.

The Essex Education Committee has passed plans for extensions at LEYTON county high school for girls, at a cost of £17,000.

The Essex Education Committee is to enlarge the Havering Avenue school, ROMFORD, to provide additional accommodation for 900 pupils.

The Essex Education Committee has acquired a site in Kipling Street, TILBURY, for the erection of an elementary school.

SOUTHERN COUNTIES

The Kent C.C. is to widen the railway bridge near BOROUGH GREEN station, at a cost of £4,500.

The BOURNEMOUTH Corporation has received sanction to borrow £6,000 for reconstruction work at Fisherman's Walk.

The BOURNEMOUTH Corporation is seeking sanction to borrow £11,425 for the purchase of 4 to 14 Cotlands Road, required for fire brigade purposes.

Plans passed by the BOURNEMOUTH Corporation: Additions, Bryanstone Road and Wimborne Road, for Messrs. Barclays Bank, Ltd.; office, Derby Road, for Mr. A. E. Horspool; shop, Wimborne Road, for Mr. F. A. Roscoe; conversion into shops, Wimborne Road, for Mr. P. Vass; house, The Avenue, for Mr. H. Masters; conversion into shops, 5 and 7 Richmond Park Road, for Messrs. S. E. King and J. Saunders; additions, South-Western Hotel, Northcote Road, for Messrs, Eldredge, Pope & Co., Ltd.; alterations and additions, 631 Christchurch Road, Boscombe, for Mr. F. N. Corben; alterations, 609–613 Christchurch Road, for Messrs. F. W. Woolworth & Co.; shops and flats, Tuckton Road, for Mr. A. H. Parks; shop, Commercial Road, for Messrs. Marks and Spencer; house, Harbour Road, for Mr. Hughes; house, Cellars Farm Road, for Mr. E. Jenkins; two houses, Castle Lane, for Mr. Roscoe; eighty-eight houses, Castle Estate, for Mr. J M. Leyland; business premises, Westover Road, for Mr. S. B. Parsons; house, Glenferness Avenue, for Messrs. G. E. and W. R. J. Lambert; house, Cobham Road, for Mr. Whitehead; two houses, Stephenson Road, Southbourne, for Mr. G. F. Hirst; house, Broad Avenue, Queen's Park, for Mr. E. Duss; house, Portman Crescent, for Mr. J. M. Whitehouse; two houses, Leigham Vale Road, for Mr. F. W. Woods; house, Award Road, for Mr. W. E. Luckham; house, Thistlebarrow Road, for Mr. E. Ridout; house, Fernside Road, for Mr. F. W. Holloway; house, Broadlands Avenue, for Mr. F. J. Webb; house, Castle Lane, for Mr. G. Stanner; house, Pettit Road, for Mr. R. Straker; twenty houses, Claremont Avenue, for Mr. S. G. Ward; two houses, The Grove, Moordown, for Mr. A. F. Holly; Baptist Church, Cardigan Road, for the trustees; two houses, St. Luke's Road, for Mr. F. House; bungalow, Hillcrest Road, for Mr. J. P. Pewtress; house, Carbery Avenue, for Mr. A. Webb; house, Alumhurst Road, for Mr. H. Solomon; four houses, The Avenue, Redhill Park, for Mr. H. Masters; roller-skating rink, Wycliffe Road, for Mr. J. M. Blackwell; additions, 238 Old Christchurch Road, for Messrs. Crawshaw and Son; house, Strouden Avenue, for Mr. Adams; bungalow, Elms Way, for Messrs. Bannings; house, Priory View Road, for Messrs. Symes, Chisham and Saunders.

The Kent Education Committee is to erect an elementary school in Mayplace Street, CRAYFORD.

The Kent C.C. is seeking sanction to borrow £6,000 for the erection of a nurses' hostel at LENHAM sanatorium.

Plans passed by the NORTHFLEET U.D.C.: Two houses, Park Avenue, for Mr. Johncock; house, Singlewell Lane, for Mr. R. Stubbs; garages, Perry Street Road, for Messrs. A. and H. Hardy; house, Park Avenue, for Mr. G. W. Offin; six houses, Park Street, for Mr. Oxley.

The Kent Education Committee has obtained an alternative site at ORPINGTON, for the erection of a central school.

The Kent Education Committee has obtained a site at YALDING, for the erection of a central school.

SOUTH-WESTERN COUNTIES

The PAIGNTON U.D.C. has now approved the sketch plan of the concert pavilion proposed to be erected at Paignton Green, and has decided to invite local architects to submit competitive designs.

Plans passed by the PENRHYN U.D.C.: House, Barco, for Mr. John Thornborrow; eight houses, Norfolk Road, for Penrith Co-operative Society; office, Gilwilly Lane, for Mr. T. Langley; twelve houses, Croft House Estate, for Lords Estates, Ltd.

MIDLAND COUNTIES

Plans passed by the BEDFORD Corporation: Rebuilding the Stanley Arms, Harpur Street, for Messrs. Usher and Anthony, for Messrs. C. Wells Ltd.; four houses, Southville Road, for Mr. E. H. C. Inskip; house, Winifred Road, for Mr. G. J. Tucker; house, Kimbolton Road, for Mr. W. Laughton.

The BEDWORTH U.D.C. is to undertake the erection of waterworks, at a cost of £17,000, which includes the construction of a reservoir at Newdigate.

Plans passed by the GLOSSOP Corporation: Alterations and additions, Howard Street premises, for the Glossop Carriage Co., Ltd.; alterations and additions, Whitfield Wesleyan Church, Hague Street, for the trustees; house, Newshaw Lane, for Mr. J. Wood.

The Warwickshire Education Committee has decided to proceed with the erection of the proposed high school for girls, at SOLIHULL.

NORTHERN COUNTIES

The North Riding Education Committee is acquiring a site at GRANGETOWN, for the erection of a senior school.

The SOUTH SHIELDS borough engineer has prepared a scheme for clearing the Thames Street unhealthy area.

The SOUTH SHIELDS Corporation has approved plans submitted by Mr. S. Shepherd, of alterations to the Pavilion Theatre, Derby Street.

Plans passed by the SOUTH SHIELDS Corporation: Alterations, Old Mill Inn, Hardwick Street, and bungalow, St. Peter's Avenue, for Messrs. T. A. Page and Son; alterations, Fletchers Inn, Catherine Street, for Mr. J. Gordon Durham, for Messrs. R. Fenwick & Co., Ltd.; junior schools, Cleadon Park, for Messrs. J. Morton and Son, on behalf of the Education Authority; extension to premises, Market Place and King Street, for Messrs. Croftons, Ltd.; shop, Park View, Harton, for Mr. Howard Hill, on behalf of Messrs. Lock Bros.; alterations, 127, 129 and 131 Maxwell Street, and new mission hall, for Mr. Howard Hill, on behalf of the trustees of Bethesda Church.

The SUNDERLAND Corporation is preparing plans for the extension of the mental hospital.

The TYNEMOUTH Corporation has approved a scheme for the erection of 100 four-roomed non-parlour, three-bedroom type and 100 three-roomed, non-parlour, two-bedroom type self-contained houses at Balkwell.

The TYNEMOUTH Corporation has approved a plan prepared by the borough surveyor, for a new retaining wall and layout of the sea front at Cullercoats, at a cost of £11,000.

Plans passed by the TYNEMOUTH Corporation: Alterations, Borough Theatre, North Shields, for Mr. J. L. Rose, on behalf of the Gaumont British Picture Corporation, Ltd.; two houses, Manor Estate, for Mr. W. Stockdale; nine houses, The Broadway, Cullercoats, for Mr. J. R. Wallace; shops, Albion Road, North Shields; alterations, Turk's Head Hotel, Front Street, and offices, Church Way, North Shields, for Messrs. F. R. N. Haswell and Son; fourteen houses, Balmoral Gardens, North Shields, eight houses, Brightman Road, houses, Queen Alexandra Road, and additions, Brewer's Bank, North Shields, for Mr. A. K. Tasker.

WALES

The SWANSEA Corporation has approved plans, submitted by the architect, for a nurses' home and admission block at the mental hospital.

Plans passed by the SWANSEA Corporation: Petrol depot, Neath Road, Llansamlet, for the Russian Oil Products, Ltd.; five houses, Dyfatty Street, for Swansea Hide and Skin Co.; two roads, Manselton Estate, for Sir C. Mansel; fifty-six houses, Penlan Road, Treboeth, for Mr. Ll. L. Thomas; bakery technical college, Mount Pleasant, for the Education Committee; alterations and rebuilding, 7 and 8 Castle Street, for Messrs. Burton, Ltd.; house, Brynhyfryd Street, for Mr. W. D. Williams; house, Bethel Road, Llansamlet, for Mr. T. J. Phillips; store, Pwll Street, for Mr. E. Spooner; two houses, Trewyddfa Common, Plasmarl, for Mr. B. Hughes; house, Vicarage Road, for Mr. J. T. Jones; house, Cwbath Road, for Mr. D. Roberts; four houses, Vicarage Road, Morriston, for Mr. David Rosser; house, Clydack Road, for Mr. A. Arnold; two houses, Heol-y-Cnap, Treboeth, for Mr. Evan Davies; alterations and additions, Mariner Street, for Messrs. Geo. Williams & Co.; house, Bonymaen Road, for Mr. D. R. Owen; house, Llangyfelach Road, Clasemont, for Mr. A. V. Mort; fifty houses, Carnglas Estate, for Messrs. T. and G. Spragg; two houses, Gower Road, for Mr. W. G. Connick; two houses, Pinewood Road, for Mr. John Davies; four houses, Lon Cedwyn, for Mr. A. E. Wright.

THE PUBLISHER'S PAGE

READERS of the JOURNAL will have noticed the photographs of some attractive old bridges which appeared in a recent issue. These were taken from the collection of Mr. E. Jervoise, A.M.INST.C.E., who for the last four years has been making a survey of the ancient bridges of England on behalf of the Society for the Protection of Ancient Buildings. This survey is now complete so far as the South of England is concerned, and the fruits of it are being published by the Architectural Press in book form on Friday next, under the title, *Ancient Bridges of the South of England*. The book contains much interesting historical information, and reference is made to practically all the ancient bridges which still exist, whilst about eighty photographs are included in the illustrations.

If readers of the JOURNAL were asked to guess at the number of ancient bridges still surviving in the country, the most widely divergent estimates would be received. It may be a matter of surprise to some to hear that in this book, which deals only with the counties south of the Thames, Mr. Jervoise makes reference to no fewer than 400 different bridges.

The book is of handy pocket size, and in order to make its appeal as wide as possible is being issued at the popular price of 5s. 6d.

THERE are many good things, [of which the following are a few particulars, in the June issue of THE ARCHITECTURAL REVIEW: Evelyn Waugh contributes a racy article in which he describes his search in Barcelona, during a brief visit, for buildings designed by Gaudi, the Spanish architect, who died about five years ago. The article is illustrated with views of the *Parc Guell* and *The Temple of the Holy Family*, the two most important of Gaudi's works. Another feature, of special interest to those who have a thought for the beauty of our towns and countryside, is a telling satire in words and pictures on Oxford, with special reference to the adjoining village of Cowley.

The drawings in the Architectural Room of the Royal Academy form the subject-matter of an amusing and informative article by Mr. Trystan Edwards, who overhears the pictures criticizing one another, and in another article Mr. Raymond Mortimer returns to the attack on the policy of the officials of the Royal Academy, and explains why the works of the most serious English artists are never represented in these exhibitions.

The coincidence of the Exhibition of Architects' Drawings made from 1800 to 1850, now being held at the Royal Institute of British Architects, with the summer exhibition at the Royal Academy, affords Mr. Raymond Mortimer the opportunity of comparing the quality of architectural draughtsmanship in the nineteenth century with that of our own day, in a series of comparative illustrations which are accompanied by his critical notes.

Adam Prosser writes succulently on the possibilities of sporting subjects as motifs for interior decoration, and illustrates some rugs, curtains, wall-papers, etc., in which the idea has been carried out.

In addition, the issue contains illustrations of new buildings, and another article in Mr. Nathaniel Lloyd's series, "A History of the English House," accompanied by further illustrations of Palladian and Georgian houses.

Evelyn Waugh, from a painting by Henry Lamb.

THE great summer migration to Stockholm is about to commence. One wonders how many architects who habitually go abroad for their holidays will visit Sweden this year? The exhibition of Swedish Arts and Crafts is proving an attraction the like of which has not been seen for a long time. Readers of the JOURNAL and REVIEW who are thinking of going may obtain any information they require by writing to the Architectural Press, 9 Queen Anne's Gate, S.W.1. For the novice we may point out that transport is available by air, land and sea. Those who are in a hurry may leave London at half-past ten in the morning, lunch at Amsterdam, dine at Malmö, turn in on a sleeper (the Swedish State Railways sleepers beat any others on the Continent) and wake up in Stockholm just after eight o'clock the following morning—a little under twenty-two hours. For those who are indifferent sailors there is the Dover-Calais Channel crossing, comfortably brief, and the Sassnitz-Trälleborg train ferry, which involves another four hours on the water. All the rest may be done by train. The Harwich-Hook of Holland or Harwich-Flushing routes take you into the North Sea, and if you do not mind this much, you will no doubt prefer the direct steamship route which involves very little more of it. There are two sailings weekly from London, and those who choose to travel at week-ends will get a foretaste of Swedish things going over in a ship decorated in Sweden.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½
STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft.	0	4	3
DO. 6 in., per ft.	0	5	0
DO. 9 in., per ft.	0	7	9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6

CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ½ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super.	0	11	0
York templates sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0
Add to the foregoing prices, if in York stone, 35 per cent			
DO. Mansfield, 12½ per cent.			
Deduct for Bath, 33⅓ per cent.			
DO. for Chilmark, 5 per cent.			
SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6

RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

BUILDING CONTRACTS OPEN

Unless the contrary is expressly stated, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district. Application for plans and particulars should be made to the address given at the end of each entry.

BOSTON : HOUSES

May 30.—For the erection of 112 houses on the Fenside Road housing site, for the T.C. D. G. Cockrill, Borough Surveyor. Municipal Buildings, Boston, Lincs. Deposit £2 2s.

ENTRANCE TO THE REPTILE HOUSE, ROYAL ZOOLOGICAL GARDENS, REGENT'S PARK, N.W.

By

E. GUY DAWBER

IN his design for the new Reptile House for the Royal Zoological Society, Mr. Guy Dawber, a Past President of the R.I.B.A., has taken full advantage of the suggestions for amusing detail which are offered by the nature of the subject.

Close inspection of the drawing reproduced on the next page, in conjunction with the above photograph, will reveal the presence of many well-known reptiles, carved and used with decorative effect. Lizards and toads, snakes and chameleons, gambol and frolic to enrich the architrave which encloses the double entrances, while the keystone of the arched recess boasts a group of intermingled cobras.

To contrast with the richness of detail, the general expression is of a broad and simple nature; brick piers, with channelled panels on their faces, and with stone caps, support a well-proportioned stone cornice and pediment of generous projection, in the later-eighteenth-century manner, to accord with the architectural traditions of the neighbourhood.

Incidentally, the design as a whole shows how the duality of motive inherent in the double entrances has been overcome by containing them both in one large and dominant arched recess, the unity thus achieved being still further emphasized by the stone eye in the plaster tympanum of the pediment.

SKETCHING (FOR GOOD OR EVIL)

"The Town is full of Prout-bits"
—*Guide to Spain*: O'SHEA

WE do not know whether it were our own recent example in founding a sketch club which has fired the young architects of Reading to do likewise. We learn that they have gathered themselves into the "Ionic Architectural Club," which seems a model of its kind. Although its programme will certainly include caricatures of both the old-established architects and the more ancient buildings of the neighbourhood, the serious side of the endeavour is properly stressed and embraces conscientious study by means of lectures, competitions, drawings and any other means of furthering the art. The opening lecturer, Mr. Talfourd Cumming, very wisely, knowing that the young mind runs to detail, emphasized the need for recording such details faithfully. We hope his excellent advice was not interpreted to mean that detail was of first importance to the sketcher, or that the proper aim was at the pretty little piece or the "Prout-bit."

It is well recognized today that sketching has two objects. The first is such a study of the subject that the architect's difficulties and his success or failure can be properly understood; the second is to make a well-designed pattern, in other words a picture on paper, of the thing seen.

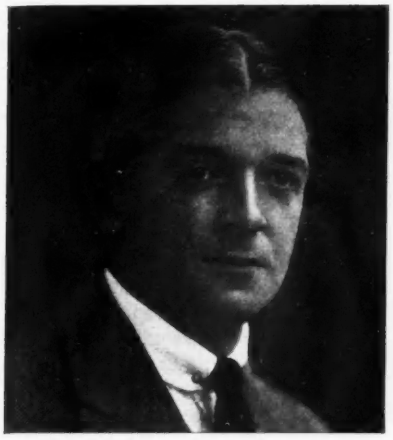
Undoubtedly, the first object is better attained by the study of a modern building than of an old one. We are more quickly able to appreciate the point of view of today, we know the pitfalls, and have smelt the powder of the up-to-date client's criticism; to see the best work of recent years is more educative than the easy enjoyment of ruins.

We suggest therefore to our young Reading friends that the most fruitful subjects of their studies will be, first, the modern houses of the Thames Valley, homes replete with every luxury in bathrooms and lounges, and with every labour-saving device short of robot servants in the kitchens; and secondly, the new factories between their city and London. From these can be learnt the lesson of proper location, the relation of site to lines of transport, and the layout of gardens and recreation grounds. Instead of a "Prout-bit" the first sketch will be a bird's-eye view.

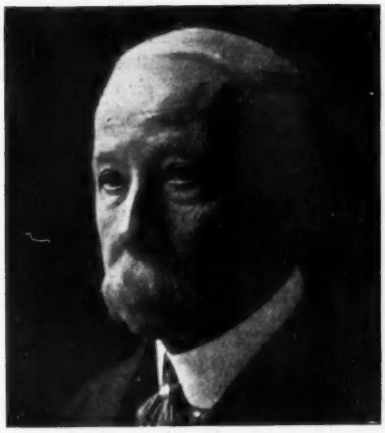
There will arrive in the mind the appreciation of the plan, the importance of which was stressed the other day by Sir Giles Scott with a kind of monumental common sense in a letter to *The Times*. Then the view-point for the delineation of the actual building will be such as gives the best idea of the planning, and, with the sketch proceeding, the artist's mind will be at work seeing through some blank wall the reason why it is blank, for the accommodation of bookcase or sideboard, and remembering how the fireplaces are gathered into the groups which outside effect the dominance of chimneys; or realising the long benches of the workshops behind the long rows of factory chimneys, and the layout of the machines beneath the saw-tooth roofs.

It is not likely, alas! that we shall see an impression of Regent Street in a humorous sketch by Lutyens, or an ironical drawing of the new Olympia by Blomfield, though how truly critical such performances might be! But it seems extraordinary that we find so few renderings of good modern work when we look through the portfolios of the younger generation. Surely the clean contemporary "job" is as interesting as that with a lichenous past!

The second object of sketching is to make a picture. Such dabbling is not only the most delightful of hobbies, but the practice of design in another art. The mind is broadened in the process, however feeble or indelicate the touch. There are certain simple, sensuous qualities of architecture which can be best approached through sketching; colour, for instance, and texture. As well, in drawing architecture with the pencil, we learn the importance of what Le Corbusier calls "the directing line" of the building. It is possible to capture the whole spirit of the composition merely with the firmness and delicacy of the line, which is a shorthand interpretation of the design.



For to the architect design must always be present, and his art is an old fort set against chaos, and in every Gothic church he sketches he sees the joyful relief of men that the Dark Ages and barbarism had been rolled away.



MEMORIAL TO MEN OF AN AMERICAN DIVISION WHO FELL IN FRANCE AT VARENNES-EN-ARGONNE, DESIGNED BY PAUL-PHILIPPE CRET

This monument to the Pennsylvanian recruits (28th and portions of the 79th and 80th American Divisions) is erected on the site of a public place destroyed by the enemy during the war, and was conceived to embellish and frame views of the surrounding country. It overlooks the river valley where the men advanced to the pursuit in September, 1918. A pair of pillared screens, terminating in pylons, one of which is seen, encloses a sunk lawn.

NEWS & TOPICS

Percy E. Thomas, O.B.E. (of Ivor Jones and Percy Thomas) whose winning design for the Accrington Police and Fire Station is reproduced on pages 862 and 863. He has been a member of the Council of the R.I.B.A. since 1922.

W. R. Lethaby, who delivered an address on "The Preservation of National Monuments" before the Society for the Protection of Ancient Buildings last week, was for many years architect to the Dean and Chapter of Westminster.

SCHEME FOR A NATIONAL THEATRE

THE committee appointed to devise an agreed scheme for the establishment of a National Theatre have drawn up a report and submitted it to the Government. The report suggests that capital could be found if the State would provide a grant to meet annual charges for interest and sinking fund over a few years, earmarking for this purpose some of the proceeds from the licences for wireless receivers, which already bring in a surplus of over £300,000 a year. This fund is not part of the general revenue from taxation, and might quite properly be used for the promotion of music and the drama.

★

The committee are of the opinion that a National Theatre is a practical proposition, though nothing can be said on the financial side until questions of site, cost of building and so forth have been settled. Their suggestions as to the type of building they have in view follow very closely the conditions laid down for the competition held a few years ago, and include one large auditorium to hold 1,800, and a smaller additional auditorium.

STONEWORK IN DECAY

Professor W. R. Lethaby, speaking at the annual meeting of the Society for the Protection of Ancient Buildings, made some interesting remarks on the subject of stonework. All stone is decaying—always, he said. It needs a protective skin which can be renewed from time to time if it is to last the centuries. Mediæval masons coated their stone with lime and whitewash, and they painted and gilded their stone, not alone for decoration's sake, but as a preservative. We think whitewash today only worthy pigsties and cottages, but if we had common sense instead of taste we would whitewash the Houses of Parliament instead of spending a million on renewing their decayed stonework. The avoidance of decay should be one of the guiding principles of design—not how to use so much Portland stone, but how to keep it. Nevertheless, things do decay, and without decay stone has no virtue or depth or colour. And were it not for decay there would be no society to protect ancient buildings.

★

One of Professor Lethaby's incidental comments was somewhat arresting. He thought it rather curious that we seemed to be much more sensitive of injuries to ancient works of art when travelling abroad than when we were at home. "I have read," he said, "keen observations on dreadful things done in France, Italy and Germany. But such doings seem different in our own cities, and we prepare the way by calling them 'necessary improvements.'" I am not so sure that this indictment has the same validity today that it had, say, even ten years ago. There has been a rapid awakening of the public conscience in matters artistic, thanks to the exertions of the numerous societies who have made preservation their watchword. But, of course, it is quite in our national character to tend to rank foreign art above our own.

A SCHOLARSHIP IN RESTORATION

The chairman of the same meeting announced the decision of the Society to institute a scholarship which has as its purpose the training of a young architect in the repair and restoration of ancient buildings. This is, I think, a very sensible and generous use of the Society's funds, and one which with good fortune may bring them an accession of well-trained enthusiasm which they are well able to make of real value to them in their good work.

ACADEMICIANS "ON PROBATION"

It does one good to read one of Richard Sickert's harsh, unpolished criticisms of contemporary institutions. His recent castigation of the Royal Academy is full of point, especially in the matter of superannuation and the Associateship. As he says, the older members are quite often the most accomplished artists and the most experienced organizers, while the idea of probationership in matters of art can never be applied to members of a national academy. The Associateship should be dropped, and some form of alphabetical order should govern the hanging of works.

COMPETITIONS THAT ARE BANNED

The frequency with which it is announced that such and such a competition is barred to members of the R.I.B.A. because the conditions do not conform with the regulations laid down by the Council is rather surprising. I have never personally followed any one particular case and cannot remember whether the lost sheep have usually been shepherded into the fold, or how rigidly party discipline has been maintained after the issue of a warning. It would be of real interest to know the nature of the common transgression, and how far successful are the efforts of the R.I.B.A. to impose their authority.

A CODE OF STEEL BUILDING

A letter to *The Times* brings into prominence the lack, until now, of a national code of steel-frame building. Not only are building bye-laws dumb on the subject, but there have been no agreed basic principles of design, the steelwork engineers having been satisfied to take the back seats and sing

seconds to the architects' lyric airs. And the architects have been so used to the arrangement that they have seen nothing significant in the curious bunglings which brought stability to their composite structures at the price of all suavity, and certainty of purpose in the internal arrangement of them.

*

The engineers are now taking the lead in this matter; steel must be treated with respect and an ideal code of construction laid down. Today neither stone nor steel is master, and each bungles the other where both might work in harmony.

A COLD-WATER SHAMPOO

It has been suggested by an architect in Manchester that cold-water washing would make a world of difference to the grimy façades of that city, and it has been further suggested that the Fire Brigade are the right people for the job, working on quiet Sunday mornings. While I think that firemen should be paid for putting out fires and for nothing else, I think the cold-water treatment is the most effective and least damaging method of keeping stonework clean. Against the heavy chemical deposits of centuries cold water makes little headway, and is better employed on newer buildings. Upon these the work can be done rapidly and, as one may see on the screen between the Office of Works and the Foreign Office, very effectively. It is much cheaper than any other method, and can be done by the house staff of any large building or corporation.

THE ISSUE OF CHARING CROSS

By the time these lines appear in print the Charing Cross Bridge dilemma will have been resolved. It seems almost certain now that the L.C.C. will not attempt to get their obnoxious Bill recommitted to Parliament. The chances of its passage are thought to be too slender. Instead, the whole subject will be reconsidered by an advisory committee, if the Council take the advice of their own Improvements Committee. Under an independent chairman would be convened representatives of all parties interested, including the Royal Fine Arts Commission, the Royal Academy, the R.I.B.A., the Institution of Civil Engineers, the Surveyors' Institute and the Town Planning Institute, their report being due in nine months' time.

*

Such a decision would do honour to the common sense of all concerned, and it seems not unreasonable to hope that the opportunity afforded of doing a fine thing well may yet not slip through our fingers. Everyone is agreed that a road bridge at Charing Cross is a pressing necessity of our Metropolitan life; we should get a monumental scheme for the £12,500,000, which is the limit of cost in view.

A NOTABLE ARTS AND CRAFTS EXHIBITION

The exhibition of students' work at the L.C.C. Central School of Arts and Crafts, opened last week, shows how efficiently the school is carrying out its objects of helping British handicrafts and industries by maintaining ancient traditions and furthering modern development in design and workmanship. It is a school solely for the education of art and craft workers, and the exhibits include silversmith's work, textiles and costumes, painted and sculptured architectural decoration, stained glass and mosaic, furniture, book production, engraving and lithography. All the work shown is of the most advanced type and is executed from beginning to end by the individual student himself. Among the exhibits I liked the best were the studies in lithography by G. W. Morries, of *Punch*, and E. Clark Hall, the unusual drawings of animals by B. Purvis, the bookbinding by G. Wilkins and T. G. E. Smith, the architectural model of an inn in Wiltshire by J. W. G. Smith, the modelling in pottery by A. Allinson, and the aquatints by Clifford Webb.

HEREFORD'S BISHOP'S PALACE

The Ecclesiastical Commissioners have now power to contribute towards the repair of such a notable architectural treasure as the palace of the Bishop of Hereford. This lies just away from the busy streets. Part of the building, notably the timbered hall, dates from the latter part of the twelfth century. Today, after 750 years, three arches and five pillars bear the whole weight of the roof. This is a unique building. The only other similar Norman woodwork to be found in this country is a pillar at Farnham Castle and two bays of an old tithe barn which stood until recently in Suffolk. The arches of oak in the hall or eastern range of the palace each have a span of twenty-one feet.

MUNICIPAL ARCHITECTURE IN BOMBAY

I noted some months ago a proposal that the Bombay Corporation should establish an architectural branch. The Municipal Commissioner, who was asked to report on the subject, has now reported that the idea that municipal buildings should as far as possible be designed on sound architectural lines has always been kept in view in designing the buildings so far erected. The Corporation will agree, he says, that architectural designs mean extra expenditure, and in these days of financial stringency it has been found necessary to strip the buildings as much as possible of the architectural features and ornaments but not so as to make them ugly (!). The present staff of the architectural branch is quite capable of designing buildings in any style, and the appointment of a person holding the A.R.I.B.A. diploma would only entail heavier expenditure on account of higher pay without adding in any way to the efficiency of the department. The department is not wanting in men with necessary qualifications, he concludes, as there are at present two persons with the Government Diploma in Architecture and four who have passed the old Advance Examination in Architecture. All of which strikes me as very deplorable.

EXTRAVAGANZA IN ANTWERP

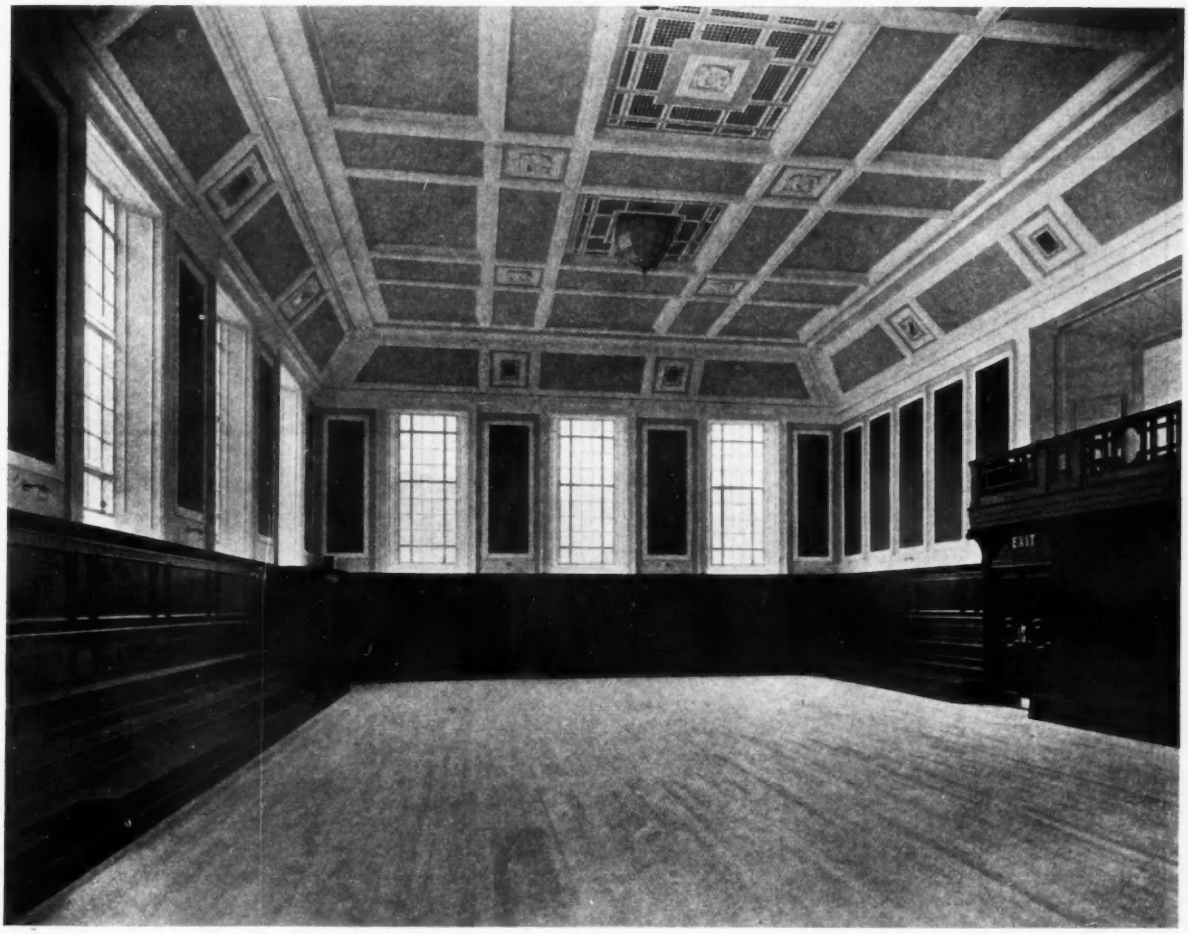
A speculative builder of Antwerp, who had put up some flats on the outside of the city, suddenly saw wealth coming to him in the shape of the exhibition, whose site was intended to cover his little speculations. He was a greedy fellow, was this builder, and thought he could hold out a bit on a rising market. The authorities couldn't wait, however, and did not buy. Instead, they proceeded to erect the wall of their exhibition, cementing the flats into it securely at each end.

Now the poor tenants have floodlights playing on them into the small hours, and their friends—if they care to undergo the trial—must either pay at the entrance gates when they come on a visit, or be escorted by vigilant guardians who take care that no one may enjoy the wonders without payment. Meanwhile the builder sleeps of nights, for he has heard that the district is to become a garden suburb. He sleeps, and dreams dreams that would shock you or me, gentle reader.

ASTRAGAL

CECIL SHARP HOUSE, REGENT'S PARK, N.W.

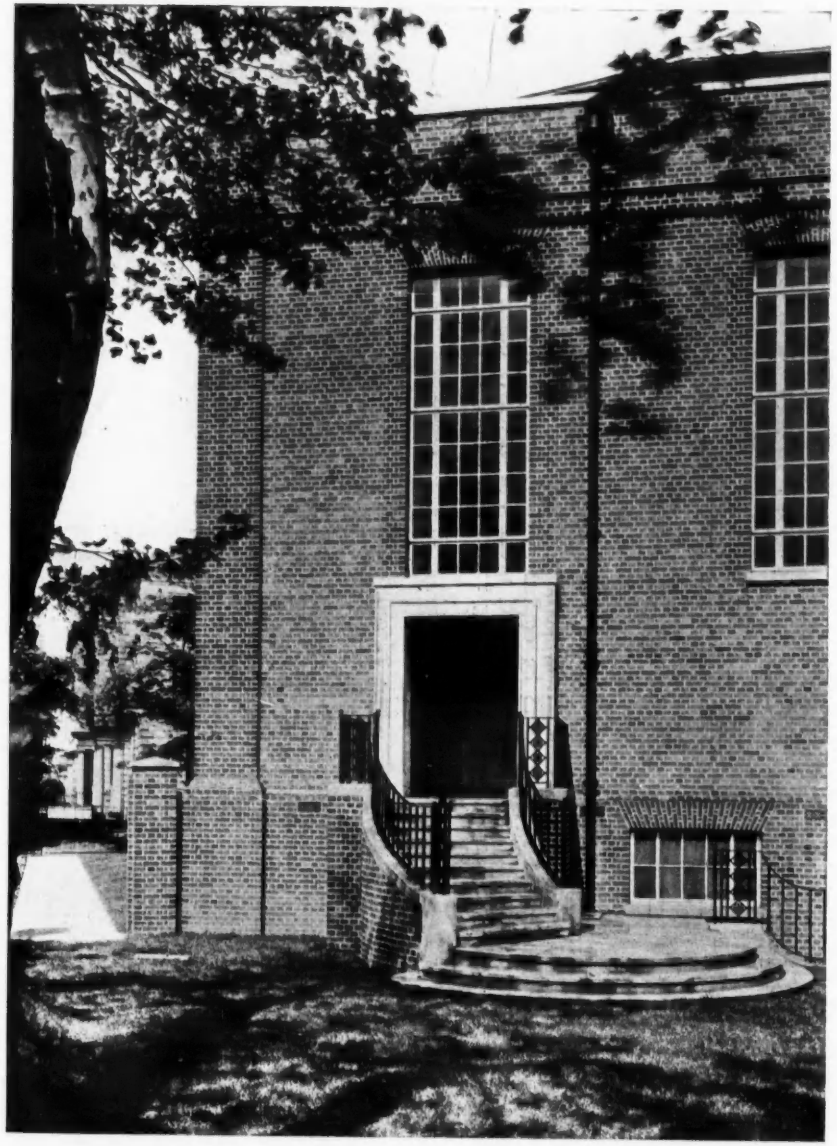
Headquarters for the English Folk Dance Society



DESIGNED BY H. M. FLETCHER AND GODFREY PINKERTON

ON Saturday afternoon, June 7, the Rt. Hon. H. A. L. Fisher will open Cecil Sharp House, and formally give it into the keeping of the English Folk Dance Society. No better tribute could have been offered in memory of the great work of the late Cecil Sharp, fulfilling as it does his ambition to found a national building to provide headquarters for the Society and a common centre for the English traditional arts.

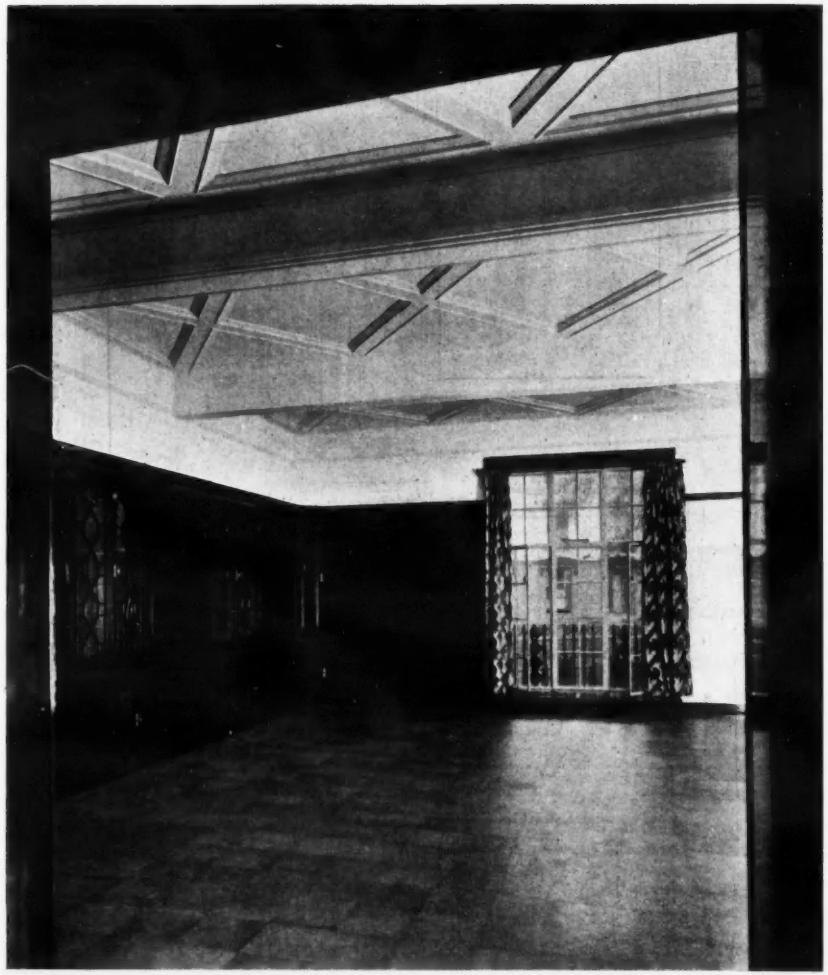
The building stands on a corner site on the northern border of Regent's Park, London, and provides a main dance hall, perhaps the first of its kind to be erected specially for folk dancing, two classrooms, a library, buffet, changing rooms and administrative offices. On the south-east corner of the site is an open-air theatre, which can be approached from two pathways, one on each side of the building, and from two doorways from the main dance hall.



The large classroom in the semi-basement, called the Trefusis room, like the main dance hall, has a semi-sprung floor of pine. It is, however, somewhat different in decorative treatment. The walls and ceiling are in similar colours to those of the main dance hall (see illustration on this page), but the doors are of a brilliant red, picked out in black, and having a black surround. The chairs also are in red.

On one side of the classroom is the men's changing room, and on the other the women's. These rooms, also given a colour scheme in red, cream and broken white, are fitted with the most modern appliances, including shower baths.

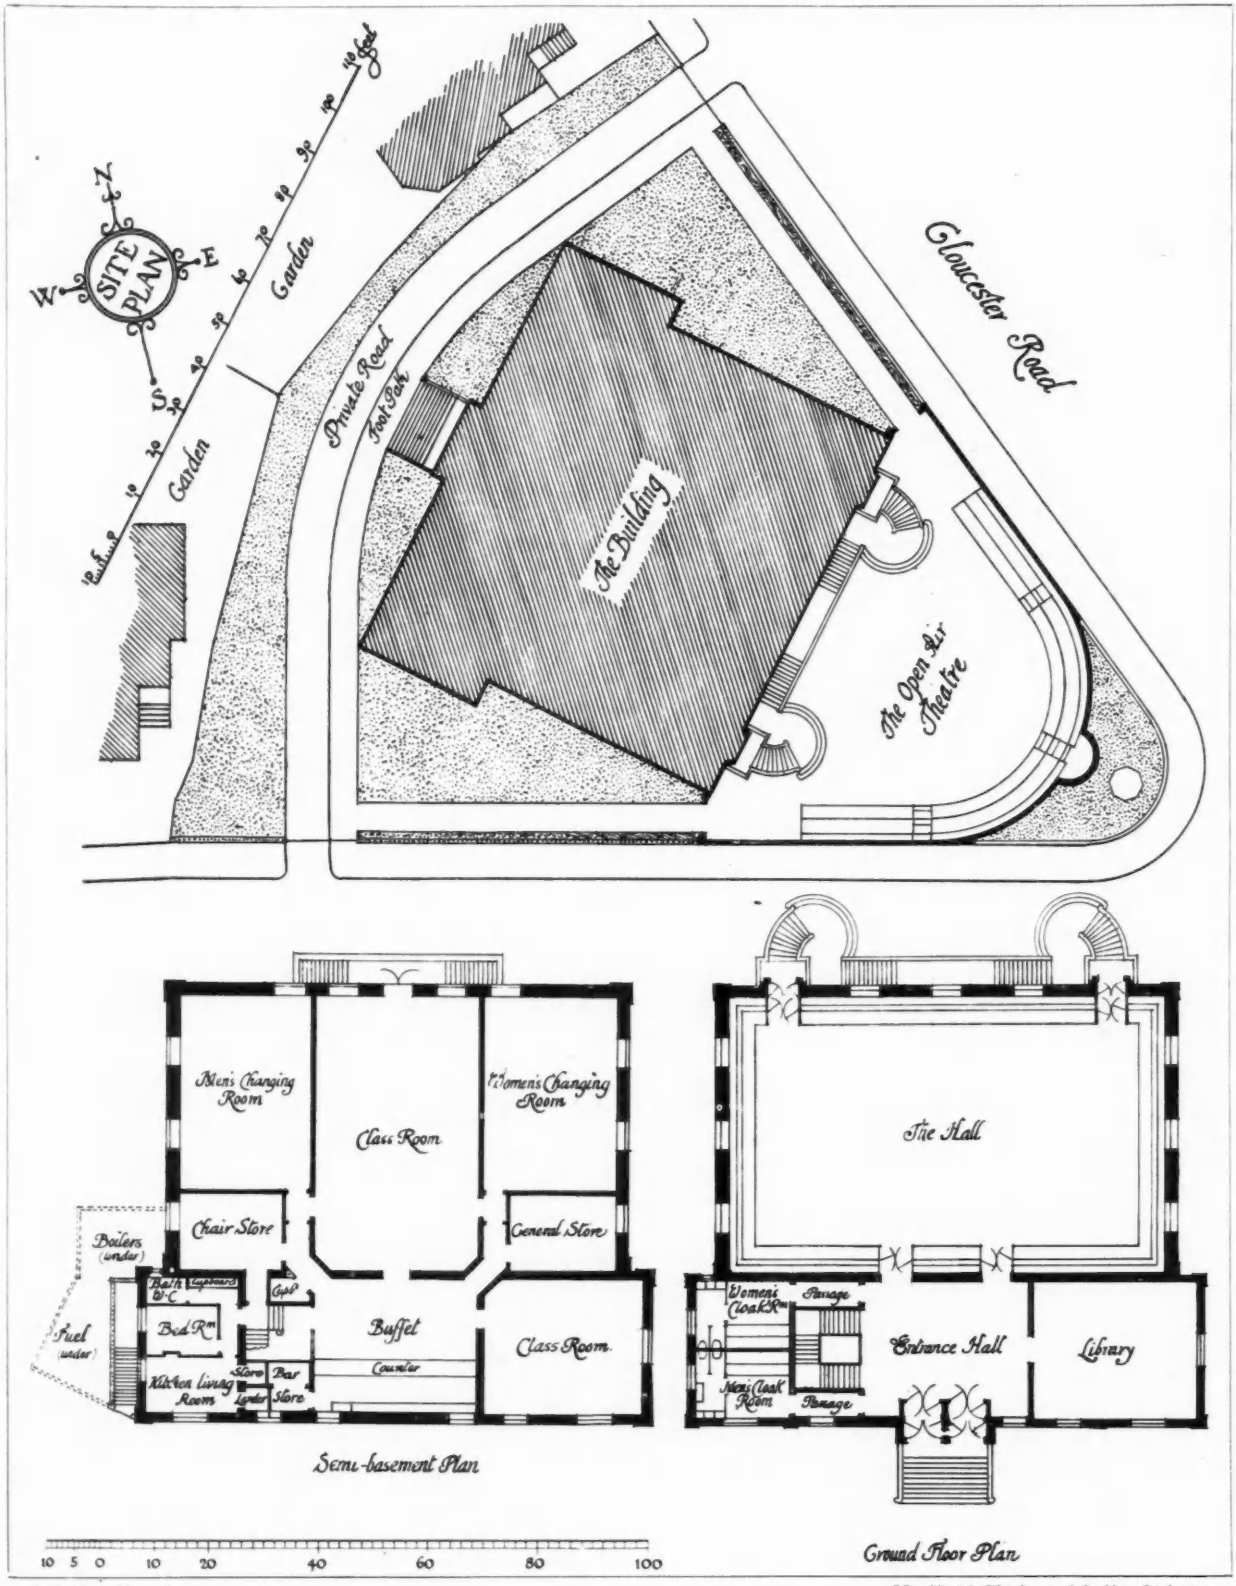
The main dance hall has a musicians' gallery and two permanent tiers of seats. It is probably the first hall to be erected to meet the special requirement of folk dancers. The floor is of pine, and is semi-sprung. All the woodwork, including the seating, is of pine, stained oak colour. On the upper part of the walls and on the slope of the ceiling are acoustic panels. Electric lighting is from portholes in the slope of the ceiling, augmented by two central ceiling lights, silver coloured. The decoration is in cream and white.



The main entrance; and one of the exits, with curved stairs, from the main dance hall into

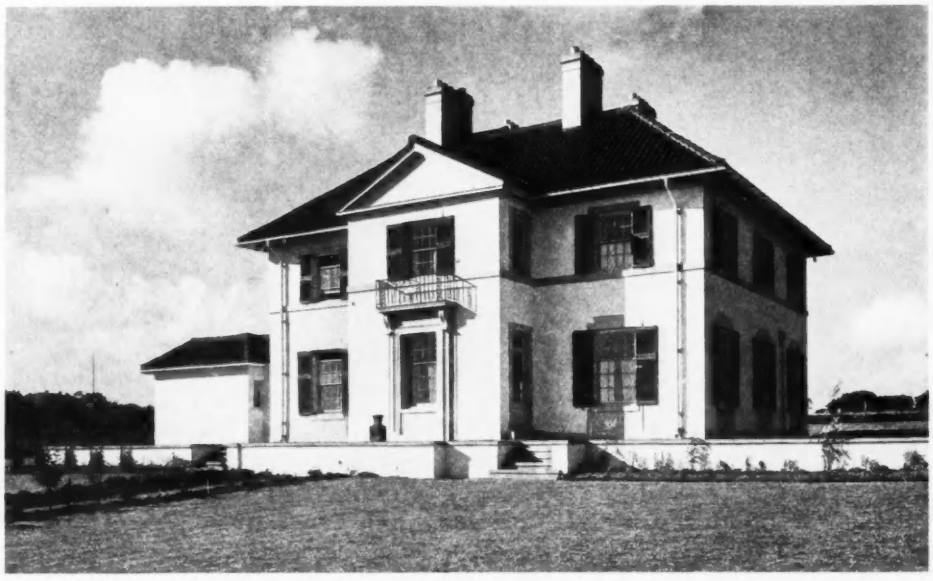
which in plan are curved one towards the other. The building is constructed of rusticated

The main entrance; and one of the exits, with curved stairs, from the main dance hall into the open-air theatre. As will be seen from the plan (page 856), there are two exits from the hall into this theatre. They are both of similar design, except as to the stairs, which in plan are curved one towards the other. The building is constructed of rusticated bricks, with English Portland stone dressings. The roof is covered with slates in graduated courses, and the railings are in wrought iron. The windows are of metal; the doors of teak.



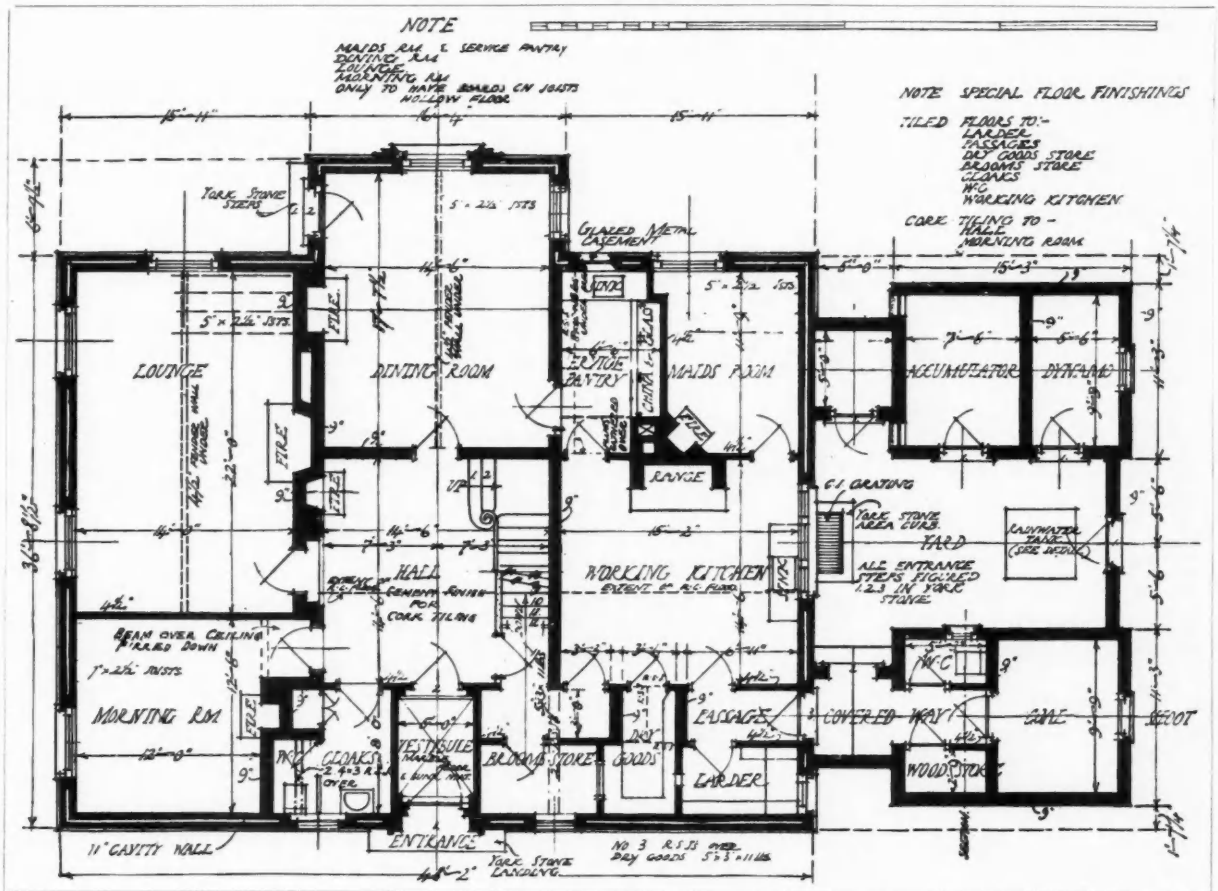
Cecil Sharp House.]

[*By H. M. Fletcher and Godfrey Pinkerton.*



The library; and the entrance hall. The former will contain, as a nucleus, the late Cecil Sharp's rare books on folk music and folk lore, costumes and instruments of traditional dancers and mummers, and copies of all his manuscripts. Both the library and the entrance hall have cork floors, cream-coloured walls, and ceilings painted broken white. The main entrance doors and lobby are in teak, the other woodwork is pine, stained oak colour. The balustrading to the artificial stone staircase is in wrought iron and has a teak handrail.

Cecil Sharp House.] [*By H. M. Fletcher and Godfrey Pinkerton.*

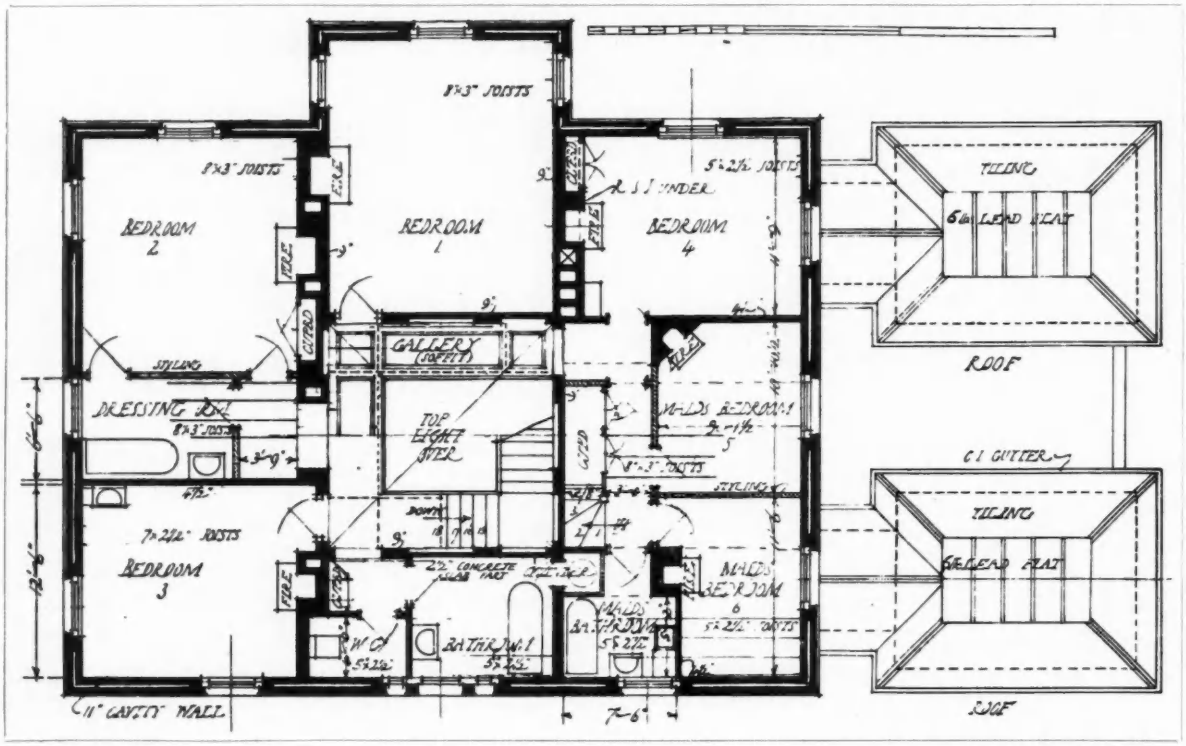


Plans of the layout, the semi-basement and the ground floor. On the first floor is the upper part of the hall, the musicians' gallery, and enquiry, general, and private offices. The semi-basement is ventilated by a special system of ducts, connected to a fan room in the roof.

The garden side. The house has been erected in Gayton, Cheshire, with 11-in. hollow concrete walls. In the centre of the main roof, which is covered with tiles, is a reinforced concrete flat with an asphalt surface, containing top lights above the staircase.

A CONCRETE HOUSE IN CHESHIRE

DESIGNED BY HERBERT J. ROWSE



Approximately the left half of the ground floor is occupied by the principal apartments, grouped on two sides of a spacious hall, and the right half by the servants' quarters. A staircase from the hall leads to the wine cellar, with its storage bins, and a store. The first-floor plan is reproduced on the following page.

The front entrance; and the central feature of the garden side. The entrance front is of simple design, the wall being unbroken except for the doorway and five windows, three of which are on the first floor.

House at Gayton.] [*By Herbert J. Rowse.*

On the first floor are six bedrooms, including two for the maids, and in the roof are another servants' bedroom, boxroom, and cistern room. Above the staircase is a coffered ceiling with top light.

ENGLISH PRECEDENT No. 118

BATH STREET, BATH

The colonnaded street is the very heart of Bath. This view is taken with the Cross Bath behind the camera, and looking towards the Pump Room, and includes nothing that is not the direct contribution of eighteenth-century architecture (if we except the lamp standard that obscures the delightful fountain at the end of the street).

Twenty years ago a city council was only just prevented from pulling it down. It was saved by several citizens of taste, and today no council would dare to suggest its removal. Unfortunately, it leads nowhere in particular, so that it cannot prove what a delightful modern shopping arcade it could make.

—[E. MAXWELL FRY.]

LETTERS FROM READERS

R.I.B.A. Building Jury

SIR,—I was interested in Mr. C. Holden's suggestion. First impressions may lead some to consider this an admirable way of dealing with the problem, but I have in mind the experiences related at a London meeting by a well-known American architect. He said that in the early days of their competitions it was decided that this method should be tried in the case of an important building. Each competitor was allowed two votes; the idea being that they would probably give one for their own design and the other for that which they considered the next best. Unfortunately, things did not work out so satisfactorily. What really happened was that each gave one vote to himself, and, to make his position more favourable, "they all with one accord" gave the other vote to the worst design submitted, which was not only selected, but erected!

H. R. GARDNER

Hadrian's Wall Controversy

SIR,—The Council of the Edinburgh Architectural Association (which is at present in communication with the Northern Architectural Association on the matter) has been considering Astragal's reference in your issue of April 30, 1930, deprecating the controversy over the proposed quarrying operations on Hadrian's Wall and bearing the implication that, as there are seventy miles of it, the few miles to be quarried would not matter.

The Council has instructed me to state that this point of view does not accurately represent the facts of the case. Were the Wall of equal merit along the whole of its course exception could not be taken to what Astragal said, but it is really only archæologically and scenically effective for the few miles about Housesteads, and it is upon these few miles that the proposed quarrying operations are to be concentrated.

LESLIE G. THOMSON
For the Secretary, Edinburgh Architectural Association.

Condemned Houses

SIR,—In the leading article in your issue for May 21 with reference to condemned houses and grievances under the Rent Restriction Acts, the various points of view are very fairly put, but I do not think the difficulties are limited to dangerous houses inhabited by protected tenants.

Obviously if the dangerous structure notice involves the whole dwelling, the tenants have got to be ejected whether protected under the Rent Restriction Acts or not. Personally, as a matter of equity, it appears to me that the rehousing of persons who have got to be ejected because of the dangerous condition of the dwelling should be the responsibility of the local authority. Here again it is a question of how far that onus should be put upon the local authority.

Recently, in the Borough of Bermondsey, dangerous structure notices were served in regard to some cottages, and in at least one case the front was taken out. Ultimately the owner was pleased to sell the site to the Borough Council at site value and the Council found accommodation for the tenants and erected two cottages in place of the five unfit cottages. I am afraid that the Council would not regard this as a precedent to be followed in every case.

Where the dangerous structure notice arises through the house being practically worn out, and not through neglect on the part of the owner, and the tenants are persons in humble circumstances, I do not think it would be an unfair thing to place upon the local authority the responsibility of rehousing, subject to the right to acquire the land at site value.

E. GOFF CLARK,
Town Clerk, Borough of Bermondsey.

The Economics of Steel

SIR,—An investigation of the economic aspects of building, particularly of the multiple-story and industrial type, cannot fail to lead to the conclusion that building regulation, to use the term in its widest sense, is thoroughly out of step with modern requirements.

The artificial barriers which restrictive regulations set up, not only to development in the building industry but to industrial recovery generally, are a direct menace to our economic life and are in urgent need of review on a national scale. This need is emphasized by the alarming amount of unemployment in the country and the great possibilities for the relief of unemployment which lie before the building industry if only the economics of the industry can be put on a proper and enlightened footing, so that capital may be attracted to and safely invested in building.

The science of building has now entered upon an entirely new phase through the advent of steel and the absolute certainty of design of steel structures. Moreover science has made vast contributions to building in other directions, notably in precise knowledge of the nature and characteristics of materials in relation to weather and heat and sound insulation.

Progress in building materials has assumed a highly technical character, requiring specialized knowledge which it would be unfair to expect from local authorities. Hitherto regulations have been deplorably static; there is no single industry in the country which suffers from such grave handicaps as the building industry. Instead of one good national standard—if building must be controlled—there are a dozen indifferent ones, with varying degrees of interpretation.

The Lord President of the Council has set up at the Department of Scientific and Industrial Research a committee, with which the British Steelwork Association is closely associated, to investigate the steel structure in all its bearings, and this committee is at present engaged in formulating an interim report on steel-framed buildings. The committee is a very strong one and is sitting under the chairmanship of Sir Clement Hindley. Its personnel is as follows:

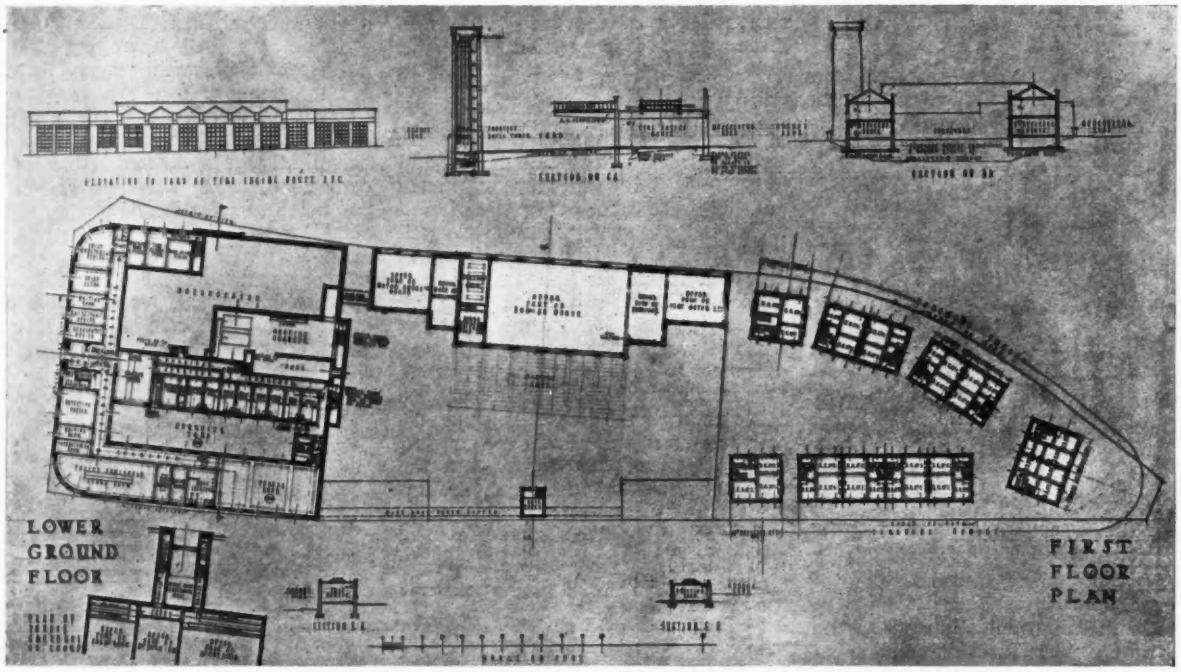
D. Anderson, M.INST.C.E.
R. Freeman, M.INST.C.E.
B. L. Hurst, M.INST.C.E., M.I.MECH.E.
Prof. C. Batho, D.SC., A.M.INST.C.E.
Oscar Faber, O.B.E., D.SC., M.INST.C.E.
G. Topham Forrest, F.R.S.E., F.R.I.B.A.
Conrad Gribble, M.INST.C.E.
Prof. C. E. Inglis, O.B.E., M.INST.C.E.
Lt.-Col. J. Mitchell Moncrieff, C.B.E., M.INST.C.E.
Prof. A. J. S. Pippard, M.B.E., D.SC., M.INST.C.E.
Prof. A. M. Robertson, D.SC., M.I.MECH.E.
Prof. R. V. Southwell, F.R.S.
Commander W. R. Gilbert, R.N.
J. H. Humphryes.
J. E. James.
J. D. Stitt.
C. J. Kavanagh, O.B.E.

All the technical aspects of steel-framed building are being investigated and the necessary research work is being carried out at the Building Research Station under the direction of Dr. R. Stradling. The committee will have the widest technical information at its disposal, both in this country and from America and Germany. The Office of the Lord Privy Seal and the Ministry of Health—which has in a very difficult field shown a high sense of public duty—have been kept informed of the work of the committee and have given the British Steelwork Association their support.

The architectural profession can look with confidence to this pioneer work to establish a rational basis for building progress and will undoubtedly give of their best in whole-hearted and sympathetic co-operation to rescue the destinies of building from their present unfortunate position.

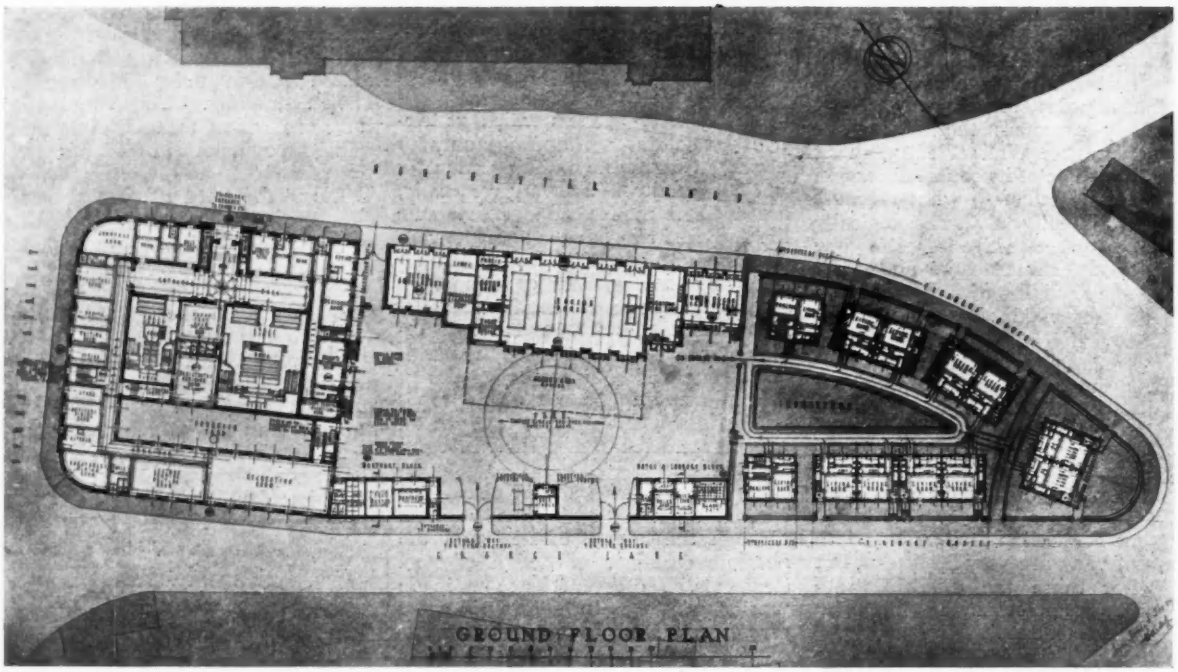
C. J. KAVANAGH

The Sketch Club



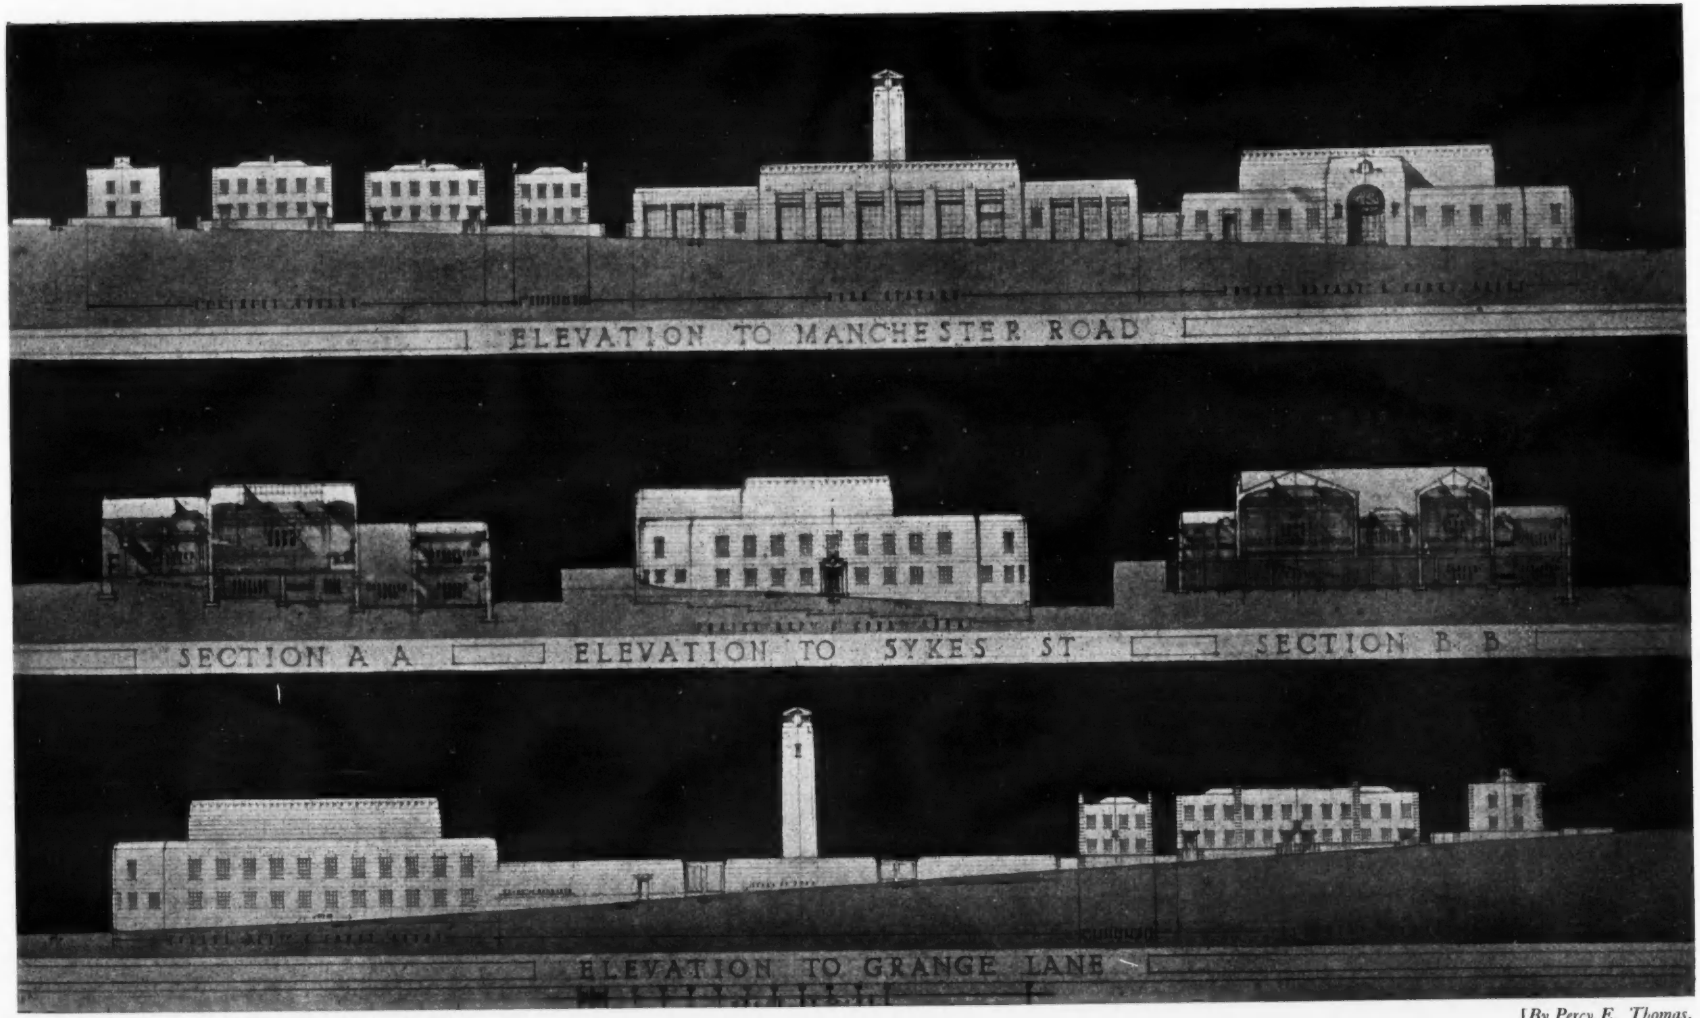
SIR,—I agree with the policy—a very wise one—of "visitors first" in the pages of the Sketch Club. But secretly I shall be glad to return to our own fireside, having bidden the visitors God speed.

All success to the Sketch Club!



WILFRID QUAYLE.

POLICE AND FIRE STATION: ACCRINGTON



The First Prize Winning Competitor's Designs

The drawings of the lower ground- and first-floor plans of Percy E. Thomas, of Cardiff, placed first, with a premium of £250. The assessor, Herbert J. Rowse, of Liverpool, placed second (premium £150) the designs of Allen and Silcock, of Liverpool; and third (premium £100), J. C. Prestwich and Sons, of Leigh.

The ground-floor plan of the winning design, by Percy E. Thomas. The scheme is to occupy an island site resembling an irregular long rectangle, with one truncated, curved corner. The buildings fall into three groups—on the left, the police departments and court house; in the centre, the fire station proper, with a spacious yard, in the corners of which are a mortuary and kennels, opposed to a bath and lavatory block; and on the right, firemen's residential quarters, surrounding an open courtyard.

Police and Fire Station, Accrington : the winning design.] [*By Percy E. Thomas.*

Three elevations and two sections. The elevation to Manchester Road may be regarded as the principal one, its fellow being that to Grange Lane. For ceremonial purposes, however, an entrance from Sykes Street gives access direct to the Court House, and this is, accordingly, given a sedate and distinctive treatment. All aspects are dominated by the tower.

Settling-Up Honeywood : ii

THE DRAINS ARE SUSPECTED

BY KARSHISH

(H. B. CRESWELL)

Sir Leslie Brash—the client—and his family have been in occupation of Honeywood Grange for three weeks, and damp, which seems to be mainly due to condensation, has been complained of.

GRIGBLAY TO SPINLOVE

Dear Sir, 2/3/26.

As proposed to you by Mr. Grigblay, we held off with metalling the entrance drive until the owner had got his furniture in, and our foreman tells us that the heavy lorries have done a lot of damage to the bottoming. Mr. Grigblay looked in yesterday and thinks you ought to see what has been done, as we must make a claim for restoring, and Mr. Grigblay thinks the best thing will be to put a 5-ton roller over the 9-in. pitching and then level up with 4-in. chalk rubble before the 3 ins. of metalling, as the present bottoming is rather light.

Bloggs will be on the site till middle of next week finishing the paths, etc., and clearing up. We have an expert ganger who will look after the road.

Bloggs says there are various little jobs her Ladyship wants done in the house, and we are attending to these. We propose to put these in a separate account.

Yours faithfully,

Heavy motor lorries are a great tax on private roads, which require better foundations than were formerly necessary. Spinlove is once more indebted to Grigblay for warning him to postpone the finishing of the road. It would otherwise have been badly broken up, and the additional layer of rubble was in any case desirable.

It will be noticed that Grigblay says nothing of Spinlove's demand for the Statement of Account. In point of fact, the reason Spinlove wants the account at once is a good reason why Grigblay should wish to hold it back. However exact Spinlove's methods may be—and we have no evidence that they are particularly exact—they will fall far short of the orderly detailed records which are a necessary part of the daily routine of a builder's office, so that Spinlove will have to depend in great part on his memory in determining that certain charges are justified and in fortifying himself to disallow others. If a builder delays rendering his account, the architect will be at a disadvantage in fulfilling his duties as arbiter of what is just and unjust, and be more or less at the builder's mercy. There is also a psychological reason favouring delay in making claims, of which everyone is conscious and which seems to depend upon repugnance to reopening old disputes or returning to forgotten battlefields. When an owner is in bland enjoyment of his accomplished ambition, and his architect immersed in fresh activities (and anxieties), neither has much appetite for renewal of controversy. In addition to this, a builder is obviously in a bad position if he renders his account before he knows what may be required of him in the matter of making good defects ; for if he is to be met by exacting and crochety demands, he will be inclined to reimburse himself by claims for doubtful extras which he otherwise might prefer not to raise ; or if, by some misfortune, he is involved in a demand for costly restitutions that become the cause of an action for damages, he will wish to be free to inflate his account to the full limits that plausibility and legal ingenuity can effect, as an offset to the claim against him. Thus there are good reasons why a builder should delay sending in his account till the time within which he is under contract to make good defects—usually nine months—has expired, or is on the point of expiring ; and this no doubt explains why protracted delay in rendering the final statement of account is common. It must be remembered, however, that a builder does not make out his statement of account until he has brought up to date his prime cost account which shows what the actual cost of material and labour is ; and as some invoices come to hand only months after the materials are delivered, an early rendering of the statement of account would dislocate his organization.

SPINLOVE TO GRIGBLAY

Dear Sir, 3/3/26.

I will go on to the site on Monday and settle what is to be done to complete the entrance road.

I understand that the work Lady Brash has asked you to do relates only to fittings. This, as you proposed, should be rendered in a separate account. You will, of course, let me know if any kind of structural alterations, or decorations, are asked for.

I shall be glad to know when I may expect your statement of account.

Sir Leslie Brash mentions that damp is appearing on the chimney-breasts of the second floor. Will you therefore leave necessary ladders on the site so that I can examine the listings.

Yours faithfully,

Spinlove is wise in directing the builder to make a separate account of the odds and ends of work which are necessary to enable an owner to fit himself and his belongings into the house ; but he will have to see that none of this work is what should properly be included in the contract work of "completing" and of making good defects. Such accounts are otherwise apt to become inflated by a carpenter employed to fix coat-rails or shelving, including in that work time spent unhanging and easing doors.

BRASH TO SPINLOVE

(TELEPHONE MESSAGE)

11.20. 4/3/26.

B. notes you on site Monday. Hopes stay night. White tie. Phone. R.S.P.

Tell him *Yes*. J. S. 4/3.

O.K. R.S.P. 4.10. 4/3.

Spinlove has begun to record and file telephone messages, as he ought to do—though not quite in this manner. We recognize in "R.S.P." his assistant Pintle, whose style, even in these few words, also identifies him. He is an excruciating person and ought to be sacked, unless—as his toleration by Spinlove might suggest—he has on some occasion saved his master's life.

We noticed before that Spinlove had established intimate social relations with the Brashes ; and as Brash is precisely the sort of man who would be well aware of the disadvantage of this intimacy should his architect let him down ; and as he is, besides, somewhat a self-important, unapproachable person, the thing is not exactly what one would expect.

GRIGBLAY TO SPINLOVE

Dear Sir, 4/3/26.

We have not overlooked that you wish our statement as soon as possible, and we will press on with this work, which is in hand. In the meantime we shall be glad to receive a certificate for, say, £3,500 on account. We may remind you that we sent you a rough approximate statement on January 31st, which we think must have escaped your attention.

Yours faithfully,

LADY BRASH TO SPINLOVE

Dear Mr. Spinlove,

It is dreadfully close here, the house always smells stuffy and the drains must be *very* bad for I have tried disinfectants but it only makes it worse instead of better so something will have to be done or I am afraid we shall all be *affected!* There was a *horrid* smell the other day and I am sure it was the scullery sink or something and it might get into the larder though I told them always to keep it shut as tainted food is *not pleasant* and I am *most* particular even the dogs are not allowed to and it is *specially* at night though Leslie will not believe me.

How peaceful after all the stormy weather we have been having !

Thursday. Yours sincerely,

Lady Brash complained of a bad smell on an earlier occasion before the house was finished. That, after some trouble, was found to be the pungent aroma of the new untreated oak, which the lady did not like. Spinlove apparently does not answer this

letter as he was, as we know, going to the house a day or two later.

SPINLOVE TO GRIBLAY

Dear Sirs, 6/3/26.

Yes, I set aside your letter of January 31st, as the work was then not completed and you were not entitled to a certificate; and the matter has since escaped my attention, and the statement covered by your letter cannot be found in this office. I am at a loss to understand how you justify a certificate for £3,500, and shall be glad if you will let me have a copy of the missing statement.

Yours faithfully,

A lame business. Spinlove seems to have put aside the statement without looking at it.

SPINLOVE TO GRIGBLAY

Dear Sirs, 9/3/26.

I enclose specification for work in completing entrance road. I ought to have your estimate of the extra cost, as Sir Leslie wants to know this.

I am annoyed to find that wet gets into the chimneys and shows on the second-floor breasts. I could see nothing wrong with the listings, and Bloggs assures me the soakers were properly lapped and turned up—in fact, I saw the work being done. It is, therefore, evident that the water strikes through the cement and runs down behind the upturned edge of the soakers, and I learn from Bloggs that the cement was *not* waterproofed with Puddlyte. The listings will have to be replaced in Puddlyte cement as specified. The work should be put in hand at once, a small bit at a time, as weather allows, and care taken to keep tarpaulins rigged to prevent rain getting in.

Lady Brash tells me she finds the house "stuffy," and that she has not felt well since she went to live in it, and that two of the servants have been unwell and she suspects something is wrong with the drains. This is not possible, but, as a fact, did the District Surveyor test the whole of the drains and give you formal certificate of acceptance of the sanitary work? If so, kindly send me the certificate by return.

Yours faithfully,

It seems that Spinlove used lead soakers laid in with the tiles and turned up against the brickwork where roof slopes butt up against chimneys, but replaced the usual lead cover-flashings, turned into the brick joints and covering the up-turned edges of the soakers, with cement fillets filling the angle between tiles and chimney-face. These "listings" are a perfectly sound, water-tight device; although they are associated with the tradition of humble buildings rather than important works of architecture. Spinlove, we remember, had several knowing ideas for a sham mediæval roof which he could not get carried out, but he seems to have had his own way with this one.

The Local Government Board model bye-laws secure that all drains shall be planned on established scientific principles of sanitation, and architects are, therefore, relieved of the preoccupation of trying to save money by following ideas of their own; and inspections and tests by District Councils' Surveyors reduce—in practice though not in law—the architect's responsibility for seeing that the work is properly carried out. Spinlove's letter suggests that he is in need of evidence of this official approval to enforce the assurances he offered Lady Brash of the soundness of the drains. Spinlove's urgency will be readily understood by those who read the earlier letters. If Lady Brash gets the idea into her head that something is wrong with the drains, nothing but a course of hypodermic injections is likely ever to get it out again.

GRIBLAY TO SPINLOVE

Dear Sir, 10/3/26.

The whole of the drains were duly tested with water and the pipes with smoke by Mr. Gallop, the drain Inspector, and the whole were inspected on two occasions by the District Surveyor, Mr. Potch, whose certificate of approval we enclose. We are sure there is nothing wrong, as the work was done under the supervision of Bloggs; and as Mr. Potch could not find fault with it no one else is likely to be able to. [*This letter was evidently dictated by Grigblay.*]

As regards the listings, this is not, in our opinion, the best method of flashing to chimneys, but we have no reason to think that the work at Honeywood is defective, as it was carefully carried out to your instructions. We have respectfully to point out that Puddlyte to listings was not, as you state, ordered by you. Puddlyte cement is specified for bedding and jointing to weathered brick members, only.

We do not know to what the damp in chimney-breasts is due, but Mr. Grigblay expects to be that way on Friday and will take the opportunity.

We have noted your provisional acceptance by telephone today of our estimate of £64 12s. for remaking entrance road. We have ordered the pitching and enclose details of our measurements and rates on which our estimate is based.

Yours faithfully,

Spinlove is making a muddle of things. He ought to have asked the Quantity Surveyor what the approximate value of the work on entrance road was, and left it to be measured and valued at settling-up. Apparently he accepted Grigblay's estimate so that the work could be put in hand, but subject to measurements being checked and rates agreeing with the Contract Schedule. Now this is a task for the Quantity Surveyor, and in any case Spinlove had no business to learn what those rates are, for the priced bills of quantities, which constitute the Contract Schedule, are properly kept under seal. A builder has a right to expect that they will be so kept, as otherwise the architect is in a position to vary the contract in the interests of his client, and unprofitably for the builder, by substituting work for which the builder has included a low price for that for which he has allowed a good one. Such a proceeding by a building-owner is manifestly unfair and, by an architect, definitely dishonest, for the architect is, by the terms of the contract, constituted arbiter between client and builder.

It is not usual for the District Sanitary Inspector to test with smoke, but he has the right to do so, and there were reasons why Mr. Potch, the District Surveyor, should instruct him to so test at Honeywood.

SPINLOVE TO LADY BRASH

Dear Lady Brash, 11/3/26.

As promised, I enclose the formal official certificate of the Local District Surveyor showing that the whole of the drains conform with the regulations of the Local Government Board and Public Health Acts; and that the pipes, both below and above ground, have been subjected to smoke and water tests; and that the whole of the work was approved as sound and to his satisfaction. I hope that this will entirely banish any doubts you may have. May I assure you that I have none whatever myself. As I told you, I personally overlooked the whole of the arrangements, and you may rest assured that everything is safe and sound. Even if a defect had developed in the drains since they were tested and passed, which is unbelievable, it could not by the remotest possibility lead, as you imagine, to contamination of the air in the house.

With kind regards,

Yours sincerely,

PS.—Will you please return the certificate when you have done with it?

Here we see our young friend making his old mistakes. In his anxiety to emphasize his assurances, he represents sanitary security as a very difficult and dangerous matter to arrange and a still more difficult matter to prove—which are the particular things he should have avoided. He also depicts himself as persuaded, only, of the purity of Honeywood: he does not, as he should, assert a fact, but reasons his conclusions, although he knows that the person he addresses is incapable of reasoning and unable to weigh the evidence if she were. On the top of all this he actually admits the possibility of a defect and, without knowing what that defect may be, pledges his word that it cannot set up insanitary conditions. It would probably have been better if he had left Brash to open the subject, as he would certainly do were it more than a figment of his lady's imagination; but Spinlove should certainly have addressed himself to his client

and not to Lady Brash, and in either case he might well have confined himself to sending the certificate without comment. Why the exasperating fellow cannot hold his tongue, after all he has suffered from unnecessarily wagging it, is beyond understanding. It is inconceivable that there is anything wrong with the drains, but Spinlove has given his client reason to think there may be.

GRIGBLAY TO SPINLOVE (PRIVATE)

Sir, 12/3/26.

I looked in at Honeywood when I was passing today. You can take it from me that there is nothing wrong with the listings and, if there were, they would not let water into the flues to run down and lie in puddles on the back hearths of fireplaces as it has been doing. There had rightly ought to bea dampcourse across the chimney, and flue pipes in the stacks; for the rain drives across from the S.W. something cruel, and the proper thing to live in up at Honeywood is a submarine, but we can make all right with a bit of soap. The house is dry, but the water drives right through the 9 inch, that's certain, for the wall at the bottom of the hollow is soaked; but nothing is showing inside, though the maids were quack-quacking about a bit of sweating there is which is only what you must expect in a new house. [*"Sweating" is here loosely and inexactly used by Grigblay to signify condensation.*]

The matter I am taking the liberty to write to you privately about is this New Novelty Super Paint the old gentleman insisted I use and which is going to be a bit more of a novelty than he bargained for. The ripple is much more than it was and is forming in ridges. Sir Leslie may think it looks pretty so, but he will change his mind when it begins to fold over on itself and break away in flakes—which is what comes next, for I found a place behind a radiator in the bathroom where it is doing a bit of private rehearsal. The worst place is on the wall of the kitchen where the furnace flue goes up behind. The maids have brushed it over and washed it down till there isn't any paint left, scarcely.

As you know, sir, I refused to take responsibility for Riddoppo and gave warning before the painters left the job that it would all have to come off again —except what came off of itself—and I hope you will bear it in mind, because when Riddoppo gets a move on and shows how super it knows how to be (and we shan't be long now), the dogs will begin to bark; and as I don't want to be bit, and you, I take it, don't want either, and as I have perhaps had a little more experience of mix-ups of this kind than has happened to come your way, I take the liberty, with all respect to your superior judgment, of dropping you a friendly hint—and it is just to take no kind of notice, and if the old gentleman says anything or makes any complaint, to hold out that the paint is no concern of yours any more than it is mine, for I understand you objected to Riddoppo and only carried out instructions in passing on Sir Leslie's orders to me. Please be very careful, sir, what letters you write to Sir Leslie, and don't write any if avoidable, for lawyers are wonderful fellows at proving words mean the opposite to what they say.

I hope no harm done by me addressing you, but thought best, as I am afraid there is trouble ahead.

I am, sir,

Yours faithfully,

For a builder to write such a letter to an architect is most unusual, although the understanding established between Grigblay —a builder ripe in years and experience—and Spinlove—an architect mature in neither—would render it easy for Grigblay to make the same communication in conversation; for Grigblay's individuality is masterful, and Spinlove, although he has great tenacity and can show spirit on occasion, impresses us as lacking personal force. Grigblay has, however, formed the habit of dissipating the evening preoccupations of his active mind in well-purposed letters to Spinlove which, though intimate and fatherly in tone, are perfectly respectful—and that is all there is to say about it. It is necessary to call attention to the oddness of the circumstance, or an experience few architects are ever likely to have might be supposed usual.

The meaning of the letter is that Grigblay, in visiting the house, is reminded of the imminent failure of the inside paint work, and he is uneasy. Apparently he feels that his disclaimer, and Brash's acceptance, of responsibility for Riddoppo, does not exactly secure him; and he is afraid that Spinlove may be led, by characteristic exuberances, to countenance an interpretation of the facts prejudicial to Grigblay's position. Spinlove, of course, cannot by anything he may write or say commit Grigblay; but he may readily mislead Brash as to what Grigblay's obligations are, and thus foment contest.

[NEXT WEEK: III—THE STATEMENT OF ACCOUNT.]

QUESTIONS THAT ARISE

Tasmanian Oak

"Experiment" writes: "*I have been recommended to lay a floor to a large hall in Tasmanian oak blocks, and I should, therefore, like to know the qualities of this wood, and whether it is considered satisfactory for flooring of this type.*"

Tasmanian oak is not a true oak, and it bears a resemblance to English ash, especially when first cut.

It is a wood that is easily worked, straight grained, of close texture, strong and elastic. It is very useful where required for bending, and also the colour tones down to various grades of plain oak.

I have found it satisfactory for various floors I have had laid suitable for quite hard wear, and have found that it takes a good polish. It could be used with safety for the floor of a large hall.

J. A. G.

Expenses and Tax

"Architect" writes: "*May I claim relief from income tax for expenses incurred in entertaining my clients?*"

Although entertaining expenses appear to be a troublesome item when computing profits for the purposes of income tax, they should be easily dealt with if only proper records are kept of them and put through the books in the same manner as any other expenses are recorded.

In large companies where entertaining expenses are incurred, the managers and other heads of departments are obviously reimbursed for such expenditure, and it therefore must be put on record in the books; but in the case of one-man businesses and professions, such as an architect's, the matter is different.

For instance, many professional men in the course of their daily routine have, for business or professional purposes, to entertain customers or clients, and they usually pay for such expenses out of their personal cash and forget to make any record of them.

When the accounts are reviewed for income-tax purposes, inspectors are always wary of expenses claimed beyond accounting records, that is to say, the taxpayer says: "But I have never charged anything for entertaining expenses, and I ought at least to have an allowance, say, of £50."

It is therefore absolutely necessary to treat this item on exactly the same lines as any other expenses and make out a proper voucher for the amount incurred with reasonable details thereof, which should be signed and dated and filed with the usual receipts.

The general practice is that all reasonable expenses of entertaining are allowed for income-tax purposes, and if they are surcharged by the Inland Revenue Authorities an appeal should be entered forthwith and fought out; but provided records and proper explanations are forthcoming (if required) there should be no trouble in having this item treated as a charge.

Many companies and firms do not

even show this item separately, but include it under headings such as "General Expenses," "Business Expenses," "Trade Expenses," etc.; but to my mind this is apparently not necessary. Why not make a clear item of this expense and stick to your figure?

M. L. H.

R.I.B.A. Contract Form

J. C. T. writes: "*I recently obtained tenders from ⅛-in. scale plan and specification only for a small house, the lowest tender of £850 being accepted, under the usual R.I.B.A. contract form (October 1909 edition). The first and third clauses in the specification read as follows: 'The tender to be in one lump sum and must include for all labour and materials necessary to complete the buildings in each trade in the usual manner, and for complying with bye-laws, even if not specially mentioned in the specification. The general quality of the labour, materials and finish must be such as is usual in a house of this class, i.e. distinctly better than cottage work, but not equal to work usually put in a much larger building.' The building is now roofed in, and it has been found that the specification does not mention either skirtings, door architraves, or picture moulds. I claim that these are all the 'usual finish' and must be included in the contract sum. The builder claims they are 'extra.' The picture moulds are shown clearly on the ⅛-in. scale section.*"

The question is one of fact. The answer depends on what is understood in the profession by the expression "in the usual finish" in relation to the facts before me.

I am not competent to express an opinion as to whether it is a custom in the profession that the items specified in the question should have been included, or whether they come under the heading of "extras," to be paid for accordingly.

Trade custom is a matter of fact and must be proved by evidence by those who allege it, unless the custom has been recognized judicially. The onus of proof rests on the party alleging the trade custom, and provided it is not unreasonable or contrary to the general law, the courts will recognize it and will enforce it.

With regard to the picture moulds, different considerations apply, as they are shown clearly on the scale section.

Subject to any express stipulation in the contract to the contrary, the basis of the contract is the plans and specification.

Whilst the items other than the picture moulds are conspicuous by their absence, and it is a question of trade custom whether one is entitled to read into the contract an unwritten clause that they should be included in and form part of the plans or specification, yet, in the case of the picture moulds they are provided for expressly, so that they form part of the plans.

In my view, in the absence of any trade custom to the contrary, *prima facie* the picture moulds are included in the contract, so that the builders who allege they are extras according to trade custom must prove their allegations; with regard to the other items, the onus of proof, in my opinion, is on the architect.

E. F. I.

Charcoal Box

D B. writes: "*Can you give me any information about a charcoal box for absorbing the smell from the filter bed of a septic tank installation for a house occupied by six persons? State size and construction and what sort of charcoal, whether it should be in a wire tray for replacement, how long will it be effective in absorbing the smell, and whether it will regain the power of absorption if it is exposed for a time to the fresh air. It is proposed to insert it in the pipe connecting the filter bed with the ventilation pipe.*"

The application of charcoal for the purpose of deodorizing offensive matter has long been practised. Charcoal is a very porous substance, to which it owes its properties as a purifying agent. When freshly burned it will absorb about ten times its own volume of oxygen and even greater quantities of other gases. A cubic foot of charcoal is capable of condensing in its pores about 100 cubic feet of ammonia and 50 cubic feet of sulphuretted hydrogen, both of which gases are among the offensive products of the putrefaction of organic substances. This power of absorption is not confined to gases, moisture being also imbibed.

With this combination, the offensive gases, all of which are capable of undergoing oxidation, are acted upon chemically by the oxygen and converted into inodorous products such as sulphuric acid.

The hard varieties of charcoal concentrate the greater volumes of gas and of the vegetable charcoals; that prepared from coconut shells is the most absorbent, while animal charcoal, which is prepared by charring the bones of animals, has still greater absorbing properties. Its efficiency is proportional to the amount of surface exposed, and it should therefore be used in a coarse granular state. The efficiency is gradually impaired by use, but is again restored by reburning.

Although, as will be gathered from the above remarks, charcoal has much to recommend it as a deodorizing agent, it has been found in practice that in a moist situation it is liable to become so caked and consolidated that it will neither allow the gases to filter through nor absorb the impurities contained in them.

For use in connection with a small septic tank the charcoal, about six inches in depth, should be contained in a wire tray about twelve inches square and placed in such a position that the whole of the gases emanating from the tank may pass through before escaping by the vent-pipe into the atmosphere.

As there should be no current of air through a septic tank, the vent-pipe acting more as a safety valve than a ventilator, in preventing any undue pressure of gas in the tank, the quantity passing through would be comparatively small, and it is considered that the deodorizer would not require attention more than twice or three times in a year.

N. H.

Grained Woodwork

G. writes: "*The woodwork to the drawing-room of a house I am redecorating is grained and varnished a light oak colour. My client has taken a dislike to the light colour, but would like the graining, which is well executed, to remain. He suggests that the woodwork might be darkened, and still retain the graining. Can this be done?*"

In reply to your correspondent I would suggest that the work could be overgrained as follows: Well rub down and apply a coat composed of burnt sienna and burnt turkey umber in equal proportions, thinned with linseed oil and turpentine also in equal proportions, with the addition of a good liquid drier, and finish with one coat copal varnish.

D. E. C.

Fixtures to Partitions

"Harassed" writes: "*In my offices I have had considerable trouble with different fixtures, such as fire appliances, hat and coat racks, etc., which are fixed to partitions by means of screwing to wood plugs. These have all become loose, and several have fallen away from the partitions. A jobbing builder told me that they were fixed with inferior plugs, but, after he had fixed, as he called them, to stouter plugs, the whole became loose again within a few weeks. I understand that the partitions are solidly built of terra-cotta blocks. Can you inform me whether these fixtures are usually secured in the above manner to this type of partition? If not, in what manner is this work done?*"

Hollow, terra-cotta block partitions do not provide a satisfactory grip for plugs, and probably the various fixtures are secured by little else than the plaster.

If it is inconvenient to transfer the fixtures against brick walling, where wood plugs could be used, I consider that the only satisfactory way would be to secure the fixtures with bolts through the partitions.

W. A. D.

A NOTE ON PROPORTION

IT is very desirable to know what is meant by good proportion. There are many dogmatic statements in existence, but it is very rare for any author to tell us how to get good results in a practical way.

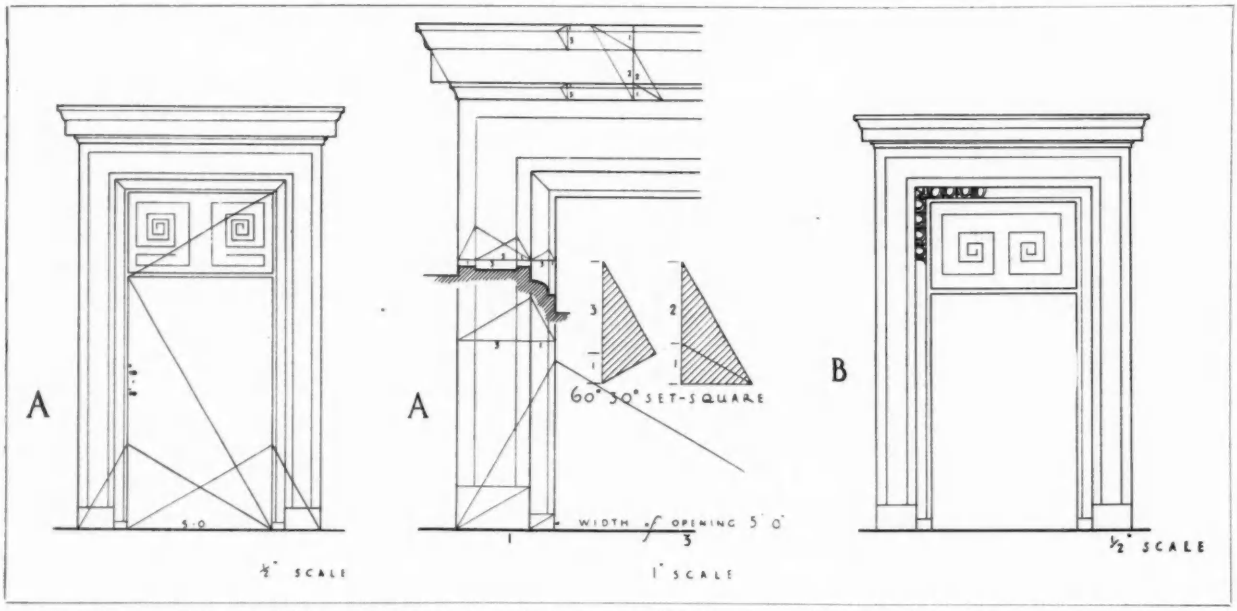
Sir Theodore Cook wrote: "Everything in Nature is capable of mathematical expression if the conditions are only sufficiently well known"; Owen Jones, a deep student and practical designer of the beautiful: "Compositions in equal lines or dimensions are less beautiful than those which require a higher mental effort to appreciate them"; Viollet-le-Duc: "It is not enough to fix on dimensions differing in height and width according to mere caprice; it is necessary that these dissimilarities should proceed from a general principle, and it is in this respect that the determination of proportion by triangles is advantageous."

Now here is a method of procedure that can be practically used with a set-square.

Take the 60 deg./30 deg. set-square, and to ½ in. scale set out a door opening 5 ft. wide; this gives a tangent of 8 ft. 8 in. (A). Then use the set-square flatwise to get a panel above door. This set-square can be used in many ways to get other proportions; in this case I will only use it to divide into one and three for the architraves and one and two in the cornice. Apply the set-square (see 1 in. scale details of A) to the width of opening to get widths of architrave three to one; to divide architrave into two parts in the proportion of three to one; to divide outer part of architrave into three to one and the remainder into three to one; and then to divide the smaller part of architrave into three to one. Run these divisions round the door opening.

Further correspondence will be got if the whole composition is in the same ratio as the opening. This will require a little additional height, which gives a pleasing cornice. In the cornice, for variety, I use the one to two division, but return to the one to three division for fillet to cyma and hollow of bed-mould; some simple design in the panel above door completes the composition. It is particularly rhythmic, but the divisions of line are one to two and one to three, both extremely commonplace, and they do not in the least carry out Owen Jones's valuable hint, so I go through the same process with the golden cut set-square and get a design (B) just as rhythmic but far more subtle in its ratios.

There are certain standards of proportion specially pertaining to the various animal and vegetable forms, the whole range of creation generally; man, elephant, horse, hound, bird, butterfly will have an ideal form, and each member will be an approach to this ideal, i.e. will have an individuality.



The ratio of the human head to the rest of the figure is generally accepted as one seventh-and-a-half part, and deviations so slight as one-eighth or one-seventh make the head too small and too large.

In a similar way we accept those proportions in architecture which were considered beautiful in ancient times, and while we aim at new combinations we yet reverence old traditions, but we know that, as Viollet-le-Duc says: "The utter decay of official instruction and the loss of the traditions have allowed the clue with which the professional guilds were so familiar to slip from our hands." And only those who have plenty of time for systematic study of a subject can reasonably expect to arrive at any advance. Knowledge comes very slowly. As a well-known illustration, our present knowledge of the Parthenon dates back less than 100 years.

From 1750 to 1755 Stuart and Revett were measuring in Greece. Their first volume was published in 1767, and we had the Greek revival in architecture. This revival had practically died out before the discoveries of the Greek refinements.

In 1810 Cockrell discovered the Greek entasis. In 1829 Donaldson established the inclination of the columns. In 1837 Pennethorne discovered the curvatures, having four years before discovered the curves at Thebes; he had been to Athens in 1833, again in 1835, and returned the third time in 1837, before he discovered the curvature of Greek architecture.

In 1838 Hoffer and Schaubert, German architects, also discovered the curvature. In 1851 Penrose gave his most careful measurements. In 1866 Pennethorne published his discoveries.

These three drawings, which illustrate the points made in the above article, have been reduced from ½-in. and 1-in. scales respectively.

LAW REPORTS

IMPROVEMENT SCHEME : POWERS OF THE MINISTER OF HEALTH

Rex v. *The Minister of Health. Ex parte Yaffe. Court of Appeal. Before Lords Justices Scrutton, Greer and Slesser*

THIS was an appeal by Mr. Abraham Yaffe, an estate agent and property owner of Liverpool, from the judgment of a King's Bench Divisional Court, composed of the Lord Chief Justice and Justices Swift and Talbot (Mr. Justice Swift dissenting), discharging a rule nisi for certiorari which had been granted on March 26, 1929, at the instance of Mr. Yaffe, calling upon the Minister of Health and the Liverpool Corporation to show cause why an order of the Minister of November 23, 1928, confirming an improvement scheme known as the Liverpool, Queen Anne Street, Improvement Scheme, 1928, should not be quashed.

The point raised in the case was whether the confirmation of a scheme —good or bad—by the Minister of Health gave it statutory effect and prevented the Court inquiring into it.

The contention of Mr. Yaffe was that the Minister had no jurisdiction to make the order for the reason that the scheme was not for the erection of houses for the working classes and was not an improvement scheme within Part 2 of the Housing Act, 1925, because it contained no concrete proposals for the development of the land within the Queen Anne Street area after acquisition by the Liverpool Corporation. Mr. Yaffe further contended that the scheme did not provide for the rearrangement or reconstruction of any of the streets or houses in the area, and he also objected to the scheme on various other grounds.

The majority decision of the King's Bench Divisional Court was that where the Minister had made an order bona fide intended and purporting to be made under section 40, subsection 5, of the Housing Act, 1925, confirming an improvement or reconstruction of any of the streets or houses in the area, no question of ultra vires could be raised in a court of law.

The Court discharged the rule and Mr. Yaffe now appealed.

The Court, after long legal arguments, allowed the appeal.

Lord Justice Scrutton, in the course of his judgment, said that under the decision in the Derby case a scheme must, in order to be within the Act, include maps and particulars, showing not only the land to be cleared, but proposals for its use when cleared. When a scheme did not comply with those essential conditions, the local authority and the Minister could be prohibited from proceeding with it. In the present case the scheme did not comply with the provisions of the Act, and before the order was made the Liverpool Corporation or the Minister could be prohibited from proceeding with it, and he hoped that local authorities and the Minister would comply with the view of the Courts as to the limitation of their powers under existing Acts. The order made by the Minister here did not sanction any particular plan of reconstruction. The present Act enabled the Minister to take away the property of individuals without compensation upon certain conditions, but in that case those conditions must be complied with. Only the clearest words could give final validity to an order made without compliance with the conditions. Here there were no such words. The Attorney-General had argued that once an order was made it had statutory effect even if it violated all the statutory conditions. With that he could not agree.

His lordship declined, without clear words or authorities clearly binding, to hold that when Parliament delegated to the Minister the authority to deprive citizens of property without compensation on certain conditions, Parliament had allowed him to make such an order without complying with those conditions, so that his order should have the effect of unquestionable law. The writ of certiorari should go to the Minister of Health to bring up the order in question to be quashed as in excess of jurisdiction. The order of the Divisional Court should be set aside and the Minister ordered to pay the costs of the applicant there and below. The Corporation of Liverpool should have no costs from any body, as they were a proximate cause of the error.

In this case it was very desirable that the highest tribunal should express an opinion on the legal position. But as a matter of constitutional importance he hoped that Members of Parliament and Ministers and Parliamentary draftsmen would consider whether that form of legislation was really satisfactory. It might be convenient to Ministers not to have to consider carefully whether the powers which they were purporting to exercise were within their statutory authority and the powers delegated to them by statute. Parliamentary draftsmen might have got in the habit of inserting that kind of Star Chamber clauses either on the instructions of the Minister or, as a matter of habit, without his instructions. Members of Parliament might not trouble to consider what the sections to which they were giving legislative authority really meant, but simply follow the authority of the Minister and the Government Whip. But he could not think it desirable that when Parliament delegated authority to affect property and persons only if certain statutory conditions were observed, it should then pass clauses which, it might be contended, allowed those delegates to contravene those conditions and make ultra vires orders which could not be controlled by the Courts which had to administer the laws of the land.

Lords Justices Greer and Slesser concurred.

ALLEGED WAIVER OF BREACHES

Morgan-Jones v. *Wilson. King's Bench Divisional Court. Before Justices Talbot and Finlay*

THIS was an appeal by the defendant from a judgment of Deputy Judge Mullens, sitting at the Marylebone County Court, in favour of Miss T. Morgan-Jones, from whom he had rented a service flat at Westbourne Terrace, Paddington, under an agreement of July 9, 1929.

The county court judge, having heard the evidence that there had been a failure to implement the obligation to provide hot water and central heating from October 3 to October 28 and on November 4 and 5, held that there had been a serious breach by the plaintiff of the agreement, but that the payment of rent on October 10 constituted such a waiver by the defendant of the breach that he was not entitled to rely upon it, and that there could not be a termination of the tenancy. He found for the plaintiff for £54, and for the defendant for £5 damages for breach of contract by the plaintiff.

For the defendant, it was argued that the rent paid on October 10 amounted in law to a waiver.

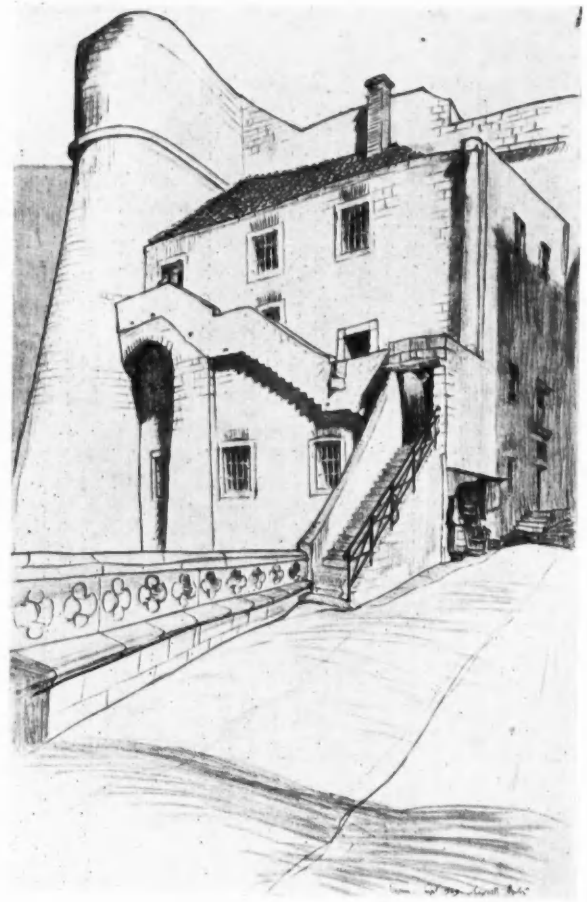
Mr. Justice Talbot, in his judgment, said the only waiver which the county court judge appeared to have considered was one affected by the payment of rent. It was now known that the payment was made on September 27 and that the judge was not to blame for taking the payment as on October 10. It was impossible to hold that the payment on September 27 could operate as a waiver of breaches which began early in October, and even if the date of payment was to be treated as October 10, there was the further difficulty that the breaches manifestly continued after that date. The judge had misdirected himself as to the effect of the facts he had found. Under these circumstances, he should have entered judgment for the defendant. The appeal would be allowed with costs.

Mr. Justice Finlay concurred.

THE SKETCH CLUB

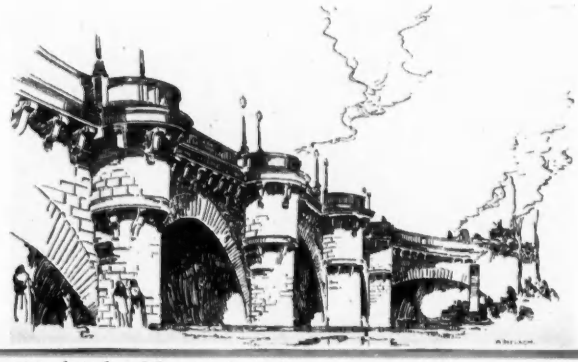
FOURTH SESSION

THE name Ragusa itself inspires a feeling of romance, and it would indeed be difficult to find another spot so small in area that is so full of romantic picturesqueness. Everything contributes to it—the natural surroundings, the people, costume and architecture—each in their own way the essence of beauty.



The city is built on the side of the steep hills rising from the Adriatic and is surrounded completely by magnificent fortifications which climb and descend the steep inclines in an almost incredible manner. At the west end of the city Fort Lorenzo stands out in the sea against the skyline as a great sentinel. Dominating the city, it is the sole building on a promontory of rock some 300 ft. high, the whole of the top of which it covers, the walls rising directly off sheer precipices of rock to the south-east and west. It is impossible to imagine a building more perfectly in harmony with its site, nor can it have been any less perfect in its time for the purposes for which it was built.

There are only two gateways into Ragusa (or Dubrovnic, as it is now called), one at the west and one at the east. The latter, known as the Ploca, leads over a bridge spanning a deep inlet from the port. Against the inner walls of the fortifications has been built later a guard-house, with a delightful external stairway leading to the different apartments.



The entire town is built of a warm yellow stone, its tile roofs every shade of peach colour. M A

By L. F. Bullivant.

THE bridge has ever been associated with man's endeavour and achievement. At first an adventure, the art of bridge building today is no more than an exact science, at best a collaboration between architect and engineer.

Built in 1578, this graceful bridge, curiously enough, the oldest of all Paris bridges, despite its name, compels one's admiration, if only for the ease with which it takes its place in its surroundings. The solidity, the easy swing, go to make this achievement extraordinarily satisfying, and quite one of the most lovely things that Paris has to show. A. R.

ON the hill, high above the sea, at Abbotsbury, stands St. Catherine's Chapel, with its fine barrel-vaulted roof, and in the little village below the fifteenth-century monastic barn "grows" out of the ground. It is of an ecclesiastical appearance, which is heightened by lancet windows and heavy buttresses.

A little stream feeds the fish-pond in front, which reflects this expression of the life and work of the builders. F. M. C.

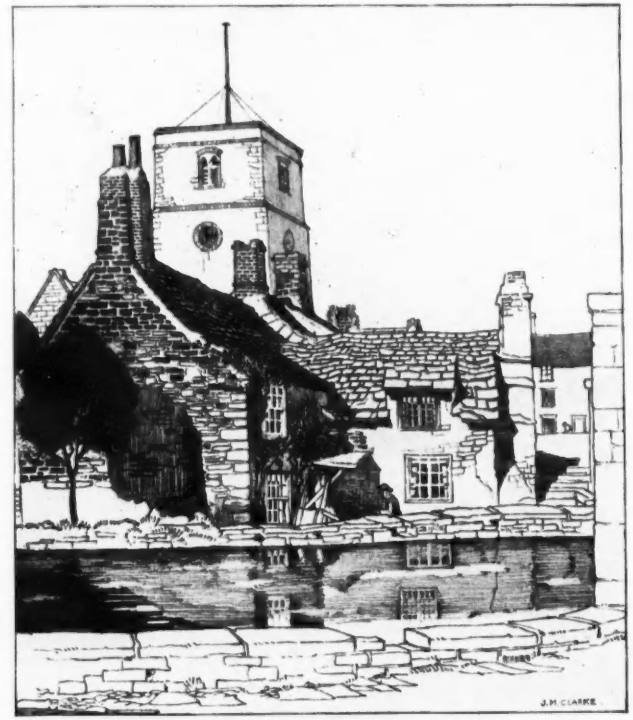
In the rue Malpalu, Rouen, France.
(Pencil.)
By Alan Reiach.

WHAT greater delight is there for the true sketcher than that of exploring old streets, fallen into disrepair perhaps, full of curious dwellings, and indescribable smells—of ferreting about old gabled houses, or of looking for the beautiful in the mean?



Rouen has lost much of the charm she must once have had, when she was one of the centres of French court life, a city of splendour and pageantry. Nevertheless, she still holds for us the reward that comes from the study of her streets and houses, her wonderful churches and her public buildings, a reward that is a picture of a city of the mediæval days. A. R.

THE Ghent Canal skirts the whole of the eastern side of the town of Bruges, from the Minne Water Bridge, that is, to the old Porte de Damme; on its banks stand the Porte de Gand and Porte Ste. Croix. From the high ramparts beyond the latter gate there is a beautiful panoramic view of the city and of the open country on the other side of the water. The Porte was built in the fifteenth century, and is still in a fair state of preservation. L. F. B.

THE quarrying of stone having been the staple industry of Swanage for centuries, it is natural that this quaint old seaside town should be built almost entirely of local material. It is located in that portion of Dorsetshire known as the Isle of Purbeck.

Perhaps the Mill Pond is the most interesting spot in the old portion of the town. It is situated just off the quaint and tortuous High Street, and adjoining the parish church of St. Mary.

This old-world corner, with the solid square tower of the church as a background, forms a most interesting group for the sketcher. J. M. C.

NEWS CONCERNING THE

Holiday Sketches Competition

AUTHORIZED BY THE ARCHITECTS' JOURNAL SKETCH CLUB

Prizes of ten and five guineas are offered by the Editor of THE ARCHITECTS' JOURNAL for the best sketches made during the months of June, July and August—one set of prizes for each month. The sketches should be the fruit of this year's holiday. They must also be unsigned. The rules are simple. Read them now. Also, do not miss THE ARCHITECTS' JOURNAL for June 18, in which another set of motto labels will be found.

THE RULES

THE FOLLOWING PROFITABLE INSTRUCTIONS WHEREIN IS SET OUT HOW TO USE THE PLEASURES OF SKETCHING FOR THE ADVANCEMENT OF THE NOBLE ART ARE ADDRESSED TO ALL SKETCH CLUB MEMBERS, PAST, PRESENT AND TO BE.

1. Three competitions will be held to cover the 1930 holiday season, the closing dates of each being in the middle of July, August and September respectively.

2. The competitions are open to any reader of THE ARCHITECTS' JOURNAL.

3. Two prizes, a first prize of Ten Guineas and a second prize of Five Guineas, will be awarded in each month's competition for the best and next-best sketches sent in.

4. Competitors may enter for any or all the three months indicated, if they choose, but no competitor can win more than one prize.

5. A maximum of five drawings may be submitted by individual competitors for each month's competition. Such batches must be sent complete under the same cover.

6. The size of the drawings is not to exceed that of Royal drawing-paper, i.e. 24 inches by 19 inches.

7. All drawings should possess some definite architectural or craftsmanship interest, but they need not be exclusively concerned with buildings, and drawings of boats, vehicles, etc., will also be eligible.

8. The drawings will be judged by the Editor of THE ARCHITECTS' JOURNAL, whose decision will be final.

9. Entries for the July competition should reach the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, Westminster, S.W.1, between the first post on June 16 and the first post on July 15. The result of the competition will be published in THE ARCHITECTS' JOURNAL for August 6.

10. Entries for the August competition should reach these offices between the first post on July 16 and the first post on August 15. The result of the competition will be published in THE ARCHITECTS' JOURNAL for September 10.

11. Entries for the September competition should reach these offices between the first post on August 16 and the first post on September 15. The result of this competition will be published in THE ARCHITECTS' JOURNAL for October 8.

12. A motto of one word is to be chosen by the competitor, who will remain known by this motto until the award has been made. Only then will his identity be divulged.

13. Each entry must be accompanied by a sealed letter giving the competitor's name, address and occupation (whether principal, assistant or student). The letter should also state that the competitor will observe the rules of the competition and that the drawings submitted are his work, executed on his holiday this year. It must be enclosed in an envelope sealed with a blank seal and bearing nothing but a motto label on which is written the motto chosen by the competitor and the number of drawings entered. Copies of this label will be found in THE ARCHITECTS' JOURNAL during the period covered by the competitions. (See p. xli of this issue.)

14. Each drawing must bear on the back a similar motto label bearing the competitor's motto and the number of drawings entered. No other means of identification must appear on the drawing. Drawings bearing a signature will be disqualified.

15. Owing to the drawings being submitted under a pseudonym no acknowledgment can be sent.

16. THE ARCHITECTS' JOURNAL will publish a selection of the drawings submitted.

17. No responsibility can be taken by The Architectural Press for loss or damage.

THE MOTTO LABEL IS SIMPLY A DEVICE FOR ENSURING PERFECT ANONYMITY. MORE LABELS FOR THE JUNE COMPETITION WILL BE FOUND IN THE ARCHITECTS' JOURNAL SKETCH CLUB ISSUES DURING THE PERIOD OF THE COMPETITION—I.E. ON JUNE 18 AND ON JULY 2.

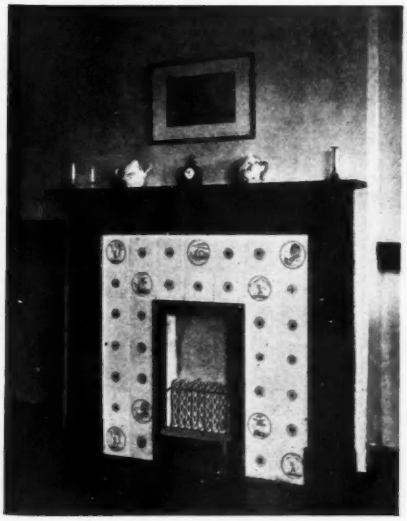
LITERATURE

GAS FIRES AND THEIR SETTINGS

IT is typical of the late Sir Lawrence Weaver's practical interest in the problems that strew the path of architects that he should have applied himself to the study of the gas fire.

This book, which was reprinted from an article contributed to *The Architectural Review*, arose from Sir Lawrence Weaver's connection with the Gas Industries' Section of the Wembley Exhibition, and traces the history of gas fires from the early days of cast iron grids and asbestos tufts to its present-day development.

The text is illustrated by many photographs of gas fire settings designed by well-known architects. These range from the type of gas fire that relies upon some form of period decoration for its effect, and is usually set deeply within a fireplace of the same date, to the most severe examples of the " inset " type with the minimum of projection. Of the former, the gas fires that now occupy the beautiful marble fireplaces at the R.I.B.A. premises are the most interesting, and show how very possible this adaptation may be, while Mr. Edward Maufe's studio fireplace is perhaps the best example of the gas fire that commands its own setting.



Looking through the charming illustrations, one feels that while it is possible to make a quite good-looking thing out of a period gas fire in a period setting—and please a great many people thereby—the gas fire becomes really very interesting in measure as it tends to eschew historic styles and strives to take on something of its own character, begotten by the necessities of its construction as an efficient burner of coal gas. This means that the gas fire is to shrink in size and depth, to sink into the wall, and to lose the whole paraphernalia of fire-place, hearth and overmantel. Then, being unable to masquerade in any one historic style, it can be nothing but itself—a modern gas fire.

It is the " inset " type of fire, of which there are many examples in this book, that has achieved this distinction of having a soul of its own, and it is to the development of this type, carried already far ahead by the charming example that was designed especially for Sir Lawrence Weaver's own music room, that we must look if we are to perfect the type.

It is for this reason that this review of gas fire design should recommend itself to all who are interested in the works of our own time; its production, both as to printing and format, are only additional reasons for keeping a good thing.

E. M. F.

Gas Fires and their Settings. By the late Sir Lawrence Weaver. London : The Fanfare Press. Price 7s. 6d. net.

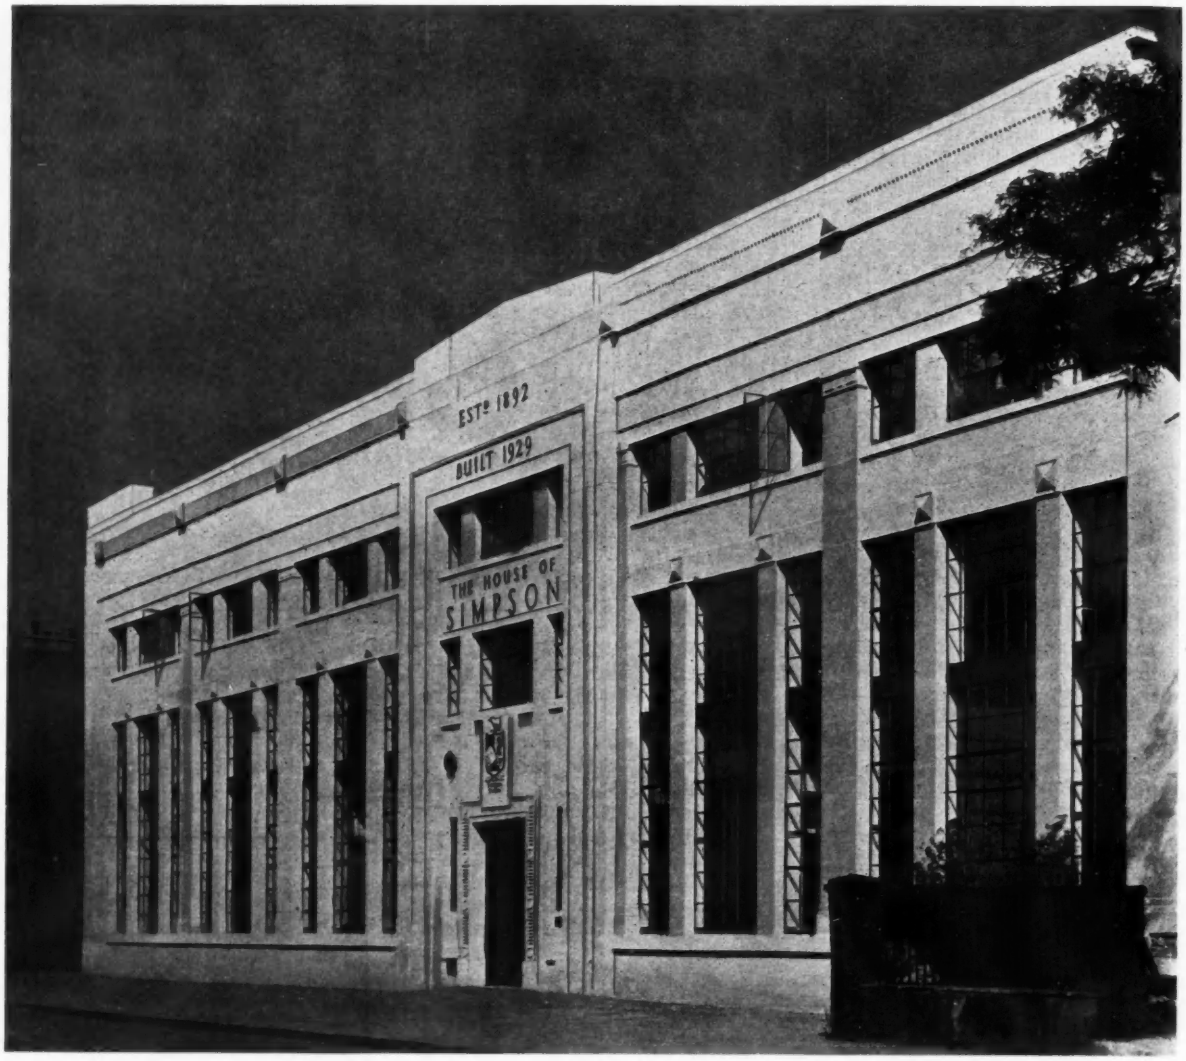
33 Ways—
but not for the Sketcher

There are three-and-thirty ways
Of spending one's holidays. . .

ALL sorts of people spend their holidays in all sorts of different ways, but for the sketcher there is only one way of spending a holiday. For nine or ten months, or even more, his powers have lain dormant, and the hand that darted so nimbly over the paper has been bent to stricter tasks. Lack-lustre eyes and furrowed brow tell their tale of disappointment, even, perhaps, of transient tragedy.

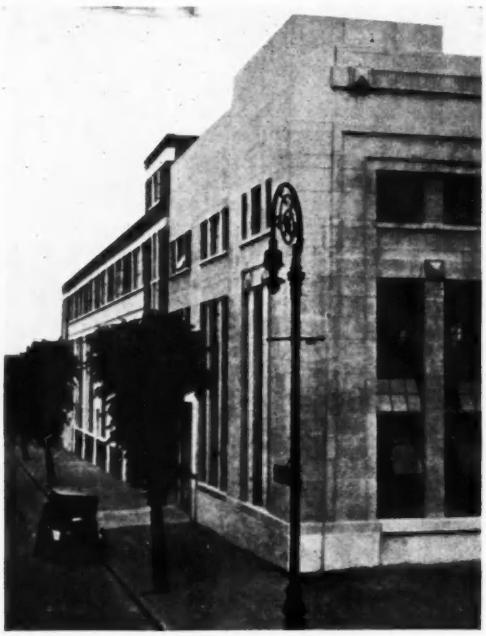


The summer grass, says Shakespeare, grows fastest by night. Not so the love of summer sketching. The coming of spring, the lengthening of the days, and, on April 13, the final paroxysm of Summer Time, fill the passionate sketcher with a frenzy of desire. By the time the holiday comes round he is ready to sketch or burst. No train or motor-car can carry him fast enough to his coveted sketching-ground. For one or two weeks (more seldom three) he abandons himself to sketching with a reckless intensity. His bliss is complete. His holiday has, for the time being, made him immortal.

The devotee of whom the foregoing picture is drawn is not the sort of person who needs encouragement. And the primary purpose of the Sketch Club HOLIDAY SKETCHES COMPETITION is not to give encouragement. Its purpose is rather to foster the social side of sketching, to spread among sketchers the combined gospels of love and of rivalry : in short, to provide a means whereby their ardour may be communicated from one to another. The members of the Sketch Club have great ideas about affectionate rivalry, which they say is the principle that makes the world go round. It is true that THE ARCHITECTS' JOURNAL makes the Sketch Club go round; nevertheless . . .

Nevertheless, all those who intend to take a holiday and/or who profess a love of sketching, should read what is printed on the facing page about the HOLIDAY SKETCHES COMPETITION. What the hospitals' silver-paper campaign has done for silver paper, this competition will do for holiday sketches. How many exquisite drawings made in past summers have been thoughtlessly thrown away or allowed to languish on a dusty cupboard shelf ! What waste ! What criminal waste ! Let not the present year's crop moulder in oblivion.

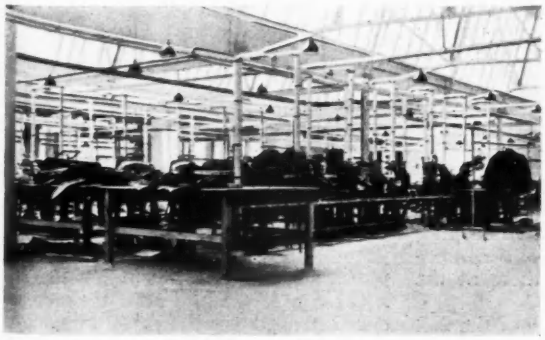
A sloping fireplace, without interior frame, in a private office, No. 9 Hanover Square, W.1. Designed by Oliver Hill.



Views of the main front, to Stoke facing north, to Newington Road; and of the return, Somerford Grove.

CLOTHING FACTORY

DESIGNED BY HOBDEN AND PORRI



THIS building was planned as an up-to-date clothing factory, with a large open space for sewing machines and presses on the ground floor, lit by a north light roof, carried on a minimum number of stanchions. In the front building, facing west, to Stoke Newington Road, finished goods are stored, packed and dispatched. The northern building is occupied on the ground floor by pressers and inspectors; therefore, large windows extend up to the sill level of the first floor. The first floors over the front and return building, used for trouser and vest making, are also particularly well lit. The second-floor front building with a top light is used for a cutting room, whilst windows on the west front are reduced to a minimum to avoid excess of afternoon sun, thus also allowing the area of voids to be kept within the limits of the London Building Acts. Steel chutes deliver the cut-out materials to lower floors.

The building is constructed with a steel frame and solid reinforced concrete floors. The elevation to Stoke Newington Road is carried out in artificial stone; that to Somerford Grove in stock brickwork with white cement-rendered piers and artificial stone mullions, rising from a plinth of salt-glazed bricks.

Part of the architects' drawing of the ground-floor plan. The building, the entrance of which is on the easterly side of Stoke Newington Road and has Somerford Grove on its northern flank, extends farther than is shown in an easterly direction. It has been specially laid out for the particular factory processes involved, and to give large areas of uninterrupted floor-space.

Clothing Factory, Stoke Newington, N.]

A view inside the factory, showing the excellent lighting given by the north light roof. After dark, special factory lamps are in use.

[*By Hobden & Porri.*

Another view in one of the workrooms, showing benches, machine tables, etc. Some of the sewing machines can be seen on the right.

IN PARLIAMENT

[BY OUR PARLIAMENTARY REPRESENTATIVE]

The Government's Slum Bill

STEADY progress is being made in Committee with the consideration of the Housing (No. 2) Bill, which contains the Government's proposals for dealing with slum clearance.

Clause 5 provides that where a local authority is satisfied that the housing conditions in any area are dangerous or injurious to the health of the inhabitants, it might pass a resolution declaring the area to be an improvement area, with a view to the demolition or repair of such dwelling houses as were unfit for human habitation, the purchase of land for opening out the area, and the abatement of overcrowding.

Sir Philip Pilditch moved an amendment aimed at enabling a local authority to deal with an improvement area by " the purchase of such dwelling-houses or other buildings in the area as can with advantage be repaired, altered, added to or provided with better sanitation by the authority in order to facilitate the proper carrying out of the improvement." His object, he said, was to allow improvement schemes to be utilised to the full as valuable adjuncts to clearance schemes. The amendment would make it possible, by the reconditioning of unsatisfactory dwellings, for people who would be otherwise displaced to remain in the area and among their friends. It would, of course, be necessary for local authorities to receive financial assistance from the Exchequer towards the cost of reconditioning.

Mr. Greenwood, the Minister of Health, said he was not willing to encourage local authorities to become the owners on a large scale of semi-derelict cottages. It was the business of the landlord to keep his property in proper repair. Moreover, the amendment would be too costly to operate to make it of any value.

The amendment was rejected by twenty votes to seventeen, and the clause was agreed to.

An amendment to Clause 6 (Treatment of Improvement Areas), enacting that the Rent and Mortgage Interest (Restriction) Act shall cease to apply by reason only of the fact that, under the clause, the landlord comes into possession of a house or part thereof, was carried by twenty-seven votes to fifteen.

Clause 6, as amended, was agreed to.

Slum Clearance

At question time Mr. Ramsbotham asked for the number and names of those cities in Great Britain and Wales where the provision of housing accommodation was on such a scale as to permit the immediate operation of the slum-clearance proposals in the Housing (No. 2) Bill now before the House.

Miss Lawrence said that the operation of the slum clearance proposals obviously necessitated the provision of alternative accommodation for persons who would be displaced, and would generally involve an extension of the ordinary programme of building which local authorities had in hand. The Minister had no doubt that local authorities would be able to take effective steps for the removal of slum conditions and the rehousing of the people at an early date after the passing of the Bill.

Exportation of Historical Works

Mr. Lovat Fraser asked the First Commissioner of Works if he was aware of the indignation caused by the transportation of Tudor cottages and other buildings of historical and artistic interest to foreign countries; and whether he would introduce legislation to prevent this process.

Mr. Lansbury said if Mr. Lovat Fraser could give him any details of the cases which he had in mind, he would gladly have them investigated, and consider whether his department could take suitable action under its existing powers.

Hyde Park and the Carillon

Captain Crookshank asked when the carillon now in Hyde Park was to be removed.

Mr. Lansbury said he understood that the building at Wellington, New Zealand, on which the carillon was to be permanently erected, would not be ready to receive the carillon as soon as was expected, and he had therefore acceded to a request that the carillon be allowed to remain in Hyde Park until September next.

House of Commons Terrace Improvements

Mr. Mander asked the First Commissioner if he would consider providing the Terrace of the House of Commons with chairs and tables more in keeping with its historic architectural surroundings than were available there at the present time.

Mr. Lansbury said in view of the fact that in the near future the Terrace was likely to be the scene of building operations in connection with the repair of the stonework, and as the question of the raising of the level of the river wall was now under consideration, he did not think that the present time was opportune for the consideration of the improvement suggested.

Foreign Manufactured Woodwork

Major Colville asked the Minister of Health if he was aware of the large increase in the quantity of foreign manufactured woodwork imported into this country during the last year; and if he would consider what steps might be taken to encourage a greater use of British articles in a market which was to a large extent created by State-aided house-building.

Miss Susan Lawrence said the Minister was aware of the recent increase in the figures for imported builders' woodwork. He had already sent Major Colville a copy of a circular recently issued to urge local authorities to make use, to the utmost extent practicable, of goods and materials of home production or manufacture, but as the Minister pointed out to him on March 20 last, so far as State-assisted building under the Housing (Financial Provisions) Act, 1924, was concerned, Section 10 prohibited the imposition of any condition which would prevent materials from being purchased in the cheapest market either at home or abroad.

State Subsidies in Scotland

Mr. Johnston informed Miss Lee that the total amount of State subsidies paid by the Department of Health on Scottish housing from May, 1912, to March 31, 1930, was £10,161,199. Of this amount £1,625,672 was paid during the financial year ended March 31, 1930. The estimated expenditure for the financial year to March 31, 1931, was £1,772,232.

COMPETITION RESULT

The result of the Association of Architects, Surveyors and Technical Assistants' Competition for a lock-up hangar for an aerodome (arranged in conjunction with Messrs. Ewart and Son, Ltd.) has been adjudged by the assessors, Messrs. W. T. Hamlyn and Chas. McLachlan, as follows :

A Class. First, W. Brooke.
A Class. Second, F. Gibney.
B Class. First, J. W. Davidson.
B Class. Second, F. Stobart.

The competition was divided into two classes, for those over and under 25 years of age, and the prizes cover free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. The drawings will be exhibited at the R.I.B.A., 9 Conduit Street, W., on June 14, between 11 a.m. and 3 p.m.

SOCIETIES AND INSTITUTIONS

THE FATHER OF ENGLISH POTTERY

"JOSIAH WEDGWOOD, F.R.S., 1730–1795, Potter, Inventor and Man of Science," was the subject of a paper read by Mr. Harry Barnard at a meeting of the Royal Society of Arts, held on Wednesday last. Mr. Frank H. Wedgwood presided.

To realize Wedgwood's place as "the Father of English Pottery," Mr. Barnard said, it was necessary to glance at the state of the pottery industry at the time of his birth. Pottery was then a home industry, carried on at the back of the modest thatched house, with one oven that served more than one potter. The ware made was mainly of a very coarse description, the material being the ordinary marl of the district. It was, he pointed out, this state of things which must have set young Wedgwood thinking, and the serious outlook upon his every-day surroundings fostered in him the desire to improve that which must have been distasteful to a nature like his, so that his fertile brain was alert to every opportunity that presented itself to reform both the condition of the worker and the work.

Josiah Wedgwood, who was the thirteenth and youngest child, started on the potter's wheel as a "thrower" at nine years of age. Here he quickly mastered the craft of throwing, and soon became a very smart little workman. At fourteen years of age he was apprenticed for five years to his brother Thomas, to "learn his Art, Mistery, Occupation, or Imployment of Thrower and Handleing."

Towards the close of his apprenticeship he turned his attention to the ordinary cream-coloured ware, and by 1761 Wedgwood had brought this cream ware to a considerable degree of perfection. He had approached the matter systematically, making a vast range of experiments extending over many years, for the improvement of both the "body" and the glaze.

As an inventor, Mr. Barnard said, Wedgwood occupied an important place. At a time when the pottery industry in Staffordshire was quickly developing and throwing off the lethargy which had prevented any material change for so long a period, this intelligent and industrious young potter had an open eye and mind for any improvement, and seemed to grasp at once any suggestion, however slight, upon which he could work. His start as a master potter was certainly due to the discoveries he had made, which resulted in the invention of new wares, as well as new tools for producing designs and effects which were novel.

DEGREE FOR H. G. BRADSHAW

The Council and Senate of the University of Liverpool have decided that the honorary degree of Master of Architecture be conferred on Mr. H. Chalton Bradshaw, secretary to the Royal Fine Arts Commission.

RIBBON DEVELOPMENT

At a meeting of the Town Planning Institute, held on Friday last, Mr. James Macaulay read a paper on "Town Planning Economics."

Speaking of ribbon development, Mr. Macaulay said it was a new phase caused by the evolution of road transport, as to the economics of which he found it difficult to arrive at definite conclusions. Such development was undoubtedly, in the first instance, due to the individual, was not a community movement, and in this respect had taken no thought of the community's interests.

From the local authorities' standpoint in many cases a certain amount of ribbon development would be welcomed as an economic contribution towards expenditure upon arterial main and secondary roads.

From the town planner's point of view, however, it seemed clear to him that all development arose after full consideration of community and, in fact, regional and national interests, and was therefore inclined to be opposed to ribbon development as such.

In land development the frontage values along important transport routes were, as a rule, most valuable, and when it came to internal or central land the problem of efficient development on economic lines was tackled along lines which in the past had looked to the frontage or main lands paying for any loss on back or internal land.

From this standpoint, therefore, it was apparent that the highest values were likely to be attached to the sites where ribbon development was now taking place, and such development, being of a promiscuous nature as distinct from the regional or town planning method, was therefore almost certain to be uneconomic.

From its nature, ribbon development was also inclined to be uneconomic in so far as the increased cost of transport was likely to arise, quite apart from any sociological and other considerations.

It was of the essence of good town and regional planning that development should be co-ordinated towards the provision of the best community, social and home life, the saving of transport, the co-ordination of industry and commerce and the provision of the best cultural facilities for everyone, and such objects were not likely to be served if carried out along lines of ribbon development to its extreme and at present unlimited forms.

REOPENING OF ST. PAUL'S CATHEDRAL

The Council of the R.I.B.A. has arranged to celebrate the reopening of St. Paul's Cathedral on June 25, after many years' reconstruction work, by a special general meeting on Monday, June 23 next, at 8.30 p.m., at which a lecture dealing with the restoration of the Cathedral will be delivered by Captain C. Stanley Peach, F.R.I.B.A., and Mr. W. G. Allen, F.R.I.B.A. The lecture will be illustrated by slides and by an exhibition of models, masonry specimens, drawings and photographs, which will remain open till June 28 (10 a.m. till 8 p.m.).

THAMES BRIDGES CONFERENCE

At a meeting of the Thames Bridges Conference held recently, the following resolution was passed :

The Thames Bridges Conference places on record its satisfaction that the Private Bill Committee of the House of Commons, by rejecting the official Charing Cross Bridge scheme, has saved an important part of Central London from permanent injury by radically defective planning.

The Conference at the same time reiterates its conviction that a road bridge at Charing Cross is urgently required and that immediate steps should be taken by H.M. Government :

(i) To inquire into the railway position in regard to the development of London, including the relationship between the tubes and the suburban railways.

(ii) To secure by competition (open to architects, engineers and town-planners) a plan, in accordance with the data obtained, for the future development of Central London (on both sides of the river) including Charing Cross Bridge and its approaches.

The Conference is further of opinion that in view of the evidence given before the Committee on the subject of Waterloo Bridge the underpinning and reinstatement of that bridge should now be proceeded with.

WINDMILLS OF GREAT BRITAIN

The Society for the Protection of Ancient Buildings has issued a pamphlet in which an appeal is made for the preservation of windmills. They state that unless some organized effort is made to save these ancient structures, nearly all will have soon disappeared.

The Society intends, therefore, to make a record, with photographs, of all the windmills still standing in Great Britain. When this is complete, it is hoped to publish it in book-form. The Society also wishes to raise a fund so that a few carefully selected mills in different parts of the country may be

bought, repaired, and maintained as interesting monuments.

The record of windmills in Warwickshire and Cambridgeshire has already been completed, and several other counties are almost finished. Obviously, however, to compile a correct record of all the mills of Great Britain is no small task, and any information or photographs will help the Society considerably. Funds are also urgently required.

Subscriptions and information should be sent to the Windmill Secretary, the Society for the Protection of Ancient Buildings, 20 Buckingham Street, W.C.2.

OBITUARY

REGINALD BRUCE : 1883-1930

We regret to record the death of Mr. Reginald Bruce, A.R.I.B.A., M.T.P.I., at the age of forty-seven.

Mr. Bruce was a well-known town planner, a member of the Town Planning Institute, and honorary editor of their *Journal*. He first came into prominence as regional surveyor to the Manchester and District Joint Town Planning Advisory Committee. During the years 1923-1926 he prepared, in co-operation with the surveyors of the various constituent councils, the Committee's regional plan and report, which, when published, resulted in the services of Mr. Bruce being sought by other similar bodies.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents, and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

DUDLEY SCHOOL COMPETITION. Latest date for submission of designs.

TRADE NOTES

As a result of the wish expressed by several architects to visit the Silvertown works of Messrs. Venesta, Ltd., the company has arranged a series of such visits, the first of which took place on Wednesday last. The party met at the company's offices at Vintry House, and an opportunity was given there of inspecting the suites of rooms used by the directors and clerical staff, in order to judge of the decorative effects produced by the various styles of panelling carried out in Venesta birch, Venesta oak, Australian blackbean, teak, Sapele mahogany, Corona oak batten-board, Burmah padouk, Corona walnut, and cellulose-treated Plymax. At the Silvertown works—which cover some thirteen acres of ground and where over 1,000 hands are employed—there was much to be seen of great interest in both the plywood and the Plymax sections. In the former the visitors were able to study the processes by which decorative veneers are jointed and then cemented under great pressure to the plywood base. The manufacture of Plymax was followed with equally close attention in all its stages. These included testing, sawing to size, and final conversion into motor-car bodies, barrels, boxes, and other constructional units for which the rigidity and lightness of the material offer such marked advantages.

*

Messrs. E. Pollard & Co., Ltd., have negotiated the purchase of the goodwill of the old-established and well-known firm of Samuel Haskins and Bros., Ltd. Under the terms of the merger, now announced, Messrs. Leonard Haskins and Adrian Haskins, the present managing directors of Haskins Bros., Ltd., join the board of E. Pollard & Co., Ltd., as directors, under the chairmanship of Mr. Edward Pollard, and from there will direct the continuation of the Haskins method of production in bronze metalwork and shutter construction, in the interests of their many friends and clients. In addition, members of the personnel of the Haskins metal-working and shutter-making departments are joined with those of the already extensive kindred departments of E. Pollard & Co., Ltd., which combination should add enormously to productive activity in the future. It will be remembered that the Walthamstow factory of Haskins Bros. was recently gutted by fire. A new factory is, however, already in the course of erection on the site of the burnt-out premises, and if hopes materialize this should be complete within two months and the Haskins plant which is now working in temporary premises will be moved in. Nothing but engineering will be carried on in the new factory, which will finally be equipped with, it is claimed, all the latest type precision machinery, and shutters and architectural bronze work will be specialized in. Messrs. Haskins's clients will continue to receive the personal attention of this staff, and existing contracts are being carried out with the assistance of E. Pollard & Co., Ltd., until the new factory is ready. It is interesting to note that the business of Haskins was established during the reign of George III in 1784, and has been directed by descendants of the founder ever since. E. Pollard & Co., Ltd., on the other hand, is a comparatively young firm, being founded by Mr. Edward Pollard, the present chairman and managing director, just thirty-five years ago.

*

Mr. H. Hepworth Thompson, managing director of Messrs. Holophane, Ltd., was the first man to speak on the telephone from Brazil to London.

*

The Croft Granite Brick and Concrete Co., Ltd., have sent us a booklet containing illustrations in colour of the twelve Croft Adamant marbles, which they have standardized with the object of bringing down the cost of production as low as possible. Any natural marble can be reproduced by the firm if desired. Copies of the booklet may be obtained from the company, 15 Victoria Street, S.W.1.

*

Owing to the fact that the demand for the Compton organ for cinemas, concert halls, and such-like buildings has been so great as to outstrip the works at Chiswick and Park Royal, the John Compton Organ Company, Ltd., have erected a new works in Chase Road, Willesden, N.W., from the designs of Mr. F. E. Simpkins, architect. In the new works the various departments are planned so that each operation necessary for the construction of the organs can be performed in proper sequence and with the greatest efficiency. In addition to the accommodation provided for the workshop departments, the building will contain the firm's general offices, a suite of directors' rooms, board room, and offices for the drawing and technical staffs. At present the firm have no fewer than twenty organs in course of construction for theatres in different parts of the country, including the super cinema at Victoria, S.W., and the Capitol, Haymarket, S.W. But with the additional facilities now at their disposal the firm hope to cater for theatres in overseas countries.

*

We are informed that the increased business of the Brilliant Sign Company, 1907, Ltd., has necessitated the appointment of two new directors to the Board, Messrs. W. H. Fowler and R. W. Grigg. Mr. Fowler has been with the firm for twenty-seven years, during which period he has successfully handled many departments. Mr. Grigg has for some time been sales manager in the shopfitting section, and has had a long experience of shopfitting, both on the administrative and production side. The appointment of these new directors will also enable Mr. F. G. Lucas, the managing director, to retire in the near future, a step he has contemplated taking for the last twelve months.

Messrs. Williams and Williams, Ltd., Chester, have obtained the contract for metal windows for the whole of the factory and distributing depot which the Ford Company is erecting in Stockholm. The building, it is claimed, will be one of the biggest in Sweden. Firms in five countries tendered.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors, and some of the sub-contractors for the buildings illustrated in this issue :

Cecil Sharp House, Regent's Park Road, N.W.1 (pages 853–856). General contractors, F. Troy & Co., Ltd., who were also responsible for the joinery. Jackson; alterations, "Queen's" Hotel, for Messrs. Nuttall's Breweries, Ltd.; two houses, Bare Lane, for Messrs. H. Hillman and Sons; four houses, Devonshire Grove and Avenue, for Messrs. Holroyd and Killbank; house, Tibicar Lane, for Mr. E. Sutcliffe; alterations to conveniences, Green Street, for the trustees of Green Street Chapel; shop, Lancaster Road, Torrisholme, for Mr. H. Barker; two houses, Royd Grove, for Mr. G. Jackson; house, Upper Marine Parade, for Mr. R. Moore; four houses, Willacy Parade, for Messrs. F. Obank & Co.; fifteen houses, Knowlys Street, for Messrs. Atkinson and Shaw; two houses Bare Lane, for Mr. H. L. Moody; two houses Leyster Street, for Mr. S. Rhodes.

Mr. C. F. Murphy is to prepare plans for new buildings for the MORPETH Cottage Hospital.

Messrs. Cackett and Burns Dick are preparing plans for offices for the NORTHUMBERLAND C.C.

Messrs. Adshead, Topham and Adshead are to prepare plans for extending the municipal buildings of the SALE U.D.C., at an estimated cost of £14,000.

The SHIPLEY U.D.C. Housing Committee has approved lay-out plans submitted by the architect (Mr. Dawson) for the erection of forty-three houses at Wood Top and forty-six houses in Carr Lane.

Messrs. Wm. Pitts and Sons have prepared plans for the erection of thirty-four houses in Nab Wood Road and Nab Wood Terrace, SHIPLEY.

The WALLSEND Education Committee is to erect a school at Wellington Street, from plans prepared by Messrs. P. L. Browne and Son.

The WHITEHAVEN Education Committee is to erect an elementary school, to accommodate 400 pupils.

WALES

Messrs. A. Brocklehurst & Co., architects, have prepared plans for the erection of a Wesleyan church at BARGOED.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 1s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6

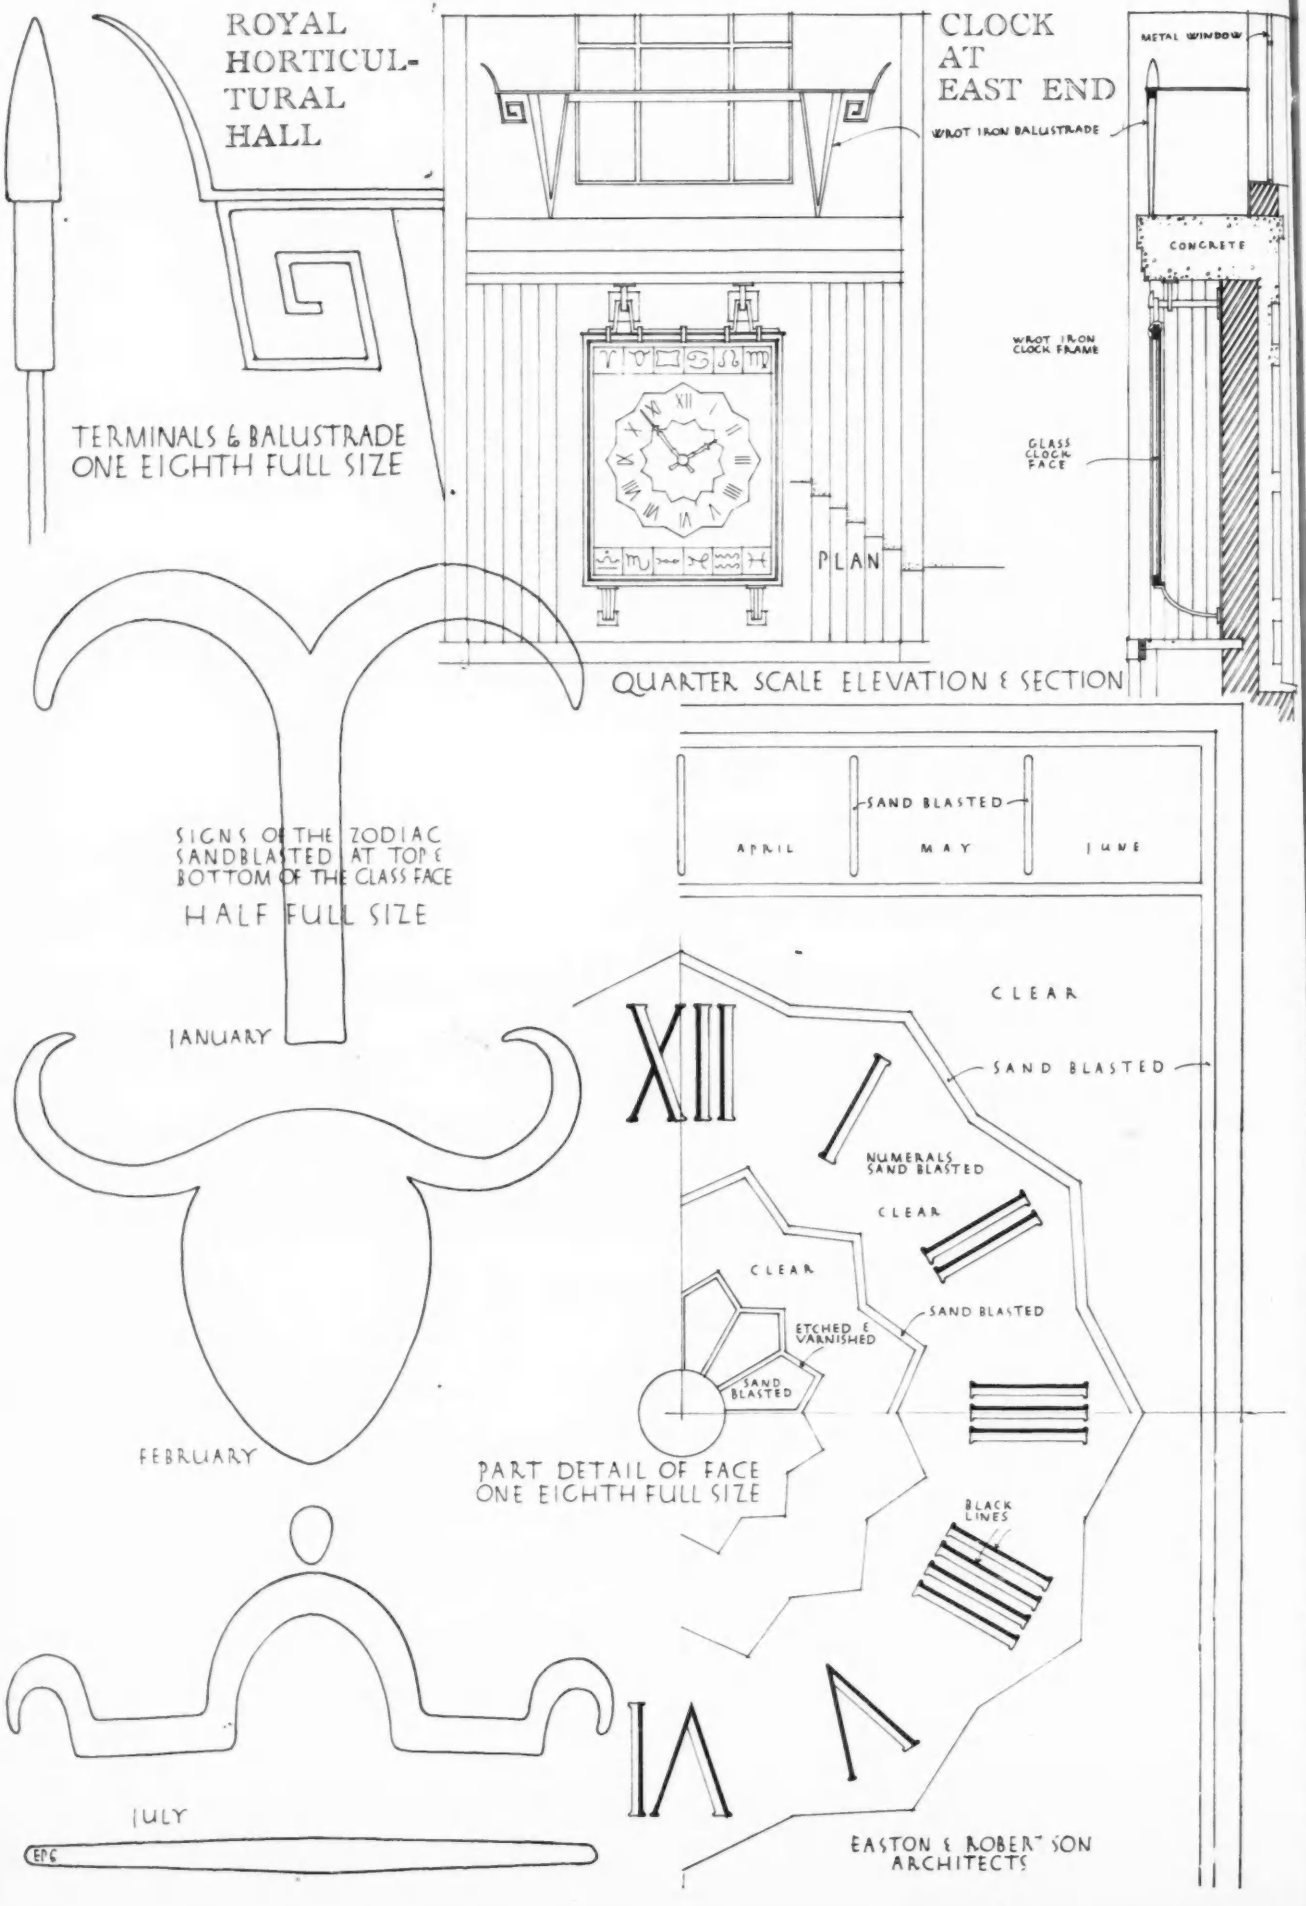
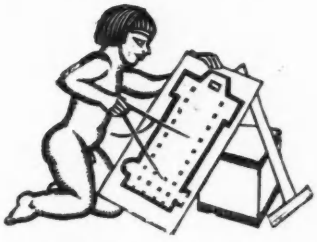
SCALE DETAILS:
A WEEKLY SERIES



CLOCK AT THE ROYAL HORTICULTURAL HALL, WESTMINSTER, S.W.
DESIGNED BY EASTON AND ROBERTSON

THIS photograph and the drawing, reproduced to scale, show in general mass and in detail an electric clock face at the end of the main hall in the building that earned for the architects—Easton and Robertson—the Gold Medal of the Royal Institute for the best street front executed within four miles of Charing Cross during 1928.



No "works" in the ordinary sense are visible. In an electric clock the mechanism required is small, and, further, it has been cleverly concealed behind the decorative star in the centre of the face.

The use of the twelve signs of the Zodiac for decoration is very fitting in a hall whose functions are so definitely connected with the seasons, and the drawing shows two of these drawn half full size to give some idea of the decorative quality which has been given to them in their conventionalized form. The plate glass face itself is framed in a band of hammered iron and hangs in front of a series of recesses in the concrete end wall. The iron balcony to the window over the clock should also be noticed for the subtle connection between its shape and outlines of plants and leaves, another allusive link.

NOTE: The drawing reproduced overleaf may be read with ordinary architect's scales (one-quarter-inch; one-and-a-half inches; and six-inches to one foot).

PLUMB WISDOM!

NOTE: For the text of the remarkable recommendation of the L.C.C. Central Public Health Committee on this vital subject, see page 905

A VERY remarkable thing is about to happen, the like and the magnitude of which English architecture has not seen these many years. If it were not for certain aspects of this event over the which a veil of reticence is drawn by a peculiarly national delicacy in these matters, the news would be broadcast from the seats of authority and taken up in tumultuous acclamation by the eager Press, to be passed on in glowing paraphrase.

Since this delicacy is as valid as any heathen taboo, it is unlikely that the event we are to speak of will be given the prominence which, as the harbinger of good fortune to a harassed profession, it most surely deserves; and our announcement must be made rather in the spirit of personal congratulation to our tribe than to the accompaniment of general jubilation.

Very well, then. It is well known to us that the means by which the health of the community is served are very often in conflict with the finer and more spiritual aspects of architecture. This conflict, represented on the one side by the nobility of abstract design and on the other by the utility of honest plumbing, has been waged unceasingly over a million drawing-boards since the law first recognized the remarkable series of inventions that started the science of sanitary engineering upon its long and successful course.

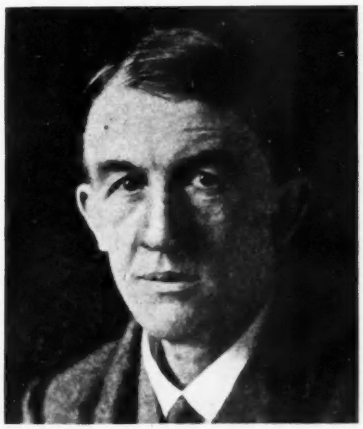
Do we not know how hardly that battle has been fought; how strewn the field has been with mangled designs? Can we not recall the devilish ingenuity with which we shuffled the plan so that the dread apartments, to which we are about gradually to refer, were placed in wells and areas and other retired places? And can we count the miles of four-inch pipes, branching in robot forests of black tubes, that have laid low and brought to shame so many of our cherished works? The retrospect is too painful for sensitive minds.

Let it be known therefore that this uneven battle draws to its close. New legislation is foreshadowed that will award victory to the weak.

Looking back, we recognize it as a wise provision that ordained in those experimental days that water-closets (there!) should be placed upon outside walls of buildings, where they might be ventilated from the open air; as we also admit the wisdom of bringing down all soil pipes upon the face of the building. The age which had placed health and convenience before every other consideration could not have done otherwise. Many years have passed since this law was fashioned, and ceaseless experiments, here and abroad, have brought a fumbling science to full fruition, nearly to become an art. The mechanical contrivances of our fathers have been simplified and made foolproof by long trial and error, and to the efficiency of sanitary engineering has been added the science of ventilation—the invention of artificial respiration for buildings.

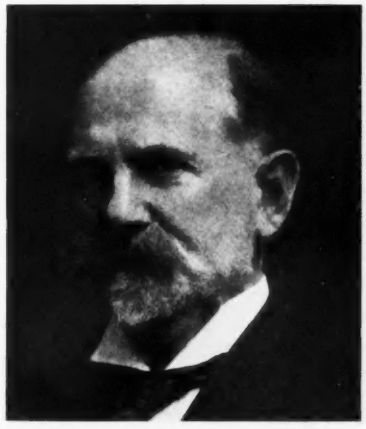
Now, as it is our sad lot to be fettered by the results of our own pioneering, we have had to see with envy how foreigners, indebted to us for our inventions, have gone on to put them to a more logical use than we have been able, bound as we have been by our out-of-date laws. This position is, at long last, to be rectified, and from now on it will be possible, using internal ducts, artificial ventilation and electric lighting, to place lavatories where we like.

What this means to modern commercial architecture we alone know, who have fought the battle. It is a tremendous step forward. It is a reversal which, if we read our information aright, will affect planning of great buildings as nothing before, making possible all sorts of new combinations of interior rooms, and giving a new freedom in the manipulation of nearly every form of plan.



Have we not therefore cause to rejoice?

THE OCTAGON CHAPEL, NORWICH:
BUILT IN 1754 FROM DESIGNS BY THOMAS IVORY



Behind this unusual building lies an interesting story. Robert Brettingham, who, it may be noted, had taken out his freedom of the city of Norwich as "bricklayer" more than thirty years before, in 1753 offered to subscribe £30 towards the expenses of the project, at the same time submitting drawings of his own design therefor. His tactics were so far successful that he was actually appointed architect and surveyor for the work at a fee of 3 per cent. on its cost. But there were other designers in the field, and, as he gave, besides, various causes for dissatisfaction, Brettingham's appointment was, after considerable dispute, cancelled. He was paid ten guineas for his drawings (and, incidentally, nothing more was heard of his donation). Other entrants in what had some of the features of a limited competition were Lee and Rawlins, but it was Thomas Ivory (1709–1779) who eventually carried the day. He had a model of his scheme prepared, and it is to be imagined that its novelty (for he is credited with the origination of the octagon idea) wrought in his favour.

NEWS & TOPICS

John Watson, A.R.S.A., F.R.I.B.A., the new President of the Royal Incorporation of Architects in Scotland. He is a partner in the firm of Watson, Salmond & Gray and was awarded the Scottish Architecture medal in 1927.

Sir Herbert Baker, A.R.A., F.R.I.B.A., who was made a Knight Commander of the Indian Empire in the King's Birthday Honours last week. He was architect for India House, London, and the secretariat and legislative buildings, Delhi. His South African work includes the Union Buildings, the Government House, and Cathedrals in Salisbury (Rhodesia) and Pretoria.

THE CITY OF PILGRIMAGE

NORWICH, so near to the East Coast, has the tang of the North Sea in its air, and I hope a little of the spicy breeze will show itself in the deliberations of the R.I.B.A. Conference. The old city is full of those angularities which give personality to a place. Even the names of the parishes and roads seem to stick out for the tongue to fall over, or the ear to be tickled by—Tombland, St. Peter per Mountergate, St. John Timberhill, St. Martin's-at-Oak, Brazen Door Gates, Unthank Road.

★

Of course, Norwich, though founded B.C., is a Gothic city, as Old Crome's fine picture of it from Mousehold Heath shows very clearly. The beautiful atmosphere is vibrant with spires and towers, and the windmill, though built in the seventeenth or eighteenth century, is full of the Gothic spirit. The late G. G. Scott perpetuated this tradition with his exquisite church of St. John, which everyone should see, if only to compare with the work of his son. Of the older Gothic work, the Cathedral, St. Peter Mancroft, and the Castle are the most important. Much of the latter has been rebuilt, but the solid and severe look of dominance cannot be destroyed even by restoration. It reminds me of some modernist work on the Continent. Within, all is delightful now, for the rooms are used as a museum for the best collection of stuffed birds in England, and as a picture gallery, whilst its former occupants, the jail-birds, are given a roost elsewhere.

THOMAS IVORY, NORWICH ARCHITECT

The lives and works of the eighteenth-century architects of Norwich have been described by Mr. Stanley J. Wearing, F.R.I.B.A., in his charming little book, *Georgian Norwich, Its Builders*, which should be in the hands of every visitor. The most competent was Thomas Ivory, who designed the Octagon Presbyterian Chapel (see frontispiece). He obtained the commission from the most difficult client in the world, viz., the building committee of a religious body, and his clever manœuvres and manifestations are a lesson in how to become a "real architect." He also built and managed a theatre, "finished with every possible degree of elegance and convenience," as his son said, "in a feeling of affectionate gratitude to a deceased parent."

ROMANCE IN THE MARKET-PLACE

I must remind all London visitors to Norwich, however, that, first and last, it is a market town. We Cockneys miss a great deal of the romance of the streets in not having our market day, with flocks of sheep driven down the Strand and bulls tied in rows to rings in the walls of Trafalgar Square. But, really, the plan and layout of cities is often dependent on the routes used by men and beasts from the country round, who flock in on one day in the week. Norwich is happy in having not only a noble market-place, but a feeling of the villages from which the market people come—I mean, that in many odd nooks and narrow streets are cottages with East Anglian pantiles, and many walls are built of the knapped flint for which the countryside is famous.

THE KING'S BIRTHDAY HONOURS

The honours list reveals no new architectural knights, although Sir Herbert Baker is made Knight Commander of the Indian Empire. He has prepared plans recently for a new building in Northumberland Avenue for the Royal Empire Society, and bids fair to eclipse Sir Edwin Lutyens' output ton for ton.

★

The knighthoods bestowed upon Mr. F. W. Goodenough, the controller of sales for the Gas Light and Coke Company, and upon Mr. V. G. Crittall, the pioneer of standardized metal windows, will be applauded by the profession at large. It would be difficult to imagine two other men who have better served the cause of architecture in this country. Their record of usefulness is a tribute to exactly the type of intelligence that appeals to architects.

THE BURDENS OF WATER SUPPLY

One is so apt to imagine water as heaven-sent and not to be paid for unduly that the difficulties of supplying water are apt to be overlooked. Heaven knows we have heard enough of water in the last few years; too much water or too little, but the actual position over the country at large we know little of, nor of the effect of the gigantic housing developments on the sources of supply.

★

One aspect of the problem is reflected in the chronic shortages of water in remote villages, which are unprovided for by the larger undertakings. The average consumption

has risen from seven to fifteen gallons per head daily, and ancient sources are totally inadequate. Needless to say, the supply to these places is a quite unprofitable business.

★

Another difficulty arises out of the wide arterial roads, which should not of course be used for ribbon housing development. These roads are too wide for a central pipe with branches to each side, and the burden of a dual main is too great for any water company. The imposition of a rate on property to pay for the extra main will serve to show the foolishness of building great traffic roads and using them for low-rated property. No more foolish act was ever committed by responsible authority.

RIDDLES OF SPEED AND SPACE

Have the automobile and the electric train become stabilized as methods of transport, or, so far as transport is concerned, are we still living, as we were at the commencement of the century, in an age of limitless uncertainty? These pertinent questions were asked by Professor S. D. Adshead in *The Morning Post* last week. If, he says, the mechanism of the automobile has reached perfection —which we may well assume it to have done, for experience teaches us that there is a climax to the perfection of any particular kind of machinery—then we can plan London for the future with a confidence not previously justified.

★

Up to the present most of the readjustment to new conditions made possible by the motor-car and the electric train has been hasty, accidental, experimental and, on the whole, unfortunate. One cannot help agreeing, therefore, with Professor Adshead that the problem at the moment—and it is a problem more insistent in regard to London than anywhere—is how still further to extend traffic facilities, how to gather together the scattered threads and how to weave them into an organized whole.

★

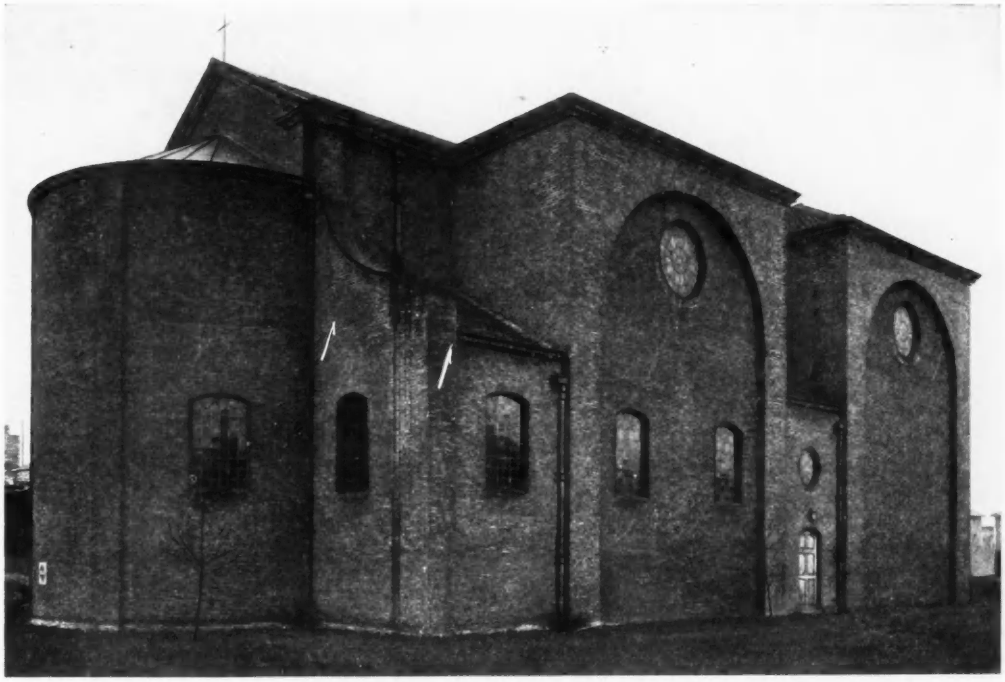
It is a little ironical, as Professor Adshead points out, that we have found the best way to reduce the speed of traffic to a pace that will not be dangerous in a populous district is to do exactly what we thought was wrong twenty years ago, viz., to encourage the construction of a type of road that will not permit of too rapid and dangerous driving, with good visibility in every direction, but which may be narrow and twisted and obstructed at all junctions with main roads. Such roads will save a host of policemen and prevent all England from being converted into a network of racing tracks.

LIVERPOOL'S PRIDE

It is inevitable that the civic spirit should flourish more conspicuously in the provincial cities than in London. The capital, from its sheer size, is at a disadvantage in this respect (I am not at all sure that this does not lie at the bottom of such episodes as that of Charing Cross Bridge). Clearly, this spirit animated many of the speakers at last week's dinner at Liverpool of the builders of that district. Professor Abercrombie, remarking with justice that the practical side of building was being turned over to what was called a co-ordinating engineer (and to this burning question I see the correspondence columns of this JOURNAL have been opened), went on to observe that in Liverpool the architects had struck a happy balance with the engineers. Naturally, he had no difficulty in pointing with pride to the result in many magnificent structures in the town. But he could hardly be president of the Liverpool Architectural Society without being conscious of the bad spots, and with characteristic frankness put his finger on two of them. "I think," he said, "our Pier Head is in a very shoddy state"; and "a rash of bungalows is spreading over the country." That is as true of Lancashire as of the rest of fair England. And the keenness with which he deplored it is the measure of his pride in a city that can show the new Holt building and the ever-growing Cathedral. Incidentally, it now seems certain that Liverpool Roman Catholics will realize their ambition and shortly see their own vast cathedral arising on the Workhouse site. Yes, a proud city is Liverpool !

A NORMAN CHURCH PRESERVED

The tiny church of St. Nicholas at Studland, Dorset, is, with Iffley and Stewkley, a nearly perfect specimen of Norman work, within, if not without. There was a time when disintegration of the 800-year old fabric was hastening its ruin. That time is past, and merciful repair rather than restoration has made everything but its roof timbers sound and durable for more hundreds of years to come.

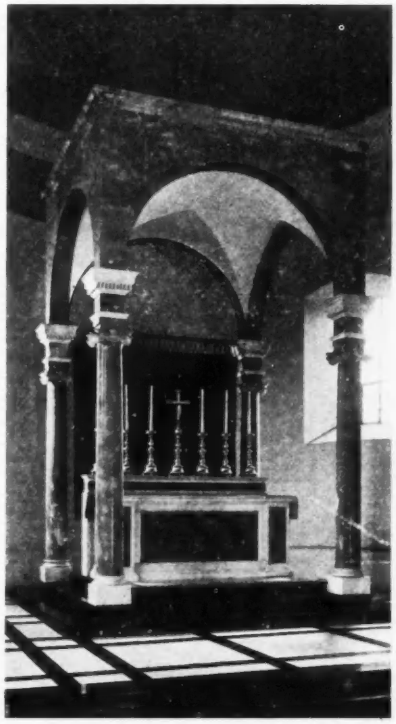


ASTRAGAL

The tiny Norman church of St. Nicholas, Studland, Dorset, now made safe for the years to come by the aid of the Church Building Society, Incorporated, from whose recent report this illustration is taken.

CHURCH AT GORTON, MANCHESTER

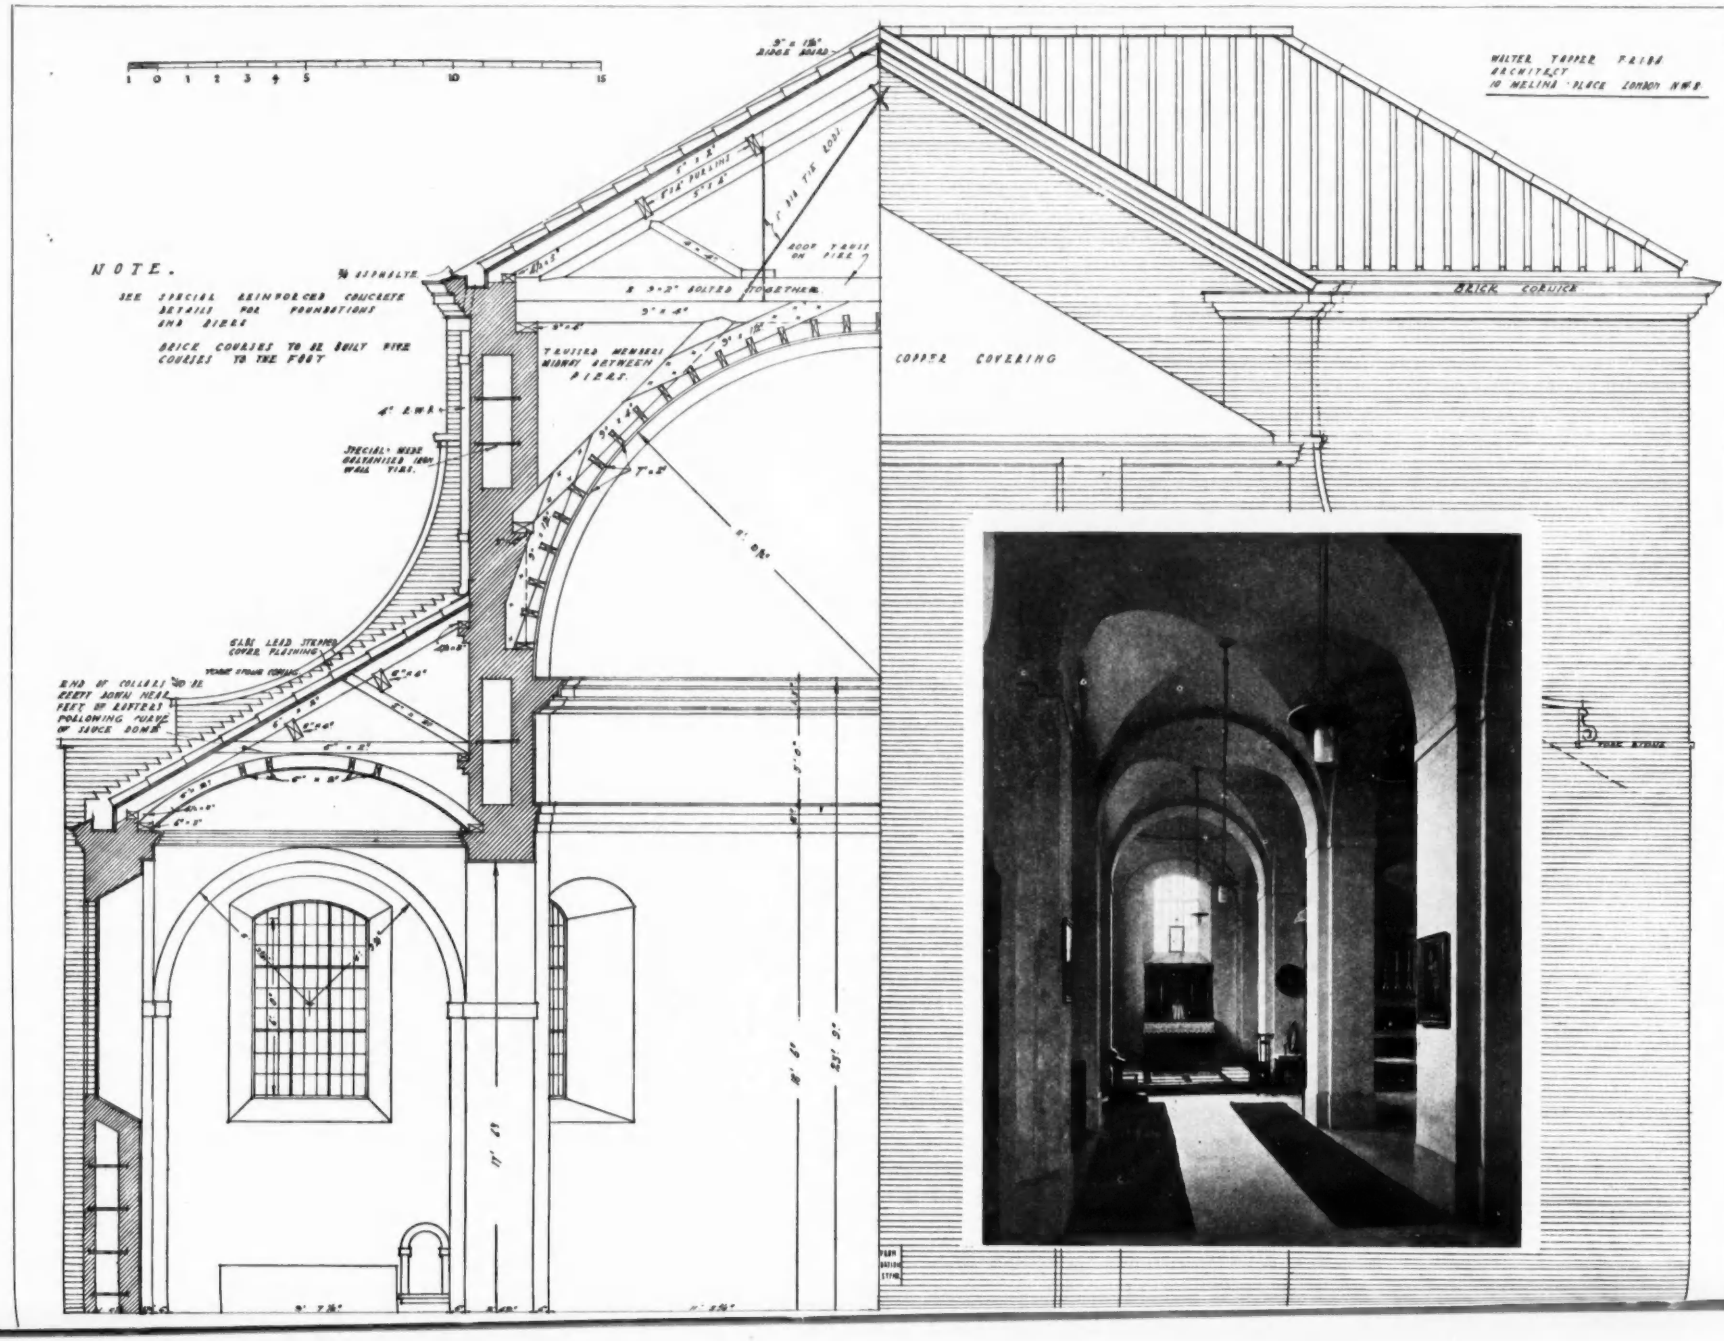
DESIGNED BY WALTER TAPPER



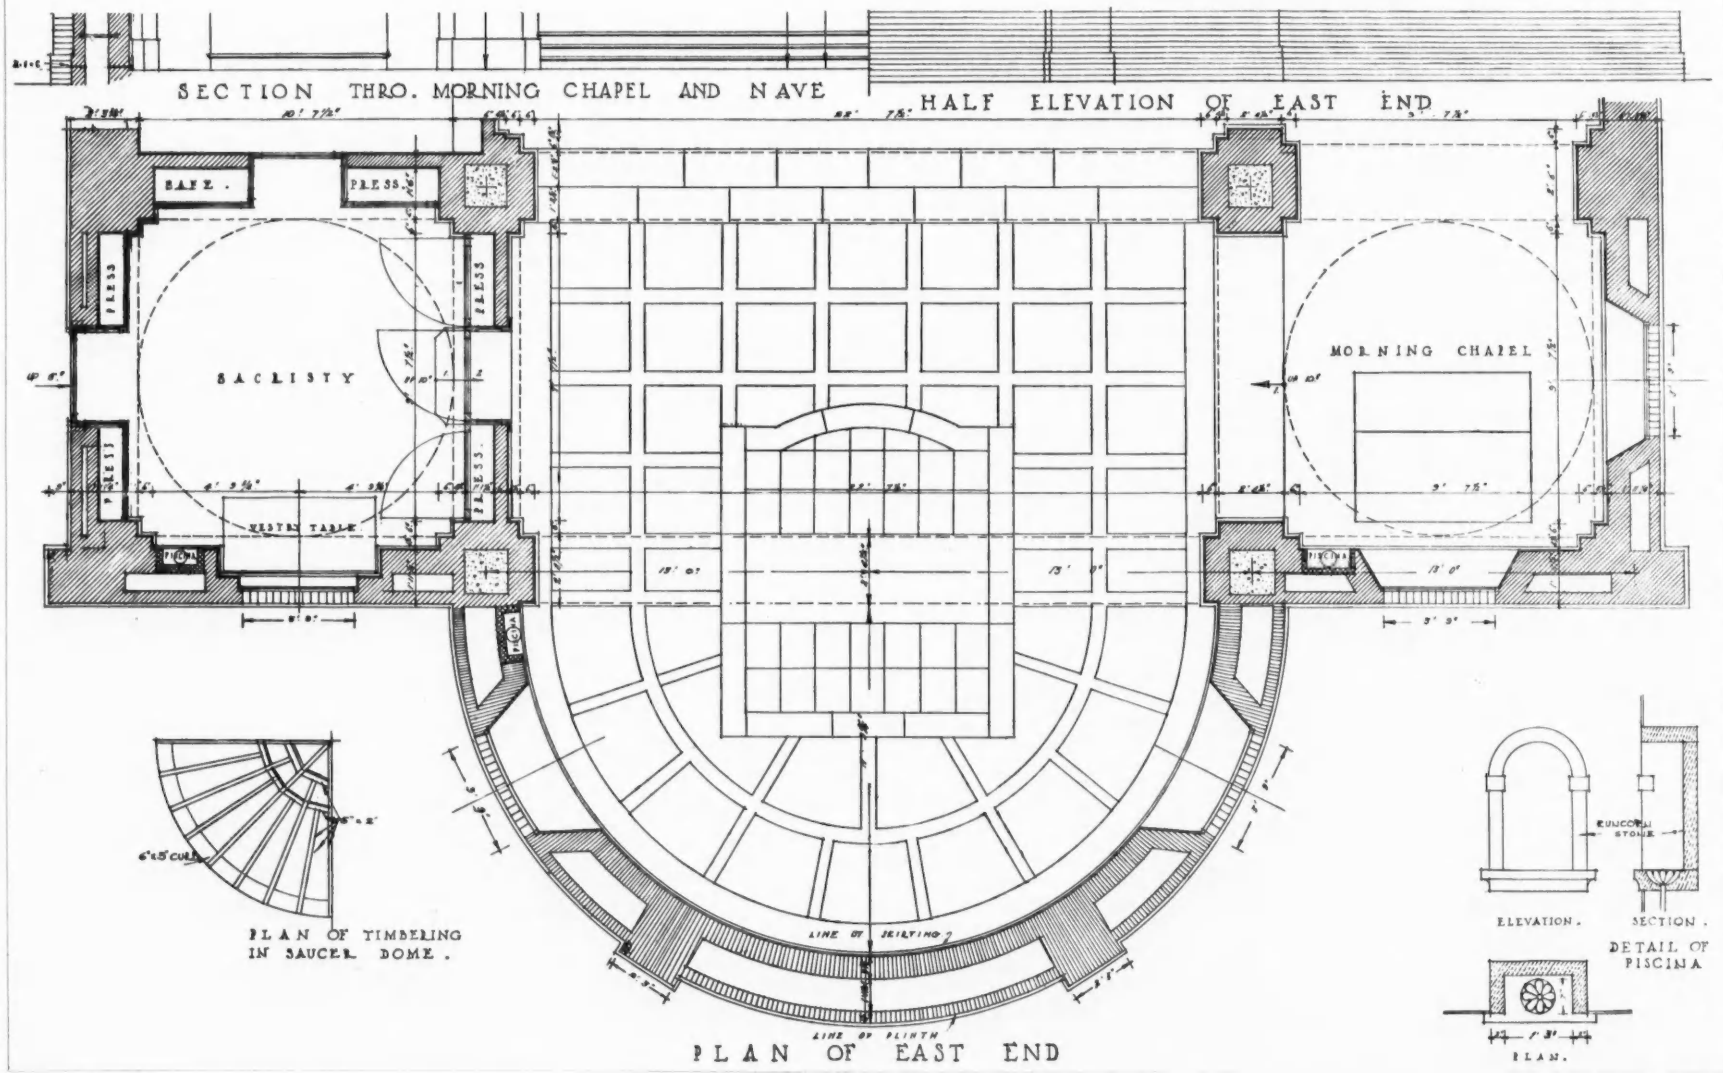
A view of the church from the north-east. The walls are of brick, five courses to one foot. The main roof is covered with Roman tiles, that of the east (left) end with copper. A further section of the church remains to be built.

THE Church of Our Lady of Mercy and St. Thomas of Canterbury owes its name and its being to a benefaction left by Mrs. Angelina Frances Clarke. A sum of £10,000 was left by this lady, a daughter of Sir Bryan Milman, at one time Resident of the Tower of London, with instructions that a basilica should be built and placed under the patronage of Our Lady of Mercy and St. Thomas of Canterbury. The money was left in trust with the Community of the Resurrection, Mirfield. Mrs. Clarke, whose husband was British Consul in Zanzibar, was herself responsible for a work on the architecture of Sir Christopher Wren.

Mr. Walter Tapper was commissioned for the work, and two-thirds of the basilica has now been completed. On entering, the visitor is immediately arrested by the proportions of the building; the apse and the two completed domes, with the round arches and square pillars, giving one a vivid idea of the appearance of the church when the final dome is added.

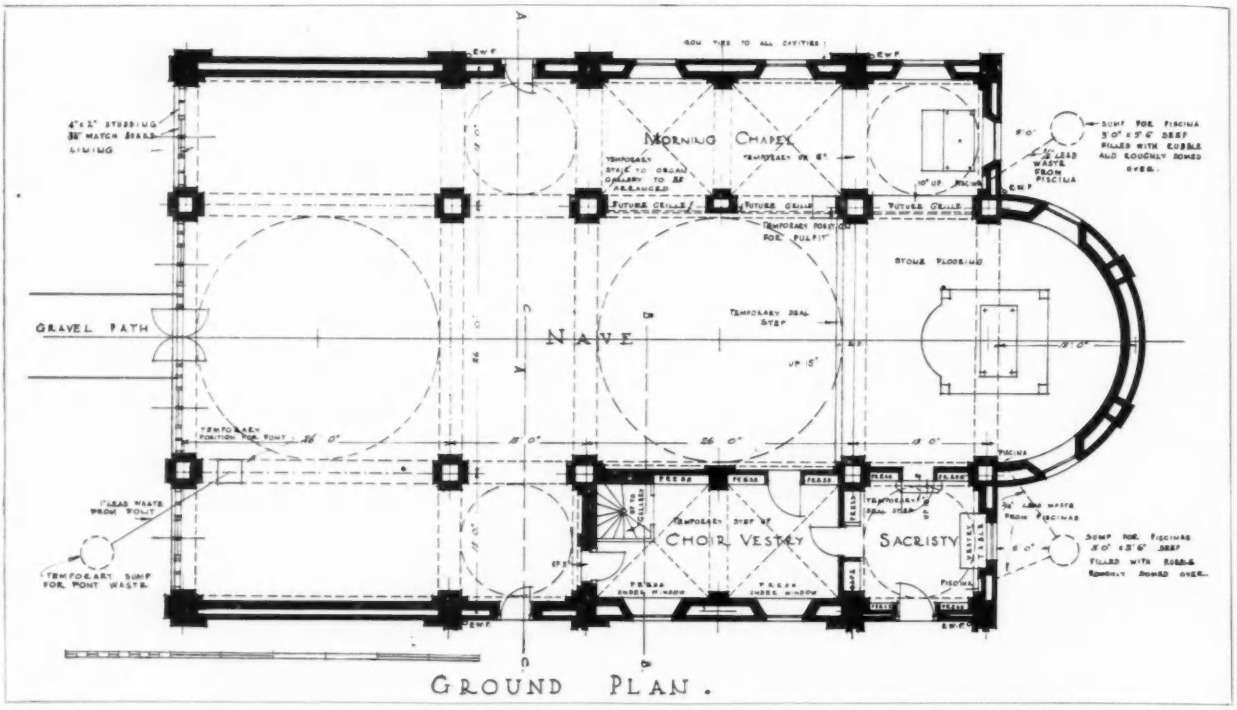


There is a baldacchino over the altar, with pillars in yellow and white marble, and a canopy in Derbyshire alabaster. The altar is in marble of the same two colours, and is set in the midst of the sanctuary pavement and on the customary three steps.



On the north side of the nave is the morning chapel, and on the south the sacristy and choir vestry. Special features of the church are the organ and choir lofts, connected by the massive rood loft which separates the two domes. Entrance is gained to the loft by a special staircase leading up from the choir vestry on the south side of the church. The plaster of the walls has been washed over with a cream wash and as a result, on the drabbest of Manchester days, there is a glow and brightness about the interior which is most refreshing.

The church was consecrated by the present Archbishop of York, Dr. Temple, who was then Bishop of Manchester. The church is set in the midst of modest corporation dwelling-houses of the northern Metropolis.



The pillars of the baldacchino are in yellow and white marble, and the canopy is in Derbyshire alabaster. The altar is in marble of the same two colours.

WALTER TAPPER F.R.I.B.A.

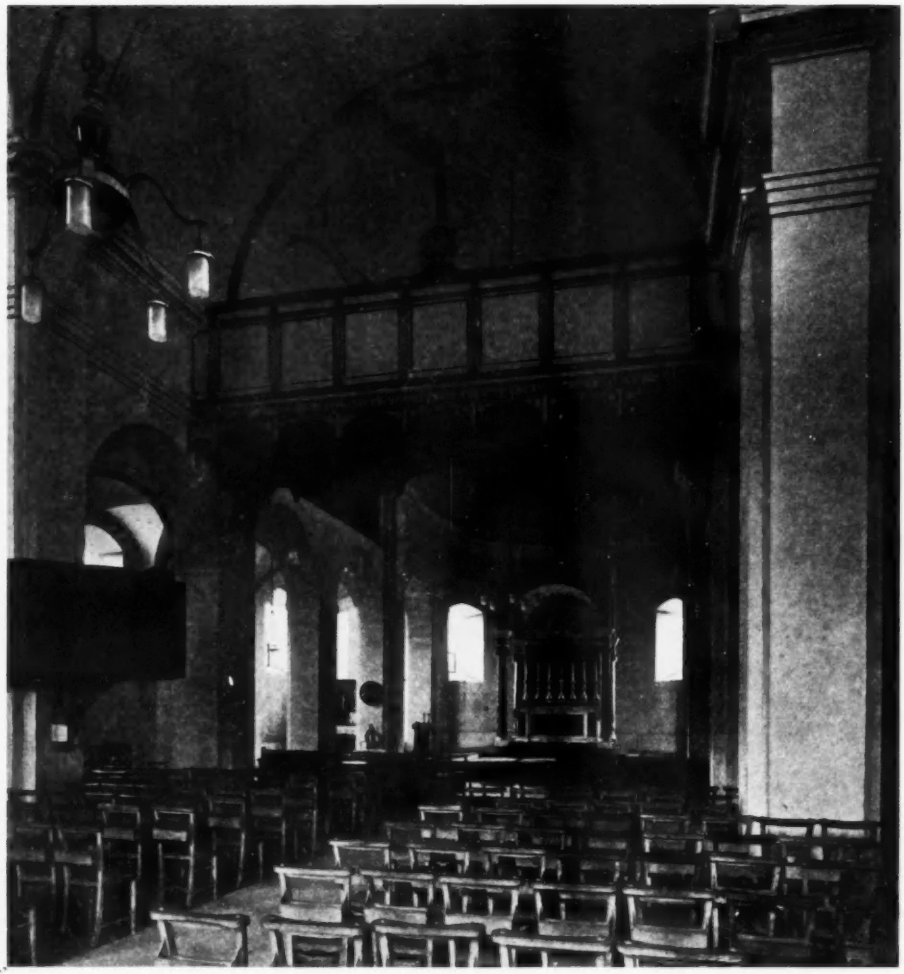
BRICK COURSES TO BE EVEN FIVE COURSES TO THE FOOT
COPPER COVERING
BRICK CORNICE

Church at Gorton.] [*By Walter Tapper.*



These two illustrations—the architect's working drawing of the east end, and photograph of the morning chapel—should be compared with the plan reproduced on page 894. The morning chapel extends along the north side of the nave for a distance of about 40 feet and is balanced on the south side by the sacristy and, behind it, the choir vestry.

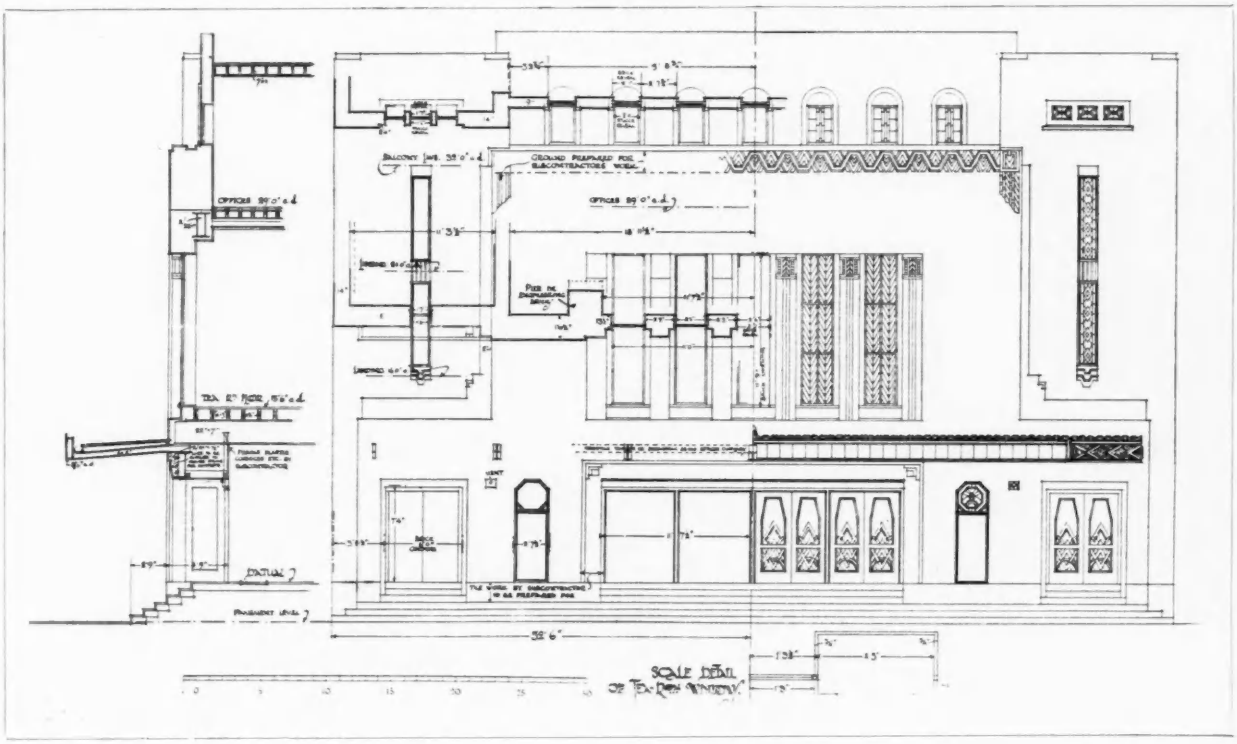
Ground floor plan. The church measures approximately 190 ft. long by 56 ft. wide. Special features are the organ and choir lofts, which are connected by the massive rood loft shown below and entered by a staircase from the choir vestry.

CHURCH AT GORTON

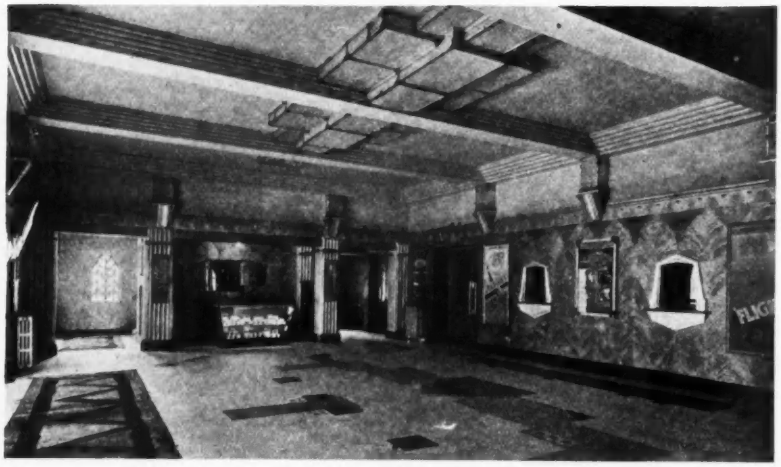
BY WALTER TAPPER

The east end of the church, showing the altar and rood loft which connects the organ and choir lofts.

The walls, of plaster, cream washed, reflect an atmosphere of brightness on the dullest of Manchester days.



The principal front faces Church Street, and can be seen from the main road from London to Dorking. The five windows on the first floor light the café, entrance to which is obtained from the doorways at each end of the façade. These doorways also serve the entrance hall to the cinema. The main elevation has a white surface and is decorated in colours of brilliant hues. Reproduced below is the architect's working drawing.

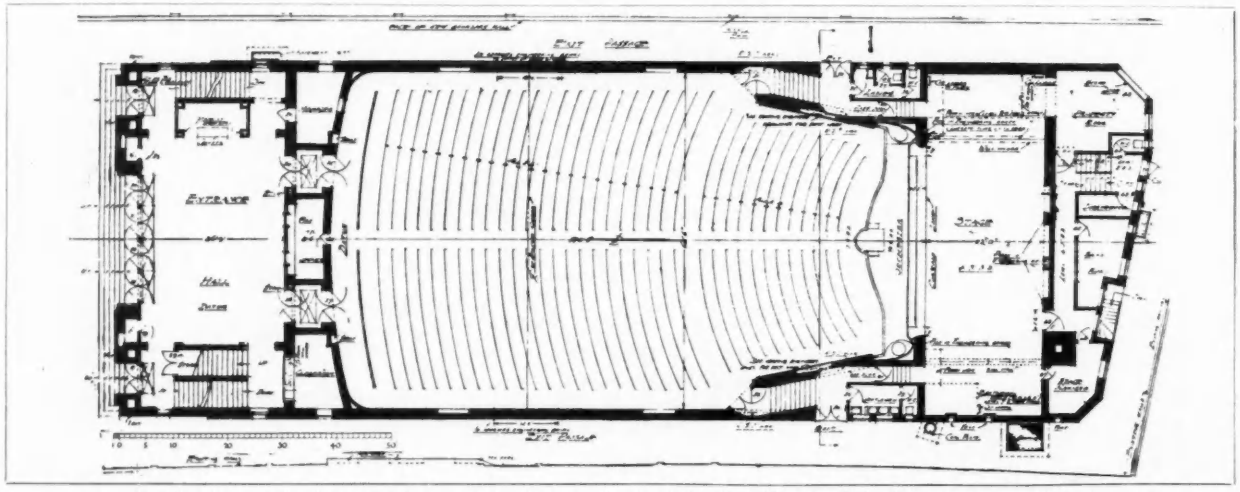


CAPITOL CINEMA, EPSOM

DESIGNED BY ROBERT CROMIE

EPSOM now possesses one of the most modern cinemas in the country, replete with every known improvement in silent and speech kinematography. The main entrance is in Church Street, and leads into the entrance vestibule, giving access to the auditorium and to the balcony.

In the vestibule the floor is of coloured ceramic mosaic laid in design, and the ceiling is of silver colour, with a single lighting fitting of cubist pattern running



The entrance hall, looking towards the "chocolate shop." On the left are the doors leading to Church Street; on the right, the pay-boxes and the doors to the auditorium.

The lighting of the stage from the auditorium has been arranged by the provision of spot light chambers in the roof, as well as at each side of the bioscope chamber, while the stage itself is adequately equipped with grid, electrician's fly perches, flood and float lights. The whole of the curtains, dimmers and lighting effects can be controlled from the bioscope chamber —necessitating ten miles of electric cable.

Low-pressure hot-water radiators are installed, and all the corridors and entrances are superheated. A plenum system of forced air is also provided.

The café is decorated in black, flame and primrose, silver and gold. It contains built-in settees and metal furniture. Gas and electric cookers, boilers and urns are installed for quick service. All food is kept in refrigerators.

Plan of auditorium. The theatre has been specially designed for "talkies," and is provided with a balcony and a full stage.

along its centre. There is a frieze of lanterns of hanging glass, and a "chocolate shop." The pay-boxes each bear a marked resemblance to the proscenium arch within the auditorium.

On the walls of the auditorium the colours range from primrose to sun tones and orange. The ceiling is designed on the principle of a loggia, using the motif of beams in silhouette against the sky effect. It is decorated in pale greens, jade, cerulean blue, amethyst and silver, and is architecturally "supported" by the vertical lines of the balcony walls, from which it is separated by an enriched frieze of silver and jade.

The stage curtains, of a special Parisian fabric, and the proscenium are surrounded by a deep cove of scolloped planes, with illuminated edges, and treated in plain silver. The proscenium frame itself is finished in colours of metallic lustre. On each proscenium splay is an illuminated grille.

The lighting of the auditorium is arranged on three circuits, which enables effects to be obtained for the intermingling of colours.

Capitol Cinema, Epsom.] [By Robert Cromie.

The proscenium, looking from the balcony. It is surrounded by a deep cove of scolloped planes, with illuminated edges, and treated in silver. On either side of the proscenium is an illuminated grille, an illuminated clock, and an exit doorway.

Settling-Up Honeywood : iii

THE STATEMENT OF ACCOUNT

BY KARSHISH

(H. B. CRESWELL)

¶ *Although the house has only been occupied five weeks, there has been complaint of damp by the owner, Sir Leslie Brash, and of defective drains by Lady Brash. The former has, apparently, been disposed of; the latter has not. Grigblay, the builder, has also written privately to Spinlove, the architect, warning him that the patent paint inside the house, used by Brash's orders, is going wrong.*

GRIGBLAY TO SPINLOVE

Dear Sir, 12/3/26.

Our estimate for certificate, £3,500, is as follows :

Amount of contract ..		18,440
Less 5 per cent. retention	922	
Received on a/c ..	15,500	
		16,422
		2,018
Add balance variations account, say		1,500
		£3,518

We shall be glad to receive your certificate as this matter has been standing over some time.

Yours faithfully,

On completion of the work to the architect's satisfaction—an event which, we understand, is dated February 10th—the 10 per cent. retention of the value of work done was reduced, under the terms of the contract, to a 5 per cent. security for the builder's performance of his covenant to make good defects appearing within nine months. Grigblay was at any time entitled to require the value of extra work to be included in the computation of Spinlove's certificates, but does not appear to have asked for it.

GRIGBLAY TO SPINLOVE

Dear Sir, 13/3/26.

Mr. Grigblay visited Honeywood yesterday and is of opinion that the damp on chimney-breasts is due to rain driving into the brickwork of the chimney. It also drives through the parging into the flues which may account for complaints made to Bloggs of the flues not drawing. We think that the trouble can be cured by treating the face of the brickwork with soap, unless you prefer application of some special waterproofing. If you will let us know what you wish we will estimate cost of same.

Yours faithfully,

Grigblay's readiness to supply an estimate is no doubt to make clear to Spinlove what he is slow to discern for himself, namely, that the architect, and not the builder, is responsible for the architect's mistakes. Having regard to the exposed situation and the extreme, though not exceptional, porosity of the facing bricks, Spinlove ought, as Grigblay says, to have put dampcourses through the stacks and piped the flues. He will, no doubt, on the next occasion when a similar conjunction of circumstances arises, benefit by this experience ; but it was no part of the builder's duty to foresee the trouble : a builder has preoccupations enough without thinking for the architect ; and though he would, for his own credit and in a spirit of collaboration, warn the architect when he saw dangers ahead, he may have learnt that such interferences are not always welcomed ; and that when they are, and the precaution proves ineffective, or for any reason is afterwards regretted, the trouble he puts himself to lands him in trouble he could do without.

Perhaps this is Spinlove's first experience of building with sand-faced bricks in an exposed situation. In that case he will have good reason to appreciate the device of the hollow wall which he has apparently carried out with exact care. If the ties binding the 4½-in. inner wall to the 9-in. outer wall were not of a particular pattern, the rain, which Grigblay discerned to stream down the inside of the outer wall when driven by heavy wind, would creep across to the inner ; and if the clearing-battens, hung in the space between the walls when the bricks were being laid, had not been carefully maintained, droppings of mortar would have lodged on these ties with the same result. If, also, Spinlove had neglected to carry the hollow space down through the dampcourse which stops water rising from the ground into the wall; or had mortar droppings been allowed to accumulate at the bottom of the hollow ; the water flowing down the face of the outer wall would have soaked across into the lower part of the inner. So, also, if the dampcourse had not been below the concrete foundation of the wood floors and above the ground—that is to say, if it had been in any other position than opposite the 4-in. or 6-in. thickness of dry brick rubbish on which the concrete floor foundation rests—damp could, again, find its way into the bottom of the inner wall. We gather that none of these things has happened, for it is evident that the south front of Honeywood Grange is being severely tested and Grigblay noticed nothing wrong. How severe that test may be in an exposed situation is only fully known by architects and builders of experience.

Rain will drive right through a 14-in. wall of London Stocks laid in lias lime mortar faced with the best sand-faced, hand-thrown bricks, and run from the under side of concrete lintels over window openings so as to collect in pools on the floor. It will penetrate 9-in. walls of impervious Fletton bricks laid in hydraulic mortar and cement stuccoed in two coats. It will even make a 14-in. wall, similarly stuccoed, so damp as to recommend renewal of the cement stucco with a special waterproofed rendering. Stone and concrete walls present their special problems, but it will be seen that Spinlove has done well in dealing with a brick one, and, under thoroughly bad conditions, secured that his client has a dry house.

SPINLOVE TO GRIGBLAY (PERSONAL)

Dear Mr. Grigblay, 13/3/26.

I have duly received your letter. I am aware that you always objected to the use of Riddoppo, and I also advised against it, so that Sir Leslie cannot very well hold us responsible. I certainly should say nothing on the subject unless Sir Leslie himself raised it.

I note what you say of wet in the chimney, and have written instructions today.

Yours truly,

The tone of this letter suggests that Spinlove resents the implication that he needs guidance, so that it is a pity his attempt to show he is not such a fool as Grigblay thinks should make it clear that he is a much bigger one. The issue does not, as Spinlove implies, turn upon Brash's holding the architect and the builder accountable, but upon whether the facts make them legally responsible ; and if Spinlove is going to address himself to the subject as though the point were open and debatable, he will be certain to prejudice his own and Grigblay's positions exactly as Grigblay fears, and lead Brash on to make claims which, though they may be untenable, will be likely to embroil everyone in the distresses preliminary to litigation. It will also be noticed that Spinlove brackets himself with Grigblay as though they were in the same boat. They are not. Their responsibilities are different.

SPINLOVE TO GRIGBLAY

Dear Sir, 13/3/26.

I note that the damp in chimney-breasts is due to rain driving into the stack, and shall be glad if you will treat the whole of the brickwork of all chimneys above roof with two coats of "Dessikex" damp-proofing, applied as directed by the manufacturers. I prefer this to treatment with soap. The work should be put in hand at once.

Yours faithfully,

A pound of soft soap in a bucket of boiling water allowed to stand overnight and sprayed freely on to brickwork with a garden syringe, is a reliable damp-proofing which Grigblay seems to have confidence in. Certain proprietary and much-advertis.d powders, which are effective in waterproofing the mortar or concrete in which they

are incorporated, are nothing but soap; and soft soap in the water will have much the same effect. In ordering "Dessikex," it is likely that Spinlove is buying treacle or soap or alum or salt at twenty times its value under a new name; but as the Wealth of the Nation appears to depend on the exploitation, at exorbitant prices, of common expedients under crack-jaw appellations, no doubt he is benefiting industry. As, however, Grigblay has had great experience of wet walls and Spinlove very little, it would have been wise for Spinlove to use what Grigblay h.. practical experience of, rather than what .. commended to him either by report or its own expensive brags.

SPINLOVE TO GRIGBLAY

Dear Sir, 15/3/26.

I do not understand why there has been such delay in rendering your final statement of account. You now send me a summary showing extras £1,500. I was totally unprepared for this, and can only suppose there is some mistake. Have you taken the provision for contingencies into account, and the saving on the provision for well-sinking and pump, for instance? A considerable part of the variations will come into a measured account which the Quantity Surveyor must deal with; and the value of that work has still to be ascertained. I shall be glad to have a rough summary of the variations account on which you base your claim. I must prepare Sir Leslie Brash for what is ahead as I am sure he has no idea that extras have mounted up in this way, and I have no knowledge of their ever having been ordered.

I enclose certificate for £2,500, which is as much as I feel entitled to certify at this time.

Yours faithfully,

We need have no doubt that Grigblay's estimate of extras is right; and when Spinlove says he is totally unprepared for such a figure he only tells us what we expected to hear. It is not surprising that he should lose touch with the account, as his careful contract arrangements were upset in various ways for which he was not responsible; but it is surprising that he should have remained unconscious of that fact. He ought to have been forewarned, and with greater experience he would have been: he ought also to have found opportunities to let his client know what was happening, but it is doubtful whether with greater experience he would have done so. When the interferences of the client, or adventitious circumstances, make hay of the careful safeguards of the conditions and of the detailed forethought of the drawings and specification, the whole position gets out of hand for the architect; and if the building-owner, after being informed of the results of interferences and alterations, persists in following his own devices; his architect cannot, without risk of impertinence, make any gesture of checking him.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 15/3/26.

Mr. Grigblay has asked for further certificate on account. This was due to him, on completion of the work, in February. I find he is entitled to the sum of £2,500, and have today sent him a certificate for that amount. This makes the total of certificates £18,000. The contract amount, as you know, is £18,440, but there will be the cost of extra work—garage, alteration to kitchen and other variations and additions and so forth—to add, which will, I am afraid, run into several hundred pounds. I am pressing the builder for his statement of account giving particulars of these extras.

Yours sincerely,

PS.—As this money was due to Mr. Grigblay more than a month ago, he will probably be glad of a cheque at once.

Spinlove's ideas of administering the gilded pill are raw, but promising. A degree of tact which trespasses on slyness may be forgiven on these painful occasions. The owner has to be informed of—and reconciled to paying—a bill of extras for which he is unprepared; and the easier the gradations by which the revolting intelligence is imparted to him the happier for him; and the happier for the builder; and the happier also for the architect, whose forethought for his employer's peace of mind is sometimes prompted by a care for his own.

Spinlove's postscript is due to Brash's habit, in the past, of holding back payments to the builder to the extreme limit fixed in the contract for honouring certificates.

GRIGBLAY TO SPINLOVE. (CONFIDENTIAL)

Dear Sir, 15/3/26.

In reply to your favour I take the liberty of writing to make clear, as there seems to be some confusion on the matter, that I painted with Riddoppo only on your statement that those were the orders of Sir Leslie Brash, and that he accepted responsibility for same; and I ask you to bear that fact in mind, as it is the position I take and hold to. I ought to have refused to touch the stuff, but I wished to oblige Sir Leslie so far as I was able; and as he would not take my advice he must settle the matter with the man whose advice he did take instead—and that, I suppose, is himself.

I write very frank and open, sir, because this is a serious matter for someone, if it isn't for me. It's not going to cost a hundred pounds, nor two hundred, nor yet three, with the cleaning of the stuff off the walls and joinery and the loss of going to a hotel—for they can't be expected to live in the house all those weeks it will be before it's done. Therefore, sir, I ask you to let Sir Leslie clearly understand that I have nothing more to say on this matter, as it will save a bit of trouble and be the best for everyone, including,

Yours truly,

GRIGBLAY TO SPINLOVE

Dear Sir, 16/3/26.

We have to acknowledge certificate for £2,500, which we have sent on to Sir Leslie Brash, and hope we shall receive his cheque per return, as it is a long time since we had anything on account and we were entitled to 40 per cent. more than this six weeks ago, which please note and oblige,

Yours faithfully,

This letter is curt to the point of being threatening. We have already seen that although Grigblay is lavish of good offices and kindly forethought, he is impatient of sloppiness. All he says is perfectly just, and Spinlove deserves to be told it. It is the architect's duty to see that the builder, as well as the client, gets his dues. Spinlove has shown no consciousness of his remissness in holding back the certificate for so long, and has not in any adequate way apologized to Grigblay for so disobliging him. He is, further, not entitled to withhold £1,000 on the plea of his ignorance of the state of the account. It is his duty to inform himself.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 18/3/26.

I have duly received your communication anent certificate and will conveniently arrange for cheque to be transmitted in due course. I cannot, however, accept responsibility for Mr. Grigblay's neglect to present his claim previously at an earlier date. I apprehend with satisfaction that these payments are now drawing to a final termination, but I am considerably astonished at your happy-go-lucky—if you will pardon the expression—intimation of additional extras running into the total amount of *several hundreds of pounds*. I am aware that accumulated additional extras have accrued, but the exact anticipated total of the figure of my eventual liability is a matter of more importance to me than you appear to divine; and though a matter of half a dozen hundred pounds one way or the other may seem of insignificant importance to you, it is, I may inform you, of *considerable importance to me*. I desire that you will be so good as to transmit the exact figure forthwith and also clearly intimate to Mr. Grigblay that the accountancy is in your hands and that I am not prepared to acquiesce in any inflated extortions. Surely it does not lie in Mr. Grigblay's decision to decide what additional extras he shall demand?

I have re-perused your communication to Lady Brash anent the surveyor's certificate of sanitary efficiency, a second time. Are you *confident* of your conviction that our sanitary provisions are entirely without blemish? In the concluding passage terminating your letter you surmise the possibility of a defect in the arrangements having eventuated subsequently to the previous tests. This I apprehend to be a matter for further imperative investigation.

Yours sincerely,

Brash's avoidance of the low word "drain" marks a refinement that is rare.

SPINLOVE TO GRIGBLAY (PRIVATE)

Dear Mr. Grigblay, 18/3/26.

I perfectly understand the position you take and it has my approval. I myself shall most certainly refuse to accept responsibility for Riddoppo.

Yours truly,

Spinlove's assurance will, again, increase Grigblay's doubts. The disparity may be subtle but it is vital. The point is not what action Grigblay may in future take, but what his position, in fact, now is. Spinlove's approval or disapproval cannot alter those facts, and Grigblay is in no way concerned with it. It is clear, also, that Spinlove does not understand his own position; and Grigblay must have little confidence that he will not allow Brash to believe he has a claim against both of them.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 20/3/26.

The delay with the certificate was not Mr. Grigblay's fault. He made his claim before the money was due, and in setting the matter aside I overlooked it. I should be obliged, therefore, if you will regard the certificate as dated February 10th, which is the day it fell due.

I cannot yet say what the total of the account is, as much detailed measuring and pricing, and checking of the daywork accounts and merchants' vouchers, etc., is necessary in order to arrive at it. Grigblay will render an account which it will be necessary for me to check and certify. The actual "accountancy"—as you term it—will be done by the Quantity Surveyor, who ranks as auditor in ascertaining the exact sums due in respect of work which I find to be properly authenticated as extras. I shall hope, however, to be able to give you an approximate statement in the course of a week or two.

I can assure you that the drains are all right. It is inconceivable that they have developed any defects since they were tested.

I have discovered the cause of damp over the attic fireplaces, and have told Grigblay to put this right at once.

Yours sincerely,

PS.—Will you please return the surveyor's certificate?

Spinlove has laid out the mechanism of settling builders' accounts, so that Brash will have a right idea of it, quite neatly.

He is, however, too emphatic in his pride of drain. The development of defects in Honeywood drains is not inconceivable. We heard of a clay subsoil when the cellars were dug, and the movements of clay in response to changes of temperature and humidity may lead to early cracking of cement pipe-joints which would cause failure under the water test; and the heavy lorries already referred to may have done similar damage. Such defects, however, do not ordinarily lead to insanitary drainage, as the conditions of the tests, which exact perfection, do not arise in use; and if by accident they did arise, the amount of pollution of the subsoil would be insignificant.

GRIGBLAY TO SPINLOVE

Dear Sir, 22/3/26.

We note your instructions *re* waterproofing to chimneys. Our price for this work, which includes the necessary ladders and scaffolding, is £42 12s. We will use "Dessikex" if you wish, but we happen to know what this stuff is made of, and we should prefer to apply two coats of either Sorrellming or Flutate, both of which are colourless and can, in our experience, be relied on. The work, however, cannot be put in hand till the summer as, whatever we use, the brickwork must be quite dry and ought to be warm when the application is made.

Yours faithfully,

[NEXT WEEK: IV.—MORE NEWS OF THE DRAINS.]

QUESTIONS THAT ARISE

Ancient Lights

P. L. writes: "*Clients of mine wish to erect a building upon land adjoining a house. The house and land are divided by a passage 3 feet wide, which is common property and a right-of-way to back gardens. The house has four windows that are ancient lights; it has also a dining-room with four windows overlooking this passage, which are not ancient lights. Can they claim any privilege for these windows? Do the original ancient lights create a precedence in favour of the new windows?*"

It appears from the facts before me that a dining-room containing four windows has been erected recently as a wing to a house, which house has rooms that have a prescriptive right to light, commonly called "ancient lights."

I am asked to express an opinion as to whether the windows in the dining-room have, in the circumstances above mentioned, a prescriptive right to light by virtue of the fact that the other windows in the house are so protected.

The right to light is a right, apart from an agreement between the owners of adjoining properties, acquired for a window in a dwelling-house after the window has been in position for nineteen years and one day (Prescription Act, 1832). Once this right has been established, the owner may have a right of action if it is infringed. The right does not confer upon the owner an absolute right to an unlimited amount of light, but only to a reasonable amount of light for ordinary domestic purposes. If a structure is erected which diminishes the light to a window which has "ancient lights," it is not actionable unless the plaintiff can prove that the amount of light which is left is insufficient for ordinary domestic purposes. (*Colls* v. *Home and Colonial Stores* (1904) A.C. 179.)

The Court has refused to lay down an absolute standard; each case must be judged on its own merits. The 45 deg. rule is a useful guide, but the Court has refused to fetter itself.

In this case, however, the right to light for the windows in the dining-room has not been acquired under the Prescription Act, so that your client will, in the absence of an agreement to the contrary, be entitled to blot out entirely all light to these windows, notwithstanding the fact that in the exercise of his legal rights he acts from improper motives, or causes great damage and hardship to the owner of the house containing these windows (see *Mayor of Bradford* v. *Pickles* (1895) A.C. 587).

As to whether an agreement is in existence is a matter of fact upon which I have no information before me, so that I am unable to express a final opinion upon the question before me.

E. F. I.

Sash Windows

"Interested" writes: "*Is the familiar sash window an English invention or was it introduced with other Renaissance features from abroad? Elizabethan buildings seem to have stone mullions and casements, but with the pure classic forms of the eighteenth century they give place to sashes, as in the Banqueting Hall in Whitehall by Inigo Jones.*"

The example of Inigo Jones's Banqueting Hall is, unfortunately, no guide to the use of sash windows, as they were a later alteration. Old prints show the windows with centre mullions and transomes. The sash window was probably introduced into this country from Holland at the time of William and Mary. The palace at Loo in that country had sash windows throughout. Sash windows are shown in the designs of Daniel Marat, the architect of

William III, in 1712, and in the England of Queen Anne they were popular. Early sash windows often had no weights and were propped open by sticks, the lower sash only being movable.

Sash windows have never become popular in France, and in 1699 de Lorge had one specially made from an English model for his house at Montmartre, but in Scotland Dr. Johnson found that they had become usual in spite of the strong French influence in that country. Early sash windows can be distinguished from later examples by the thickness of the glazing bars; those in the "Wren" period are often nearly 2 ins. wide, but by 1790 they had shrunk to mere threads, to vanish entirely before the advent of plate glass.

LL. E. W.

Church Repairs

"Architect" writes: "*I have been asked by a churchwarden to prepare plans for altering the pews and repairing the stone chancel floor in a parish church. There are, I am told, certain formalities in the Church of England with which an architect has to comply. Do these affect the building?*"

The formalities to which your correspondent refers are simple and are dealt with by the Secretary of the Parish Church Council.

The architect prepares his scheme, and submits to the Council, if it is approved, a copy of the plan, with an outline specification, which is forwarded to a body called the Diocesan Advisory Board. This Board is comprised of a number of clergy, ecclesiologists and architects, and its duty is to see that the proposed work does not damage or deface objects of interest. It also has power to veto anything in bad taste or out of keeping with the church. When the plan is returned approved, it is then forwarded with the necessary documents to the Diocesan Registrar, with the request for the grant of a "faculty."

The Registrar orders a notice to be placed in a conspicuous position in the church stating the nature of the proposed work, and any objections by parishioners must be made before a certain date.

In your correspondent's case there are not likely to be any objectors, and in due course, on payment by the Church Council of the usual fee, the faculty will be granted.

In this particular case the red tape may appear annoying, but the effect of these safeguards has preserved much old work in remote districts, which would otherwise have been destroyed by ignorant parsons and churchwardens.

A. F. W.

Cracks in Partitions

C. H. B. writes: "*I recently inspected a new building where the plastered partitions (hollow terra-cotta blocks) to the upper floor were cracked along the line of a joint for the whole length of the partitions under the main steel beams. The crack shows on both sides of the partitions. It is not at the joint between the beams and the top of partitions, but at the next joint below. The roof is covered with asphalt and the floor is of steel-concrete construction.*

"*I had the plaster cut out for the whole length for a width of 6 inches, canvas fixed to the partition, and the work made good in Keene's cement, but the cracks are appearing again. Several of the rooms contain some very delicate instruments, and, other than the unsightly appearance, it is important that the plaster which crumbles around the cracks should be effectively made good. What is the reason for this defect, and is there a possible cure?*"

I have had similar trouble to that experienced by "C. H. B." on some new work. I found that the fracture was caused through the expansion and contraction of the steel roof beams.

I specified that the partitions were to be pinned tightly to floors and ceilings, and this was faithfully carried out by the builder, resulting in a stronger joint against the beam casings than to the joints below.

The trouble would have been avoided if an expansion joint had been left between the top of the partitions and beams, covered with a wood fillet.

Despite the expense, if a thoroughly satisfactory job is required I would remove the top course of blocks and rebuild, leaving an expansion joint.

W. A. D.

Advertisement Hoardings

A. J. T. writes: "*A firm of billposters has erected a large hoarding in a field opposite to my house, shutting out my view of the river. The hoarding is some 30 ft. back from the road, and I understand a rent is paid to the farmer on whose field it has been put up. Is there any possibility of getting this eyesore removed?*"

Unsightly hoardings can be removed under the Advertisements Regulation Acts, 1907 and 1928. These Acts do not themselves prohibit advertisements, but they authorize local authorities to make bye-laws. The county form of bye-law, which applies to the whole county, except boroughs and urban districts with a population of over 10,000, reads as follows:

"No person shall erect or exhibit or permit or cause to be erected or exhibited any advertisement so as to disfigure or injuriously affect the view of rural scenery from a highway or railway."

All county councils in England, except two, have taken action under either one or other of these Acts. The earlier Act only protects "the amenities of a public park or pleasure promenade" or the "natural beauty of a landscape," but the scope of the 1928 Act is wider and more county councils have brought their bye-laws up to date.

The Acts are in operation and only need enforcing, and it is for your correspondent to put pressure on the council to take action or to institute proceedings himself—since any member of the public who suffers by the breach of a bye-law is entitled to proceed against the offender.

S. C. A.

Asphalt Covering for Roof

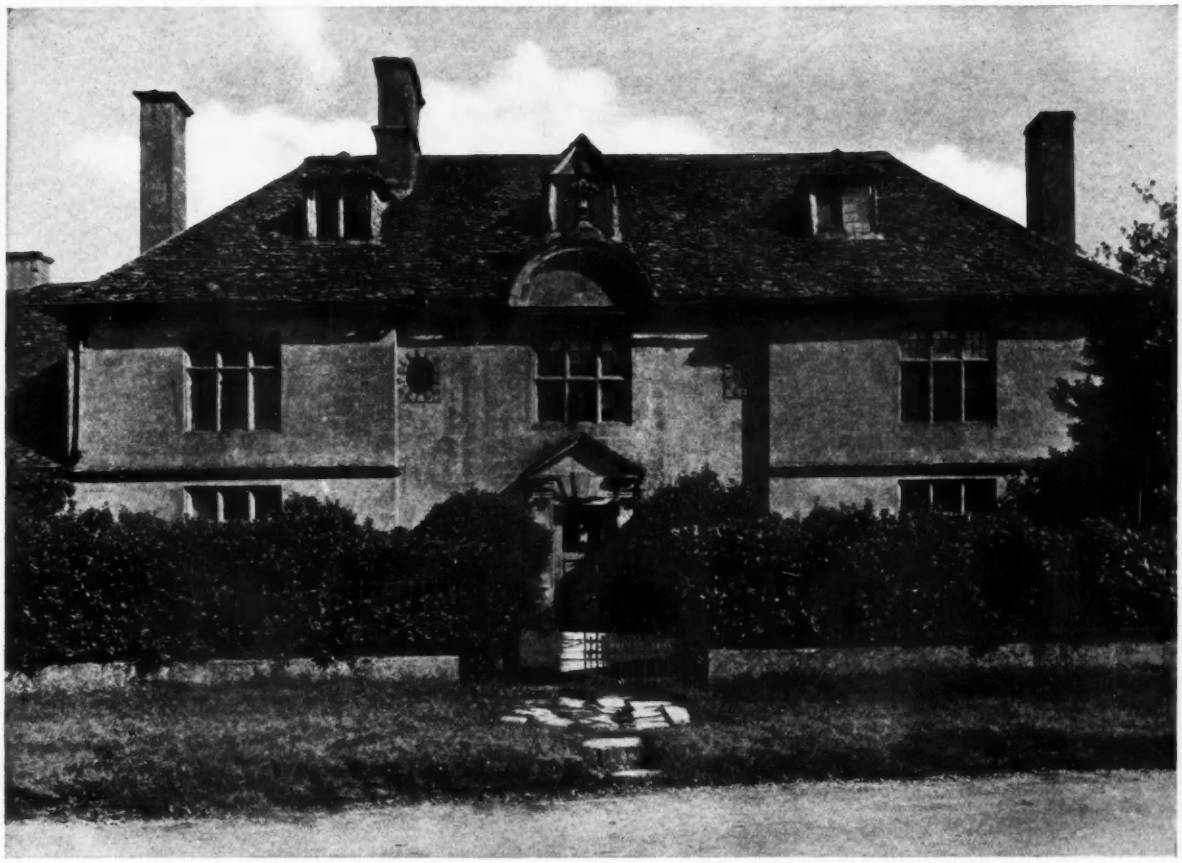
"Spec" writes: "*I am specifying an asphalt covering for a new concrete flat roof; on one side I am carrying the asphalt down a sloping portion of the roof, pitched at 60°. I propose including for fixing a lead strip at the angle between the top of the slope and the flat roof, between the two layers of asphalt. It seems to me that if the asphalt should creep there would be a tendency for the asphalt to crack at this joint, and that the lead would strengthen this angle. Would this be a safeguard?*"

Your correspondent seems to have the mistaken view that there would be a joint at the junction of the flat and sloping roof. This would not be so, as the work would be executed in one operation.

By fixing a lead strip, as he suggests, he would only invite cracks, owing to the expansion of the lead.

I recently observed a failure in connection with this type of work, where a lead apron had been fixed between the layers of asphalt and dressed into a gutter.

Instead of finishing the asphalt just over the apron with a splay at roof level, it had been turned down almost into the gutter, resulting in a series of cracks at the bend over the lead.



It is true in this case that the lead is slightly exposed, but even with about ⅜-in. cover of asphalt the heat would tend to expand the lead.

I am sure if "Spec" employed a specialist firm of asphalters for this work, they would protest against the inclusion of this strip.

The home of the Medford family at Mickleton, Gloucestershire : a study in symmetrical tradition.

ENGLISH PRECEDENT No. 119

MEDFORD HOUSE, MICKLETON, GLOUCESTERSHIRE

The house is built for the most part of Campden stone, but, in or about 1699, Samuel Medford made additions, in the classical style, to the original fabric. These took the form of an extension to the north end (an indication of which is seen on the left of the photograph), and the south end was constructed in brick, no doubt at this time.

The stone mullioned windows have the traditional details. The lunettes light powdering closets, and as the powdered wig did not reach general use until the middle years of Queen Anne's reign, they are probably additions.

[THOMAS FALCONER]

LETTERS FROM READERS

The Economics of Steel

SIR,—If you, sir, wanted to build a ship, you could go and buy a little book of rules and formulæ; and if you observed those rules and made no mistakes in your additions you would have an A1 ship which could enter any port and carry any cargo; for the science of using steel for ships is an exact science. Or if, distrusting ships, you preferred to bridge Brooklyn Harbour or the Brahmaputra, you could buy another little book of rules and formulæ, and if you used the same care, any railway in the world would entrust its wagons to your bridge, and people of all nations would walk contentedly over it; for the science of using steel for bridges is an exact science. But if, sir, more modest, you wanted a garage for your little car—that is different. You cannot go and buy a little book because there is no little book to buy; for the science of using steel for garages has not so far developed as to command universal acceptance.

So, deprived of your little book, you come to me and ask me to design a garage for you in steel. First, you must tell me where you live; because what in Whychester passes for a sturdy structure the citizens of Howminster regard as a flimsy menace to their safety. With my special knowledge of these things, I will guide you; for I know that Jones, who surveys in Howminster, was born in Fiji, and he sees to it that the buildings under his care are so designed that they will safely withstand such typhoons as that which once ravaged the city of his birth. But if you would have your garage in Whychester, it will be quite a different affair; for Brown, surveyor, is Whychester born and bred: of typhoons he recks nothing; centre of gravity is his watchword and eccentricity his nightmare. We will design accordingly.

It is said that in America they arrange things differently. I have heard that in that country you could buy a little book, and that, armed with that book, you could design a garage which would be permitted in any town. How dull! The Americans say that because they have standard building rules they can get their buildings so cheaply and so quickly. Of course they can—but at what a sacrifice! If you had wanted your garage in America you would have got it quickly, you would have got it cheaply, but you would have lost that feeling of glorious adventure, of launching out upon uncharted seas. We should have sacrificed those long, friendly chats with Jones or Brown upon questions of principle and questions of detail, upon questions of theory and questions of practice. You and I would have missed those intimate discussions as to whether it would not be better, after all, to sell your car; and, sir, worst of all, I should not have had the chance of meeting you.

Let us see to it that our Kavanaghs do not conspire to rob us of our pretty, mediæval customs.

N. L. ANDERSON

Electric Transmission Towers

SIR,—I beg to call your attention to an illustration from a book entitled *The Face of the Land*, which appeared in THE ARCHITECTS' JOURNAL for May 7.

This illustration purports to be a view of the towers and cables of the electric supply grid traversing an open tract of country, and underneath is printed "when we come to scenery such as that of the South Downs or Lakes we are entitled to ask whether it is not grotesque folly to mar such national heritages for the sake of uniformity." This illustration is a reproduction of the faked photograph which appeared in the press last autumn, when an agitation was on foot to prevent the Grid passing along the back of the South Downs.

I would ask, on the other hand, whether it is not "grotesque folly" on the part of those who are anxious to preserve the beauty of the English countryside to avail themselves of misrepresentation of facts. As shown in this illustration, the towers appear to consist of clumsy wooden posts and braces, instead of being, as they are, constructed in steel of the lightest possible design, and the cables, which are represented as sagging in a deplorable manner, are shown of the thickness of an elephant's leg, though as was pointed out by Mr. Rowlinson in the JOURNAL of May 21, their actual diameter is about $\frac{1}{2}$ in. to $\frac{3}{4}$ in. I have seen several of these transmission lines in different parts of the country, and the actual fact is that the cables are invisible, and the towers when seen against a background of hill or woodland are hardly noticeable at all.

A good cause is being injured by excessive sentimentalism and reiterated cries of "Wolf!" The supply of cheap electricity all over the country, which is the object of the grid, is absolutely essential to the future prosperity of this country, and the method of transmission, which has been arrived at after most careful and anxious consideration by the best technical experts, must be accepted, however much one may yearn for the England of a hundred years ago. Personally, I am convinced that the form of tower which has been adopted does the least possible injury to the landscape and has a quality of its own. I venture to say that elements of beauty and romance are to be found in these lines of towers striding over hill and dale, if only one has the vision to see them, if only one can readjust one's intellectual focus to the inevitable conditions of changing civilization.

(SIR) REGINALD BLOMFIELD

Specialized Materials

SIR,—"A manufacturer of specialized building products is entitled to fair play for his material. The architect would do well, therefore, to assure himself that the instructions issued by the manufacturer have, in fact, been faithfully followed."

To read such sentences (page 836 of THE ARCHITECTS' JOURNAL for May 28) made the sun shine just a little more brightly, made the routine of the day a little less stereotyped, endowing it with more keenness and enjoyment than it sometimes seems to possess.

I wonder how many architects realize what heart-burnings we commercial folk have over the scepticism with which some building operatives meet the suggestion that entirely new methods be employed? It is heart-breaking, sometimes, to see a carefully-manufactured, high-grade product, the result of years of infinite research and long and close attention to field results, used in a manner that not only invites, but ensures, ultimate dissatisfaction. The architect can so easily help us—those of us who *service* our products; those who will spare no effort nor expense to teach, explain, guide and demonstrate with patience born of some psychological experience. Believe me, we are bound to approach such educational work with no little philosophy and forbearance.

If our guidance of the work is at the instance of the architect himself, after he has done *his* share by properly specifying the manner of procedure *before* the subsequently accepted tender for the work was first submitted, we are on firm ground. When the operative says: "It's all very well to ask me to proceed thus and so *now*, in a way which I never before heard described. I did not *bid* to do that. Why wasn't I told I should have to do it *before* I put in a price?"—is he not entitled to a modicum of sympathy?

Only by just such normal, sane, easily effected co-operation as that suggested by the golden words of the two sentences quoted, can the full value offered by a live, modern manufacturer be realized and obtained.

Our cry is: "Help us that we in turn may help."

FREDERICK COLEMAN

THE SPECIFICATION WRITER

Warming the Water in a Private Swimming Bath

THE building of a private swimming bath does not come every day to the domestic architect. When Braddell and I were instructed to devise a scheme, we approached the subject with very fresh minds. There were several matters of detail to be learned from observation or from the kindly advice of those who had had experience, but on the vital question of heating the water there was an ominous lack of unanimity of opinion as to the success of the various methods hitherto adopted.

For our purpose it seemed most desirable to obtain a system which would heat the bath in a few hours and which would, moreover, bring the water to a more or less uniform temperature. I discussed the problem with Mr. E. E. Pope, the heating engineer, of Reading, who approached it with an equally fresh mind.

In a few days he produced a complete new scheme in outline.

Briefly, this was to run four flow pipes, two to each side of the bath, one above the other, with small inlet jets taken off each flow and through the bath wall at spaces of six inches; and then to take four return pipes, equally spaced in the floor, with a similar number of tube outlets connected to them. The flow jets were below the water level of the bath, and these and the outlets were $\frac{3}{8}$ in. diam.

At first sight this seemed somewhat alarming, meaning as it did in our case some 228 inlets and 228 outlets to the bath. On the other hand, examine it as I would, I could find no possible reason why it should fail to work. Nevertheless, it was with a feeling of some trepidation that I decided to adopt the system. Luckily there was some time, while the foundation work was in progress, to consider and perfect the details.

To start with, we realized that the small outlets in the bottom of the bath might get choked with sediment. The return pipes were, therefore, carried through both ends with cleaning eyes, so that they could be cleaned with rods. Though probably unnecessary, the same was done with the flow pipes.

The jets and outlets were cut off flush with the lining of the bath and reamered back about $\frac{1}{32}$ in. behind the face. The ends of these pipes were incorporated in a decorative scheme so that they are almost invisible. The size of the main flow and return pipes was, of course, regulated by the size of the bath, and the distance apart of the small jets and corresponding outlets was governed by its width. It was decided to do all the work inside the walls and floor of the bath in copper.

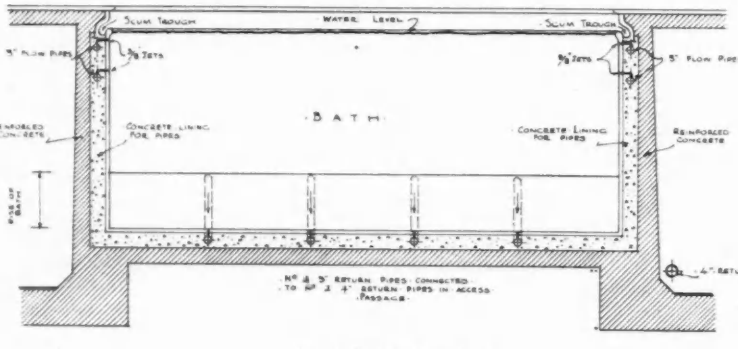
The system was designed to heat, in our case, 30,000 gallons of water from 40 degrees to 78 degrees in six hours. Mr. Pope recommended a sectional boiler capable of about $1\frac{1}{2}$ million B.T.U.'s to obtain this result, and we decided that the boiler should be oil fired.

The water to the bath is filtered before entering, and when the bath is in use it is being slowly but constantly changed by opening a valve from the feed tank.

It was, of course, necessary to cap all the ends of the inlets and outlets during the construction and finishing of the bath to keep the small pipes clear; it was, therefore, impossible to test the system at all until the absolute completion of the decorations. The day came at last when the caps could be removed and the bath filled.

At the first test, somewhat naturally, the principal aims were : 1 : to show that the bath could be heated at all, and 2 : to see how quickly it could be done. The result left no doubt on the first point, but in the endeavour to speed up the operation the temperature got much too high, reaching about 100 degrees in the bath in six hours. We realized at once that it would be necessary to regulate the flame of the burner lower than the thermostat could be set to.

At the second test, therefore, we set the burner by hand to keep the boiler temperature between 96 to 100 degrees. The result this time was satisfactory beyond our hopes. In four hours, starting from cold, the temperature at the top of the bath was 78 degrees and at the bottom 74 degrees. Moreover, there was no point at the top of the bath where the temperature varied more than $\frac{1}{2}$ degree, and at the bottom it was completely uniform all over.



The results attained are briefly : 1 : the great speed with which the bath can be heated ready for use; 2 : the excellent natural circulation which gives a uniform temperature without resource to electrical or other acceleration; and 3 : the great saving in fuel, not only in heating the bath in the first instance but in keeping it going over a long period.

An actual test proved that after the four hours necessary to heat the water in the first instance, the burner could be turned out, and in the twelve hours from 8 p.m. to 8 a.m. the temperature in the bath dropped only four degrees.

The two accompanying diagrams illustrate the system which Mr. Pope has now patented. In constructing the walls of the bath the reinforcement was set up, the piping was then run and secured in position, and the concrete was then filled in in one thickness.

HUMPHRY DEANE

MOST important modifications in the law governing the positions of water-closets, etc., in buildings in London are foreshadowed in the minutes of a recent meeting of the London County Council. Hitherto it has been obligatory that sanitary conveniences should be situated on an external wall of the building. That requirement is likely to be rescinded, subject to certain provisions as to

CROSS SECTION THRO BATH

The illustrations reproduced on this and the facing page are of cross and longitudinal sections of the private swimming bath referred to in the article by Humphry Deane, and show the arrangement of pipes and jets for heating the water on the novel system described in the text.

lighting, ventilation, etc. The proposed amendment would have a far-reaching effect on the planning of new buildings and the reconstruction of old ones. The text of the recommendation in the report of the L.C.C. Central Public Health Committee, which was moved, put and agreed to, is printed below :—

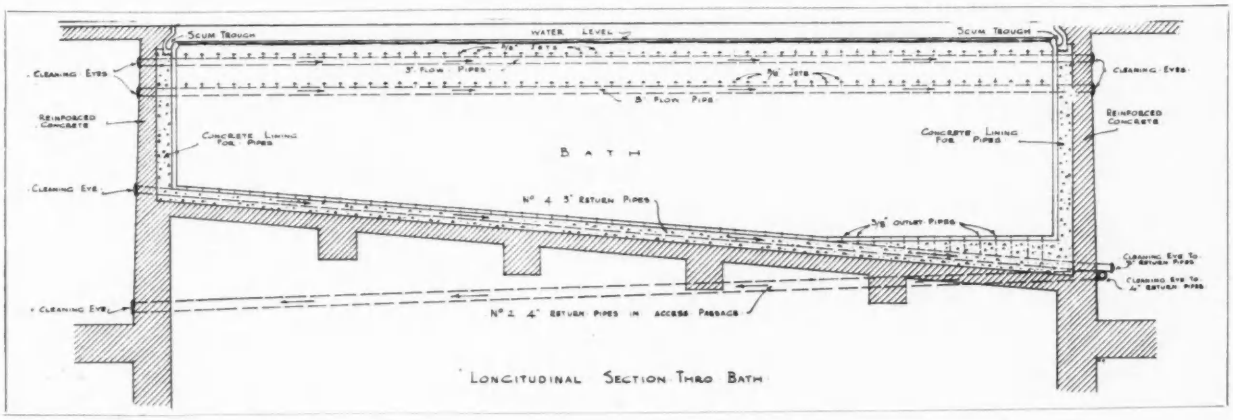
BYLAWS AS TO WATER-CLOSETS, ETC.

FOR some time past consideration has been given to the question of the revision of the bylaws made under section 39 (1) of the Public Health (London) Act, 1891, and section 24 of the London County Council (General Powers) Act, 1928, with respect to water-closets, urinals, etc.

In preparing revised bylaws regard has been had to suggestions submitted by the metropolitan borough councils and technical associations and to experience of the working of the existing bylaws. Their order of arrangement has been varied, particular requirements have been classified under distinct headings, and many minor alterations, variations and additions have been made so as to give a clearer presentment of the requirements. Important additions have been made dealing with the position, construction, lighting and ventilation of water-closets and the position and construction of urinal apartments, the latter being included under the powers conferred by section 24 of the L.C.C. (General Powers) Act, 1928.

Two provisions in the bylaws call for special comment :

(1) *Water-closets not on an external wall.*—A proviso to bylaw 2 (1) permits a water-closet to be so situated that none of its sides is an external wall and that an open space need not be provided if means of artificial lighting and a system of mechanical ventilation are furnished to such water-closet. Difficulties have, owing to site limitations, been experienced in Central London in providing for the construction of water-closets in both existing buildings and buildings in course of erection in a position having an external wall abutting upon an open space as at present required, with the result that such conveniences have, in many instances, been provided in a manner not in strict compliance with the bylaws. As the aim of the bylaws in this connection is to secure sufficient natural lighting and adequate ventilation, it was considered that, while the principles laid down by the current requirements should be adhered to where the character of the site reasonably provides for compliance, provision should also be made for sites and conditions where compliance is difficult and may be impracticable, so long as the convenience can be so lighted and ventilated as to allow for maintenance in a sanitary state.



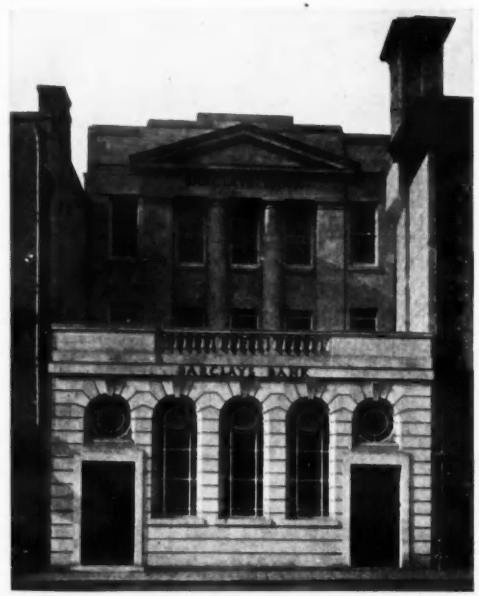
With the next appearance of the Specification Writer department (i.e. THE ARCHITECTS' JOURNAL *for June 25) it is hoped to include notes upon the new method of writing specifications, classifying the work to be done by its locality in the building rather than by the trades involved, a departure that is engaging the increasing attention of architects.*

Comments received from certain metropolitan borough councils and technical associations disclosed objection, on principle, to the construction of water-closets without means of natural lighting and ventilation. To meet the objection it was proposed to provide for the metropolitan borough councils to exercise their statutory discretion in giving or withholding consent to the construction of a water-closet so situate as not to have an external wall and an abutting open space, but in informal discussion of the matter with officers of the Ministry of Health it was ascertained that the proposal would not be likely to be acceptable to the Minister. As the form of construction envisaged will in all likelihood be limited to a type of building where the expense of installing mechanical ventilating appliances would be justified and would not become a general practice, the proposal was not pressed and the position, under the revised bylaws in their present form, will be that any person will be able to construct in any premises a water-closet not having an external wall and an abutting open space provided that suitable means of artificial lighting and a system of mechanical ventilation are furnished thereto.

(2) *Flushing of urinals.*—To meet objections raised by the Metropolitan Water Board to bylaw 3 (2) (*b*) (iii) and (iv), the flushing period, while a urinal is in use or available for use, was increased from twenty minutes, in the first draft of the revised bylaws, to twenty-five minutes, and a footnote was included, directing attention to the Board's regulations as to maximum flush and alterations to fittings, but the Board was not satisfied and contended that the requirement was likely to lead to waste of water. The requirement is in our opinion reasonable and necessary to ensure, in ordinary cases, maintenance of a urinal fitment in a sanitary state.

The draft revised bylaws have been submitted informally to the Minister of Health and he has suggested certain minor textual alterations, which we are advised may be accepted, subject to some consequential alterations. At the present stage the Minister expresses no opinion on the proposal that urinals shall be fitted with an automatic flushing apparatus. If the Metropolitan Water Board still wish to question the bylaw referred to under (2) above, when the draft bylaws are advertised, their objection will be considered then. Subject to this, the Minister is willing to confirm the bylaws when the statutory requirements have been complied with. We recommend

That bylaws be made by the Council under section 39 (1) of the Public Health (London) Act, 1891, and section 24 of the London County Council (General Powers) Act, 1928, with respect to water-closets, urinals, etc.



BRIDGNORTH : Refronted with local hand-made bricks. The plinth and doorway are in grey Alveley stone ; the cornice is of wood. The roof and dormers are retained from the old building.

STECHFORD : Faced with Hollington stone and Leicester sand stock bricks. Roof, green slates. A flat is provided for the manager.

STAFFORD : This building, of Hollington stone, is designed so that the ground floor can be set back in line with the upper stories when the street improvement scheme is carried out. Metal windows are fitted.

COVENTRY : Faced with similar materials as Stechford, above.

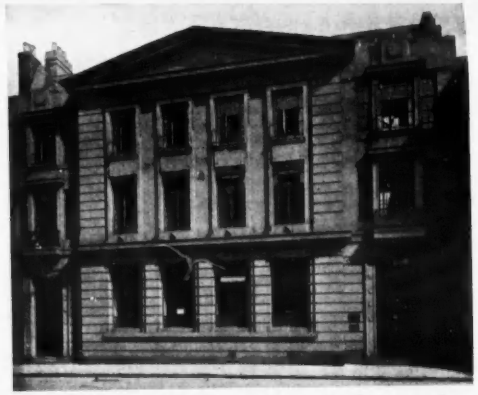
BRANCH BANKS *for* BARCLAYS

ON this and the facing page are illustrated eleven branch banks, erected recently in the Midland counties. Those at Bridgnorth and Newcastle-under-Lyme were remodelling schemes, necessitating considerable alterations in the interiors, refacing the exteriors, and the retention of the old roofs. With the exception of these and of Bedworth, in which parts of an old building were retained, the banks illustrated are new.

SOLIHULL : Walls, multicoloured bricks ; roof, Bridgwater tiles.

Stafford design, above. trated are new.

SOLIHULL : Walls, multicoloured bricks ; roof, Bridgwater tiles.

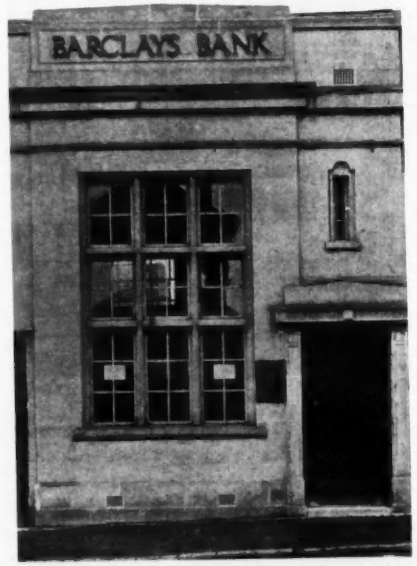


HALL GREEN, Birmingham : Leicester sand stock brick walls, with Darley Dale stone dressings.

DESIGNED BY

MOSELEY : Also faced with sand stock bricks and Darley Dale stone. The three deep metal windows give a family resemblance to the Stafford design.

COVENTRY : In stone, with each of the two doorways emphasized by an iron balcony on the first floor.



PEACOCK AND BEWLAY

NEWCASTLE-UNDER-LYME : An alteration in which the roof and certain old walls are retained. Exterior, Hollington stone.

KING'S NORTON : A new branch bank erected in an important suburb of Birmingham. It comprises the banking premises and a residence for the manager. The exterior is of Darley Dale stone. The interior fittings are of oak.

BEDWORTH : In adapting these premises a passageway and a considerable portion of the old building had to be retained.

IN PARLIAMENT

[BY OUR PARLIAMENTARY REPRESENTATIVE]

Hadrian's Wall

REASSURING information as to the future of Hadrian's Wall was given in the House of Commons last week by the First Commissioner of Works. In reply to questions put by Mr. Denman and Mr. West Russell, Mr. Lansbury said that the Government had given the question of the proposed quarrying near Hadrian's Wall their most careful attention and had come to the conclusion that, if the quarrying could be confined to a limited area, the result would be that no serious harm would be done, and the way would be left open for the preservation of the surroundings of the remaining stretch of the wall. Negotiations would proceed with this end in view. He would like to emphasize the fact that neither the wall nor the *vallum* was in any danger of being actually touched or damaged by the quarrying operations. At the same time, hon. members would be glad to know that a Bill was in course of preparation which would give his Department adequate powers to protect the surroundings of ancient monuments, including, of course, the Roman wall.

Charing Cross Bridge Scheme

Asked by Major Nathan to state the present position in regard to the Charing Cross Bridge scheme, Mr. Morrison, the Minister of Transport, said that the question of the promotion of a scheme for the construction of a new bridge was a matter which fell primarily to be dealt with by the London County Council as the bridge authority. He understood that the London County Council, at their meeting on June 3, decided not to take any action with a view to recommitting the Charing Cross Bridge Bill, but to appoint a Committee representative of all the interests concerned. Until he had had an opportunity of fully considering the matter, he would not be in a position to make any statement.

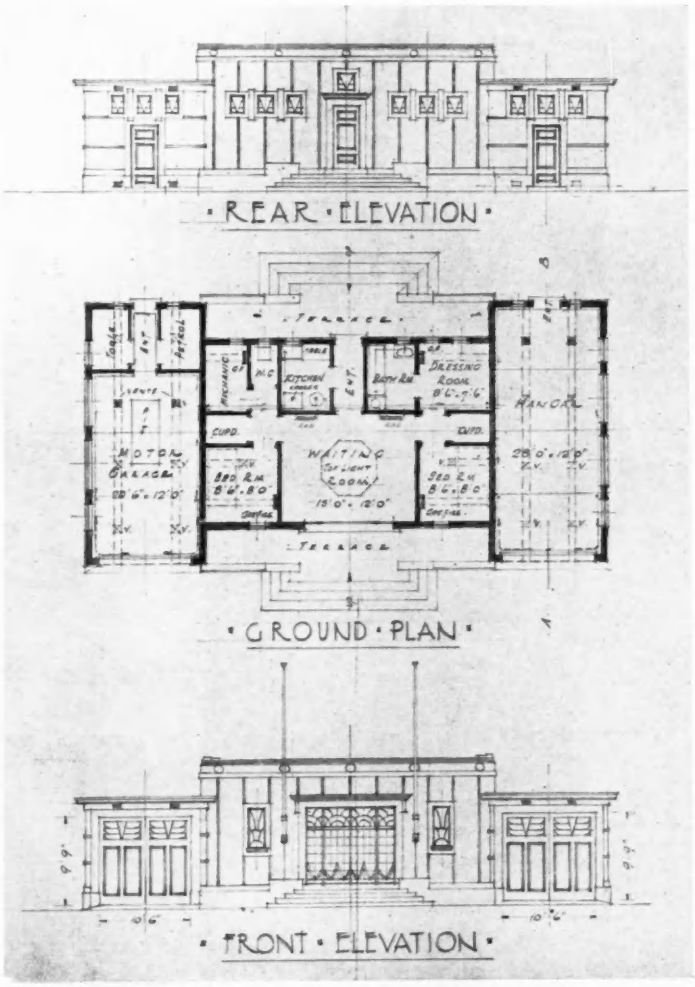
Existing Building Regulations

Mr. Arthur Michael Samuel asked the Minister of Health whether he would request the National Physical Laboratory and the Building Research Station to embark upon an investigation with the specific object of enabling them to advise, on their own initiative, local authorities as to how such authorities could advantageously eliminate rules and practices from existing building regulations which did not take into adequate consideration modern improvements in building materials and methods, and were consequently hindering employment in the building and co-operant trades.

Miss Susan Lawrence, who replied, said that the question which Mr. Samuel raised was, in London, for the London County Council. Elsewhere, the by-laws referred to had been in recent years subjected to a process of reconsideration with reference to modern improvements in building materials and methods. The Building Research Station was engaged on continuous and systematic investigation into building materials and structure.

Hyde Park as an Air Port

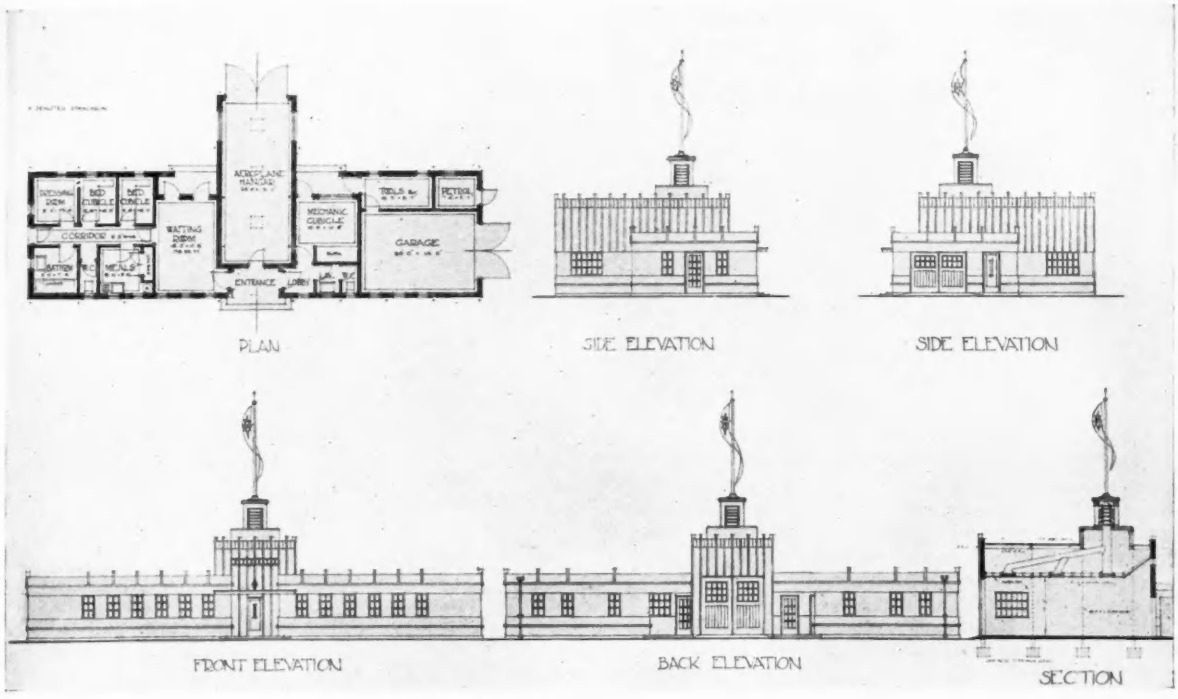
Mr. Sanders asked Mr. Lansbury, First Commissioner of Works, whether he had under consideration the question of permitting a certain portion of Hyde Park to be used as an air port.



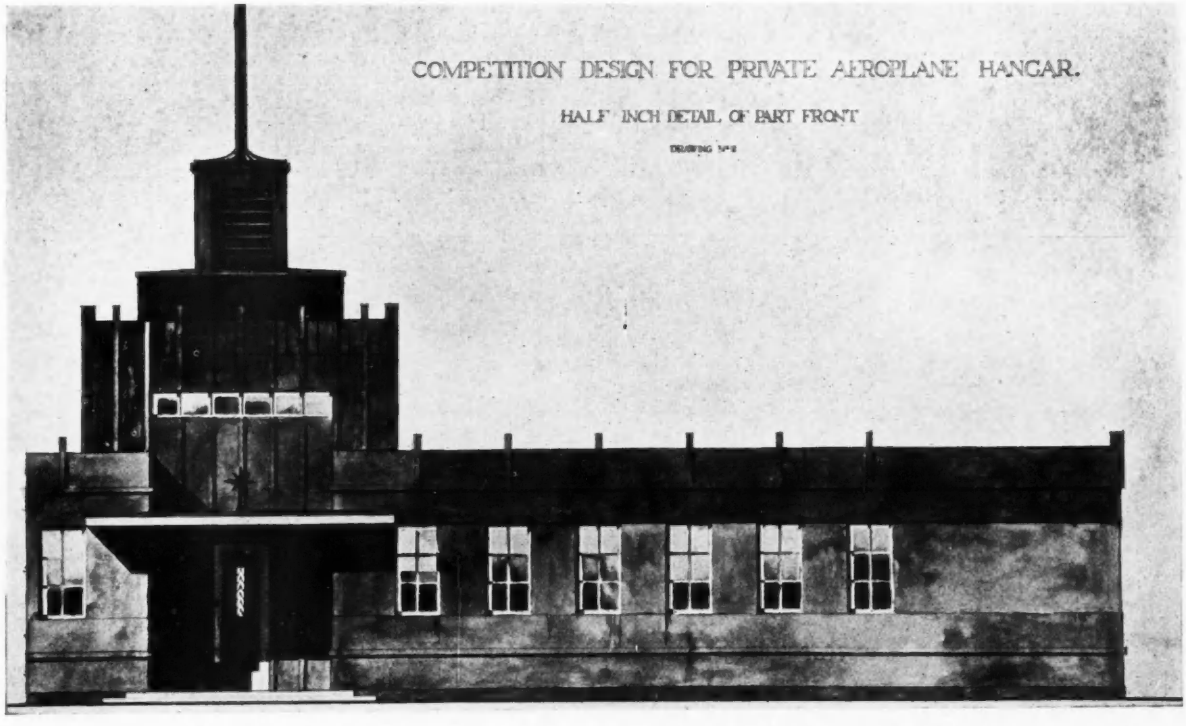
Mr. Lansbury in reply said he had seen the reports in the newspapers, but the matter had not otherwise been brought to the notice of his Department. The only statement he could make was that he had no intention of giving countenance to any such project.

The Channel Tunnel

Asked by Sir Austen Chamberlain whether he had any statement to make regarding the Channel Tunnel, Mr. MacDonald said his report would be circulated as a White Paper. He stated that the decision of the Government would be found to be against the Tunnel.



The Government's Slum Bill



Despite lengthy sittings of Standing Committee "A," the Government's Bill dealing with slum clearance continues to make but slow progress. The Bill is unlikely to pass into law until well on to the end of the session.

Competition promoted by the Association of Architects, Surveyors and Technical Assistants for a Lock-up Hangar for an Aerodrome. First Premiated Design, Class A. By W. Brooke. The winning design, Class B, is illustrated on the facing page.

PRIVATE LOCK-UP HANGAR FOR AN AERODROME

Competition promoted by the Association of Architects, Surveyors and Technical Assistants for a lock-up Hangar for an Aerodrome. First Premiated Design, Class B. By J. W. Davidson. The competition was arranged in conjunction with Ewart and Son, Ltd., and assessed by W. T. Hamlyn and Chas. McLachlan. It was divided into two classes, for those over and under twenty-five years of age, and the prizes cover free places in the A.A.S.T.A. party to Madrid in September, including second-class rail and steamboat travel throughout and all hotel expenses, except personal expenses. The drawings will be exhibited at the R.I.B.A., 9 Conduit Street, W., on June 14, between 11 a.m. and 3 p.m.

LITERATURE

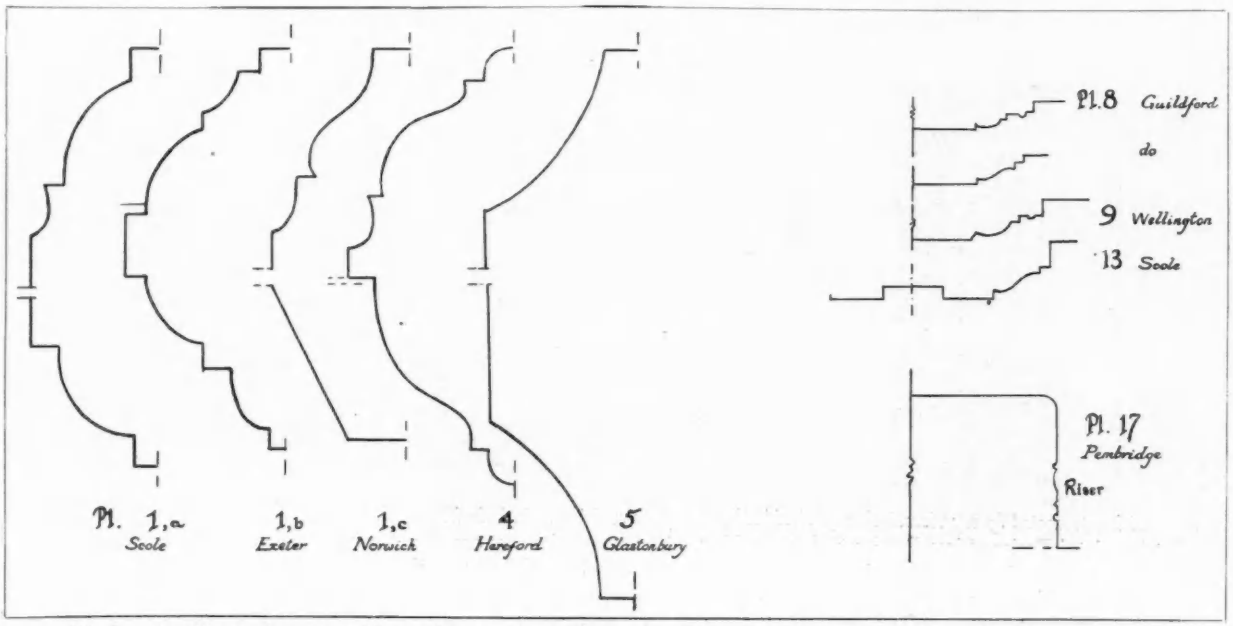
MOULDINGS OF THE TUDOR PERIOD

THIS portfolio is no mere picture book of architectural subjects, such as those with which the market has been flooded during the last few years, but a serious working record of well-chosen examples drawn from many counties. Primarily, it consists of full-size details of mouldings, but these are connected and made intelligible by small (⅜-in.) scale drawings of the objects with dimensions figured in. Its chronology (although no dates are given) extends from the early-sixteenth to the mid-seventeenth centuries, and covers Late Tudor, Elizabethan and Jacobean works. The authors have shown wise discrimination in confining themselves to ordinary domestic examples. These are infinitely better types of native work than pretentious and magnificent creations found in the houses of great folk, which, generally, were gross in conception and clumsy in execution. Indeed, except for occasional exceptions, it will be found that ordinary design, which was current at any period, represents the best design of that period.

The authors show appreciation of curves, avoiding that elementary but common blunder of supposing that every moulding of the ovolo type is necessarily a quarter of a circle. As they have not committed themselves by showing the centres from which their curves are struck, it is reasonable to conclude that they were drawn free-hand by their designers and should not be represented as compass-struck.

Amongst the mouldings drawn are those from windows, panelling, fireplaces, external and internal doors, stairs and beams.

The sections of window mouldings are well chosen and present considerable variety, including all the principal types. The ovolo moulding from Scole, plate one, has additional members within the glass line and, as carried out, must present an extremely satisfactory effect. That from Exeter, on the same plate, has cavetto and ovolo separated by fillets on one side of the glass line, but on the other side has two ovolos, similarly divided, thereby violating that good rule of not placing two convex or two concave mouldings together. However, craftsmen in the sixteenth century constantly departed from general practice and yet produced entirely satisfactory results. The moulding from Norwich on plate one is of earlier character, and whereas on one side of the glass line it has an ogee, finishing with a sharp quirk at the fillet and continued with a shallow hollow, it has a simple splay outside the glass. The mullion from Hereford, on plate four, is rich in rounds, hollows and ogee curves, and these on one side of the glass are smaller and more varied than upon the other side. The mullion from Glastonbury is from a stone window, and is almost symmetrical, with hollow chamfers within and without, of characteristic early-sixteenth-century form.



Of sixteenth- and seventeenth-century panel moulds an infinite variety exist, yet one finds the same mould repeated in examples from counties which lie far apart. Two from Guildford, on plate eight, show variations found in the same piece of panelling. That from Wellington, Somerset, on plate nine, differs little from one at Guildford; but that from a door at Scole, plate thirteen, is channelled down the centre, a detail one often finds in late-sixteenth-century stone windows and in woodwork.

The sections of fireplaces and doorways are valuable records, the importance of which is much enhanced where, as in many instances, sections of the door-moulds accompany the latter, for often a designer may have difficulty in finding authority for door sections, which few measurers note.

The details of stairs, naturally, display sections of handrails and strings, both of which are important and useful. On plate seventeen there is a full size of a delicate and charming moulding from the face of a riser—an unusual but delightful feature.

Another detail, seldom rendered, is the beam mould, of which a dozen or so examples are given.

Probably this is the most important work of its kind that has been published since Hurrell's *Old Oak English Furniture* in 1902. As a book of reference and inspiration, it should prove valuable. If it should induce those who acquire it to measure other examples themselves, to arrange them comparatively and to strive, by comparison, to detect the principles upon which the craftsmen concerned worked, the knowledge acquired will certainly prove invaluable. It is not to be

Window, panelling and stair mouldings selected and reduced from the full-scale plates in Mouldings of the Tudor Period.

expected that this is to be learned in the schools—it is one of those things which a man must find out for himself, and when he has found it he can never produce those travesties of sixteenth-century design which, so wittily, have been branded (by Mr. H. Chalton Bradshaw, I believe) as "Jacobethan."

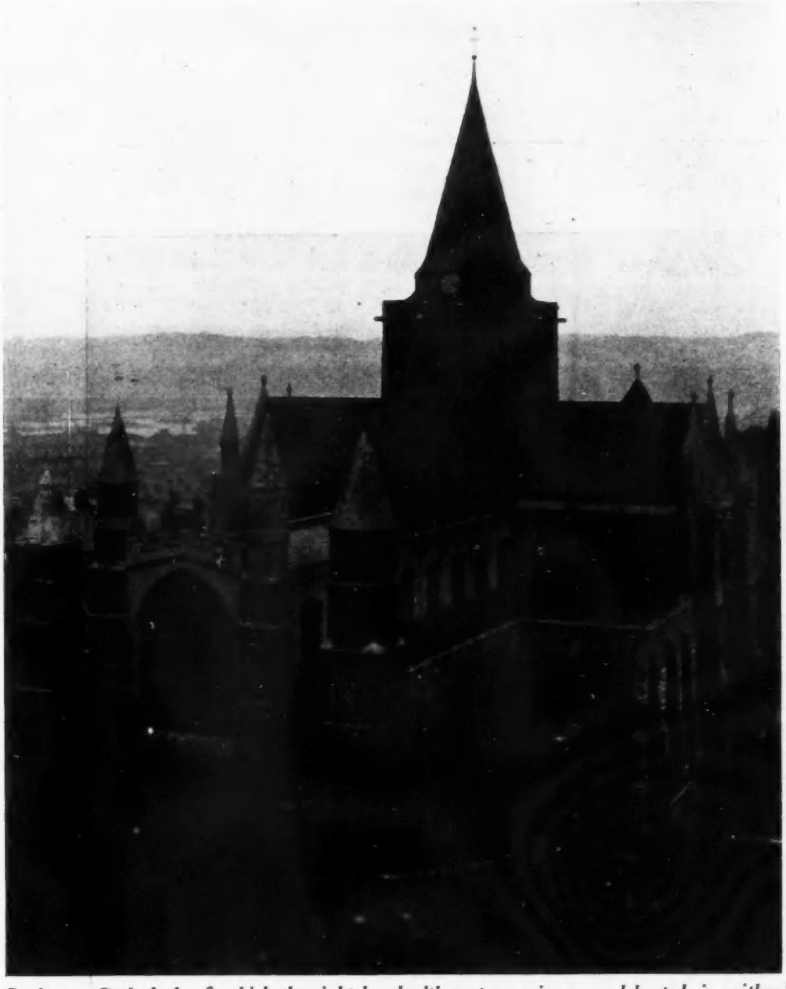
RUBBER FLOORING

THE failure of adhesion in certain cases of rubber floor coverings led the International Rubber Association to carry out a series of experimental tests. The result of these investigations has been published, and their thoroughness may be judged from the fact that the English edition of the report comprises some 150 pages, and is likely to remain the standard book on the subject for a considerable time. Tests were carried out on the rubber material itself, the various forms of adhesives, and on the composition of the flooring, the results showing that it is necessary to consider all these together when deciding the suitability of laying this type of floor covering.

Good rubber flooring, whether in sheets or tiles, should be smooth, non-porous, and when bent double for a period of six hours, should not break or crack. A too soft rubber floor will not adhere as well as a harder one, but on the other hand, a too hard floor will not deaden sound.

Of the many adhesives tested, the ordinary rubber solution in benzine was found to give the most satisfactory result when stuck to wood flooring. Resin cement also gave satisfactory results as long as the floor was dry, but the adhesion failed in the presence of damp more easily than in the case of the rubber solution, which held until the wood was saturated. With magnesite flooring, rubber was again the most satisfactory solution, especially when the filler was sawdust; but this particular type of sub-flooring is probably more used in shipbuilding than in architecture.



The tests carried out on concrete floors, which are the most common in practice, give some interesting results. Rubber solution adheres to a screed when the proportion of cement to sand is large, and the report suggests that this should never be less than 1 cement to $2\frac{1}{2}$ sand. Damp will weaken the adhesion of rubber solution, and render useless resin cement by the liberation of any free lime in the concrete. An existing floor which is permanently damp is unsuitable for rubber covering.

The experiments showed that the weakness lay rather in the composition of the concrete surface than in the adhesive, and further tests were undertaken to find a more suitable screed. The most satisfactory result was obtained by using a screed of 1 cement to $1\frac{3}{4}$ coarse sawdust well mixed dry, and with only sufficient water added later to form the material into a paste. When dry, the surface skin of cement was removed by scouring before applying the adhesive in the case of rubber solution. With this mastic the adhesion is unaffected by the presence of dampness. The laboratory test was so successful that large-scale tests have been carried out in Holland with satisfactory results.

The report recommends the use of resin cement as an adhesive on concrete floors that are bone dry and likely to remain so for laying rubber tiling, as it allows the tiles to be laid slightly away from their final position and pushed up over the cement, which ensures the edges between the tiles being flushed up with the cement and made waterproof. This cannot be done with rubber solution, which renders the tile immovable the moment it is laid. The report concludes with chapters on specification and method, which will prove a valuable guide to architects and prevent disappointment when laying this type of floor.

LL. E. WILLIAMS

Adhesion Problems in connection with Rubber Flooring. Report of the Rubber Flooring Research Committee of the International Rubber Association. The Hague, 1930.

Rochester Cathedral, of which the eight-hundredth centenary is now celebrated, is neither large nor imposing, and its spire is definitely ugly. On the other hand, the west front, damaged as it is by additions, is a fine piece of expressive architecture, the aisle walls coming through at their real value, to the advantage of the fine flanking towers.

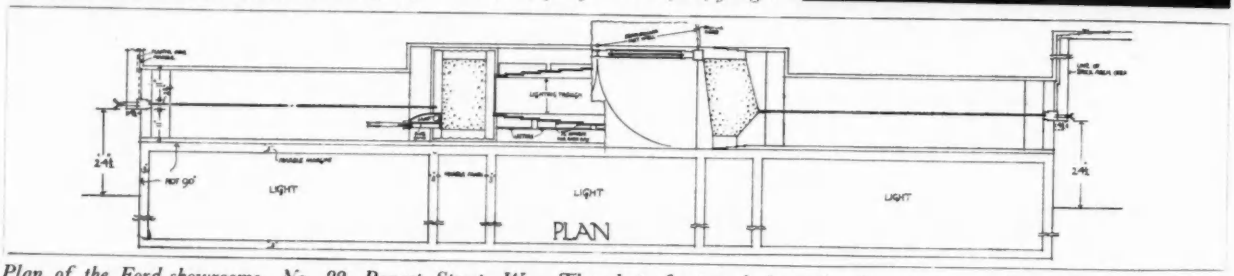
TWO LONDON SHOPFRONTS



THE two shop fronts illustrated on this page are reproduced from the June issue of *The Architectural Review*. That in Regent Street, erected for the display of Ford cars, has a main showroom two stories in height, with an interior colour scheme in silver and gold. The other, in Victoria Street, has been carried out in stainless steel, without enrichment other than the lettering and the luminous cornice.

The Ford Showrooms, Regent Street, W., by day.

The Ford Showrooms, Regent Street, W., by night

Plan of the Ford showrooms, No. 88 Regent Street, W. The shop front and the main showrooms are the work of Gerald A. Brown, in collaboration with the architects, Charles Heathcote and Sons. The main showroom is two stories in height.

LAW REPORTS

REFLECTED LIGHT : IMPORTANT JUDGMENT

Goldberg and another v. *Waite and Waite. Chancery Division. Before Mr. Justice Bennett*

THIS was an action by Mrs. Yetta Goldberg, the freeholder, and Sydney Bacons Pictures, Ltd., lessees, of 108 Great Russell Street, W.C., against Messrs. Waite and Waite, architects, to recover damages for alleged illegal obstruction of ancient lights.

The defendants denied that there had been any interference with plaintiffs' rights, or that they had suffered any damage.

Mr. Swords, K.C., and Mr. Belsher appeared for the plaintiffs, and the Hon. Stafford Cripps, K.C., and Mr. A. C. Nesbitt, for the defendants.

Mr. Swords said that the second plaintiff held a lease of 108 Great Russell Street from Mrs. Goldberg for twenty-one years from 1926, and that the defendants were the owners of premises at the rear which had been until 1927 the garden of 15 Caroline Street. On the other side of the garden was a large block of flats known as Bedford Court Mansions. There was a large recess in the Mansions over which, until defendants' building was put up, the back windows of the plaintiffs' premises obtained a fair amount of direct light. Apart from the recess, there was a certain amount of diffused light from the wall of the Mansions. The defendants said that the plaintiffs had no right to this reflected light, but if that were so it made it all the more important that the direct light should not be interfered with. The plaintiffs complained that the light enjoyed through the window in the back door, the ground-floor back-room window, the staircase window, and the first-floor back-room window, had been so materially diminished by the defendants' building as to constitute a nuisance and an illegal obstruction of their ancient lights.

Mr. Percy John Waldram, the daylight illumination expert, of 9 Gray's Inn Square, gave evidence for the plaintiffs. He said the two back rooms had been only sufficiently lighted before the defendants' new building was erected, and that they were distinctly inadequately illuminated now. With regard to the effect on the value of the plaintiffs' premises, he said there was a reduction in the normal rental value of the ground-floor room of at least £15 a year, and of the first-floor room of £10 a year. It was difficult to arrive at exact figures for the reason that when the other side of Great Russell Street was built up it might well be that reasonable lessees would not look at the rooms at any price. He put the letting value of the ground-floor back room in 1926 at £65, and of the first-floor back room at £50, and the reductions in value owing to the defendants' building down to £50 and £40, respectively. He would say that the staircase was now gloomy, but not dangerous. Disregarding the staircase and capitalizing the loss over sixteen years, the loss on the capital value of the premises was £400.

Cross-examined : He advised that the plaintiffs' chief claim was with respect to reflected light.

Mr. Cripps : Knowing that reflected light in the circumstances was not something to which they had a right?

Mr. Waldram said he could not hold an opinion on a point of law. He was hoping that that would be a point of law which would now be settled by this case. He only advised on the facts of the case.

Mr. Percy Vivian Burnett, of Messrs. Burnett and Eprile, chartered architects, of Jermyn Street, acting on behalf of the plaintiffs, said his firm wrote the defendants that they were of opinion that the proposed building would diminish the direct light to the back rooms, basement and ground and first floors of 108 Great Russell Street very seriously, and that it would deprive the windows of a considerable amount of light reflected from the side walls of Bedford Court Mansions. He gave evidence as to the loss of light to plaintiffs' building by the defendants' structure.

Mr. James Townsend Green, of Messrs. Weatherall and Green, also gave evidence in support of the plaintiffs' case.

Mr. Nesbitt, for the defendants, said he hoped to prove that the plaintiffs had not suffered any loss of direct light or, alternatively, that there was such a trivial diminution as would not justify the award of damages.

Mr. H. W. Hendry, F.R.I.B.A., of Messrs. Henry and Schooling, said he was employed to direct the erection of the new buildings. He said there was some doubt as to the inadequacy of the lighting on the ground floor of plaintiffs' premises. But the first floor was adequately lighted.

Cross-examined : He said that reflected light would make some difference, but not between adequate and inadequate light.

Mr. John Swarbrick, chartered architect and surveyor, of Maddox Street, W., described the case as the most trivial he had ever heard of.

Mr. C. J. Coade, of Messrs. Coade, Son, and Burgin, of Southampton Row, expressed the opinion that the loss of rent and loss of light was negligible, and too trivial to take any notice of.

Mr. Cripps, for the defendants, submitted that plaintiffs must prove that defendants were responsible for something which amounted to a nuisance, and even if it were, they had to prove that the light which was left after the erection of the defendants' building was sensibly less than before. The Court must look at the surrounding circumstances of the case, and here it was obvious that the substantial diminution of light in plaintiffs' rooms was caused by the construction of the Bedford Court Mansions thirty years ago. The mere addition of the insignificant obstruction by the defendants' building did not amount to a nuisance. Assuming there had been a diminution of light, the evidence showed that that which had been taken away was reflected and not direct light.

Mr. Swords replied.

His lordship, in giving judgment, said the plaintiffs made a claim in respect of two windows of rooms used for clerical purposes. These windows originally overlooked the former garden of 15 Caroline Street. About May, 1927, the defendants began building on the site and garden of Caroline Street. Questions were then raised as to the light to the windows in question. The extent to which Bedford Court Mansions obstructed the direct light had been fully put forward during the hearing. There was no question at all about that. Light came to the windows of plaintiffs' rooms as reflected light from Bedford Court Mansions. A plane tree had stood in the Caroline Street garden in front of the plaintiffs' windows. This had been cut down. But he was not satisfied that the plane tree had interfered to any substantial extent with the access of the light to the rooms. Defendants had now erected a building of which the plaintiffs complained.

THE SKETCH CLUB

Here are two points that sketchers, whether confessed or furtive, are advised not to overlook. One is that last week's issue contained full particulars of the Holiday Sketches Competition promoted by THE ARCHITECTS' JOURNAL*; and these are summarized on advertisement page xlvi of this issue. Secondly, the fifth session of the Sketch Club, due June 18, coinciding with the R.I.B.A. Conference at Norwich, sketches made in that city and in the county of Norfolk will then be shown.*

This building was nearer plaintiffs' windows than Bedford Court Mansions. Defendants' building had put an obstruction between plaintiffs' building and the wall of the Mansions from which the rooms derived their light. Before the defendants' building was erected, the rooms in question were reasonably well-lighted. The result of the defendants' building was to deprive the plaintiffs' two rooms of a substantial quantity of light. He was satisfied that the amount of light which the plaintiffs had been deprived of was such that the plaintiffs were entitled to complain on the ground that a nuisance existed. The letting value had been diminished to a capitalized amount of £225.

The question now was whether the defendants were liable in damages to the plaintiff in that sum. Plaintiffs had failed to satisfy him that any nuisance existed by the obstruction of light coming from the sky. That which had brought about the diminution of light was the interference with the light that was reflected from the Mansions before the defendants' building was erected.

There was no authority that reflected light could be acquired by prescription. His lordship did not propose to decide for the first time that an easement for reflected light could be acquired under the Prescription Act. Under the circumstances, plaintiffs having failed on this point he dismissed the action with costs.

GOOD AND SUFFICIENT REPAIR AT END OF LEASE

G.M.S. Syndicate, Ltd. v. *Kearsley and another. Chancery Division. Before Mr. Justice Clauson*

IN this case the G.M.S. Syndicate of Great James Street, Bedford Row, sought as against the defendants, John H. Kearsley and Walter G. Bell, the determination of certain boundaries, and claimed damages for alleged breach of covenant and interference with a wall.

By their defence the defendants denied the allegations of the plaintiffs.

Mr. L. Cohen, K.C., for the plaintiffs, said his clients sued as owners of the reversion of certain premises in Kentish Town Road which were held under a lease for ninety-three years from March, 1836. The lease contained a covenant that the premises should be delivered back at the end of the term in "good and sufficient repair." The plaintiffs' case was that the defendants and their predecessors in title had in breach of their obligations failed to preserve the proper boundaries of the property and to deliver up the demised premises distinct from other land. The demised premises in 1875 were vested in a Mr. Fox, the freeholder of the adjacent land, and it was alleged that that gentleman had demolished the buildings and destroyed the boundary wall between his freehold land and the demised premises, and erected shops, part of which were said to be on the land demised, on which stood the wall. There was also a complaint that the drainage system had all been made one, to the detriment of the plaintiffs' property.

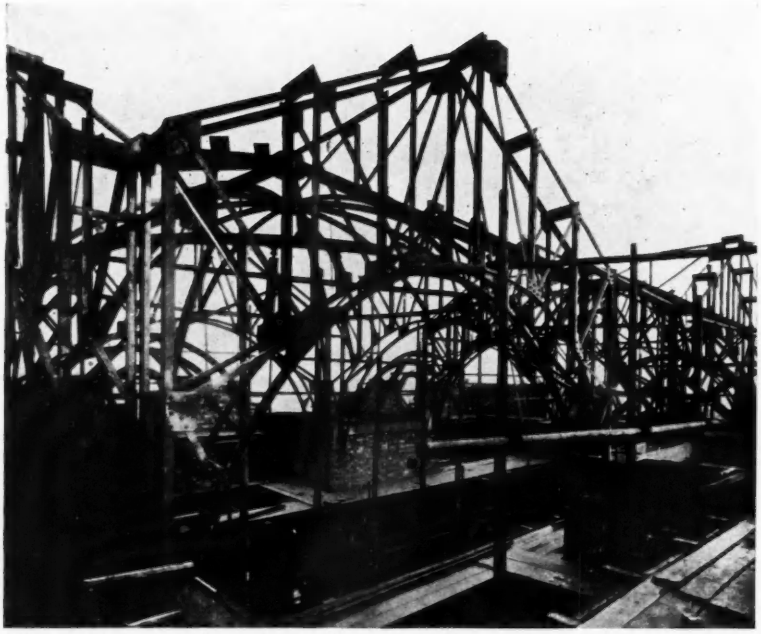
Mr. Preston, K.C., for defendants, said his clients' construction was that the alleged boundary wall was a party wall. They denied that the wall was on the plaintiffs' land or that they had confounded the boundary. They denied that the plaintiffs' property originally had a good and sufficient surface drainage. His case was that the premises, had been yielded up in the same condition as they were in immediately prior to the execution of the lease.

His lordship, after hearing a mass of evidence, said he held as a fact that the wall was in fact built so as to bound the two properties and so as to have its western face along the boundary line. The wall was now represented by a west wall of the three houses which had been subsequently built, and he granted a declaration to that effect.

Defendants, on the substantial point in the action, had succeeded, and he accordingly ordered plaintiffs to pay the defendants' costs, except in so far as they had been increased by the claim for waste through the alleged alteration of the character of the property.

Punch Summer Number

THE summer number of *Punch* is lavishly illustrated both in colour and in black-and-white.



Raven Hill's picture of an Oriental guide in the tropics placing two tourists "eggsackly on de equator," and Arthur Watts's "Beauty Doctor," will attract attention, as will also the picture by George Morrow showing how "Little Willie Jones, with a bent pin, won the first prize in the Annual Sea-fishing Competition at Paddle-beach Pier," and those by Wallis Mills telling how a couple who were bored to tears by the sun-baked crowds at European resorts went in search of new seaboards only to find the coasts of Africa and the South Sea Islands equally and even more unpleasantly crowded. H. M. Bateman's "The Man who paid off his Overdraft" is a gem.

Punch. Summer Number. Price 1s.

COMPETITIONS OPEN

June 14.—The Chelmsford Corporation invites architects to submit designs in competition for a new public library in accordance with conditions drawn up by H. V. Lanchester, F.R.I.B.A., who will act as assessor. Applications for conditions and a plan of the site should be made to G. E. Barford, Town Clerk, Chelmsford. Deposit £1 1s. Latest date for submission of designs: June 14.

June 14.—The Corporation of Kingston-upon-Thames invites qualified architects to submit competitive designs for the erection of public baths. Assessor: J. Ernest Franck, F.R.I.B.A. Premiums: £300, £200, £100 and £50. Particulars, etc., obtainable from A. W.

The steel framework of the Church of Our Lady of Mercy and St. Thomas of Canterbury, Gorton, Manchester. (*See also pages 891-4.*) *It is the work of Robinson and Kershaw.*

Forsdike, Town Clerk, Town Clerk's Office, Kingston-upon-Thames. Deposit £1 1s. Latest date for submission of designs: June 14.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thomas, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor: H. V. Ashley, F.R.I.B.A. Premiums: £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs: July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall, which is to be built on the site of the old town hall at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor: Herbert T. Buckland, F.R.I.B.A. Premiums: £150, £100, and £50. Applications for conditions of the competition, etc., should have been made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs: July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor: Professor Patrick Abercrombie, F.R.I.B.A. Premiums: £150 and £50 for first and second places, respectively. Copies of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs: September 1.

No date.—The Carlisle Corporation invites British architects to submit designs for the façade to English Street and the Victoria Viaduct, suitable for shops and business premises. The site was previously occupied by the Prison. The total length of the frontage is approximately 358 ft. Assessor: Francis Jones, F.R.I.B.A. Premiums: £300, £200, and £100. Particulars of the competition, etc., may be obtained from Percy Dalton, A.M.INST.C.E., A.R.I.B.A., City Engineer, 18 Fisher Street, Carlisle. Deposit, £1 1s.

No date.—The General Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums: £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2.

THE ARCHITECTS' DIARY

THURSDAY, JUNE 12

LONDON SOCIETY, Lancaster House, St. James's S.W.1. International Exhibition of Modern Commercial Architecture. Until June 30.

SOCIETIES AND INSTITUTIONS

R.I.B.A. PRIZES AND STUDENTSHIPS

The Council of the R.I.B.A. have decided that after January 31, 1931, in addition to the existing qualifications, competitors for the Tite Prize must at least be registered probationers, R.I.B.A., while competitors for the following prizes must at least be elected students, R.I.B.A. :

Soane Medallion.
Victory Scholarship.
Owen Jones Studentship.
Silver Medal for Essays.
Henry Saxon Snell Prize.
Alfred Bossom Travelling Studentship.
Grissell Prize.
Neale Bursary.
Hunt Bursary.
Godwin and Wimperis Bursary.

R.I.B.A. MAINTENANCE SCHOLARSHIP

The R.I.B.A. offer for award in July, 1930, one R.I.B.A. Maintenance Scholarship in Architecture, of a maximum value of £100 per annum, tenable from October, 1930.

The scholarship will be tenable in the first instance for one year and will be renewable for two further periods of one year each. It is intended to enable a student, who has not the necessary means, to attend an approved course at one of the schools of architecture recognized for exemption from the R.I.B.A. examinations. Students who are already taking such a course are also eligible to apply for a scholarship.

The value of the scholarship, up to the limit of £100, will depend upon the financial circumstances of the parents or guardians of the candidates. Further particulars may be obtained from the Secretary, Board of Architectural Education, R.I.B.A., 9 Conduit Street, London, W.1. The closing date for the receipt of applications, duly completed, is June 30, 1930.

LIVERPOOL ARCHITECTURAL SOCIETY

The H. W. Williams Scholarship for the promotion of architectural design in concrete, value £50, for one year, is open to all members of the Liverpool Architectural Society (and allied branches).

The scholarship for 1930 will be awarded for the best design submitted for the erection, in reinforced concrete, of a railway station in a new and fashionable seaside resort on the South-West Coast. The latest date for submission of designs is 5 p.m., July 31.

Further particulars are obtainable from Messrs. Hodgson, Morris & Co., chartered accountants, 41 North John Street, Liverpool.

TRADE NOTE

Messrs. Ruston and Hornsby, Ltd., of Lincoln, have received instructions from the Manchester Corporation to supply three of their six-cylinder vertical oil engines, each of 360 b.h.p., for generating electricity in connection with the waterworks undertaking on the Haweswater site. The engines work on the "Ruston" airless injection system, and they are of the totally enclosed forced lubrication type. The accompanying illustration shows an engine of the type selected by the Manchester Corporation installed in the power house of an industrial undertaking in the Eastern Counties. This is the seventeenth Ruston engine installed by the same firm, who have been users of Ruston airless injection engines for about thirteen years.

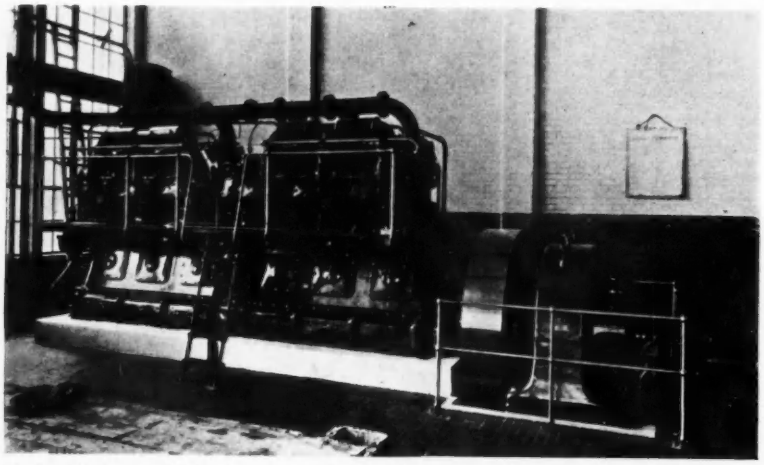
NEW INVENTIONS

The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.

LATEST PATENT APPLICATIONS

15438. Clough, H. Lighting sheeted buildings. May 20.
16077. Cowper, E. O. Building, etc., materials. May 24.
16008. Pierres, R. E. M. Constructional blocks, etc. May 24.
15642. Reimann, F. Building material. May 21.
15914. Robinson, A. P. Means for securing roof slates, etc. May 23.

SPECIFICATION PUBLISHED



329291. Berry, A. F. Manufacture of blocks, bricks, slabs, and the like, suitable for use in the construction of roads, buildings, and other structures.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Church of Our Lady of Mercy and St. Thomas of Canterbury, Mount Road, Gorton, Manchester (pages 891-894). * In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Broken brick or stone, 2 in., per yd.	0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

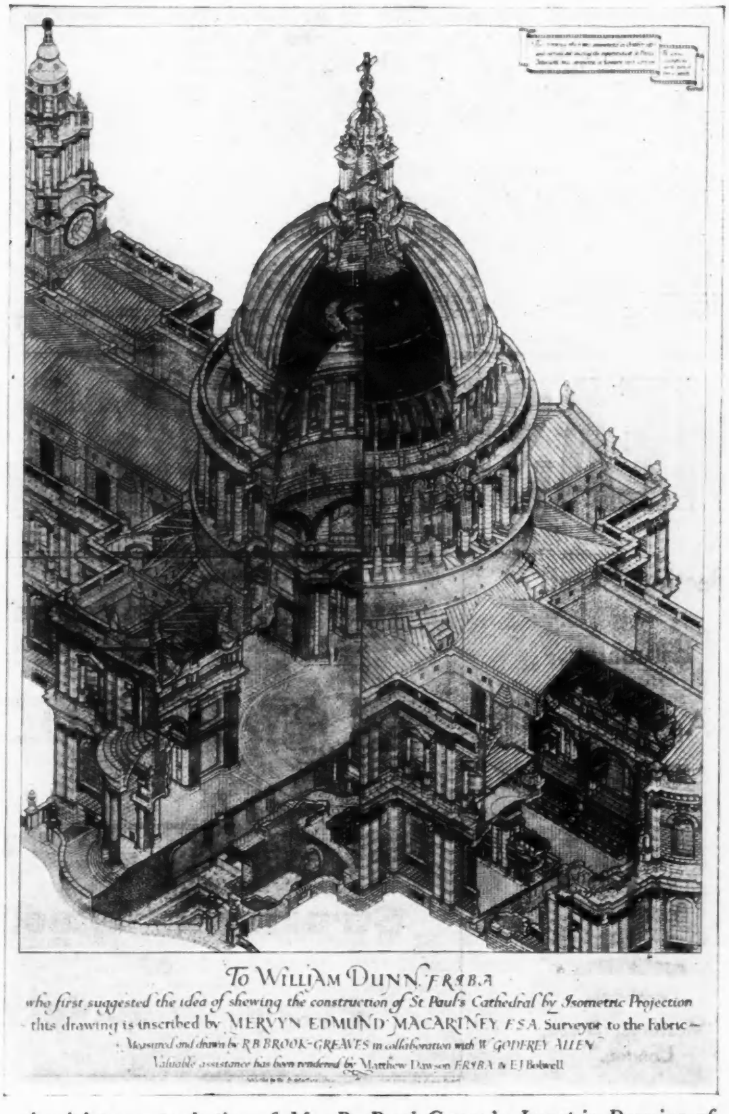
THE PUBLISHER'S PAGE

MUCH attention is bound to be focussed on St. Paul's Cathedral during the next few weeks in view of its official reopening on June 25, after seventeen years of restoration work. The progress of this restoration work gave Mr. R. Brook-Greaves an unique opportunity thoroughly to survey and measure the entire building in a way which would not otherwise have been possible, and the results of this research have been incorporated by him in his famous Isometric Drawing. Below is a reproduction of this drawing in miniature ($\frac{1}{300}$ of its original size). Reproductions in collotype to a size of 51 ins. by 37 ins. have been made by the Architectural Press, and published at 30s. each, either mounted on cloth or in four sections unmounted.



Mr. Walter Tapper, writing of the drawing, says: "It is the result of years of labour spent in investigating the exact methods of constructing the building, and in demonstrating these in a manner that the architect and layman can appreciate, although only experts can realize the patience and perseverance that such a work has involved. The drawing is a novel way of placing before the modern student the scientific methods which Wren employed to carry his dome by means of masonry on to the eight great piers . . . an unique drawing which should last for all time, both as a study in the construction of a great design, and as an example of masterly architectural draughtsmanship for students to follow. It may be confidently assumed that copies of this drawing will be found in every architectural school and technical library in the world, and in the possession of everyone interested in constructive architecture and fine draughtsmanship."

It may be of interest to readers to note that the Council of the R.I.B.A. has arranged to celebrate the re-opening by a special general meeting on Monday, June 23, at which a lecture dealing with the Restoration of the Cathedral will be delivered by Captain C. Stanley Peach and Mr. W. G. Allen. The lecture will be illustrated by slides and by an exhibition of models, masonry specimens, drawings and photographs, which will remain open till June 28.

AFTER seeing the first instalment of the new Specification Writer department in THE ARCHITECTS' JOURNAL for May 28, it is interesting to turn to the *Journal of the Architectural Association* containing the report of Dr. Stradling's paper on the Building Research Station. At the end of the lecture, Mr. Hope Bagenal, moving a vote of thanks, said: "By every post we architects receive messages of glad tidings of the solutions of all our problems. Many of these messages are so repulsive in their lettering and make-up that they go straight into the waste-paper basket; they tend to eliminate themselves, but how are we to know which are good and which are bad?"

That is, indeed, the question. We have, as Mr. Bagenal said, of necessity to proceed by experiment. The store of organized knowledge on the subject of new materials and new processes is lamentably small. "If we take the question of books, for instance," said Mr. Bagenal, "have we got plenty of textbooks covering the enormous range that we have to cover? The answer is, No; our textbooks are very few and, with a few exceptions, poor. I am afraid we must admit that knowledge for its own sake is not our strong point as a profession." To supply the knowledge to which Mr. Bagenal refers is precisely the purpose of this new department inaugurated in THE ARCHITECTS' JOURNAL. Together with the section entitled "Questions that Arise," by the end of the year it should already constitute a body of information the like of which is not obtainable elsewhere today.

Inadequate as they are, our textbooks today were built up in just such a manner. Builders and architects throughout the country went forward step by step trying new ways and new materials, and as each innovation was tested and found to be reasonable and secure, it passed into tradition which is our common possession today.

A miniature reproduction of Mr. R. Brook-Greaves's Isometric Drawing of St. Paul's Cathedral, recently published by the Architectural Press.

BUILDING CONTRACTS OPEN

Unless the contrary is expressly stated, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district. Application for plans and particulars should be made to the address given at the end of each entry.

LUDLOW : HOUSES

June 12.—For the erection of twenty-two non-parlour-type houses, for the T.C. W. G. Lane, Borough Surveyor, Guildhall, Ludlow. Deposit £1 1s.

HEYWOOD : HOUSES

June 14.—For the erection of sixty houses in six blocks, in Peel Lane, Heywood, for the Corporation. J. B. Nuttall, Borough Surveyor, Municipal Buildings, Heywood.

ARMAGH : SCHOOL

June 14.—For the rebuilding of Temple public elementary school (near Keady), for the County of Armagh E.C. G. H. Mills, Architect, The Mall, Armagh, or from the Education Office, Armagh. Deposit £2 2s.

CROYDON : HOUSES

June 16.—For the erection of fifty-two houses at Mitcham Road estate, for the T.C. The Borough Engineer, Town Hall, Croydon. Deposit £3 3s.

WREXHAM : HOUSES

June 16.—For erection of 118 dwelling-houses on the Holt Road estate, for the T.C. J. England, Borough Engineer, Wrexham. The houses will be tendered for in five groups varying from twenty-five to twenty-eight in each group.

FELTHAM : HOUSES

June 16.—For completion of forty houses and maintenance items on 164 houses on the Poors' Land housing scheme, Burns Avenue, Feltham, for the U.D.C. The work consists principally of joinery fixings and decoration. J. P. Blake, Architect, Bank House, High Street, Hounslow. Deposit £2 2s.

LEEDS : EXTENSION

June 16.—For the extension of the Colony for Mental Defectives at Meanwood Park, Leeds, to comprise the erection of adult blocks, children's blocks, lowest grade blocks, school, entrance lodge, etc., for the Mental Health Services Committee. The Executive Officer, Mental Health Services Committee, 38 Park Square, Leeds. Deposit £3 3s.

WHITEFIELD, LANCS : HOUSES

June 16.—The Whitefield U.D.C. invite alternative tenders (all trades) for the erection and completion of (1) 108 houses and (2) 220 houses on the Victoria estate, Whitefield; also drains, paths and fences, road and sewer works in connection therewith. C. F. Porter, Clerk, Whitefield. Deposit £2 2s.

PATELEY BRIDGE : HOUSES

June 17.—For the building and completion of twenty-eight scullery-type houses, for the R.D.C., viz. : (1) ten houses at Clint Road, Birstwith; (2) ten houses at Harrogate Road, Hartwith; and (3) eight houses at Greenwood Avenue, Pateley Bridge. Contractors may tender for (1), (2) or (3), or the whole. E. Moorhouse, Clerk, the Council Offices, Pateley.

TORQUAY : HOUSES

June 18.—For the erection of seventy-six blocks of houses in pairs and nine blocks of houses in fours on the Barton housing site. The Borough Engineer's Office, Town Hall, Torquay. Deposit £2 2s.

SCUNTHORPE : BATHS

June 18.—For (1) erection and completion of public baths on Doncaster Road, Scunthorpe; (2) supply and erection in connection with the baths of (a) heating and ventilating apparatus and hot and cold water installation; (b) continuous filtration, etc., plant; (c) laundry plant; (d) wiring for electric lighting and power, for the Scunthorpe and Frodingham U.D.C. W. Farrar, Engineer and Surveyor, Council Offices, Scunthorpe. Deposit, £2 2s.

LONDON (ST. PANCRAS) : GARAGE BUILDING

June 19.—For erection of garage building (with about 5,000 square feet floor space) in borough of St. Pancras, for the Trustees of the Eleanor Palmers' Charity. Salter, Rex and Co., Architects, 311 Kentish Town Road, N.W.5. Deposit £1 1s.

DONEGAL : CHURCH

June 20.—For erection of new memorial church of the Four Masters in the town of Donegal. A. E. Smith, Quantity Surveyor, 16 Upper Merrion Street, Dublin. Deposit £3 3s.

SWINDON : HOUSES

June 21.—For erection of eighty-four houses and six houses with shops on their Hurst housing estate, for the Corporation. J. B. L. Thompson, Borough Surveyor, 34 Regent Circus, Swindon.

BINGHAM : HOUSES

June 21.—For the erection of houses in the following parishes, for the Bingham R.D.C.: Aslockton, four; Cropwell Bishop, eight; Plumtree, four. C. W. Kendrick, Housing Surveyor, Council Offices, Bingham. Deposit £3.

BOLTON : MARKETS BUILDINGS

June 23.—For erection and completion of new markets buildings, consisting of fruit and vegetable market, fish market and other erections, proposed to be built on land abutting upon the southerly side of Ashburner Street, Bolton, for the T.C. The Borough Engineer and Surveyor, Town Hall, Bolton. Deposit £5.

BOLTON : BUILDING

June 23.—For erection and completion of weight and measures office, public weights office, caretaker's house, restaurant and public conveniences, proposed to be erected on land abutting upon the northerly side of Ashburner Street, Bolton, for the T.C. The Borough Engineer and Surveyor, Town Hall, Bolton. Deposit £5.

LONDON (LEYTON) : EXTENSION

June 23.—For erection of a public washhouse as an extension to the public baths, Cathall Road, Leytonstone, E.11, for the T.C. The building includes reinforced concrete work, drainage, minor alterations to the existing public baths and contingent works. The cubic contents of the new building are approximately 118,000 cubic feet. A. P. Howell, Borough Engineer, Town Hall, Leyton, E.10. Deposit £10.

LONDON (KINGSBURY) : HOUSES

June 24.—For construction of the following, for the U.D.C. : (a) Thirty-four houses on the Church Lane housing site and (b) new concrete road (about 300 yards lineal) and soil and surface water sewers. R. C. N. Newport, Surveyor, Council Offices, Kingsbury, N.W.9. Deposit £2 2s.

CRUMLIN : SCHOOL

June 28.—For erection of a Council school for juniors and infants at Sofrydd, Crumlin, for the Abertillery Education Committee. Rees Rees, Acting Secretary, Queen Street, Abertillery. Deposit £5.

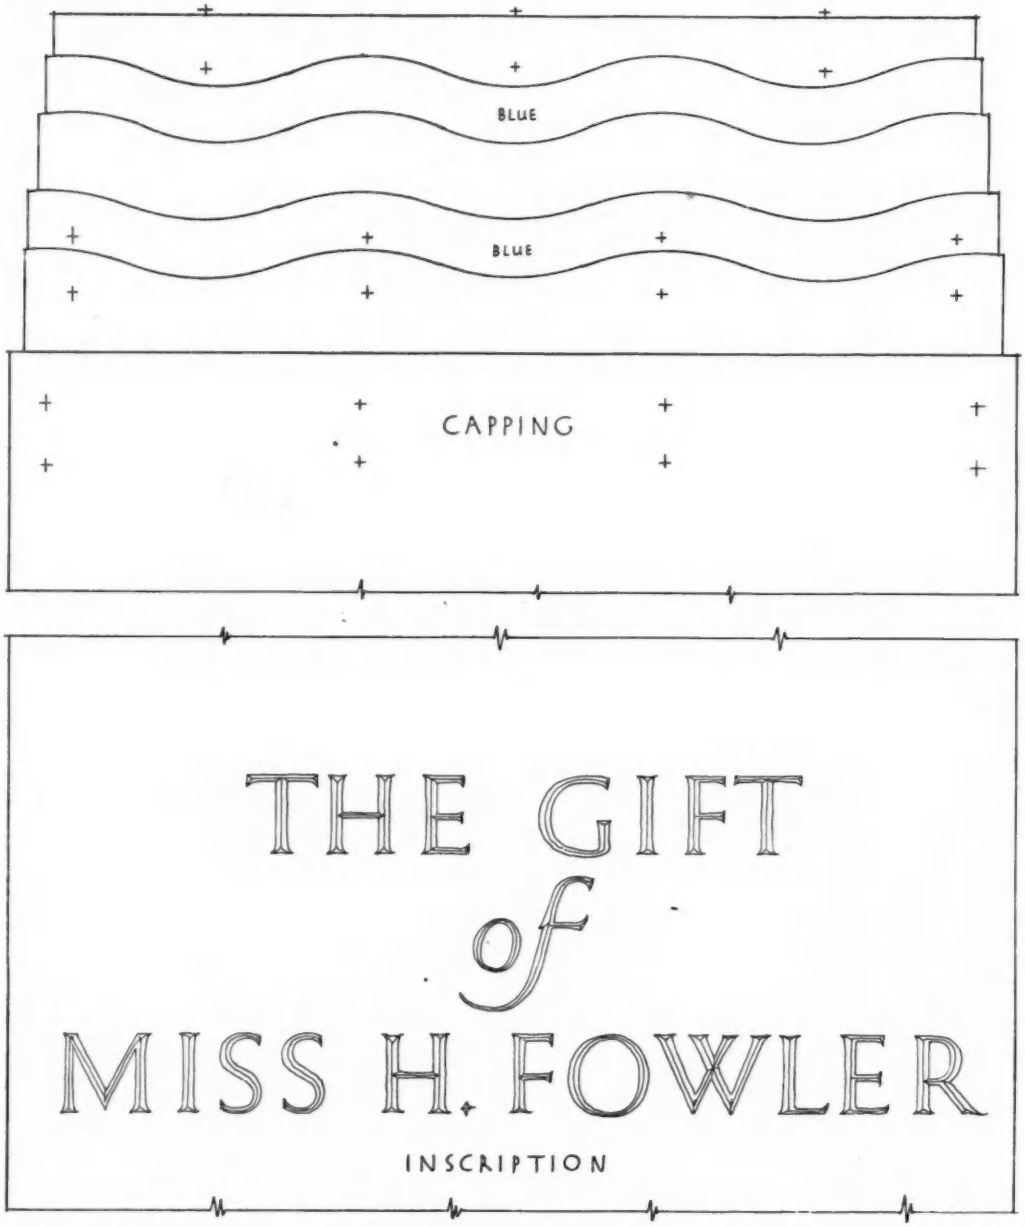
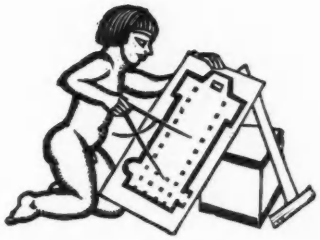
A WEEKLY SERIES



FONT IN THE FIRST CLUBLAND CHURCH, WALWORTH, S.E.
DESIGNED BY EDWARD MAUFE

THIS seven-sided font by Edward Maufe for the First Clubland Church (of the Wesleyan denomination) is of almost extreme severity, and is built of four pieces of Portland stone, the topmost carrying a band of wave offsets, two of them coloured a clean chalk blue, and the whole standing on a raised stone daïs, projecting some 2 ft. from the silver-panelled wall of the church. It is a gift to the church, and this fact is proclaimed by means of a short inscription carved on the lowest stone, in the manner known as Roman, most excellently by Mr. Eric Munday, in refreshing contrast to the usual travesty of Gothic black-letter that is so difficult to decipher.

There is no provision for drainage, as it is customary with this sect to bring the bowl of water used for the ceremonial to the font and remove it afterwards.



NOTE: The drawing reproduced overleaf may be read with architect's scales (1" and 6"=1 foot).

THE ARCHITECTS' JOURNAL

WEDNESDAY, JUNE 18, 1930

MANUFACTURERS and ARCHITECTS

"When I want aught I do ask; and, where asking faileth, I do most usually take."

—R. L. STEVENSON: *The Black Arrow*

THERE is evidence that a situation is coming into existence between architects and the manufacturers of building materials that, as it extends, threatens to present a truly remarkable aspect, one that might well have been the invention of W. S. Gilbert's fertile brain. For we have certain manufacturers, on the one hand, wailing that they can find no market for their goods; while, on the other, certain architects are crying out that they cannot get the materials they want without going abroad for them. This is notably the case with such things as decorative metalwork, light fittings, furniture, glass, textiles, etc. Recent letters published in this JOURNAL go to show that architects are quite prepared to use standard articles, but insist (so far as possible) that these shall be designed to fall into place with modern taste and surroundings.

Many manufacturers, on their part, confess to finding increasing difficulty in selling their goods in this country, and, in addition, to a tendency for their foreign trade to disappear. Those countries to which formerly there was a big export trade are now manufacturing the same articles for themselves; and because they are untrammelled by evil traditions and obsolete plant, their results are often better. This in itself has a further repercussion against the British manufacturer, because the erstwhile importer of British goods is now tending to export to Great Britain. In most cases the actual quality of the goods (from a manufacturing point of view) is not of such a high standard as that of the British article; but where the design is very much better, the architect may feel justified in sacrificing a little hypothetical quality to the ultimate appearance and æsthetic soundness of his work.

As this process develops in all parts of the world, the British manufacturer must ultimately rely purely and simply on such home sales as he can salve from the acute foreign competition. The manufacturers affected cannot, surely, fail to see this ultimate conclusion of the process; and so it is the more remarkable that they do not do more to recapture the home market which is their last resort.

The first thing for a manufacturer who finds himself in such case to understand is that the architect does not buy foreign goods only because they are cheaper. He buys them chiefly because they are better designed from every point of view. The foreign manufacturer is ten years ahead of his time; the British is, alas! often ten years behind.

It may be difficult for manufacturers to foresee the nature of impending demands; we even admit that this is so. On the other hand, there are very many people who can foretell it fairly accurately for them. We hear from time to time from members of the profession that they are clamouring for such and such a type of design, in such and such a material, and we cannot suppose that these comments are denied to the manufacturer and are reserved solely for our editorial ears.

Moreover, manufacturers do have ample opportunity for finding out what architectural thought is demanding. Every year hundreds of designs, and suggestions for designs, are submitted by architects for tender. Some of these are carried out in this country; others are executed abroad on the score of cost. But the British manufacturer has seen them; he should be able to analyse them and discover the fundamental ideas which underlie them; and, if he cannot do this himself, let him call in one of the many specialists who can do it for him. And then, above all, let him take the specialist's advice.

Manufacturers are not asked to take architects' own individual designs and standardize them (though there is much to be said for this also). All that architects have a right to expect is that the spirit and underlying thought of their designs should be catered for—as it is being catered for abroad. But this they do expect.

We know of one or two firms which have employed experts to find out for them what architects really want; the experts have duly reported—and have been ignored. This type of British manufacturer would seem to have arrived at that point at which he has neither the initiative nor the courage to *create* a demand, a particular in which he once led the world.

A TUDOR SCHOOL IN BRICK AND STONE

On Saturday last the Rt. Hon. Viscount Hailsham formally opened the Arnold, the north and final, wing of the Eastbourne College War Memorial Buildings. The entire scheme has taken about seven years to complete. The war memorial was unveiled and dedicated by Lieut.-General Sir Charles H. Harington, on June 28, 1925, on completion of the central tower and the south wing. Messrs. Tatchell and Wilson, the architects, have designed the new buildings in a free Tudor manner, in brick and stone with a tile roof, due regard being given to tradition and the scale of the existing school. Further illustrations and a description of the buildings appear on pages 929–932.

NEWS & TOPICS

William Graham Holford, a native of South Africa, and this year's winner of the Rome Scholarship in Architecture, is one of the Liverpool School students. He already has many successes to his credit, including the Travelling Scholarship to America, in virtue of which he recently spent six months in the United States.

LIVERPOOL WINS THE ROME SCHOLARSHIP

THE Rome Scholarship in Architecture has gone once again to the Liverpool School. William Graham Holford, the winner, is one of the school's most brilliant students, and a man of parts besides. He won last year the £300 Travelling Scholarship given to the Liverpool School by the Society of Arts and Sciences of America, and with it paid a six months' visit to that country, travelling and working in various offices. As a member of the University he has edited the undergraduate magazine, *The Sphinx*, and taken a leading part in the dramatic society, as actor, producer, scenic artist and even author, while his water-colour work, sent back to South Africa, has brought him in a more than negligible income. He will be the fifth Liverpool man to win the Rome out of the thirteen times it has been awarded, and with his American experience behind him he should be able to make a more profitable use of the opportunity for study than any before him. I trust he may.

RAGNAR ÖSTBERG : HONORARY FOREIGN ROYAL ACADEMICIAN

Last Tuesday the secretary of the Royal Academy announced that, at a general assembly of Academicians and Associates, Professor Ragnar Östberg was elected an Honorary Foreign Royal Academician. This is the second British honour that has been conferred on this famous Swedish architect. It will be recalled that he was awarded the Royal Gold Medal in 1926. Östberg is one of the outstanding exponents of the Renaissance in Sweden, and it is largely due to his Stadhuset at Stockholm that Swedish architecture is today so well known throughout the world. Of important buildings, I think the Ostermalms Public Secondary School and the Patent Office are, after the town hall, his greatest achievements.

MODERN BUILDING PRACTICE

It is good news that the National Physical Laboratory and the Building Research Station may shortly embark upon an investigation of existing building regulations with a view to bringing them into accord with the best modern practice. So many new materials and new methods of construction are now coming into use that it is difficult for local authorities to be fully acquainted with these and keep their building bylaws up to date unless they receive expert advice. The need for caution is so great that local authorities are apt to be far too conservative, and consequently a little "difficult" when an architect or engineer confronts them with plans showing constructional innovations. Even the Ministry of Health, which has a number of well-qualified technical advisers, has occasionally offended in the matter. Architects have reason to look forward to excellent results if the Building Research Station can be induced periodically to make authoritative pronouncements upon modern methods of building practice.

THE FLOOD WALLS OF THAMES

As a result of the disastrous Thames floods of 1928 it has been decided to raise all river frontages within the control of the Port of London by at least a foot. The estimated cost of doing this is £10,000,000, and the task of deciding who is to find the money has by no means been settled, although the obvious proximity of riverside householders puts them at the end of the pew, as it were. Doubtless they will be called upon for some contribution, though I cannot see how any part of the cost of a work which is necessitated by drainage, water supply, and by heavy dredging below the Pool at London Bridge can possibly be wrung from a poor artist on a Hammersmith Mall just because he happens to live there. I feel like asking whether Lord Melchett has done anything towards paying for Lambeth Bridge and its raised embankment. It is a question quite pertinent to ask.

THE BRITISH–FRENCH WEEK AT BRISTOL

The exhibition at Bristol of French modern art, recently held in connection with a local entente, was so well conceived and completed that I wish it could be moved, like a travelling circus, to enlighten and inspire other provincial cities. Paintings, engravings, tapestry, metal-work, medals, ceramics, glassware and sculpture were shown, including works by Bonnard, Cézanne, Degas, Segonzac, Gauguin, Matisse, Monet, Utrillo, Rodin, Bourdelle, Maillol and Lalique, yet the total number of exhibits was only 274, mainly small items. The selection was made from Paris by French connoisseurs to give a synoptic glimpse of modern French art, and that was

Maurice Utrillo's "Church of St. Denis de la Chapelle," recently on view at the Royal West of England Academy, Bristol.

exactly its achievement. It not only set a high standard, but gave a lesson in self-absorption in the subject. Each thing was designed to be true to itself, and the extraneous banished like the devil. The working of the same principle can be seen in modern French architecture, but I do not think the results are yet comparable. The Sketch Club members of THE ARCHITECTS' JOURNAL should be interested in the drawing (reproduced) by Utrillo.

PLUMB WISDOM !

Many readers of the JOURNAL have welcomed with delight the announcement in the leading article of last week and in the published statement from the L.C.C., in which a charter of freedom was granted to architects desiring to place lavatories and closets away from the outside walls. But I have also heard doubts expressed as to whether the concession will really be operative, save in exceptional cases, and some of my friends were not at all convinced that they would henceforth be allowed to place *the pipes* inside the walls. After all, from the architectural point of view this is the most important consideration. For the occasions when it seems especially necessary to bury w.c.s in the middle of a building and ventilate them artificially are comparatively rare, except in congested sites, but the disarray of sanitary pipes is almost universal.

★

In order to set at rest the fears of my friends who are so intent to design façades without these disfigurements, I approached an official of the L.C.C. He was in a position to inform me that the new regulations were genuinely intended to afford relief to the architect, and there need be no apprehension that they will be interpreted in a cavilling spirit. Every consideration will, in fact, be given to plans showing arrangements of the kind, for which good cause can be adduced. I gather, however, that the provision of properly constructed ducts to convey the piping will be regarded as of the first importance. It only remains now for local authorities throughout the country to follow the enlightened lead of the L.C.C.

" BADGER'S GREEN "

As it is all too seldom that architecture finds its way on to the stage, I naturally rushed to see Mr. R. C. Sherriff's new play, " Badger's Green," at the Prince of Wales Theatre, London. The mood is indeed changed from that of " Journey's End," for we have here a first rate comedy of village life, in which an elderly doctor, a major and a retired stockbroker who " run " the little community of Badger's Green, learn to their horror that a syndicate has been formed with the object of erecting hundreds of bungalows, a cinema, a dance hall, steam sanitary laundry and Japanese tea-gardens in the vicinity of their own homes.

★

In the midst of an exceedingly acrimonious meeting of the entertainment committee of the cricket club, news of the intended vandalism falls like a bolt from the blue upon the doctor and the major, who immediately decide to stand shoulder to shoulder in face of the common enemy. The Director of the Syndicate, however, proves altogether too clever for them, and finds it is only necessary to ask the major to organize the sports and the doctor to advise as to the right location of a hospital in order to win over these worthies to an enthusiastic support of the scheme. In justice to the Director of the Syndicate, however, it must be admitted that he also introduced a very intelligent plea for co-operation between the estate developers such as himself and the old residents of the villages, who understand and revere the spirit of the locality. Unfortunately, the crux of the matter, namely, the *design* of the dwellings, does not enter into the discussion. The play, however, had the great merit of good humour, and should certainly stimulate interest in the bungalow question.

The cartoon that won the competition for the window in Liverpool Cathedral Lady Chapel.

THE CALTON JAIL CONTROVERSY

At the Annual Convention of the Incorporation of Architects of Scotland, the meeting unanimously passed a resolution strongly urging the Government to see that a public competition should be held to procure a design for the proposed buildings to be erected on the site of the Calton Jail. It will be remembered that the Royal Fine Arts Commissioners for Scotland heavily criticized the drawings and model submitted to them by the Office of Works, and that as a result these were withdrawn while a decision was being arrived at. The strong likelihood of a public competition was hinted at at the time, though no further disclosures have been made public. It is well, therefore, that public expression of opinion should seek to precipitate action in the right direction.

WHITEFRIARS GLASS : 1680–1930

I spent an interesting hour in the stained-glass studios at 100 Wigmore Street, where Messrs. James Powell (the Whitefriars Glassworks) are celebrating by an exhibition their 250th anniversary. To them architects are particularly invited, to foster co-operation between architect and glassmaker. Here are drawings by D. G. Rossetti, Sir E. Burne-Jones and Sir Edward Poynter, besides the coloured cartoon of St. Margaret which won the Liverpool Cathedral Lady Chapel competition. Among several pieces of work for erection in modern American churches, the largest is one of seventeen clerestory windows for St. Thomas's Church, New York—where the strong light necessitates the use of very deep shadows and exceptionally strong colour. In contrast to this window, for Messrs. Goodhue Associates, is a coloured drawing for a window in an English church by Sir Giles Scott. Here the colours are pale in tone and the shadowed effects lightly touched. In addition, various effects for wall treatment in *opus sestile* and mosaic are to be seen, and some striking examples of glass enamel work, with its effective semi-metallic brilliance. Cases of domestic glass, from the seventeenth century onwards, include a set designed by Sir Thomas Jackson after spending hours in the glass-house watching the men at work.

ASTRAGAL

THE CITY OF NORWICH

Its Churches and Antiquities

By G. A. STEPHEN (City Librarian)

UNTIL little more than a century ago Norwich was still a walled city, and many traces remain of the sturdy flint walls and towers erected in the thirteenth century as a means of defence. The walls encircled the city on all except the east side, where the river provided excellent natural protection.

Within the city an almost bewildering choice of ancient and interesting buildings confronts the visitor. Pride of place must be given to the Cathedral and the Castle, the priceless heritage left by the Normans. The cathedral, built of Caen stone, with flint rubble for the core of the walls and large piers, was founded by Bishop Herbert de Losinga in 1096, and by the date of his death in 1119 the east end of the cathedral as far as the site of the present organ had been erected. The work was continued by his successors, additions being made even so late as the fifteenth century. The graceful spire, 315 feet high, was erected in the late fifteenth century. The glorious cloisters, 176 feet square, took nearly 150 years to complete, and show examples of both Decorated and Perpendicular styles. Within the cathedral the most notable features include the fine nave with fourteen bays, imposing in its length (250 feet); the beautiful vaulting of the roof, with its rich collection of sculptured bosses; and the remarkable Reliquary Bridge which spans the Ambulatory.

Norwich Castle stands on a high mound, and its square Norman keep is a landmark for miles around the city. It was built in the twelfth century, and throughout the feudal period was the scene of constant siege and strife. After the building of the city walls the castle lost its military importance, and was used as the county jail until 1884, and in 1894 it was opened as a city museum. The valuable contents include one of the finest collections of raptorial birds in existence, a splendid collection of pictures by members of the Norwich School of Painting and by modern local artists, and an attractive series of rooms illustrating the story of Norwich through the ages.

Many times has Norwich been called the "City of Churches," some thirty of her ancient parish churches providing

a wealth of interesting features. They nearly all date from the fifteenth or early sixteenth centuries, and are mostly of flint, in the Perpendicular style. It is believed that there is Saxon work in the churches of St. John Timber-hill, St. Julian, and St. Mary Coslany, and there is Norman work in St. Etheldreda, St. Benedict, St. Paul, and St. Michael-at-Thorn. Special mention must be made of the church of St. Peter Mancroft, one of the finest parish churches in the country. Standing in the heart of the city, it is cruciform in shape, with nave, aisles, chancel, transept chapels, and a magnificent panelled tower with a fine peal of bells. St. Michael's Church, Coslany, should not be missed, for its flint work is exquisite, and it has a most beautiful doorway.

Unique among Nonconformist places of worship is the Old Meeting House, a dignified brick chapel, erected in 1693, and one of the earliest surviving specimens of Free Church architecture. Within a stone's-throw is the Octagon Chapel, a fine brick building of the Georgian period, with an elegant and striking interior, designed on an eight-sided plan by a local architect, Thomas Ivory.

The fifteenth-century Guildhall is one of the most interesting municipal buildings of England, and one of the best examples of those flint-faced buildings for which the city is especially notable. The Council Chamber still retains the form upon which it was designed in Tudor times; it has panelling of linen pattern round the walls, and in the panels are the arms of several of the city companies. Above are portraits of mayors and sheriffs. The stained-glass windows contain some of the original glass. The civic plate and regalia—one of the richest collections in the country—includes a rock crystal mace, which is said to be the most beautiful of its kind in Europe, and the magnificent Reade Salt (1568).

St. Andrew's Hall (where the R.I.B.A. banquet will be held), and Blackfriars' Hall, both now used as civic halls, together form one of the best examples still remaining of friar architecture in this country. Originally, the two buildings formed the Church of the Dominican Friars, St. Andrew's Hall being the nave and Blackfriars' Hall the choir. The interior of St. Andrew's Hall shows some fine Perpendicular work, with an excellent five-light window at the west end. The adjoining Blackfriars' Hall has a timbered roof, and is well lighted on each side by five Perpendicular windows, with a seven-light window at the east end, with beautiful Decorated tracery.

Of the many old-time mansions of merchant princes and other eminent citizens, the city retains some interesting examples. Strangers' Hall, a beautiful specimen of a merchant's house of the late medieval period, was converted into a Folk Museum, illustrating English domestic life through the ages, by the late Mr. L. G. Bolingbroke, who presented it with its contents to the city in 1921. It contains an exceptionally fine banqueting hall, with oriel windows, open kingpost roof, carved oak panelled screen, and minstrels' gallery.

The Sketch Club, this week, is devoted to Norfolk subjects (pages 948-9).

Full particulars of the Holiday Sketches Competition are given on advertisement page No. viii.

Visitors to the Conference will be interested to know that a special display of architectural books has been arranged by Messrs. Goose and Son, Ltd., of 2 Haymarket, Norwich.

Another building converted to museum purposes is the old City Bridewell, a flint-faced building, parts of which were built prior to 1403, when William Appleyard, the first mayor of Norwich, occupied a house on the site. From 1584 to 1828 the building was used as a Bridewell, or house of correction for vagrants. It was restored in 1923 by Mr. H. N. Holmes, a former lord mayor of the city, and was presented by him to the city to be used as a museum of local industries.

Yet another historic mansion preserved for the city in recent years is Suckling House, so called from the family into whose hands it passed in the sixteenth century. It was built in the first half of the fourteenth century, and retains the original tie-beam and trussed kingpost. Later, the great hall was altered and additions were made to the house. The house was restored by the Misses Colman, and presented by them to the city in 1923, together with the adjoining Stuart Hall, as a memorial to their sister, Laura Elizabeth Stuart.

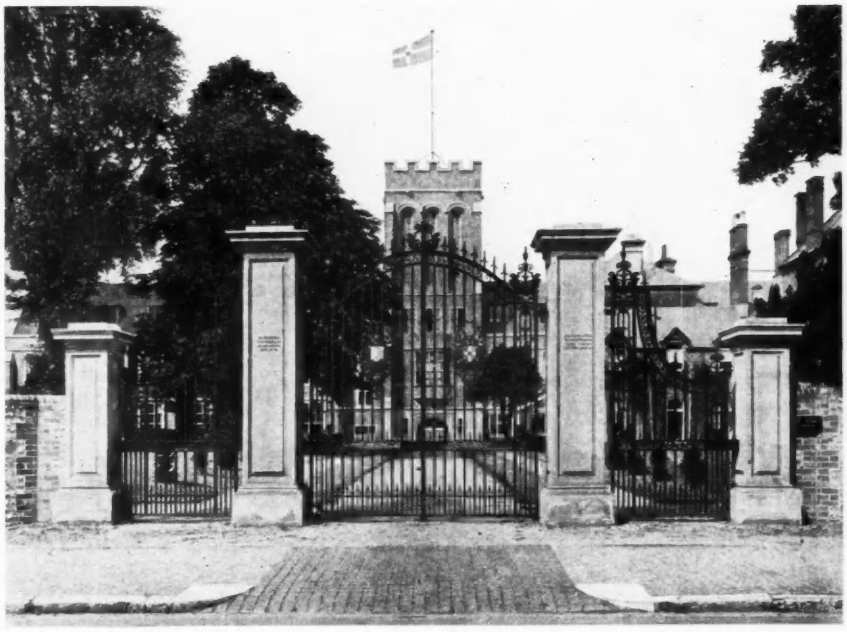
On the northern outskirts of the city is the Lazar House, a Norman building contemporary with the cathedral. Traces of the original workmanship remain, including a fine doorway on the west side. The building is now used as a branch public library.

Other examples of notable residences are the Music House in King Street, originally erected before the reign of King John, and reconstructed at the end of the fifteenth century; the Dolphin Inn (Heigham Street), built in 1587, which was the residence of Joseph Hall, Bishop of Norwich, 1641-1656; and the house (on Tombland) of Augustine Steward, a wealthy merchant and mayor of the city, who built it about 1530.

Apart from individual buildings, there is much in Norwich to attract the eye of the discerning beholder. The city abounds in picturesque courts and alleys, and some fine doorways and gateways. Amid a welter of modern buildings there is almost always some relic of a bygone age—perhaps it is a row of gabled houses, or maybe an old-fashioned inn. There is something typical of the city in the fact that visitors coming to it in the luxurious motor-coaches, which are modernity's last word in travelling, may quite probably find themselves landed at a quaint old thatched inn which has a history going back to the fifteenth century.

Of all her ancient streets, none has achieved more fame than Elm Hill, a quiet byway in the heart of the city, where the wanderer may drop back immediately into the very atmosphere of medieval England. In this old cobbled street may be found the gabled houses which for centuries have been the residences of noted citizens, and in particular the Strangers' Club, Pettus House, and the Briton's Arms, that picturesque old inn with its thatched roof and mullioned windows, its oldest portions dating back to the time of Edward III.

The Conference Tours



The headquarters of the conference are at the Stuart Hall, Norwich.

The programme of visits is as follows :

Thursday, June 19.—2.30 p.m. : Alternative visits : (*a*) Elm Hill, Grammar School Chapel, the Deanery, the Cathedral ; (*b*) Strangers' Hall, the Guildhall, St. Peter Mancroft, Bridewell (outside), St. Peter Hungate, Princes Street; (*c*) St. George's Colegate Church, Octagon Chapel, Old Meeting House, St. Helen's, Bishop Bridge; (*d*) Market Place, St. Peter Mancroft, Bethel Street, Lady Lane, High School, St. Stephens, Surrey Street, All Saints Green, Cattle Market; (*e*) St. John Maddermarket Church, St. Gregory's Church, St. Laurence Church, Strangers' Hall, Bridewell, Princes Street.

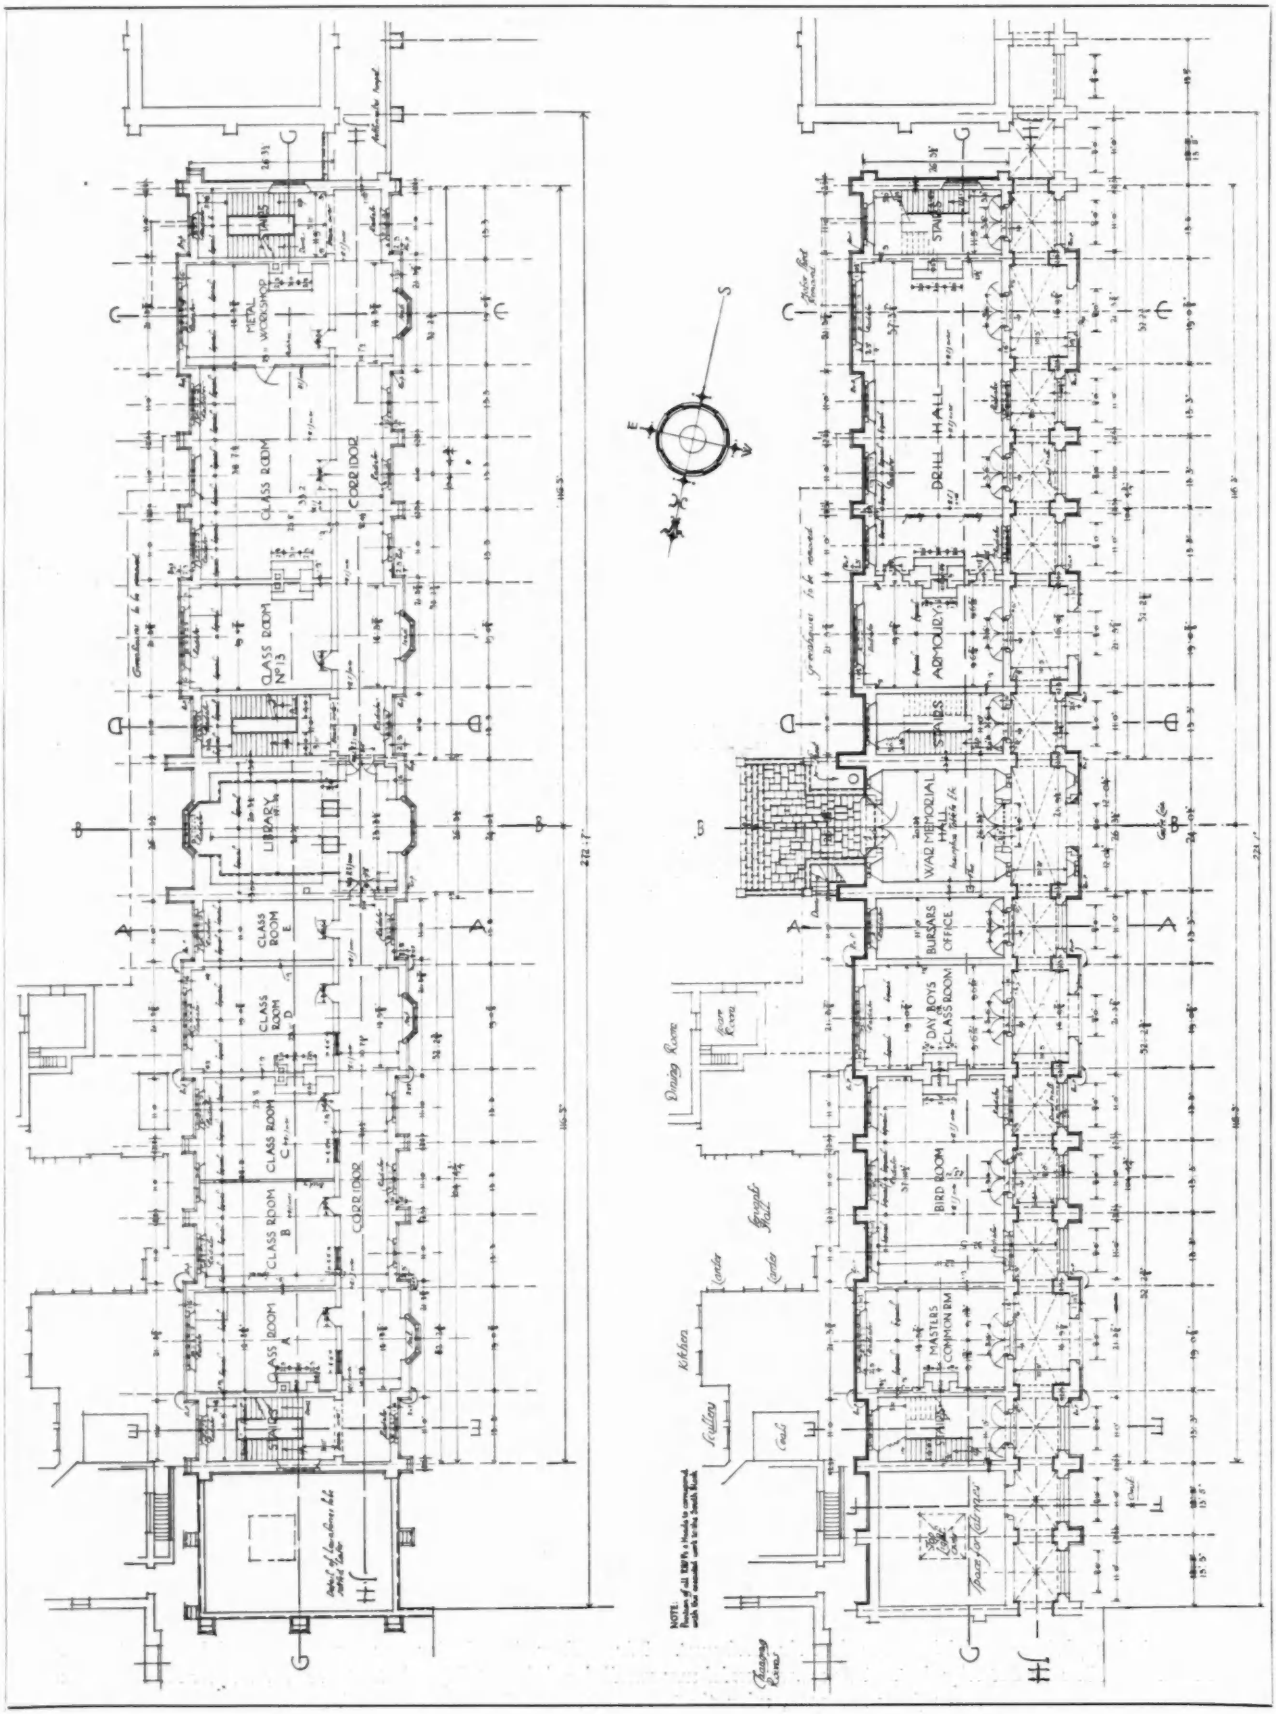
Friday, June 20.—Alternative whole-day tours. Halts will be made at places as follows : (1) Cawston Church, Salle Church; Aylsham [lunch]; Blickling Hall [tea]; (2) Melton Constable Hall, Binham Priory, Blakeney Church, Blakeney [lunch]; Cley Church, Salthouse, Letheringsett [tea]; (3) tour of the Norfolk Broads by motor-launch. The party will be taken to Wroxham and brought back from Barton by motor-coach. There will be a special regatta on Wroxham Road and visits to Ranworth and Ludham Churches, Horning [lunch], How Hill [tea]; (4) East Barsham Hall, Raynham Hall, Castle Acre Priory [lunch], Swaffham [tea]. Inclusive cost of visit, 12s.

Saturday, June 21.—Informal visits : 9.15 a.m. to 1 p.m. : (*a*) Great Yarmouth (motor-coach tour), 5s.; (*b*) Wymondham and Hingham (motor-coach tour), 3s. 6d.; (*c*) Norwich Cathedral.

The entrance gates to the new school buildings have been erected as a memorial to H. R. Thomson, who was headmaster of Eastbourne College from 1900 to 1905.

WAR MEMORIAL BUILDINGS AT EASTBOURNE COLLEGE

DESIGNED BY TATCHELL AND WILSON



THE Eastbourne College War Memorial Buildings were commenced on July 4, 1923. When the tower and south wing were completed, the unveiling and dedication of the war memorial was performed by Lieut.-General Sir Charles H. Harington, on June 28, 1925. Mr. E. C. Arnold was then headmaster.

It was not until February 28, 1929, that a contract was entered into for the erection of the remainder of the buildings, of which the north wing was formally opened by the Rt. Hon. Viscount Hailsham on Saturday last, June 14. This wing is named the "Arnold" wing as a fitting tribute to Mr. E. C. Arnold's services to Eastbourne College, both as an assistant master and headmaster from 1899 to 1929. It is to his foresight, enthusiasm and generosity that the existence of these buildings is primarily due.

The scheme, from first to last, has taken about seven years to carry out. It is therefore permissible to state briefly the problem with which the school was

A general view of the memorial buildings from the north-west. The north or Arnold wing was formally opened by the Rt. Hon. Viscount Hailsham on Saturday last. The war memorial was unveiled and dedicated by Lieut.-General Sir Charles H. Harington on June 28, 1925, when the tower and south wing were completed.

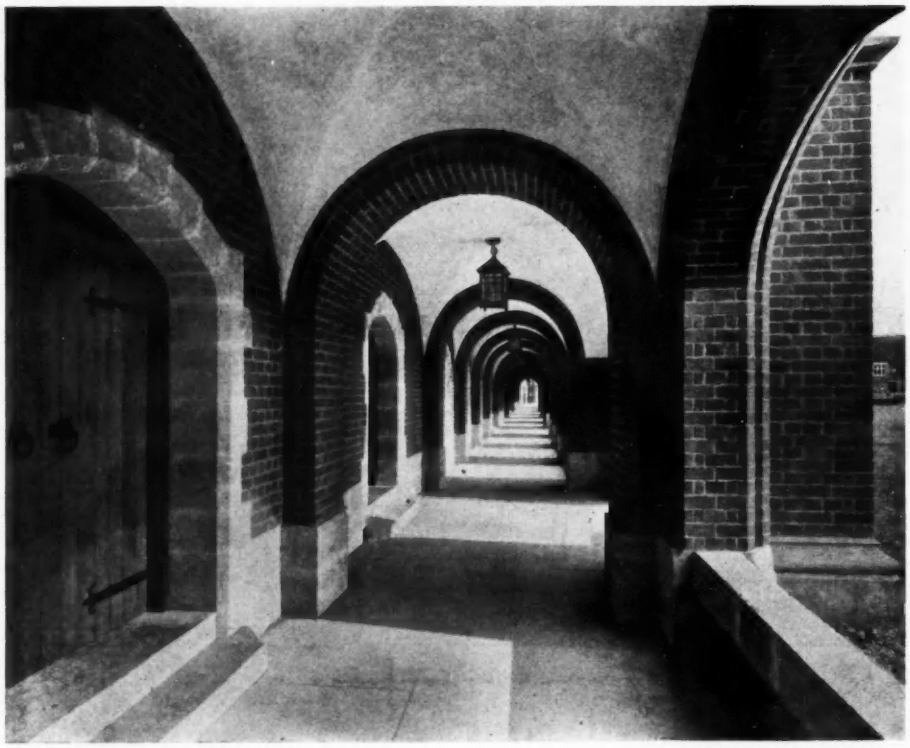
Eastbourne College War Memorial Buildings.] *[By Tatchell and Wilson.*

The tower, looking from the west ; and the entrance to the war memorial hall from the east forecourt. On the walls of the memorial hall, which is situated on the ground floor beneath the tower, are panels inscribed with the names of the fallen (see page 932). On the upper floors of the tower are the Cavendish and Dennys libraries, four music-rooms and a classroom.



confronted, namely, to erect a worthy war memorial which would at the same time form part of a larger scheme for providing further accommodation for the school; and to design this in such a way that sections could be carried out from time to time as funds permitted, without detriment to the design as a whole when completed.

Largely on Mr. Arnold's initiative, instructions were given to the architects at the end of 1921 to prepare plans for the whole scheme, and building commenced with the tower in 1923. The tower forms the central feature of the new additions, comprising also the north and south wings, one on either side. Eventually these additions can be linked up with the big school by an extension of the cloisters which run along the whole of the buildings on the west side.

The central tower, by reason of its height and size, which will always focus attention, has been designed as the war memorial proper, and made the chief external architectural feature of the school buildings. It contains on the ground floor the war memorial hall, on the walls of which are inscribed the names of the fallen, and dedicatory inscriptions; and on the upper floors the senior and junior libraries, known as the Cavendish and the Dennys respectively, four music-rooms and a classroom.

The war memorial hall. On the left walls are seen some of the dedicatory inscriptions and name tablets; and on the right the wrought-iron folding gates leading to the cloisters, illustrated below.

Eastbourne War Memorial Buildings. [*By Tatchell and Wilson.*

The cloisters run along the whole of the west side and provide the only means of access to the new school accommodation. Eventually they will be extended to link up the new work with the big school.

The remainder of the buildings have been carried out in sections as the money has been available. The erection of the south or Devonshire wing followed closely on the completion of the tower, and was carried out in two sections. It contains the armoury and drill hall, five classrooms and a workshop about 60 ft. in length.

The "Arnold" wing completes the whole scheme. It contains a bird room to house the magnificent bird collection which Mr. Arnold leaves behind to the school as another memorial to his tireless activity and to his ability as a naturalist of at least national reputation. Six carved stone panels on the east elevation bear testimony

to this fact, and embody with other motifs Mr. Arnold's arms and crest.

The remainder of the ground floor comprises the masters' common room, headmaster's and bursar's offices. On the upper floors are five large and two small classrooms and a drawing school of the same dimensions as the workshop in the corresponding south wing.

The elevations are simple, and are balanced with the tower as a central feature. Tradition and the scale of the buildings already existing have been studied, and a free Tudor inspiration in brick and stone with a tile roof has been adopted.

The work has been designed by Messrs. Tatchell and Wilson, FF.R.I.B.A., Mr. Wilson being himself an Old Eastbournian. It is fitting that the work, from first to last inspired by Mr. Arnold, should be completed as a memorial to him, when the Chairman of the Council (Major-General Sir Arnold Sillem), the Headmaster (Mr. G. V. Carey), and the Bursar (Major S. H. Foot) are all Old Eastbournians.

HEADINGTON SCHOOL FOR GIRLS, NEAR OXFORD

DESIGNED BY GILBERT T. GARDNER

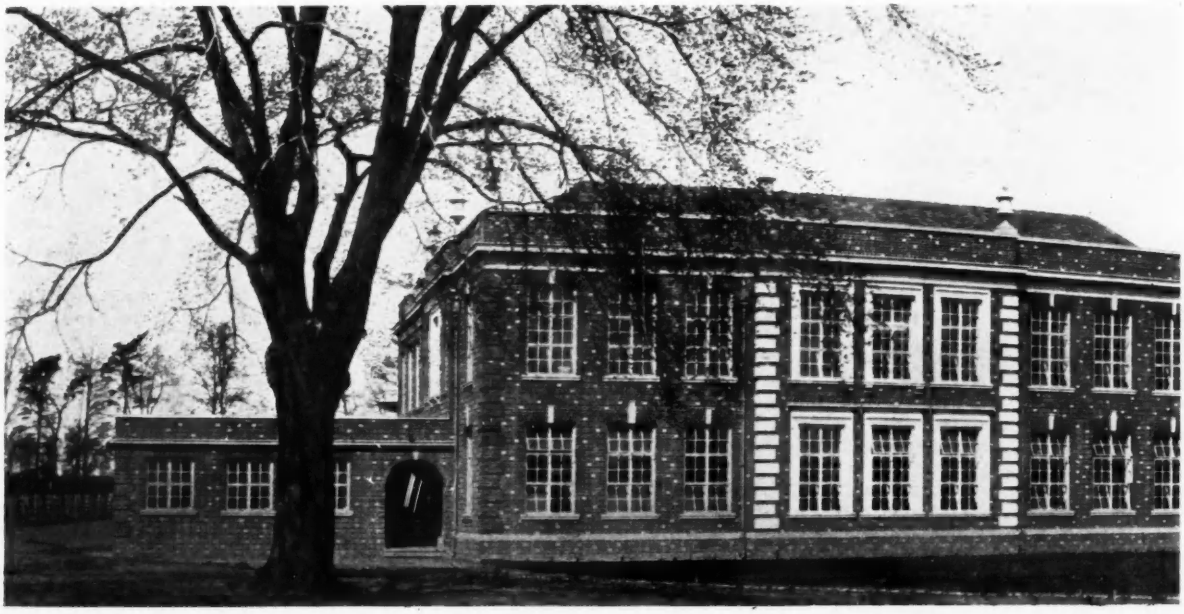
THIS school has been erected on the high ground at Headington, about two-and-a-half miles east of the centre of the city of Oxford. building is situated in beautiful grounds, about twenty-five acres in extent, surrounded by a fine belt of trees.

The facework generally is of multi-coloured bricks, and the whole of the dressings are in reconstructed Clipsham stone. The roofs are tiled with hand-made sand-faced tiles of varying deep shades of red and purple.

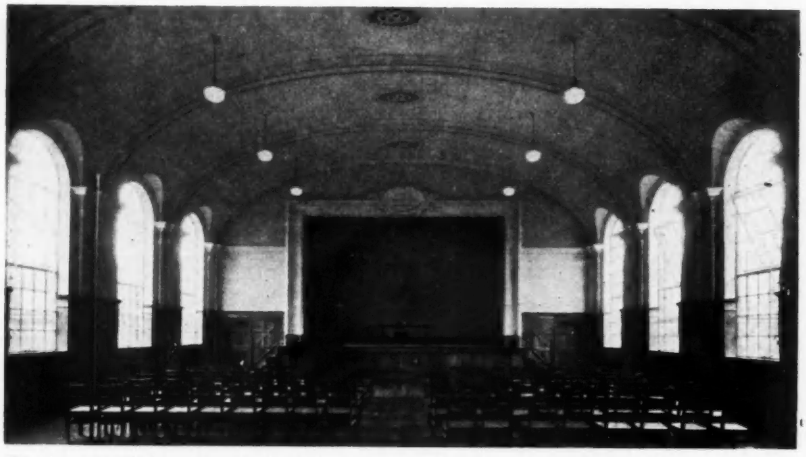
The floors of the classrooms are of Oregon pine blocks, those of the corridors and cloakrooms of composition, and of the library and other principal rooms of polished oak blocks.

The assembly hall, centrally located, and extending through two floors, is about 72 feet by 47 feet in area, in addition to the stage. The floor is of polished oak boards, and the walls are panelled in oak to a height of eight feet; the ceiling is enriched with fibrous plaster ribs.

The stage is arranged for school plays, and has a proscenium opening, about 25 feet by 18 feet, surrounded with a bold fibrous plaster moulding. Over the centre of the stage is a shield, the counterpart of that over the main entrance, bearing the school motto (" Fight the Good Fight of Faith ") in Greek characters.



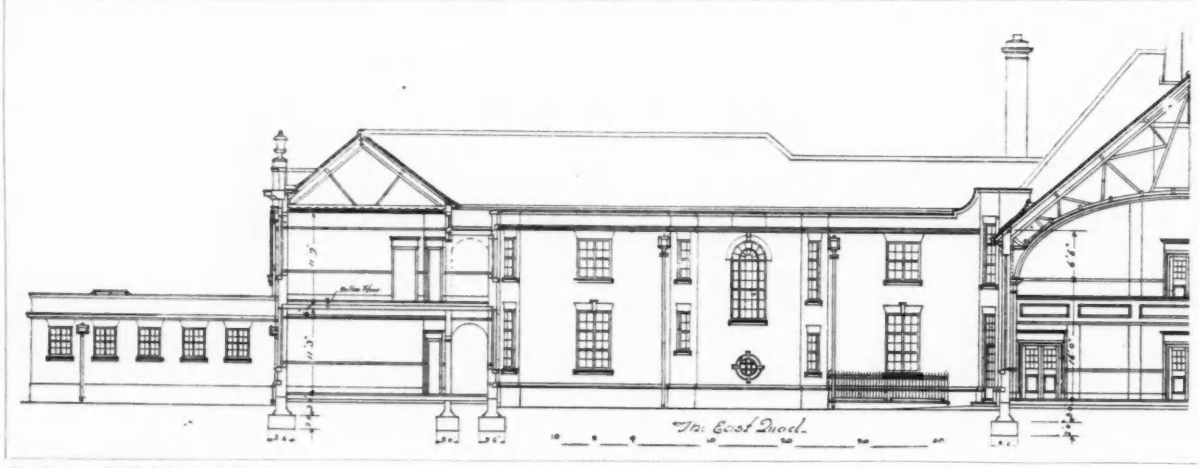
The furnishing of the library, in Austrian oak, has been provided by the efforts of present and past staff and pupils of the school. The heating is by low-pressure hot water, from oil-fired boilers. All the classroom windows are glazed with sun-ray glass.



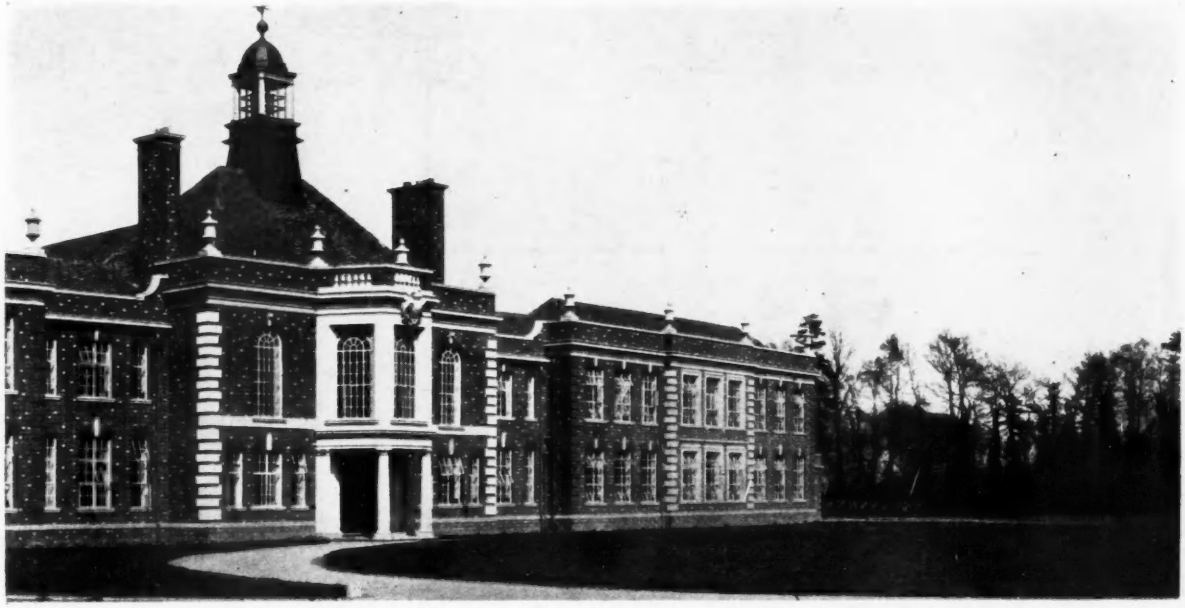
The main entrance leads, through a vestibule, to the entrance hall, and thence direct to the assembly hall. The materials are multicoloured bricks and sand-faced roof tiles. The dressings are of reconstructed Clipsham stone, and the shield bears the device, " Fight the Good Fight of Faith." The bay window above the porch lights the library.

The foundation stone was laid by the Rt. Rev. the Lord Bishop of Ripon, one of the founders, on June 21, 1929, and the completed building will be formally opened by Princess Mary, Countess of Harewood, exactly a year later, i.e. on Saturday next, the 21st inst.

Accommodation is provided for two hundred and fifty to three hundred girls, of whom about one hundred will be day boarders and the remainder resident boarders. For these, detached boarding houses are provided within a short distance of the school itself. The

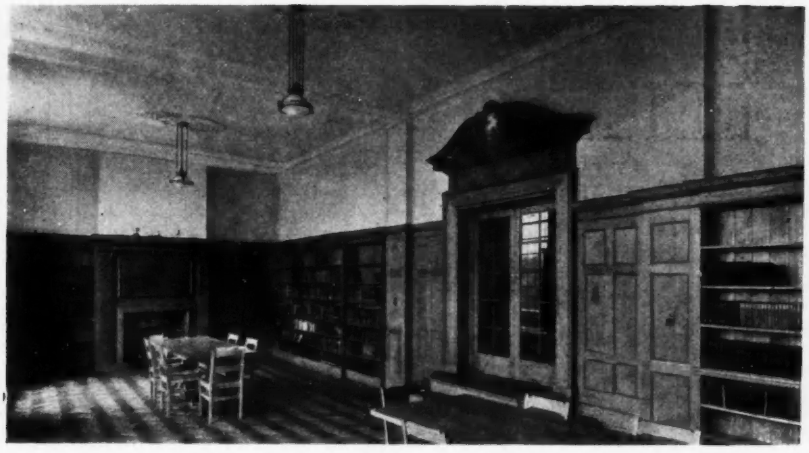


The above photograph gives a general view of the main front from a southerly viewpoint; the architect's elevational and sectional drawing, reproduced across the foot of this double-page opening, gives an indication of the design of those portions of the other side of the building which overlook two quadrangles, separated by the assembly hall. The E-shaped

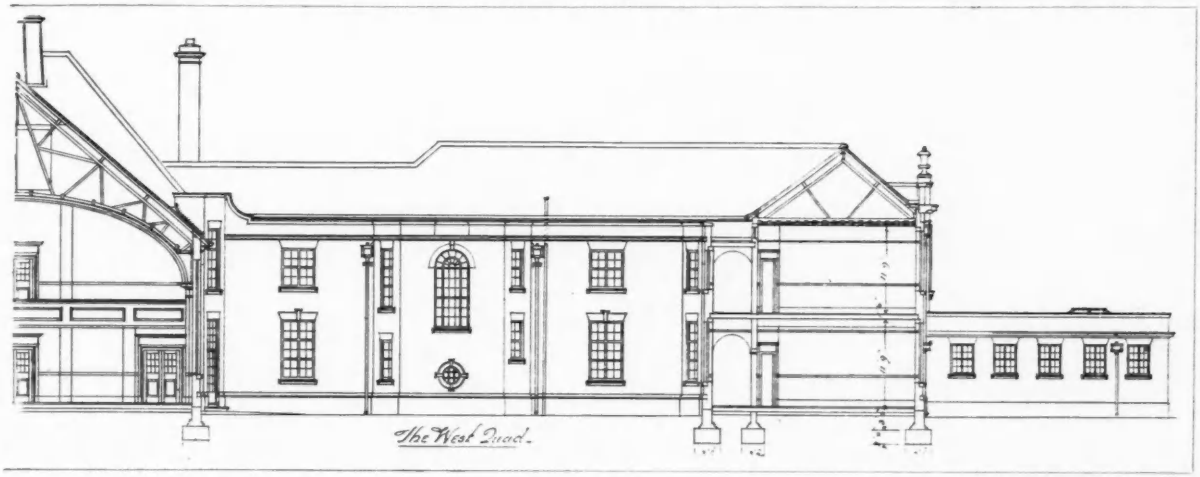


The interior of the assembly hall, looking towards the stage; the windows overlook the quadrangles on either side. The hall extends through the upper floor of the school.

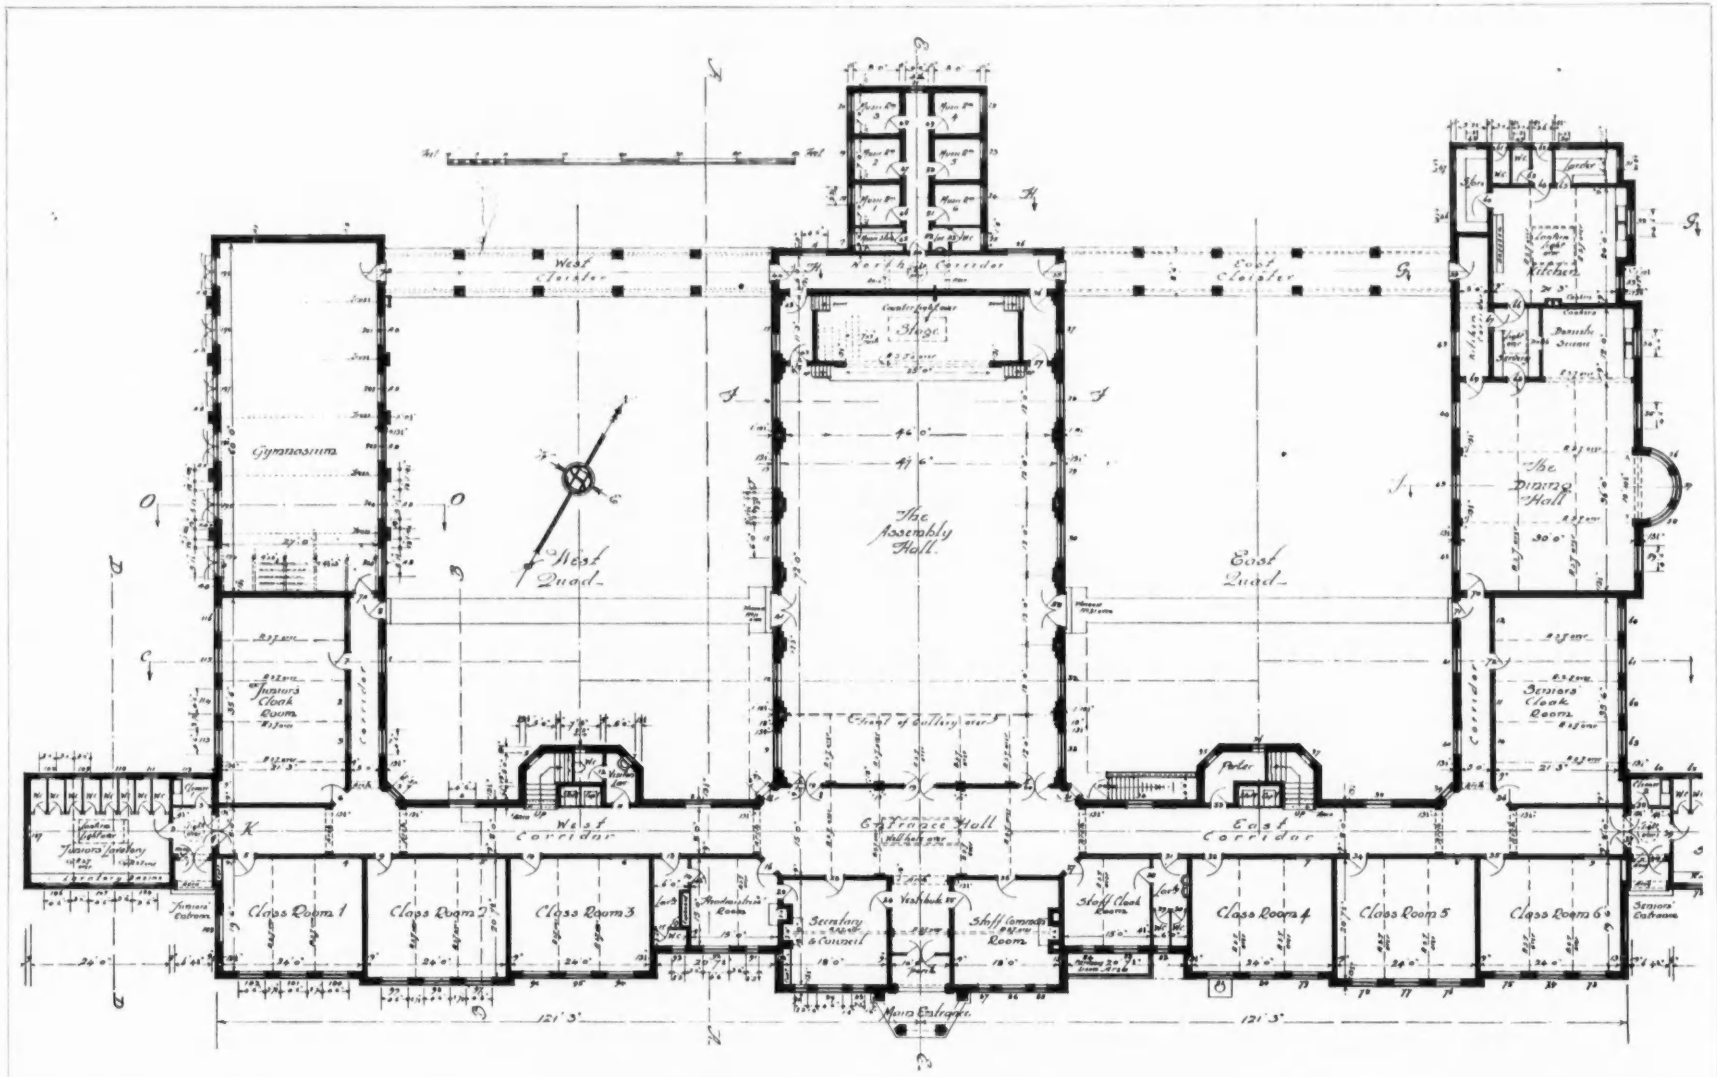
The west cloister, looking from the north corridor towards the gymnasium.



Headington Girls' School, Oxford.]

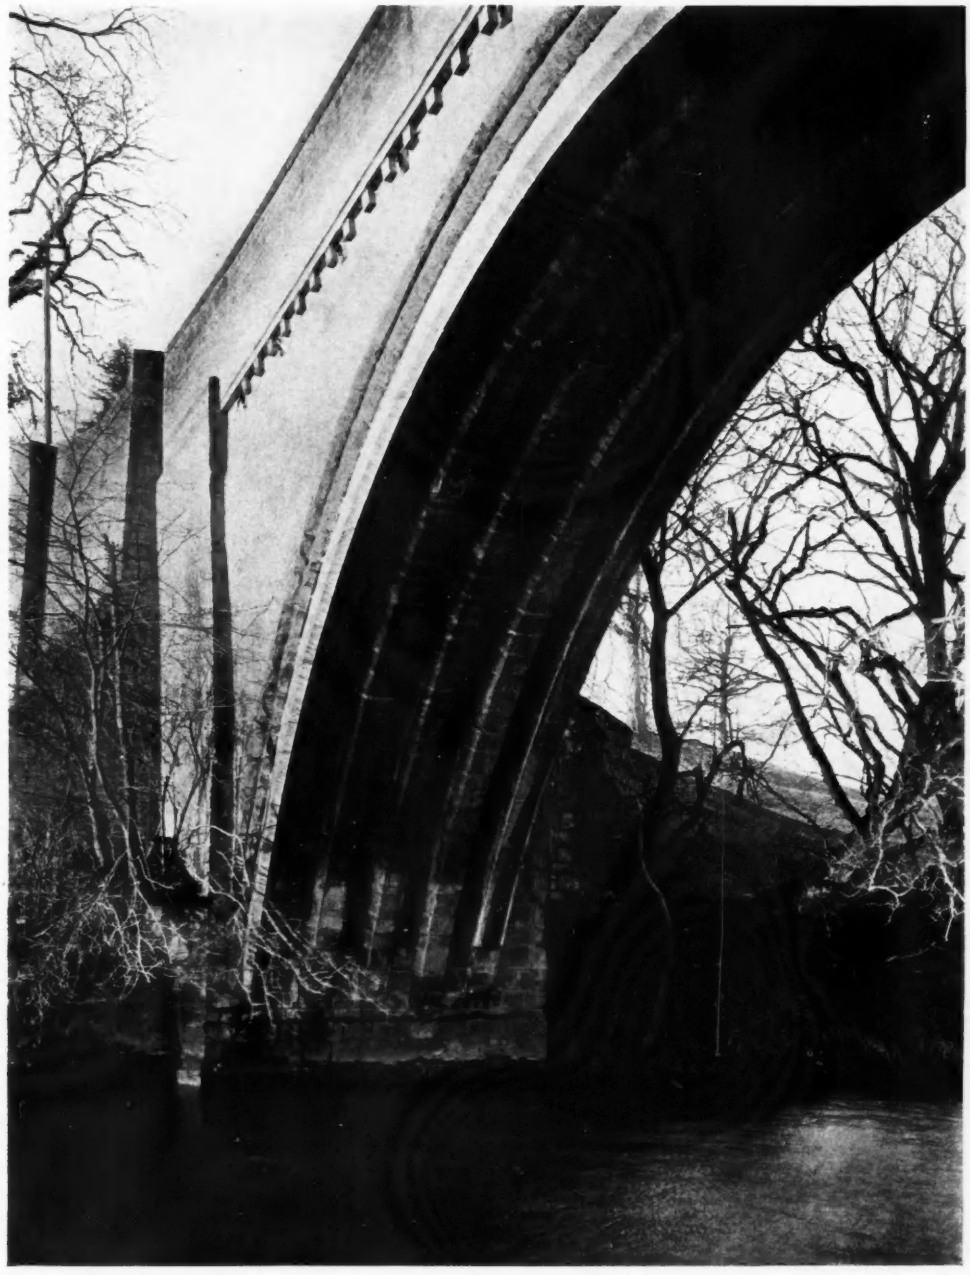


arrangement is clearly shown on the plan of the ground floor illustrated on page 936. The ranges of rooms on both floors in either wing are classrooms, stairs being arranged in the two projecting bays facing the quadrangles on the north-westerly side; lavatory accommodation is isolated in two one-story blocks at either extreme end of the building.



A corner of the gymnasium, which occupies the westerly corner of the site.

The interior of the library, the central apartment on the first floor. The "white horse" emblem carved in the pediment above the entrance doorway is the school book-plate.



[*By Gilbert T. Gardner.*

Headington Girls' School, Oxford.] [*By Gilbert T. Gardner.*

The ground-floor plan recognizes the importance of good lighting ; there will be sunshine in practically every classroom, and it is significant that sunray glass has been used throughout. Two cloisters, running parallel with the main east and west corridors, complete the enclosure of the two quadrangles. The main feature of the upper floor is the library, centrally situated over the entrance hall and offices. In the east wing, over the seniors' cloak room, is a laboratory. North of this, and a corresponding line in the west wing, the building is only one story in height. The remainder of the upper floor is given over to classrooms, rest and medical rooms, and an art room.

ENGLISH PRECEDENT No. 120

TWIZEL BRIDGE, NORTHUMBERLAND

It is doubtful whether the present Twizel Bridge is the actual structure over which the English troops passed before the Battle of Flodden. It is said to have been erected towards the end of the sixteenth century by one of the Selbie family.

The span of the great single arch is 90 feet. The arch is of the ribbed construction which typifies the earliest form of English masonry bridge, and which, after an interval during which solid ashlar predominated, returned once more with the introduction of iron, steel and concrete.

The photographs of Medford House, Glos., the subject of last week's Precedent, were by Humphrey & Vera Joel

LETTERS FROM READERS

Priced Bills of Quantities

SIR,—A statement of Karshish in his article in the June 4 issue of THE ARCHITECTS' JOURNAL should not, I think, pass without comment. He says: "The priced bills of quantities . . . are properly kept under seal . . . as otherwise the architect is in a position to vary the contract in the interests of his client and unprofitably for the builder, by substituting work for which the builder has included a low price for that for which he has allowed a good one."

The keeping of the priced bills under seal is not so universal, I think, as this statement would lead one to suppose. Few architects, I imagine, would make variations with the specific object of robbing the builder of his profit. However, just as the merchant makes his money by buying in cheap markets and selling in dear, so the builder makes his money by doing as much work as possible at high prices and as little as possible at low. On more than one occasion I have suspected that a variation has been engineered by a builder to enable him to escape a low price, and this, from his point of view, is good business. Is it not unfair to the employer if, when such a variation is suggested by the builder, the architect has no means of seeing the reason? It seems that keeping the priced bills of quantities sealed and depriving the architect of access to them is very one-sided, if at the same time the builder has a copy in his office to which he can refer. ARTHUR J. WILLIS

SIR,—Would Karshish be so kind as to inform me whether it is the usual practice for the quantity surveyor to keep the priced bills of quantities under seal, or whether this is just a suggestion of his own?

According to him, these prices should be kept from the prying eyes of the architect in case he might pore over them, and possibly upset the builders' profit by substituting for work which has been priced at a high figure that for which a low price has been given. Furthermore, Karshish says that builders have a right to expect the bills to be kept under seal in the care of the quantity surveyor. But why? Surely the architect expects that all the items in the bills of quantities have been priced at such a figure as to allow a suitable profit to the builders for each item.

A smart estimator, on an alteration job particularly, might look round the works and note where he thinks extras may occur, and price these items high, keeping others low enough to allow a satisfactory figure for tender.

I agree with being fair to builders, but an architect should have access to the bills, and be at liberty to substitute work, if necessary, on the assumption, as I previously remarked, that the builders can carry out, at a profit, all items they have priced.

I consider that Karshish is expressing his views too strongly when he suggests that an architect would be definitely dishonest to substitute work in this fashion. W. A. DOWNE

Charing Cross Bridge

SIR,—The check to the Charing Cross Improvement Bill by the Committee of the House of Commons may provide to both the promoters and opposers of the Bill the opportunity for a mental spring cleaning. The report of the Committee has once more called attention to the dominant fact in the scheme—the railway station. Every morning several thousands of people arrive by train at Charing Cross, and every evening collect again to return. The Southern Railway agreed reluctantly to the present scheme, knowing that it was to cause them inconvenience, because it was said to aid a great Imperial improvement. Before such a grandiloquent phrase, dare one ask, *cui bono?*

From the model it would seem that £14,000,000 of public moneys are to be expended to give Londoners a second-rate copy of the Place de la Concorde. Since the electrification of parts of the old South Eastern Railway many local trains that once terminated at Cannon Street now run no farther than London Bridge. The passengers have all to find their way into the City, and the result is a further congestion in the cascade of motor buses and taxis that pour across the Thames. Exactly the same condition of things will happen with the new Charing Cross bridge. The main traffic will be the same motor bus and taxi stream that will in this case have to move in a solid stream as far as Trafalgar Square before beginning to disperse. To move the proposed station yet farther back from the river will only increase this traffic problem, and again one is tempted to ask, *cui bono?* To provide space for a monumental development of the south approach to the bridge?

Anyone who has been in the Amalienborg quarter of Copenhagen knows what gloom can surround a monumentally planned centre that is in reality no centre. Let us clear our minds of cant, and remember that the purpose of a railway station is to land people as near to their destination as possible, or at the very least at some central spot from which they can immediately radiate thither. Neither Waterloo nor the new Charing Cross will ever be required to serve the needs of that part of London in which they are situated, and ninety per cent. of the travelling public arriving at and departing from them has got to get itself transported somehow to and fro across the new bridge, which will become nothing more than a long approach to these stations.

Both New York and Paris have solved the problem—the analogy between the Gare d'Orléans and the new Charing Cross is very close, as the former is built right up to the bank of the Seine and the trains are partly underground as far as the Gare d'Austerlitz. But what need is there to transport the station at all? With electrification, nearly the whole of the suburban traffic to Charing Cross could thus be passed across the river to a submerged station on the present site.

Such a scheme would relieve the new bridge of a vast amount of unnecessary traffic, and at the same time cause the least amount of inconvenience to the public. LL. E. WILLIAMS

Electric Transmission Towers

SIR,—Although I do not always see eye to eye with my friend Sir Reginald Blomfield, I wish strongly to endorse his protest against misleading representations which have been made of steel electric transmission towers (or are they masts?) of which he wrote in last week's JOURNAL. The opposition to these had better have been focussed upon creosoted fir poles of the type used to carry telegraph wires, which also are being used for electric cables, and which are unspeakably ugly and aggressively obvious.

The braced steel masts, on the other hand, are as graceful as it is possible to conceive masts could be. Naturally, we regret when open country is traversed by roads, railways or cables, and the courses these are to follow should be scrutinized and every alternative considered; but, where it is inevitable that cables should be carried above ground, the steel masts are certainly the least offensive means: indeed they possess much grace and, in a high degree, those good qualities which are so often the products of design to fit a purpose. Let there be no misunderstanding: this is no question of *taste*, it is one of *prejudice*—prejudice against steel, prejudice against change.

Unfortunately, some of our most vigorous defenders of the countryside (to whom we owe no small debt of gratitude) are often unreasonable and frequently they oppose, not because a

thing is bad but because it is an innovation.

In saying this, I do not wish to disparage efforts to defend our countryside, but in the hope that innovations may be judged upon their merits and not condemned because they are innovations. Reasonableness will forward the object in view where ill-judged opposition will fail, even if it does not actually do harm to the cause we all have at heart. NATHANIEL LLOYD

The Economics of Steel

SIR,—Mr. Anderson's impassioned plea in your last issue for the protection of our ancient privileges and customs from the attacks of impetuous youth cannot fail to touch the hearts of all steel constructors.

Are we to surrender without a struggle this most wonderful means of enlarging our circle of friends merely in order that our customers may have their requirements more cheaply and expeditiously fulfilled? These vandals who seek to transform our time-honoured Building Acts into a simple standard of set regulations for the whole country must remember that tradition is Britain's most treasured possession and we understand that any alteration to the existing Acts will be most strenuously opposed by the Society for the Preservation of National Monuments.

No, sir, we must not allow personal feelings to be overcome by any business consideration, and let us not lament the "good old days" whilst we have the power to remain in them.

W. R. GILBERT (COMMANDER, R.N. (RETD.))

A Plea for Wood Carvers

SIR,—May I support the appeal, published in your issue of May 21, for the introduction of more wood carving? I do so because of the craftsmen and because of the craft. There is no body of men connected with architecture who are more worthy of our interest than the carvers. Even in the more prosperous pre-war days their employment was precarious and, considering their skill, study, and training, was rarely adequately paid.

Wood carving, besides being one of the most ancient of the arts, is also one of the most appreciated and valued by those who are the possessors of it, and architects often find their clients taking a considerable interest in the little carving that is being done for their building. I agree with the writers of the plea, that it would be "most regrettable if these men's hands should lose their cunning" owing to lack of demand.

Today we have to meet the requirements of an age more advanced in education and refinement than that of a generation ago. Then, both architecture and furniture demanded carving that was often cheap and inartistic; now, architects as leaders and advisers prefer to omit where the money is insufficient to provide for properly studied ornament.

It may be remarked that carvers must be more proficient to create a demand for their labour, and that the more efficient craftsmen are seldom unemployed. In agreeing, I would reply that a man rises with the opportunity and, with the heritage that inspires him from the past centuries, the wood carver will prove himself quite competent to meet any demand that may be made upon him. A. T. BRADFORD

Specialized Materials

SIR,—"Every architect will admit that the arrival on the scenes of specialized materials, in ever-increasing variety, has enormously enlarged the possibilities open to him. But that their employment brings with it certain responsibilities is not, perhaps, always clearly recognized."

It was indeed interesting to read the above paragraph on page 836 of THE ARCHITECTS' JOURNAL of May 28 last.

We are certainly of the opinion that until it is possible for the manufacturers of specialized products to reduce to a minimum all risks of faulty application, it is only natural that the benefits accruing from the use of their materials will be outweighed by the possibility of failure from this cause. We can truly say that it is our experience that architects are generally willing to adopt the principles of science to the betterment of their work, but if the need for specialized knowledge and constant supervision, so necessary in most cases to ensure success, has not been emphasized by the manufacturers, their materials will most naturally be suspect if the results are not up to expectations.

We, as manufacturers of scientifically-prepared specialist products, realized that the personal factor would enter largely into the application of our materials, and, as a consequence, did not cease our labours with the production of our material, but continued until *simplicity of application was achieved.*

We rest contented, knowing that the simple directions accompanying our material to the site can be put into practice by the contractors' usual staff without any need whatsoever of additional supervision, and that the elimination of the personal element permits of no additional responsibility falling upon the architect specifying our materials.

THOS. PARKER,
General Manager,
Chemical Building Products, Ltd.

SIR,—We have read with much interest the paragraph on page 836 of your issue for May 28, calling attention to the frequent mishandling of materials owing to the special processes which they call for not being understood.

This has been particularly the case with Eldorado cork tile flooring, so much so in fact that some years ago we had to establish our own contracting department instead of selling our material to contractors, who in many cases did not take sufficient care in installing the tiles, with the result that unsatisfactory work prejudiced many architects against any type or brand of cork tile flooring.

Our idea is that architects who have the courage to adopt new materials and processes, should be backed by the manufacturers, and that such firms should take every possible step to see that the material they manufacture and sell is properly handled and installed. Only by such means can a manufacturing concern hope to establish a successful business.

E. G. ELGOOD, Manager,
(Cork Tile Department),
Cork Insulation Co., Ltd.

R.I.B.A. ELECTION RESULT

The following result of the election of the President and Council for 1930–31 was announced at a meeting of the R.I.B.A. on Monday night:

PRESIDENT: Fletcher, Sir Banister.

VICE-PRESIDENTS: Ashley, Henry V.; Fletcher, Henry Martineau; Jones, Francis (Manchester); Unwin, Dr. Raymond.

HONORARY SECRETARY: Kitson, Sydney Decimus.

NEW MEMBERS OF COUNCIL: Buckland, Herbert Tudor (Birmingham); Cooper, Sir Edwin; Green, William Curtis; Hall, Edwin Stanley; Reilly, Professor Charles Herbert (Liverpool); Robertson, Howard Morley; Searles-Wood, Herbert Duncan.

NEW ASSOCIATE MEMBERS OF COUNCIL: Cart de Lafontaine, Lieut.-Colonel H. P. L.; Howitt, Major Thomas Cecil (Nottingham); Waterhouse, Michael Theodore.

NEW LICENTIATE MEMBERS OF COUNCIL: Hopkins, Lieut.-Colonel Percy Alfred; Rees, Major Frederick William.

PAST PRESIDENTS: Gotch, John Alfred (Kettering); Tapper, Walter.

Representatives of Allied Societies:

Northern Province of England: Tasker, Lieut.-Colonel Andrew Kerr (Northern Architectural Association); Halliday, James Theodore (Manchester Society of Architects); Abercrombie, Professor Leslie Patrick (Liverpool

Architectural Society); Harbron, George Dudley (York and East Yorkshire Architectural Society); Foggitt, George Herbert (West Yorkshire Architectural Society); Buck, Walter Gerard (Sheffield, South Yorkshire and District Society of Architects and Surveyors).

Midland Province of England: Butler, Albert Thomas (Birmingham Architectural Association); Herbert, Albert (Leicester and Leicestershire Society of Architects); Deacon, Basil Charlton (Northamptonshire, Bedfordshire and Huntingdonshire Association of Architects); Eaton, George Morley (Nottingham and Derby Architectural Society); Buckingham, Ernest Hugh (Norfolk and Norwich Association of Architects).

Southern Province of England: Shires, Benjamin Priestley (Devon and Cornwall Architectural Society); Brakspear, Harold (Wessex Society of Architects); Hutt, Harry (Berks, Bucks and Oxon Architectural Association); Smith, John Arthur (Hampshire and Isle of Wight Architectural Association).

Allied Societies in Scotland (nominated by the Council of the Incorporation of Architects in Scotland): Balfour, Andrew (Glasgow); Begg, John (Edinburgh); Duncan, William Liddle (Aberdeen); Stewart, Donald Alexander (Dundee).

South Wales Institute of Architects: Lloyd, Thomas Alwyn (Cardiff).

Allied Societies in Ireland: Hicks, Frederick George (Royal Institute of the Architects of Ireland); Gibson, Robert Hanna (Ulster Society of Architects).

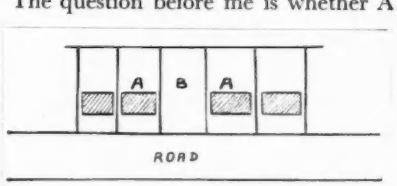
British Dominions Overseas (to be nominated by the Council of each of the following). The Royal Architectural Institute of Canada, The Australian Institute of Architects, The New Zealand Institute of Architects, The Institute of South African Architects.

Architectural Association (London): Wornum, George Grey.

Association of Architects, Surveyors and Technical Assistants: Hamlyn, William Henry.

CHAIRMAN OF THE BOARD OF ARCHITECTURAL EDUCATION: Sullivan, Leo Sylvester.

QUESTIONS THAT ARISE



Ancient Lights

"Query" writes: "*The accompanying sketch represents building plots as laid out on an estate several years ago, and the houses shown have been erected some years. The plot B has just been bought for building purposes. Can the owners of plots A claim a "right of light" for windows in their houses overlooking plot B? The end walls of both houses on plots A are some 4 ft. from their boundaries. There is nothing in any legal documents relating to the estate or to any rights of light being acquired or otherwise.*"

I have no information before me to enable me to express a final opinion on this matter.

It appears that B has recently purchased a plot of land for the purposes of erecting a building thereon. The plot of land acquired by B is situated between two plots of land, the property of A, who has erected dwelling-houses on his land overlooking the plot which is the property of B.

The question before me is whether A has "ancient lights" so as to prevent B from erecting his house to interfere with A's right of light.

"*Can the owners of plots A claim a 'right of light' for windows in their houses overlooking plot B?*" [*See reply to* "Query."]

In the absence of agreement to the contrary between A and B or their respective predecessors in title, B has a right to blot out the whole of A's light, provided A's windows which will be affected by B's building have not been there for nineteen years and one day. (Prescription Act, 1832).

Assuming the existence of an agreement between A and B or their respective predecessors in title, or alternatively that A has acquired rights under the Prescription Act, 1832, it must be pointed out that A, although he has a right to light, has no right to an unlimited amount of light.

The quantity of light that he is entitled to depends on the facts of each case (*Colls* v. *Home and Colonial Stores* (1904) A.C. 179), and the Courts have refused to lay down any absolute standard.

To constitute an actionable obstruction of ancient lights it is not enough that the light is less than before. There must be a substantial privation of light to render the occupation of the house uncomfortable according to the ordinary notions of mankind and (in the case of business premises) to prevent the plaintiff from carrying on his business as beneficially as before. In fact, the test is not how much light is taken away by the defendant's act, but how much light is left to the plaintiff (*Higgins* v. *Betts* (1905) 2 Ch. 210. *Cavies* v. *Manable* (1913) 2 Ch. 421).

In my view, the test before mentioned is safer than the rule of thumb test known in the profession as the 45 deg. rule.

Whilst the 45 deg. rule may be a good working rule, since the decision of *Colls* v. *Home and Colonial Stores* (*supra*) it cannot be regarded as more than a guide to the Court as to what may be reasonable in normal circumstances.

E. F. I.

Profit on P.C. Items

P. C. writes: "*I should be interested to have the views of readers regarding the best way of dealing with builders' profit on provisional and prime cost items in settlement of accounts. I am at present dealing with a job where several p.c. sums have been omitted altogether, and the builder claims that he added no profit for these sums, but was content with the cash discount only. I am continually meeting with this difficulty where these sums have been reduced, but where extra amounts are involved the builder asks for an extra percentage of profit.*

"*This is all in connection with work without quantities, and the specification in all cases clearly states that the sums included are net and that the builder is to add for profit.*"

If "P. C." asks the builder to add for profit on provisional and prime cost sums he should know the amount of profit the builder desires, and I therefore suggest one of the following methods:

1. That the builders tendering should be asked to state in their tender the percentage of profit they require on these items.

2. That a certain percentage for these items should be included by the architect in the specification.

In both cases the adjustment could be easily made. SURVEYOR

Condensation on a Ceiling

R. J. writes: "*I have just erected a small one-story building, which is used as a factory, and the occupants have complained of condensation on the ceiling. The ceiling is finished in Keenes, on a backing of Portland cement, and is painted. The roof is of concrete, screeded and covered with asphalt. The asphalting was carried out by a good specialist firm and is quite satisfactory, providing an "iron" surface. What do you consider is the cause of the condensation, and is there any remedy? I am extending the building in the near future and wish, of course, to avoid this trouble.*

The condensation is undoubtedly caused through the coldness of the cement finishing to the ceiling. If the ceiling had been plastered and then distempered or whitened, the plaster

would have absorbed a certain amount of heat, during the rise in temperature in the room, and would combat the coldness coming in from the outside.

As regards a remedy, this is rather a difficult proposition. I can only suggest battening the ceiling and covering with a good ceiling board. As a precaution against condensation in a building I recently erected, where the ceiling was painted, I had 2-in. hollow tiles bedded in a weak mixture of cement and sand on the concrete flat. This was covered with breeze for falls, screeded, and finished with asphalt.

This I have found effective.

W. H. L.

Rough Cast for Walls

E. W. writes: "*Can you give me hints for making up a yellow rough cast for the walls of a bungalow I am proposing to erect? I do not wish to involve my client with the constant expense of distempering the walls externally.*"

A good lasting colouring for rough cast can be made up with the following mixture of materials:

Mix five parts of coarse sharp sand with four parts of lime putty. Add 7 lb. of yellow oxide to a 10-in. bucketful of the lime putty. Just before using, it is a good plan to add to this mixture one part of Portland cement.

This, I think you will find, makes a permanent coloured and waterproof rough cast and gives quite a pleasing effect.

H. W. M.

Damp Floor

F. H. writes: "*I recently bought an old farmhouse in Surrey, and am experiencing trouble through dampness from some of the floors. These, which are of brick, are well preserved, and only in a few small patches show signs of dampness. However, the rush matting I have laid to the floor, and even the rush seats of the chairs, feel damp, especially after the house has been shut up. While the building is in an exposed position, the walls, which are mostly 2 ft. thick, are quite dry on the inside. Can you suggest the cause and any simple cure?*"

From the description of the dampness, the cause seems to be the common one of a brick floor laid directly on the ground, the damp being drawn up into the rooms through the bricks.

An experiment I recently tried with success in a similar case was to cover the floor with asphalt ¾ in. thick, turned up against the walls 3 ins. as a skirting.

This, when polished and covered with mats, has a charming effect, and has quite cured the dampness without the bother and cost of taking up the brick floor.

S. A. T.

Settling-Up Honeywood: iv

MORE NEWS OF THE DRAINS

BY KARSHISH

(H. B. CRESWELL)

Lady Brash, the client's wife, complains of stuffy smells in the house, which she attributes to defective drains. Spinlove, the architect, is confident there is nothing wrong with them and, although Sir Leslie Brash has written formally complaining of the state of affairs and requiring immediate attention, has rather tactlessly belittled the matter.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 24/3/26.

I am gratified to know that the cause of damp in the domestics' domain has been ascertained and that immediate renovations will at once be accomplished; and I have noted your arrangements for checking Mr. Grigblay's charges.

I am, however, unpleasantly disconcerted by your reference to the question of the sanitary purity of Honeywood, which is—if you will pardon me for so expressing myself—somewhat peremptory and offhand. Of course, where domestic effluents are concerned, obnoxious exhalations are in a limited degree unavoidably to be anticipated, and I should be the last person to be unnecessarily discriminating in such a matter; but where delicate ladies are concerned—and Lady Brash's mucous membrane is peculiarly sensitive to olfactory aggression—[*we were told something like this once before*]—it is most desirably expedient that the odoriferous emanations of which I speak—and which I need not more particularly define—should be limited to the exterior atmosphere, and not permitted to invade the interior of the domicile. Lady Brash increasingly complains that Honeywood is a stuffy house, and one of our domestic staff—cook, to be precise—has described her sleeping quarters as "fuggy"—I use the word as reported to me, and may therefore repeat the expression without apology. I also understand that whiffs of a repulsive nature are from time to time encountered in various parts of the house, but though Lady Brash has on a number of occasions hurried me to the seat of an unsavoury effluvium newly discovered, I have not yet been so fortunate as to arrive on the scene of offence before dissipation has eventuated; and accordingly I am not, I regret to say, in a position to indicate a precise description of the quality of the various noxious emanations which are proving incompatible with Lady Brash's *joie de vivre* and, I fear, prejudicial to her good health. I anticipate, however, that I have, in this lengthy communication, sufficiently indicated the seriousness of the situation, and I shall be gratified to be informed that its prompt amelioration has your immediate attention.

Yours sincerely,

This letter suggests that it is not the drains that require the attentions of an expert, but Lady Brash. We must feel sorry for the poor woman, but this need not prevent us from being far more sorry for Spinlove.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 26/3/26.

I was naturally disturbed by the contents of your letter, but after reading it attentively more than once I cannot help feeling that the case is not so bad as you think, for I am convinced that the drainage system at Honeywood, both inside the house and out, is perfectly sound; and if it were conceivable that anything had gone wrong it could not possibly give rise to such a state of affairs as you describe. It is incredible that the house can be "stuffy" or "fuggy" except for reasons which may give rise to that condition in any house—such as overheating of radiators, accumulations of dust, dirty carpets, lack of ventilation, etc.

I will, of course, give the matter my particular attention and do my best to discover the reason for the complaint, but I shall not be able to spare a day before the end of next week. In the meantime perhaps you will be able to find the true source of the unpleasant conditions, which certainly can have no connection with drainage.

With kind regards,

Yours sincerely,

Spinlove is not happy in the wording of the sentence in which he seeks to discredit the idea that the house can be stuffy.

SPINLOVE TO GRIGBLAY

Dear Sirs, 26/3/26.

I enclose a letter I have received from Sir Leslie Brash. I have had previous complaints of smells in the house. As I cannot go down for a fortnight and have no time to waste and you have work going on in the neighbourhood, I will ask Mr. Grigblay to take an early opportunity of calling at Honeywood and to let me know

what he makes of it all. Perhaps he will be able to see Lady Brash and establish her peace of mind, which I have, unfortunately, not been able to do. You will remember there was the same kind of trouble over the smell of the new oak when the house was being built. They may have been over-stoking and keeping the radiators too hot.

I note that waterproofing of chimneys will have to stand over till the summer.

I still have not yet received your summary of variations account.

Yours faithfully,

The stuffy, close, stale air associated with radiators is due to the hot iron causing the paint on it, and on adjoining surfaces, to smell until it has thoroughly dried up, which, in the case of oily paints, takes some time; and also to the rising currents of air carrying up dust particles with it. There is, rightly speaking, no such thing as "scorched air," though the term is sometimes used as an explanation of these unpleasant associations of radiators. Radiators, however, only in part warm by radiation; a great part of their heat is disseminated by convection, and the repeated circulation of the same air against the heated iron dries it and vitiates it. Many heating systems by hot-water radiators are enervating and dispiriting to live with. These conditions are much aggravated when the radiators are allowed to get above a certain temperature, and are remedied by good ventilations.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 30/3/26.

Your communication encourages optimistic anticipations, though you must allow me to intimate the suggestion that it is not reasonably consistent with what you previously indited to Lady Brash. You must permit me, however, to object most strongly to the astounding suggestion that the conditions I complain of are due to improper neglect of cleanliness at Honeywood. The house, I must beg permission to inform you, is *not* unventilated, dusty and dirty, and I am amazed that one from whom I have learnt to anticipate polite behaviour on all occasions should so far forget decorum as to offer any such monstrous explanatory solution of the matter in complaint.

That the house is stuffy, and impregnated with obnoxious effluviums of some kind, there is abundant evidence to substantially prove. The source of the annoyance, which is a danger to health, is for you to definitely determine, and for Mr. Grigblay to curatively ameliorate without delay.

Yours sincerely,

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 2/4/26.

I assure you that you entirely misread my letter. I admit that my wording was ambiguous, but I had no intention of suggesting what you suppose. My argument was that a defect in the drains could not possibly give rise to the conditions you describe; that such conditions were such as would be occasioned by overheated radiators, dust, lack of ventilation and so forth and that—*as you knew* these conditions did not exist at Honeywood—the explanation *must lie in some other direction.* That is all I meant to say. It never entered my head that you would suppose I could mean that Honeywood was in such a condition; and *if* I had supposed it *was*, I should, of course, have been much more careful not to let you think I thought so. [*Spinlove is not improving matters by this extreme frankness.*] Please accept the will for the deed. [*The finishing touch!*]

I do not know what more I can say until I come down to investigate for myself. That cannot, however, be immediately, as I have to go out of town on business, but I will get in touch with you as soon as I can manage next week.

With kind regards,

Yours sincerely,

This letter is a wretched performance. Spinlove not only says a great deal too much, but makes it appear that his offending letter was written in the belief that his explanation of the "noxious emanations" was, in fact, the true one. He then indicates that he does not consider the matter of any pressing importance, and, by making plain, with characteristic tenacity, that he regards the whole thing as a mare's nest, he returns, like a fly, to the bald place from which Brash has just driven him.

GRIGBLAY TO SPINLOVE

Sir, 6/4/26.

I had a chance yesterday and called at the house to examine into all these effluviums and emanations and other polite stinks that are going about, but can make nothing of it. Every house, in my opinion, has its own smells, different in different houses, if you sit down and wait for them. There were only two real Oh Mys at Honeywood on Tuesday: one was Lysol and the other was her Ladyship, who was carrying so much scent that though I have as good a nose as most it had ought to be forty feet long to reach anything else when the lady was by. She had such a lot of things, too, to tell me that it was difficult to find out anything for myself. The plumbing everywhere is a picture to see; there never was a better job. Rumble was on it, and he's a craftsman if there ever was one: it's a pleasure to look at his wiped joints. No spigotting anywhere, you may be sure, no rubber cones; solid lead tacks wiped on front angles and screwed and plugged, all joints between lead and iron or stoneware made with brass thimbles—beautiful; but you know all about it, sir, having ordered and saw the work being done.

All I could get at was that the bedrooms smelt funny, and the scullery—and why wouldn't that smell, I should like to know? There was an intelligent young girl there who had taught herself how to pull the cobweb grating out of the wash-up, and there she was with a bit of telegraph wire with a sharp burred end to go pushing into the trap when it gets blocked every half-hour and cut a hole in the lead before anyone has time to discover what a clearing eye is for. They had hung up this grating and the key of the back door, so that they shouldn't be wasted, to keep the clock going, because the weight had been lost plumbing the rain-water well.

There was talk that a smell came in at the window; so I told this same slut if you don't like stinks you shouldn't make them, for she had the grease trap outside all clogged and mucked up with kitchen filth, the container not having been emptied all the time they've been there—nor never would be if I hadn't noticed. That gully by the back entrance was flooding over. They had taken the grating out and broke it with a sledge-hammer in case someone should remember what it was for, so as to make it easy to pour down the water they wash the floors with, without the trouble of taking scrubbing-brushes and clouts out of the bucket first. That was what Jossling found stopping the trap when I told him get it cleared, along with a vacuum-cleaner fitting and a few other trifles that wouldn't be missed. That is all I could find wrong with the drains; but it's none of her business, says cook, and the chauffeur says it is none of his, so there you are! and we shall have more complaints before long unless Sir Leslie is told what is going on.

As for the smell in the bedrooms it is difficult to say. The cook had a lot of complaint and said it gave her asthma. It will give you whooping cough, I told her, before ever it will give you asthma, and I think she feels more contented now; but there certainly was a close, stuffy smell in the fifth room on the second floor, in particular, though it had never been used; and my opinion is that smoky air from outside is drawn down the chimneys by the pull of other flues, or perhaps it's down-draught. These damp flues where the rain beats into them would be likely to lead to that kind of trouble.

There was a close air in three other of the maids' rooms that was not accounted for by the windows being shut, nor yet by two towels and a newspaper pushed into the chimney-throat of one of them to plug it in case of ventilation. Her Ladyship says her own room on the first floor is very stuffy; I could not notice anything, but, there you are! I am not in the perfumery myself, and a musk-rat or a civet-cat or whatever it is, spiced up with a touch of Lysol—which is about in saucers and everywhere it has no occasion to be—smells to me after half an hour pretty much like badger. Her Ladyship uses the Lysol so she won't notice the drains, and the scent so she won't notice the Lysol, which is a queer way to go to work if you ask my opinion.

However, I told the lady I could find nothing wrong except perhaps some down-draught in the chimneys, and that everything would be all right in the summer. She seemed satisfied and was very grateful and friendly and had lunch specially served to me though it was early; so I hope we shall have no more old tommy-rot about the drains.

I am sir,

Yours faithfully,

The erratic script of this letter, conjoined with Grigblay's authentic voice, indicates that he typed it himself. We may well suppose that, if persuasion of any kind could do so, his massive resources consoled Lady Brash. Grigblay, however, here definitely oversteps the mark. He takes a great deal too much on himself: he involves Spinlove in a kind of disloyalty to his client, and the extreme intimacy of his facetiousness is subversive of discipline and, definitely, not allowable, but—as Grigblay would say—"there you are!" Spinlove has allowed himself to look to Grigblay for direction in a degree which a more substantial individuality would not tolerate.

SPINLOVE TO GRIGBLAY

Dear Sirs, 10/4/30.

I am much obliged for Mr. Grigblay's report on drains, etc. Things are very much as I supposed. I have written to Sir Leslie Brash calling attention to his servants' neglect, and have no doubt the complaint of bad smells is now disposed of. Please fix the sink grids. I do not understand how that in the scullery could be taken out.

Will you let me have your final statement of account without further delay? I have several times asked for this.

Yours faithfully,

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 10/4/30.

I came back to the office today to find awaiting me a long report from Mr. Grigblay, who in my absence and at my orders made a thorough investigation into the cause of the smells complained of, as no doubt you may have heard. He finds the "closeness" of the bedrooms to be due to the windows being kept shut, and also, perhaps, to slight down-draught carrying smoky air down the chimneys. This is due to the stacks being damp, and will disappear when the summer comes. The chimney-throat in one of the servants' rooms was found to be stopped up. This should be discouraged, as the flues ought to be open to ventilate the rooms.

Mr. Grigblay, however, found a most insanitary state of affairs, productive of bad smells, in the scullery; due, not to any fault in the drainage arrangements or defect in the work, but to the neglect and deliberate ill-usage of the appliances provided, by your servants. The grating of the sink waste has been mischievously forced out so that the trap gets choked with filth; and this is cleared by violently ramming a steel wire down and damaging the pipe, instead of removing the screwed eye provided to make such ill-usage unnecessary. Then the grease trap into which the sinks discharge has never been once emptied; and as a consequence the whole thing is clogged with congealed fat and stinking filth, and allows grease to get into the drain which it is the special purpose of the device to prevent. The iron receptacle in the gully should be lifted out and emptied once a week. In addition to this, the gully by the yard entrance has had its grid removed and deliberately broken, and a scrubbing brush and floor clouts and other things had been thrown into the drain, stopping the trap and flooding the yard with sewage.

I was certain, as I told you, that there could be nothing wrong with the drains, and Mr. Grigblay's report is very much what I expected. If the servants are told to use the fittings and arrangements as they are intended to be used, the smells you complain of will cease.

I am very glad to be able to give you this definite assurance.

With kind regards,

Yours sincerely,

Spinlove so stresses the facts as to overweigh them; and it is not tactful in him to triumph over Brash with cock-crows of "I told you so," and to remind him of his fault by rubbing his nose in it: nor is it tactful in him to appear enormously relieved in being able to give the explanation: for great relief can only be a reaction from great anxiety, and Brash will suppose Spinlove to be concerned for Honeywood's drains, when it is Honeywood's brains that are worrying him. This drain-trouble appears to be entirely of Spinlove's making. If he had written the brief, compact letters of a confident man, instead of the diffuse ones of a man anxious to appear plausible, Brash would have been fortified against his wife's complainings, and the lady, perhaps, herself assured. He is wrong in supposing that emphasis carries conviction; the opposite is true. "I saw Jones at Brighton" is more conclusive that Jones was there than: "I am certain I saw Jones at Brighton," and much more so than: "I am absolutely positive . . ."; and it is only fatuous writers of advertisements who use superlatives that suppose otherwise.

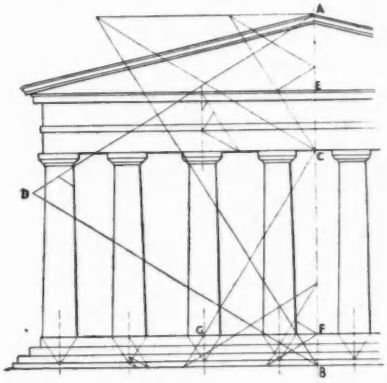
BRASH TO SPINLOVE

Dear Mr. Spinlove, 13/4/30.

I am astonished to be informed of the improper neglect to observe the sanitary amenities on the part of the kitchen staff, and have emphatically directed that it shall cease forthwith. It is scarcely necessary for me to signify that it is not incumbent upon me, as master, to keep myself personally acquainted with the conditions obtaining in the purlieus of the establishment; but I have now expressed my disapproval of past procedure in suitable terms to the person I hold to be responsible, and I confidently anticipate that no repetition of the previously objectionable circumstances will be repeated in the future.

You must permit me to express, however, that I fail to see how irregularities in the culinary domain can account for consequent olfactory intrusions in the sleeping quarters, nor do I comprehend in what way a down-draught in the chimneys can be applicable to the question of sanitary purity. I desire, therefore, that you will transmit Mr. Grigblay's report anent the matter of which I am speaking, so that I may be enabled to acquaint myself with the signification of your communication in more exact detail.

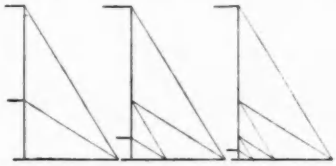
Yours sincerely,



If Brash saw Grigblay's letter the fat would, indeed, be in the fire!—which is proof that Spinlove should not allow such letters to be addressed to him. An architect should be able at any moment to lay all correspondence dealing with his client's business freely before him—in fact, the client has right of access to such correspondence, and also to possession of the whole of it after the work is completed. This follows necessarily from the relation of Agent and Principal which subsists between them. It is clear that Spinlove cannot do what Brash asks; and, even if there were no other reasons, Grigblay's letter, though it is not so marked, is clearly a confidential or private letter.

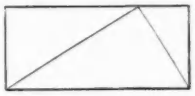
[NEXT WEEK: V—DEFECTS ARE REPORTED]

THE PARTHENON AND THE SET SQUARE



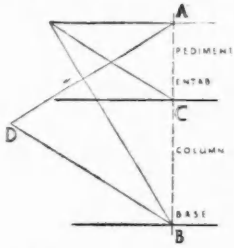
BY H. W. ROBERTS

THE more one studies the Parthenon, the more one is impressed with its amazing simplicity and beauty. In a recent book Sir Reginald Blomfield writes: "That the Greeks had a system of their own; that they worked to definite ratios of dimension and numbers and employed graphic methods of determining their proportions, such as the use of triangles and the like, to arrive at the limits of their design, seems certain."

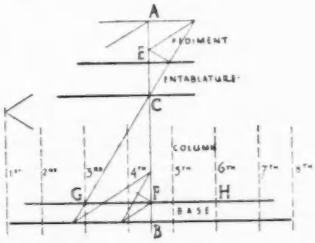


The present article describes an attempt to determine the proportions of the Parthenon by means of the set square. The sides of the set square containing the right angle are in the ratio of 5 : 8 or 8 : 13, a proportion taught by Owen Jones nearly sixty years ago, a proportion known in the Middle Ages as the Fibonacci Series; the Divine Ratio of Leonardo da Vinci as the Golden Cut; and known to the Greeks and Romans as extreme and mean ratio.

This golden cut set square has base to altitude in the ratio of 1·000 : 1·618, and this proportion can be most aptly arrived at by drawing the high slope and the low slope from the opposite angle up to the altitude or tangent.

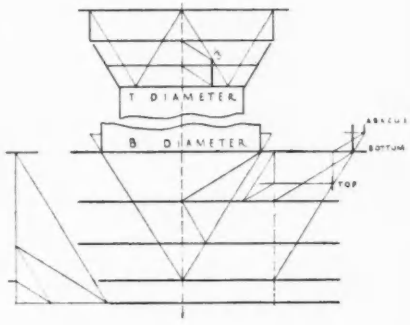


By using this set square it is an easy matter to obtain a close approximation to the Parthenon. By "approximation" I mean a result so similar that one hesitates to say which is the true representation of the Parthenon when it is compared with the most careful and truthful scale drawing.

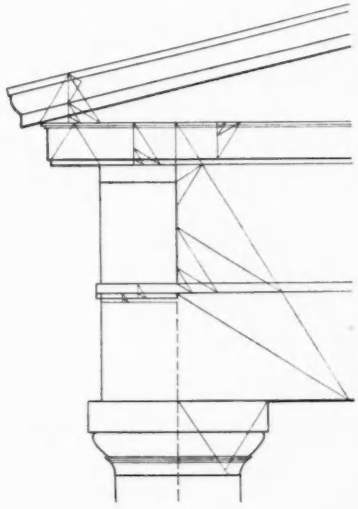


Having either the width 101·33 or the length 228·14 the set square applied in this manner gives the plan of the top step.

Then for the end elevation draw a vertical line AB 64 ft. high to any scale. The golden cut gives C the bottom of entablature; from ends of A and B draw low slopes to cut at D the full width of corona of cornice.

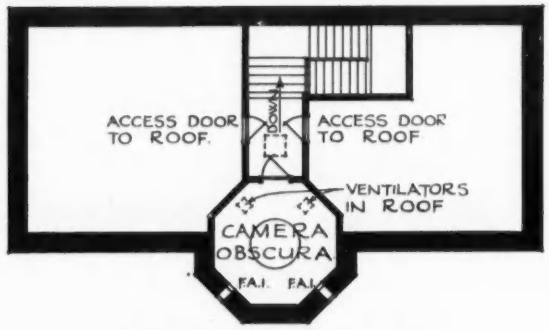


On AC use the golden cut; then slope line in opposite direction to get the point E, the top of entablature. On vertical CB take the golden cut, and then golden cut of the smaller part to get F the top of base, or stylobate; this also cuts at point G, the centre of third column; the point H, centre of sixth column, is got in similar manner; GH can now be divided into three equal parts to get centres of fourth and fifth columns; centres of second and seventh columns can be fixed at same widths; a low slope line from F will cut low slope line from A at centre of first column; the end columns are nearer together at each corner of the building.

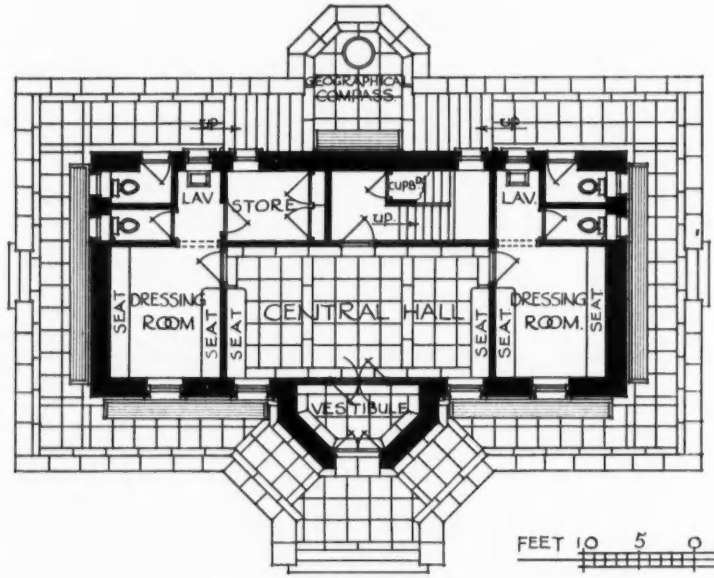


To half-inch scale draw vertical line 6 ft. high, apply golden cut, then golden cut of smaller part to get height of small bottom step. From this height draw V form; take golden cut of this vertical for depth of top step; then divide remainder into two equal parts for second and third steps; the ends of the V form will be the bottom diameter. Divide height of top step into the golden cut; then a horizontal line through this tick will give the top diameter; from end of this line draw vertical, then low slope and get the full width of abacus.

Continue the vertical line and at convenient point set off the widths of abacus; draw two V forms to get bottom of capital; take one-third of this height and transfer by low slope lines on to vertical, and get divisions of capital; draw verticals for ends of abacus and tick the width of top diameter and draw slope lines to indicate form of echinus.

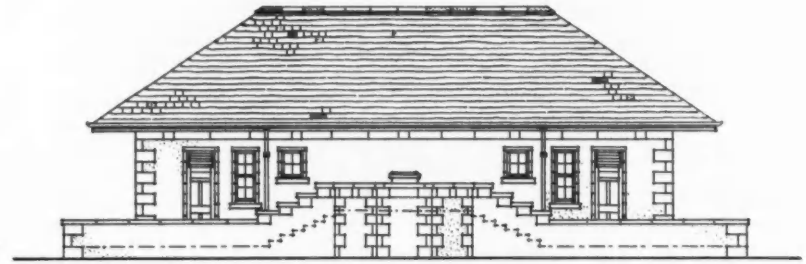


To half-inch scale draw vertical line 11 ft. for depth of entablature; the



golden cut gives height of architrave; the golden cut of the golden cut of the golden cut gives tenia band. The cornice is one-third of frieze; its bottom member is the golden cut of golden cut; the moulding at top is the golden cut of the golden cut of remainder; the projection is got as shown and the mouldings on pediment will be now easily understood from the detail. These large-scale details show the method of arriving at each part.

SPORTS PAVILION KIRRIEMUIR HILL.



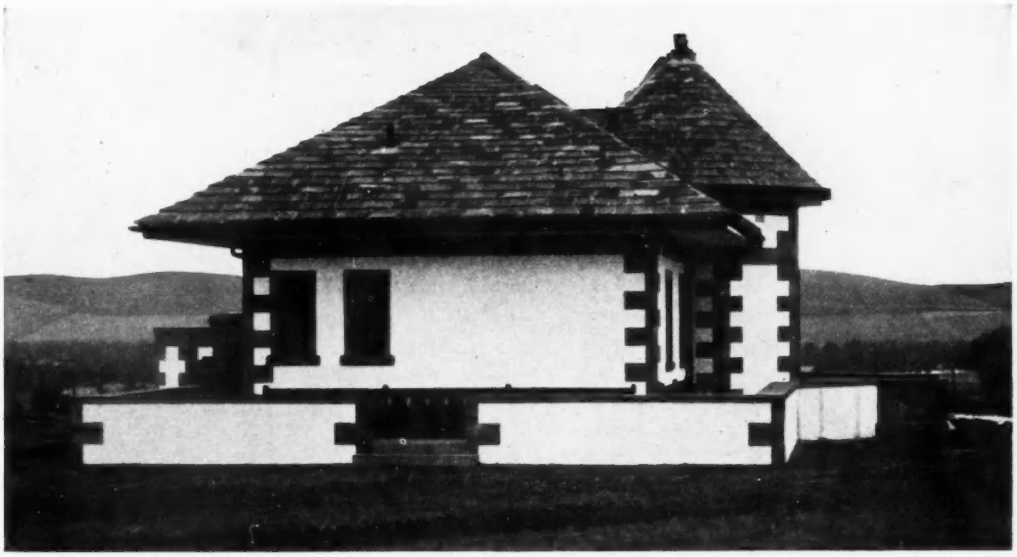
FIRST FLOOR PLAN

PLAN

CROSS SECTION.

WEST ELEVATION.

FRONT ELEVATION.



FRANK THOMSON
ARCHITECT.
11 NETHERGATE
DUNDEE. AUG. 1929.

Ground- and first-floor plans, elevations and section. On the ground floor is a central hall, 24 ft. long by 12 ft. wide, on either side of which are dressing-rooms, measuring 12 ft. by 10 ft., and lavatory accommodation. On the first floor is the camera obscura. A geographical indicator of surrounding eminences is provided on a raised platform on the veranda.

SIR JAMES BARRIE'S SPORTS PAVILION

DESIGNED BY FRANK THOMSON

A view of the pavilion from the south. The walls are of local stone, harled, with local stone dressings. The roof is covered with grey stone slates.

ON Saturday afternoon, June 7, Sir James Barrie, Bart., O.M., opened the sports pavilion at Kirriemuir Hill, which he has gifted to his native town. When the design, selected from the competitive plans submitted, was forwarded to the donor, he returned it with the nappy suggestion that a camera obscura should form part of the building, as "it would provide a great deal of amusement, especially to the young." It is probably the only one in the world on a sports pavilion.

Sir James's idea of the building which in his opinion would be suitable for the site was thus expressed by himself: "It should not be ornate or call attention to itself, but should be something that settles down quietly as belonging to the Hill. A Kirrie Building, not something from the outside."

The pavilion stands to the west of the cricket pitch on the top of the Hill (631 feet above sea level). The camera obscura is placed in the roof over the entrance vestibule and is approached by a staircase from the back of the central hall. Magnificent views are obtained from Kirriemuir Hill.

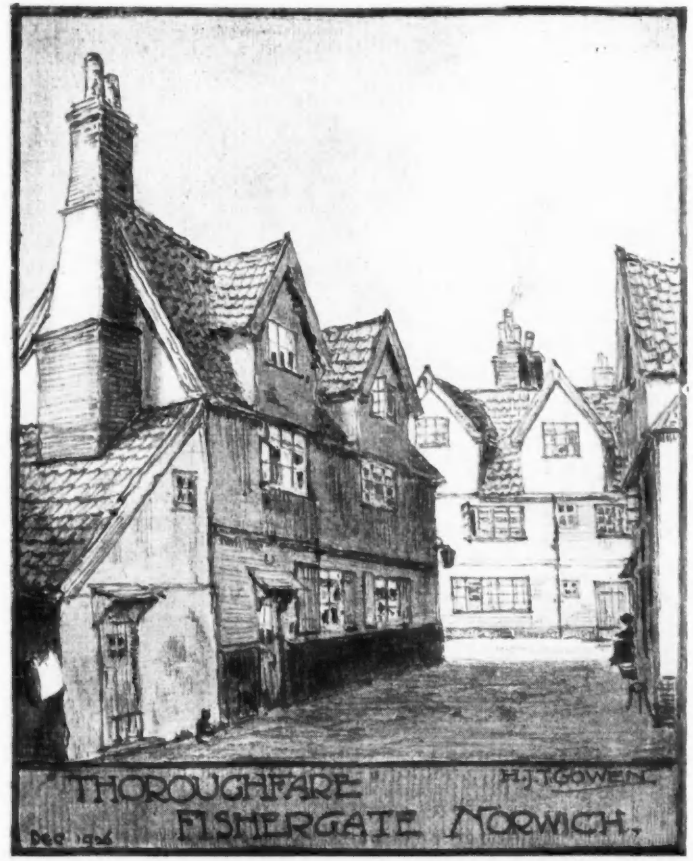
A geographical indicator is provided in the veranda, giving the height and distance of twenty-eight hills, the principal ones being: Ben Ledi, 2,875 ft.—58 miles, 165 yds.; Ben Chonzie, 3,048 ft.—40 miles, 1,540 yds.; Ben Lui, 3,708 ft.—71 miles, 1,045 yds.; and Ben Lawers, 3,984 ft.—47 miles, 660 yds.

[*Photos., D. M. Laing.*

The main (east) elevation. The pavilion stands on the top of Kirriemuir Hill, and has been specially designed to provide uninterrupted views towards the surrounding hills. The camera obscura, the head of which is seen at the apex of the octagonal roof, was installed at the suggestion of Sir James Barrie.

D

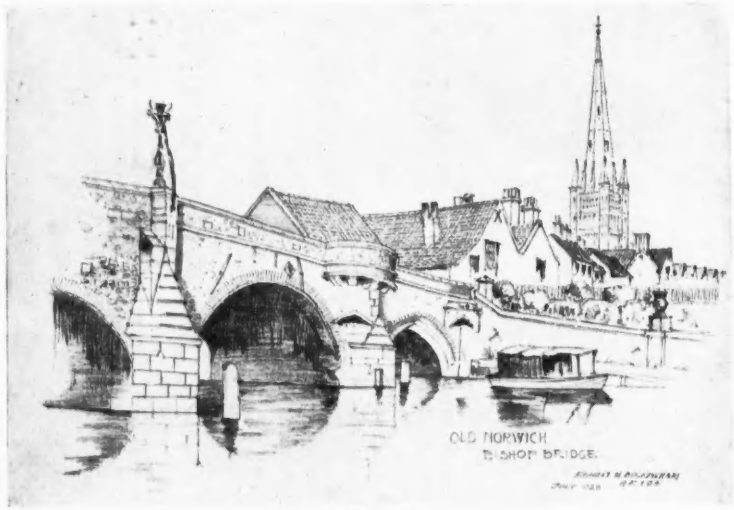
THE SKETCH CLUB
FIFTH SESSION

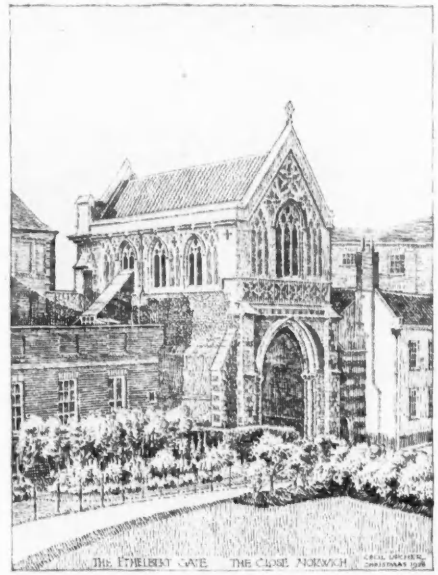


IT is natural that the insidious infection of sketching should be rife in Norfolk, that county most susceptible to the architectural sketcher. The Sketch Club's hanging committee has had no easy task in selecting the examples now presented.

St. Germyns, Wiggenhall (on the Gt. Ouse, near King's Lynn.)
By C. Upcher. (Pencil.)

SAMSON and Hercules House can be traced back to 1657, when Christopher Jay, mayor, acquired what may have been the Duchess of Suffolk's town mansion. Samson's figure (left) is original, like the door; that of Hercules is more recent and less impressive. Bishop Bridge, probably built at the expense of Richard Spynk, a notable citizen, about 1343, together with a gateway, over the west approach (removed, through weakness, in 1790) formally passed from the priors to the city in 1393. E. H. B.





Wells-on-Sea, Norfolk (between Cromer and the Wash).
By C. Upcher. (Pencil.)

THE Ethelbert Gateway, leading from Tombland to the Upper Close, is an Early Decorated building, and represents part of the fine imposed on citizens for the riots of 1272, when many monks perished. Pulls Ferry, at the extreme east end of the Close, leads out of it across the River Wensum. The old flint and stone archway is the ancient water-gate to the Precincts. Up a water-way that used to run inland, here, stone for the cathedral is said to have been brought. C. U.

SOCIETIES AND INSTITUTIONS

R.I.B.A. COUNCIL MEETING

FOLLOWING are some notes from a recent meeting of the R.I.B.A. Council:

Sir Edwin Cooper's Election to the Royal Academy. The cordial congratulations of the Council were conveyed to Sir Edwin Cooper on the well-merited honour conferred on him by his election as an Associate of the Royal Academy.

The Fees for the R.I.B.A. Statutory Examination and the R.I.B.A. Examination for Building Surveyors. On the recommendation of the Board it was decided to abolish the fee of £3 3s. in connection with the issue of the Certificate of Competency and that the examination fee of £3 3s. should in future include the examination and the issue of the Certificate of Competency.

Deputy Hon. Secretary, R.I.B.A. for Western Australia. Mr. A. R. L. Wright, L.R.I.B.A., was appointed deputy Hon. Secretary, R.I.B.A. for Western Australia.

The Court of Governors of University College, Hull. Mr. F. J. Horth, F.R.I.B.A., was appointed to represent the R.I.B.A. on the Court of Governors of the University College of Hull, in place of Mr. John Bilson, who has retired owing to ill-health.

The National Association for the Prevention of Tuberculosis. Mr. H. M. Fairweather, F.R.I.B.A., was appointed to represent the R.I.B.A. at the sixteenth annual Conference of the National Association for the Prevention of Tuberculosis, which will be held in London from 3rd to 5th July.

The Thames Bridges Conference. Professor A. E. Richardson, F.R.I.B.A., and Mr. W. Harding Thompson, F.R.I.B.A., were appointed as members of the Thames Bridges Conference.

Revision of Ordnance Maps. Mr. W. Harding Thompson, F.R.I.B.A., was appointed to represent the R.I.B.A. at a conference called by the Town Planning Institute to urge the bringing up to date of ordnance maps.

British Engineering Standards Association: Conference on the Standardization of Gypsum Plaster. Messrs. W. E. Vernon Crompton, F.R.I.B.A., and Alan E. Munby, F.R.I.B.A., were appointed to represent the R.I.B.A. at a conference called by the B.E.S.A. to consider the standardization of gypsum plaster.

The Daylight Illumination Sub-Committee of the National Illumination Committee of Great Britain. Mr. P. J. Waldram, L.R.I.B.A., was appointed as the R.I.B.A. representative on the Daylight Illumination Sub-Committee of the National Illumination Committee of Great Britain.

The Fellowship. The Council, by a unanimous vote, elected Messrs. W. G. Allen and W. L. Duncan to the Fellowship.

Membership. Nominations for membership were approved as follows: As Fellows, fifteen applications; as Associates, fourteen applications.

Reinstatement. The following ex-members were reinstated: As Fellows, Messrs. John Coulson Nicol and John Robert Sutton; as Associate, Mr. Cyril John Crossman.

Students. The following probationers were elected as students of the R.I.B.A.:

Dillon, C. J. (Architectural Association).
Good, N. D. (Architectural Association).
Goodden, R. Y. (Architectural Association).
Haswell, G. J. W. (Northern Polytechnic).
Hunt, R. D. (Architectural Association).
McLaughlan, C. P. (Northern Polytechnic).
McLean, C. R. (Special Exemption).
Marlow, A. F. (University of London).
Maw, G. M. (Northern Polytechnic).
Morrison, A. J. W. (Edinburgh College of Art).
Prior, J. F. (Northern Polytechnic).
Richardson, R. J. (Liverpool School of Architecture).
Robin, A. A. (Glasgow School of Architecture).
Robinson, G. D. (Birmingham School of Architecture).
Rosser, C. (Welsh School of Architecture).
Sein, M. T. (Architectural Association).

ROYAL INCORPORATION OF ARCHITECTS IN SCOTLAND

At the annual convention of the Royal Incorporation of Architects in Scotland, held in Aberdeen, Mr. John Watson was formally elected president and installed in office.

The report of the Council showed that during the past year seven Fellows, eighteen Associates, and twenty-two students had been elected; thus bringing the total membership, including affiliates, up to 833.

The following were elected representatives to the R.I.B.A. for the next session. Messrs. P. H. Thom (Dundee), William Williamson (Kirkcaldy), and James Lochhead (Hamilton).

Messrs. W. L. Duncan (Turriff), D. A. Stewart (Perth), John Begg (Edinburgh) and Andrew Balfour (Glasgow)—four members of affiliated societies in Scotland—have been elected to the R.I.B.A. Council.

The Rowand Anderson medal and scholarship of £100 was awarded to Mr. Hugh S. MacDonald, College of Art, Edinburgh; and Mr. G. A. Cassells was awarded a certificate and £20. The Rutland Prize—certificate and £50—was won by Mr. G. D. Hardie. Mr. J. W. Laing was awarded the Incorporation prize for third-year students.

OXFORD ARCHITECTURAL SOCIETY

The annual meeting of the Oxford Architectural and Historical Society was held recently in the Ashmolean Museum. Professor J. N. L. Myres, vice-president, occupied the chair.

Professor Myres stated that twenty-eight new members had been elected during the year, compared with forty-two in the previous year. The Society had continued its activities in promoting the welfare of objects of architectural and historical interest in Oxford and the neighbourhood.

The statement of accounts showed a balance of £70 18s. 9d.

The following members were elected as officers: President, Rev. H. E. Salter; Vice-president, Prof. F. M. Powicke; Auditors, Rev. Canon Watson and Mr. Madan; hon. treasurer, Mr. L. Stampa; hon. librarian, Mr. C. F. Bell; hon. secretaries, Prof. J. N. L Myres and Miss M. R. Toynbee. Committee: Miss Taylor, Miss Hamilton, and Messrs. R. G. Collingwood, D. B. Harden and J. H. Le Patourel.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Proposed Willingdon By-pass

IN the House of Commons Mr. Ede asked the Minister of Transport whether he was aware that the proposed new main road to Eastbourne was designed to cut through the village of Willingdon, destroying the oldest and most beautiful part of it, and whether he was prepared to consider representations on the matter.

Mr. Morrison said he was aware of the circumstances connected with the proposed Willingdon by-pass and of the alternative proposals which had been put forward. His approval of the County Council's proposals followed upon a local inquiry held last February. He was not aware that any fresh considerations had arisen, and he should deprecate any further delay in proceeding with the work. In the circumstances, he did not think that any useful purpose would be served by his hearing further representations in the matter, but he must not be taken to admit Mr. Ede's description of the effect of the scheme.

The Government's Slum Bill

During the consideration in Standing Committee "A" of the House of Commons of the Housing (No. 2) Bill an interesting discussion took place on an amendment, moved by Dr. Vernon Davies, to Clause 22, to provide that a local authority, in preparing proposals for the provision of houses in its area, shall have regard to the natural amenities of the locality, and that no works of architectural, historical or artistic interest shall be destroyed without the consent of the Minister.

COMPETITIONS OPEN

July 1.—The Isle of Man Education Authority invites architects to submit competitive designs for a new Grammar School at

Ramsey, Isle of Man. Assessor, T. Taliesin Rees, F.R.I.B.A. Particulars, etc., are obtainable from T. R. Lewin, Clerk of the Authority, Education Office, Strand Street, Douglas, until July 1. Deposit £1 1s. Latest date for submission of designs : September 30.

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thomas, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor : H. V. Ashley, F.R.I.B.A. Premiums : £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs : July 5.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall, which is to be built on the site of the old town hall at an approximate cost of £250,000. Assessor : Sir Brumwell Thomas, F.R.I.B.A. Premiums : £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs : July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor : Herbert T. Buckland, F.R.I.B.A. Premiums : £150, £100, and £50. Applications for conditions of the competition, etc., should have been made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs : July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor : Professor Patrick Abercrombie, F.R.I.B.A. Premiums : £150 and £50 for first and second places, respectively. Copies of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs : September 1.

No date.—The Carlisle Corporation invites British architects to submit designs for the façade to English Street and the Victoria Viaduct, suitable for shops and business premises. The site was previously occupied by the Prison. The total length of the frontage is approximately 358 ft. Assessor : Francis Jones, F.R.I.B.A. Premiums : £300, £200, and £100. Particulars of the competition, etc., may be obtained from Percy Dalton, A.M.INST.C.E., A.R.I.B.A., City Engineer, 18 Fisher Street, Carlisle. Deposit, £1 1s.

No date.—The General Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums : £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2.

THE ARCHITECTS' DIARY

WEDNESDAY, JUNE 18

R.I.B.A., 9 Conduit Street, W.1. British Architects' Conference, to be held at Norwich. Until June 21 inclusive. The headquarters of the Conference will be at the Stuart Hall, where an informal reception will be held during the hours 8 p.m. to 11 p.m. **8 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. International Exhibition of Modern Commercial Architecture. Until June 30.

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition open to the public. Open until September. **10 a.m.**

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. At Torquay. South-Western District Meeting.

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art, held in the North Court. 10 a.m. to 6 p.m. (Thursdays, 10 a.m. to 10 p.m.) **10 a.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

THURSDAY, JUNE 19

R.I.B.A. British Architects' Conference. At the Stuart Hall, Norwich. The president will deliver the inaugural address, followed by "Regional Planning, with Special Reference to Norwich and Norfolk," by W. Harding Thompson, F.R.I.B.A., at 10.15 a.m. Lunch, 1 p.m. Assemble at St. Andrew's Hall, where Conference photograph will be taken. 2 p.m. Alternative visits during afternoon. Reception by the Lord and Lady Mayoress, at the Castle Museum, at 8 p.m. **10.15 a.m.**

FRIDAY, JUNE 20

R.I.B.A. British Architects' Conference. At Norwich. Alternative whole-day visits. Conference Banquet at St. Andrew's Hall. 7.15 p.m. for 7.30 p.m. **7.30 p.m.**

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "Landscape Road Designs, with Special Reference to Recent Work in the U.S.A." By Thomas Adams, F.S.I., M.T.P.I. The Rt. Hon. Lord Ponsonby will preside. **5 p.m.**

SATURDAY, JUNE 21

Sunrise, 4.42 a.m. Sunset, 9.21 p.m.

R.I.B.A. British Architects' Conference. At Norwich. Informal visits. 9.45 a.m. to 1 p.m. **9.45 a.m.**

ROYAL SANITARY INSTITUTE. Annual Congress to be held at Margate until June 28 inclusive. Various lectures, discussions and visits will be held throughout the week.

ADVERTISING ASSOCIATION. At the Pier Pavilion, Hastings. Opening of the Sixth Annual Advertising Convention. The Rt. Hon. Lord Riddell will preside. 3.30 p.m. The Convention will continue until June 25, inclusive. **3.30 p.m.**

MONDAY, JUNE 23

R.I.B.A., 9 Conduit Street, W.1. Exhibition of models, masonry specimens, drawings and photographs of St. Paul's Cathedral. 10 a.m. to 8 p.m.; (Saturdays, 5 p.m.) Until June 28. **10 a.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to Westminster Abbey. Meet in the Jerusalem Chamber at 4 p.m., where Dr. Foxley Norris will address those present. **4 p.m.**

TOWN PLANNING INSTITUTE. At the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W.1. General Meeting. "Why Not More Progress with Town Planning?" By Professor Patrick Geddes, M.T.P.I. **6 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At Eastbourne. Summer Meeting. Council Meeting at the Grand Hotel, at 5.30 p.m. **5.30 p.m.**

TUESDAY, JUNE 24

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At Eastbourne. Special Meeting of Members at the Grand Hotel, at 10 a.m., followed by "A Review of the Present Position of Automatic Heating by Oil Burning." By I. Lubbock, M.A. (CANTAB.), A.M.I.MECH.E. Motor Drive to Beachy Head, 2.30 p.m. Reception by the President and Mrs. E. R. Jones in the Grand Hotel, 7 p.m. Banquet, 7.30 p.m. **10 a.m.**

WEDNESDAY, JUNE 25

R.I.B.A., 9 Conduit Street, W.1. Special General Meeting. "The Restoration of St. Paul's Cathedral." By Captain C. Stanley Peach, F.R.I.B.A., and W. G. Allen, F.R.I.B.A., and Lantern illustrations. **8 p.m.**

ROYAL SANITARY INSTITUTE. At Margate. Meetings of the Architectural and Engineering Sections. **10 a.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At Eastbourne. Summer Meeting. Assemble at Grand Hotel for Group Photograph, 9.15 a.m. Circular Motor Drive, 10 a.m. **9.15 a.m.**

FRIDAY, JUNE 27

LONDON SOCIETY, Lancaster House, St. James's S.W.1. Visits to Deaf and Dumb Asylum, 179 Clapton Road, Hackney, and St. John's Institute Hackney. Meet at the first-named place at 2.45 p.m. Tea will be provided at St. John's Institute. **2.45 p.m.**

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL SOCIETY, The Castle, Winchester. Excursion to the Joinery Works of Messrs. W. E. Chivers and Sons, Ltd., Devizes, and buildings of architectural interest in the neighbourhood. A General Meeting will be held after lunch.

SATURDAY, JUNE 28

Sunrise, 4.45 a.m. Sunset, 9.21 p.m.

MONDAY, JUNE 30

INSTITUTION OF MECHANICAL ENGINEERS. At the Henry Herbert Wills Physics Laboratory, University of Bristol. Summer Meeting. Until July 4.

TUESDAY, JULY 1

INSTITUTE OF QUARRYING. At the Grand Hotel, Scarborough. Annual Conference. Until July 5.

WEDNESDAY, JULY 2

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. Annual Exhibition to be held at Portsmouth until July 8.

FRIDAY, JULY 4

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At Southampton. Joint Meeting with the Hampshire and Isle of Wight Architectural Association. Visits to the new Town Hall (description by E. Berry Webber), the Old Bargate (description by H. P. Cart de Lafontaine), Guildhall, Empire Theatre, and Ocean Liners. Particulars are obtainable from the Hon. Secretary.

SATURDAY, JULY 5

Sunrise, 4.49 a.m. Sunset, 9.19 p.m.

R.I.B.A., 9 Conduit Street, W.1. Tour to United States and Canada by the Cunard Liner "Samaria." Returning on July 25. Members wishing to take part in the trip should apply to H. T. Leese, 26-27 Cockspur Street, London, S.W.1.

WORTHING MUNICIPAL BATHS COMPETITION. Latest date for submission of designs.

SUNDAY, JULY 6

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At Southampton. Excursion to Romsey and the New Forest.

WEDNESDAY, JULY 9

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. At Scarborough. Annual Meeting and Conference. Until July 12.

FRIDAY, JULY 11

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Annual River Trip. Visit to the West India Docks. The party will leave Westminster Pier at 2 p.m. Tickets 8s. 6d. (including tea). **2 p.m.**

SATURDAY, JULY 12

Sunrise, 4.56 a.m. Sunset, 9.14 p.m.

WEDNESDAY, JULY 16

ARCHITECTURAL ASSOCIATION, 36 Bedford Square, W.C.1. Annual Excursion to Denmark and Sweden, returning to London on July 29. Particulars of the tour, etc., are obtainable from F. R. Yerbury, Secretary, Architectural Association.

INTERNATIONAL CONFERENCE of Union Internationale des Villes and Pouvoirs Locaux. At Liége. July 16–17.

FRIDAY, JULY 18

BRITISH STEELWORK ASSOCIATION. At the Institution of Mechanical Engineers, Storey's Gate, S.W.1. "Skyscrapers in America." By G. E. J. Pistor. 5.30 p.m. (Tea will be served at 4.45 p.m.) **5.30 p.m.**

INTERNATIONAL CONFERENCE of Union Internationale des Villes and Pouvoirs Locaux. At Antwerp. July 18–19.

SATURDAY, JULY 19

Sunrise, 5.4 a.m. Sunset, 9.8 p.m.

SATURDAY, JULY 26

Sunrise, 5.13 a.m. Sunset, 8.59 p.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visits to Leeds Castle, Chilham or Bodiam, etc., organized by the Canterbury and Tunbridge Wells Chapters. Particulars of the visits are obtainable from the Hon. Secretaries of the Chapters.

THURSDAY, JULY 31

LUTON TOWN HALL COMPETITION. Latest date for submission of designs.

DUDLEY SCHOOL COMPETITION. Latest date for submission of designs.

LAW REPORT

A FACTORY THAT COLLAPSED

Webster and Weddell v. *Robson and Perrin and another. High Court of Justice. Official Referee's Court. Before Sir Francis Newbolt*

IN this action, which had been referred from the King's Bench Division, Mr. Philip Reginald Webster and Mr. William Weddell, trading as Weddell Brothers, advertising contractors and poster printers, of Sussex Road, Holloway, sued Messrs. Robson and Perrin, surveyors, valuers, etc., of King William Street, E.C., and Mr. George Clare, architect, of College Road, Harrow, for damages for negligence and breach of duty as architects, or for damages for breach of contract.

It appeared that in September, 1926, plaintiffs were minded to purchase a piece of land and erect a factory at Elthorne Road, Holloway. Defendants' firm undertook the duties of architects and instructed the second defendant to assist them, introducing him to the plaintiffs. The selected contractors were the Cellular Construction Co., Ltd., of Chandos House, Westminster, and the contract price for the erection of the building was £4,367. Defendants' firm, it was alleged, said the company was a substantial one, sound financially, and able to carry out the contract in a satisfactory way such as would be passed and approved by the County Council or the District Surveyor. It was further stated that the contractors were the English branch of the Monnoyer Construction Co., but plaintiffs alleged that this was not true. Plaintiffs alleged that in spite of their protests defendants issued certificates for payment amounting to £2,800. On October 22, 1927, the roof and floors of the factory collapsed.

Defendants denied all the allegations.

The Official Referee, after hearing the evidence, in a reserved judgment, said the case had taken nearly two and a half years to come to trial, and it presented several novel features of interest to the building trade, to architects and to those interested in the safety of buildings. During his (Sir Francis') forty years' experience he did not remember anything quite like it. Amongst the many unusual features were, first, that a factory costing thousands of pounds and requiring corresponding skill and labour, to be completely erected in ferro-concrete in London by a limited company which had no money—not even the necessary money for wages—was proceeded with in a dilatory manner, the contract time being largely exceeded, should collapse from inherent weakness; faulty design, bad workmanship and want of supervision, whilst the company rushed into voluntary liquidation without assets. No inquiries had been made by the architects about their financial standing. Secondly, the architects were named and the contract made on the R.I.B.A. model and were now defendants. They were incapable of preparing the plans and calculations for a new and experimental ferro-concrete scheme, which they advised should be used, and so the plans were prepared by a builder or engineer, who with one other man, a Belgian, constituted the Cellular Construction Co. The latter had no knowledge of the L.C.C. regulations and was using a scheme of his own not hitherto tested. Thirdly, the plans and calculations, although contrary to the regulations, were passed by the District Surveyor, who was very properly superseded in consequence. Thus Mr. Henry, who was trading as Robson and Perrin, was employed by the building owners, and signed all the certificates for payment and received all the architects' fees paid. He was not an architect, and claimed that he was not employed as architect at all. The second defendant, Mr. Clare, was an architect, who prepared an abortive plan on another system, which was not used, but he was not, in fact, regarded by the owners, the plaintiffs, as anything more than Mr. Henry's assistant. He admitted he had no skill in concrete work and could not plan specifications and calculations for the building or supervise or check the builder's work, or order mistakes to be rectified. So he relied upon a ferro-concrete expert, thus, in his own estimation, getting rid of his responsibility. This expert was, though it could scarcely be credited, the Belgian builder himself, whose work and material had to be checked and passed. He (the Referee) found that Messrs. Henry and Clare were partners as architects of the building, and were responsible if anything went wrong. He found that the architects were liable in damages. Judgment would be entered for the plaintiffs, with costs, on the question of negligence. Damages would be assessed later.

BRIDGES AND PONTAGE

LEANING over bridges has become, I fear, a lost employment. Instead, we crawl into a car and pass swiftly across them, thankful if the press of traffic has not caused our "wings" to be scraped on the parapets. When a boy, I was driven behind a pony over many of the bridges shown in this book, and the pony was pulled up, left to snatch at grass and flies, and the bridge examined, both in its reflected image in the water and, if possible, in perspective from the banks; and so my first use of Mr. Jervoise's photographs and notes is to give me back my bridges—Harnham, Bull, Amesbury, Milford, Wool and the rest, and to add many another. Each item is treated by the author separately with a character sketch, of which there are nearly four hundred. I know only of four omissions, possibly as being inconspicuous; they are, first, the small Fisherton bridge over a backwater of the Salisbury Avon (it was widened and levelled about 1905, when the arches were removed, but the old parapets refixed on steel girders); secondly, the two over Wylye and Nadder, south of Wilton Park wall, quiet work of eighteenth-century character in idyllic surroundings; and the last has just been destroyed by the appropriate authority, and its worn old parapet replaced by a balustrade so hideous it invites suicide. This bridge crossed a tributary of the Wey at Mayford.

Mr. Jervoise, in his exhaustive examination of old documents, has traced few founders of bridges, probably because nearly every original bridge was a timber construction constantly in need of repair and often of rebuilding. A few examples are mentioned in which timber is still used to span from one stone pier to another. Has he any evidence of the reverse construction, i.e. of timber posts and ribs supporting a stone "causey" and contributing to the solution of vaulting by ribs as the normal mediæval practice?

Two types of bridge appear to be general and show succinctly the two schools of the Middle Ages—the first is that of the military engineer and is a plain fortification against the stream's force; the second is that of the church builder and is lightened with mouldings, and becomes as it were a Christian and native narcissus gazing at what is divine within its own image.

A mediæval bridge needing repair was usually the subject of an "inquisition" by the King's officers. If no liability could be fixed, a grant of pontage, i.e. of exacting toll, was made to certain persons for a period till enough money was raised. The author gives many details of pontage, and his book is essential to the student of social life as well as art. It is extremely well arranged and the photographs are charming.

P. M. STRATTON

The Ancient Bridges of the South of England. E. Jervoise, A.M.I.C.E. For the Society for the Protection of Ancient Buildings. London: The Architectural Press. Price 5s. 6d. net.

TRADE NOTES

Messrs. Storry, Witty & Co., Ltd., have issued two circulars concerning the importation of putty from the Continent. In one of the circulars the firm state: "Linseed oil putty is made from whiting and linseed oil without any admixture of other oils. British-made putty, when marked 'Linseed Oil Putty,' is made from linseed oil and whiting only. A great deal of putty made on the Continent is imported into this country marked 'Linseed Oil Putty.' The bulk of it is made from mineral oil with a small percentage of linseed oil. Owing to this Continental putty being marked 'Linseed Oil,' many buyers think they are getting genuine putty at a low price. Putty made by us, whether marked 'Stority' or 'Linseed Oil Putty,' is guaranteed made from pure linseed oil and whiting, and nothing else." In the other circular the firm state: "A few days ago we received an offer from the London agent of a Continental firm quoting 'Genuine Linseed Oil Putty' at a very low price, and offering to send a keg as sample, which we obtained. We submitted it to a public analyst and found that the oil with which it was made analysed 86·25 per cent. of mineral oil and 13·75 per cent. of linseed oil." Copies of the circulars can be obtained from Messrs. Storry, Witty & Co., Wincolmlee Colour Works, Hull.

*

The accompanying illustration shows a new type of construction used for the terracing of the balcony during the reconstruction of the Theatre Royal, Bolton. It is reproduced from "The Modern Super-Cinema," an article by M. B. Buxton, M.A., ASSOC.M.INST.C.E., in *Modern Steelwork*, just published by the British Steelwork Association. This terracing, says the author, instead of being constructed in concrete or timber, is made of ¼-in. continuous steel plates, bent to shape and bolted together to form the steps. The timber flooring and casings are bolted to the upper side of the steel plating, with felting between, to prevent resonance. The whole area of each balcony is therefore covered with ¼-in. steel plating, which, besides effectively distributing the load to the rakers and cantilevers, makes a very strong and rigid flooring, free from spring and deflection. It is, of course, fireproof, and also considerably lighter in weight than concrete terracing. The advantage in this form of construction over concrete is the speed of erection; the steel plating being rapidly fixed and the contractor able to follow on immediately with the wood flooring without any delay.

The book is a review of current practice in the employment of structural steelwork and bridges and is edited by W. R. Gilbert. Among the contributors are J. R. Sharman, Howard Robertson, Alfred C. Bossom, and M. B. Buxton. It is published at the offices of the Association, Artillery House, Westminster, S.W.1. Price 5s. net.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

THE BUILDINGS ILLUSTRATED

Following is a list of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Eastbourne College War Memorial Buildings (pages 924, 929–932). General contractors for the recently executed work, Chapman, Lowry and Puttick, Ltd. General contractors for the tower and south block, Walter Lawrence and Son, Ltd. Stone carving, George Alexander. Sub-contractors: Durbin and Sons, central heating; Thos. Elsley, Ltd., rain-water goods; Bainbridge, Reynolds, Ltd., wrought-iron gates, etc.; Jacob, White & Co., Ltd., electric light and power; Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., floors; Smith, Walker, Ltd., constructional steelwork; C. E. Welstead, Ltd., lead light casements; Hollis Bros. & Co., Ltd., wood block floors; S. and E. Collier, Ltd., tiles; Weldon Quarries, stone; Daneshill Brick and Tile Works, Ltd., "Daneshill" sand-faced and hand-made 2⅝ rough texture mixed colour facing bricks, and "Daneshill" moulded bricks.

Headington School for Girls, Oxford (pages 933–936). General contractors: Benfield and Loxley, Ltd. Sub-contractors: Redpath, Brown & Co., Ltd., structural steelwork; Gloucester Brick and Tile Co., facing bricks; E. Mathews & Co., tiling contractors; Constone, Ltd., reconstructed stone, precast concrete beams, composition and terrazzo flooring, and stairs; Hollis Bros., Ltd., wood block flooring; J. H. Pye, steel windows; Engert and Rolfe, Ltd., asphalt flats; Ewart and Sons, Ltd., copper to turret and lightning conductors; the Merchant Trading Co., Ltd., "Celotex" ceilings throughout; Hill, Upton & Co., electric lighting installation; F. G. Alden, heating and hot-water installations; Mowbray & Co., Ltd., panelling and book shelving to library; H. Hunt and Sons, gymnasium equipment; J. Gibbons, Ltd., cloak-room fittings; the Bennet Furnishing Co., Ltd., laboratory fittings; F. De Jong & Co., Ltd., fibrous plaster decorations; Eagleston & Co., Ltd., sanitary fittings and fireplaces; Adamsez, Ltd., sanitary fittings; Parker, Winder and Achurch, Ltd., door furniture and miscellaneous hardware; J. H. Grant and Sons, Ltd., wrought-iron gates and ventilating trunks; Pilkington Bros., Ltd., "Vita" glass to windows of classrooms.

Sports Pavilion, Kirriemuir Hill (pages 946–947). A. Adamson and Son, mason work; A. W. Bonar, joiner work; James Clark, plumber work; James Kerr and Son, slater work; John Doig, plaster work; James Stewart, painter work; Negretti and Zambra, camera obscura; McDonald and Creswick, Ltd., geographical indicator and wrought-iron stair rail; Pilkington Bros., Ltd., "Georgian" wired glass in windows.

The ingenious construction used for the terracing of the balcony at the Theatre Royal, Bolton.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

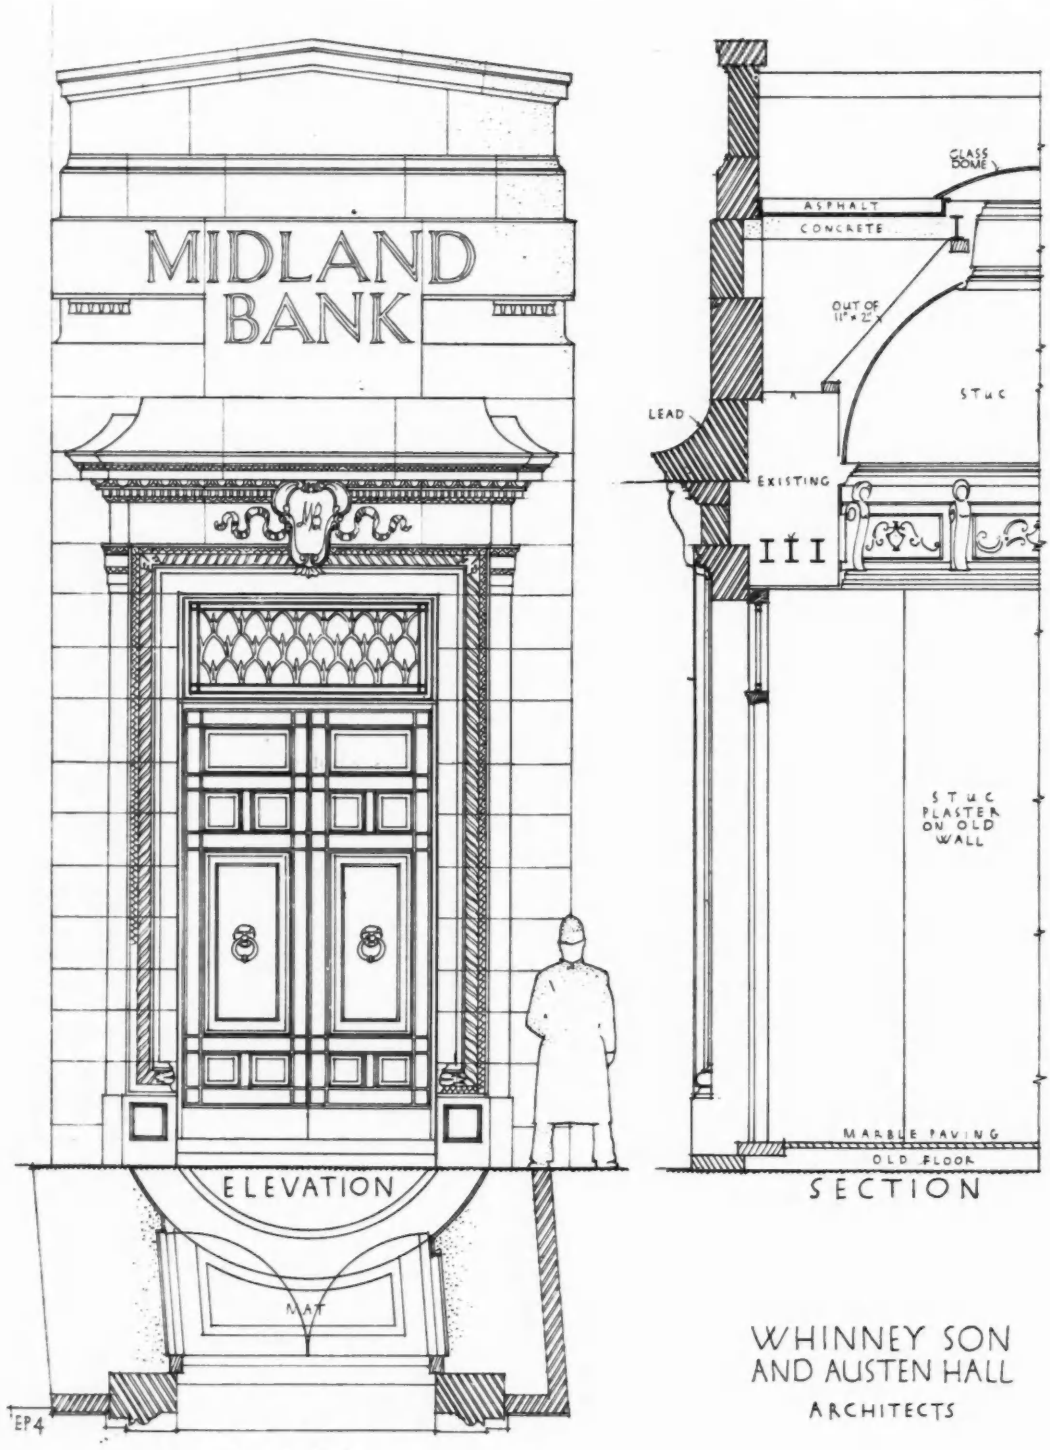
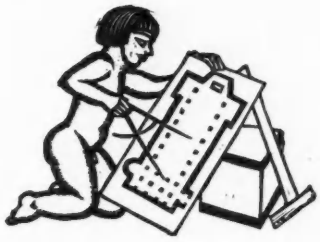
SCALE DETAILS:
A WEEKLY SERIES



DOORWAY AT THE MIDLAND BRANCH BANK, PECKHAM, S.E.
DESIGNED BY WHINNEY, SON, AND AUSTEN HALL

THE whole of the front of this building is carried out in Portland stone, finished with a sawn face and fine jointing; the carved surround to the doorway itself is surmounted in the traditional manner by a cartouche carrying the initials of the bank (M B), interlaced. The title lettering is incised to a deep V-section and afterwards gilded.

The coffered hardwood doors, which, during banking hours, fold back and form the sides of a small lobby open to the street (it will be noticed on reference to the drawing that for this reason the frames are not rebated in the usual way), give on to a circular-domed vestibule carried out in stuc, with a marble floor and skirting, and lit from the "eye." Difficulties in dealing with a change of axis between these entrance doors and the inner doors to the banking hall have been overcome by the use of this circular cell, which necessarily has no definite axis of its own.



The drawing overleaf may be read with an architect's scale ($\frac{1}{4}$"=1 foot).

ART and TECHNOLOGY

"In this country there is one great weakness in our technical education, and that is the severance, sometimes almost hostility, between the art college and the technical college, and this conflict is fought out over the body of Industry."

—Lord Eustace Percy's address to the International Congress of Building.

AT the recent International Congress of Building Works Contractors, Lord Eustace Percy made some interesting observations upon the relationship between art and technology at our educational institutions. He feared there was too often a divorce between these two subjects, with results that are injurious to industry. Moreover, in the British Report on Education and Training, it was suggested that the academic and commercial trend of the secondary school should be corrected by an equal trend towards industrial occupations. In particular, the building industry needed courses of university standard for those who might follow a career in building.

Lord Eustace considers that architectural education suffers from this unnatural division between its æsthetic and practical aspects, and he imagines the architect to be torn between the conflicting claims of the art college and the technical college. In commenting upon this statement, one must draw a sharp distinction between those recruits to the architectural profession who are fortunate enough to be able to attend one or other of the excellent architectural schools which have now been established, and the numerous body of students attached to the various schools of building and polytechnic institutions.

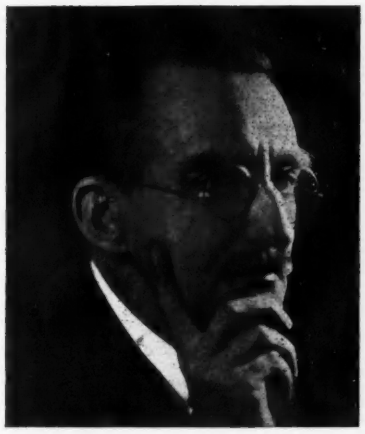
In the architectural schools, as is well known, special provision is made for the teaching of technical subjects such as building construction; and while, of course, it cannot be expected that the students should acquire at this early age a thorough knowledge of the business or practical sides of their profession, they are at least given a good general survey of the art and science of building.

Equally, in the training of builders and contractors, it is now being recognized that academic qualifications are highly desirable, and the Institute of Builders is fully alive to this aspect of the question. The men who are being trained as builders are beginning to recognize the necessity of acquiring a familiarity with the main concepts of architectural design.

It is in the teaching of the "crafts" and in industrial education that the need for reform is most apparent. The "Arts and Crafts" movement we have indeed had with us for many years, but the hundreds of art teachers who are yearly turned out by the technical schools are still for the most part disciples of William Morris. They have a hostility to the machine, as such, and believe that a special virtue resides in almost any object if only it be the product of careful manual labour. In contradistinction to the "Arts and Crafts" attitude is that of the Design and Industries Association, whose members wholeheartedly accept machinery and are prepared to make the best of it.

Although "Fitness for Function" was the slogan first adopted by this body, there are welcome signs that the conception will presently be enlarged and an attempt will be made to establish a criterion which will take into account other salient factors in design. The important thing to observe is that the machine can make nothing of its own volition, and that, strictly speaking, nothing in the world is "machine-made." All the machine can do is to cast objects into shapes determined by the intellect of man, and whatever faults there may be in a manufactured article must be attributed not to the machine, but to the human agency which directed its activities.

The present standard of industrial design is not high, but it is questionable whether it can be much improved by changes in organization, or even by a revised curriculum in the schools or colleges. The trouble is a more deep-seated one than that. Before the teaching of art can be successful, a philosophy of art is requisite; and the formulation of this has not yet been seriously undertaken by those intrusted with the task of imbuing the recruits to industry with a desire to create beautiful things. To achieve this would be to take a definite step nearer the millennium.



LOFTY TERRACES IN THE METROPOLIS OF TOMORROW:
DRAWN BY HUGH FERRISS

" How are the cities of the future really going to look ? " asks Hugh Ferriss in the foreword of his new book ; and rejoins : " Heaven only knows ! " Nevertheless, brush in hand, he steps forward reasonably and imperceptibly enough, from Part One : Cities of Today, through Part Two : Projected Trends (whence this reproduction is taken), to Part Three : An Imaginary Metropolis, marking the paces with sixty drawings, in which a touch of characteristic fantasy is the unifying principle.

Already the upper levels of zoned apartment houses, sacred but now to elevator machinery, tanks and the janitor, are today being planned by architects as living quarters, and commanding high rents.

A review of The Metropolis of Tomorrow *appears on page 986.*

NEWS & TOPICS

A. Seymour Reeves, contributor of a discussion on the group system to the Specification Writer (page 984). As a member of the R.I.B.A. Practice Standing Committee, he served as chairman of the conference on specifications between that body, the Surveyors' Institution and the Institute of Builders and so, from close dealings, writes with authority on this very important subject.

FAVOURABLE FACTORS AT NORWICH

I THINK I can place my fingers on the two factors that made the British Architects' Conference this year a greater success than any similar conference I have attended. The first is Norwich itself. We have got used to a good architectural setting for these conferences. York, Bath, Newcastle and the rest: they have all provided something memorable in the way of a scene. But Norwich (with all due respect to those other delightful places) gave us something more than a scene. It was the great, pulsating life of the place and its extraordinary personality that captivated us. Agricultural centre, industrial centre, centre of intellectual life—Norwich is all these. The cattle market on the Castle Hill and the flower and vegetable market in front of the Guildhall were superb on Saturday morning. Mr. Colman's many useful and palatable products were exploited by every speaker in turn at the banquet on Friday night. On the intellectual side you have the Maddermarket Theatre and Mr. R. H. Mottram, a happy and popular figure at the banquet. Could anyone imagine a writer of the standing and the age of Mr. Mottram (whom I remember seeing at the Æolian Hall being handed the Hawthornden Prize some years ago by—I think—the late Lord Oxford); could anyone imagine such a person turning his back on London and continuing to reside in any provincial town other than this one? Surely not.

*

I have said enough about Norwich, whose attractions have been very fully discussed in these pages already. The other reason for the success of the conference lay in the fact that the excursion programme contained one item that bore no relation to business, but was, in fact, pleasure pure and undiluted. Now this was a rare and notable thing. I remember no other conference making such a concession to professional frailty—a concession which should, and now no doubt will, again be made. Indeed, the psychology of these conferences is a very subtle matter. English architects are perhaps more efficiently organized than architects in any other country. Their organizations hold frequent meetings, and their Press is generally acknowledged to be without a rival. An elaborate business conference would, therefore, be pointless. A conference devoted to merry-making alone would make a poor story for impatient clients and a harassed office staff. But I am skating on thin ice, and will merely add that as many visitors to the conference joined tour No. 3 to knock about the Broads as the three other tours secured between them, and that the same jolly affair was the only one to be noticed in the local Press, where it filled half a column.

THE CONFERENCE BANQUET

Except that something at the banquet seemed too long, it, too, was universally enjoyed. I say "something," because I really did not notice whether it was the food or the speeches. I only know that I looked at my watch when the first of the three toasts ("The City of Norwich") had been proposed, responded to and so got over. The time was 10.30. Now, no one likes being hustled, but by 10.30 a little more ought surely to have been accomplished. Yes, three hours to finish with the first toast is definitely too much. It may, as I say, have been the food. The food was good enough, but why is it that the number of courses at these dinners is always inversely proportioned to the service accommodation that is available? On Friday last we dined in the nave of a Dominican priory; goodness knows how the food was kept decently warm. And there were nine courses, not counting the dessert. Would anyone have grumbled at five or six? Well, most of the people around me were constantly skipping something, and I know they must have felt as I did.

*

Oh, yes: the speeches. Mr. Kitson made a really magnificent opening. I have seldom listened to so good a speech. Scholarly and yet light, skilfully alternating the serious with the witty, it benefited still further from a most attractive delivery. And the Sheriff of Norwich was extremely funny. Everybody enjoyed his sly references to the Town Hall competition. "In looking round this gathering," he confessed, "I have been trying to guess which head contains the plans which will ultimately be accepted for the erection of that noble structure." And when he complained that, not being a phrenologist, he could not locate the Town Hall Bump, there was a good deal of healthy laughter, hardly lessened, I should think, by the fact that the fascinating speaker's own bumps were not concealed by so much as a single hair.

R.I.B.A. LONDON ARCHITECTURE MEDAL FOR 1929

The present award of the R.I.B.A. Bronze Medal for the best example of London street architecture, completed within the preceding three years, should prove an exceptionally popular one, for the Underground building, the head offices of the London Electric Railway, so modestly described as No. 55 Broadway, is the rare type of building which commends itself alike to "Traditionalists" and "Modernists." Messrs. Adams, Holden and Pearson indeed occupy a unique position in the ranks of architects, for their work, while unmistakably English, seems altogether to have escaped certain native influences of which we have no reason to be proud. The "country bumpkin" classic, so often practised in this country after the late Norman Shaw had set the fashion in this particular style, seems not to have appealed in the least degree to Messrs. Adams, Holden and Pearson, whose designs have always had a distinctively urban quality. I suppose it may be assumed that the medal is for the Underground building itself, judged as an architectural composition, and does not necessarily reflect official opinion about the much-disputed sculpture which is associated with it. One of the principal

virtues of the building is that it is of such distinguished design as to give pleasure alike to those who approve and disapprove of Mr. Epstein's "Night" and "Morning." The award carries a commemorative tablet to be affixed to the building; last year it was applied to the Royal Horticultural Hall, designed by Easton and Robertson.

WATERLOO BRIDGE

Time passes so quickly that it is only with an effort that one realizes for how long Waterloo Bridge has been in splints. Last week I passed under its arches on a river steamer and thought then how black and Piranesi-like the timber-work had become. Now we hear that the L.C.C. must decide whether the bridge is to be reconstructed without delay, or whether the temporary work is to be renewed at considerable cost while Charing Cross Bridge goes through its last agonies. The fate of Waterloo Bridge was linked with that of Charing Cross, though, unlike the latter, it still survives the storm of words and paper—and needs attention. "Something," as we keep on saying, "must be done." "The needs of traffic must be served"—though I have yet to see how the traffic of these bridges is related to that of London as a whole, merely by making them carry more vehicles into the Strand. The truth is that neither offers a good solution of the problem, since every wider road carries more traffic.

LANDSCAPE ARCHITECTURE

In view of the recent formation of an Institute of Landscape Architects in this country, I was interested to read the prospectus of the Harvard University School of Landscape Architecture. America is at a stage of its development comparable, perhaps, with the great period of landscape gardening in this country which left us with our wonderful heritage of park land. We have hesitated over here to take the present revival of interest in the subject at its face value, partly because there seems hardly enough work or money to justify it, and also because we have lost faith in the principles which still animate Americans. They, with work in abundance and everything to do, can afford to make a specialized profession of it and enrol young men in its service.

★

And Mr. Thomas Adam's lecture to the London Society last Friday served to prove how closely linked with the spirit of our own tradition is the work of modern American landscape architects. His subject was "Landscape Road Design," illustrated by particular reference to the Westchester parkway system, and he cheered his audience by telling them that the parkway was born in this country. It was the product of an intelligent landed nobility, and gentry whose descendants we are now in process of robbing of their last resources, while we split up their estates and develop them for speculative building. This is the reverse of the medal. This is how we are losing all they gave us.

★

It does not really matter that they laid out their parks in pride and ostentation, for the public shared, and does still share, the beauties they created, and when we lay out an arterial road today, allowing miserable little villas to line its whole width, we may wonder whether we are not in dire need of a school of landscape architects capable of educating us to the true economy of the parkway—and its beauties. It is, indeed, pathetic to think that, having spent millions upon arterial roads, we have to confess our utter failure as road designers by forming a society that goes round begging money to make them beautiful. The Ministry of Transport has failed utterly in this matter of roads, and looks very like a complacent ass, when compared with the energy with which Americans have gone all out to make roads safe for traffic and beautiful into the bargain.

THE GAY BUNGALOWS

The thin Welsh slates in the Home Counties are, in proportion to home-made tiles, growing beautifully less; especially do the bungalows ban them. The attack on "bungaloid growths" is being outflanked. Our bright young things, who mostly inhabit the one-story type, are evolving a pattern which has its good points. Not young myself, nor ever very bright, any appreciation I can convey is truly disinterested! The choice of local materials, for instance, and of gay colours is to the good; so are the evidences of a sensible work-saving plan, shown by the square shape, and the reduction of out-buildings and oriels to a minimum. The consequent unbroken pyramid of roof on a square base with recessed door gives a character which may appeal to a future house-hunter: "Robin's Roost—attractive, labour-saving bungalow, Bright Young Thing period."

★

It must be recognized soon that bungalows are one thing, and ribbon development another; the latter an unmitigated evil. But the bright young bungalows can charm us in the segregation of their own villages.

SEASIDE PRIDE

Sir Charles Nicholson has been saying hard things of Southend, and I have no doubt that Southend deserved them. Nobody exceeds in complacency the average councillor of a seaside town that prides itself upon being up to date, and one better than its neighbour. Yet of what are such people proud, when one has ruled out as subjects for pride such natural features as not even a town council can in cold blood subdue? Bandstands, piers, sunk gardens, concrete promenade, etc.? I know of so few of these that are even in passably good taste (a notable exception, however, will, I am told, decorate this issue) that one may class them, as a body, bad. How else indeed can they be when councils are so easily satisfied?

★

The people of Southend should realize that when Sir Charles Nicholson calls their sunken gardens "mud holes," the chances of his being right are all in his favour, and that he is presenting them with a professional opinion for which no charge is made. Also, were the opinions of half a dozen really eminent architects called for, they would most likely endorse the criticism.

★

I suggest that the fires of indignation might be banked while a deputation visits the best sunken gardens in England, for I am sure that Southend's anger would evaporate so soon as it saw how much better a garden it might have had, did it but know how good such things could be.

THE ART OF PEN AND PENCIL

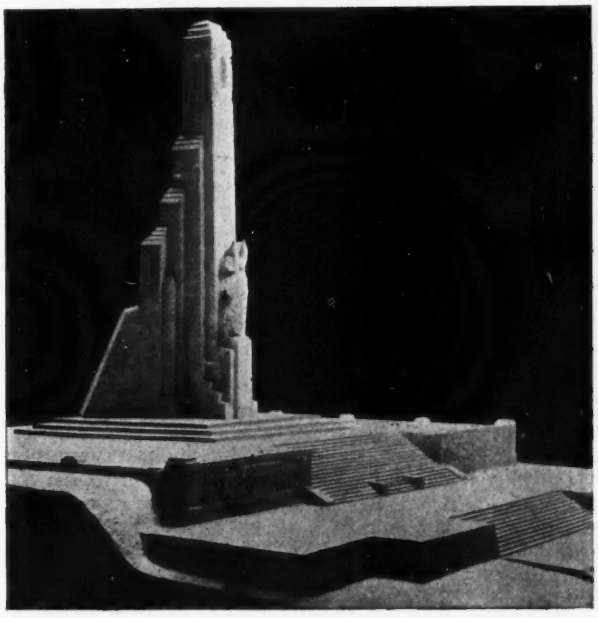
Of all the graphic arts, that of the pen or pencil drawing probably makes the most universal appeal. As for the architect, in particular, he stands to it in the relations both of consumer and of producer. Without his avidity in production such a thing as the Sketch Club could never have come into existence. His character of consumer he

involuntarily assumes from all sorts of causes. He may go, as I did, to the new *Punch* offices in Bouverie Street, where are to be seen during the next few weeks some of the finest examples of the craft by four acknowledged masters of black-and-white—John Leech, Charles Keene, Sir John Tenniel and George du Maurier—and straightway fall into a brown study. However remote the foibles and fashions of the forties and fifties of the last century appear to us today, these bewhiskered "dudes" and impossibly Junoesque females conversing so languidly in Victorian drawing-rooms are no less illuminating than their modern prototypes, regarded as foot-notes to that larger history of English manners and politics so faithfully recorded, and with such urbanity, in the pages of *Punch*.

★

Descendants of that "gentle public" to which the first number was addressed will, in fact, see in this exhibition a wider significance than that possessed by the drawings themselves, witty or apt to the moment's folly or tragedy though they are. It provides, indeed, a commentary on virtually the whole of the Victorian era which neither the sociological nor the historical sensibilities of the architect can afford to miss. It is a nation's jokes, rather than its laws, which afford the true index of character, and the wholesome fun which has made Mr. Punch a national institution should be vastly flattering to our insular pride. Incidentally, his excursions into jocular prophecy have been justified by after-events with an almost uncanny precision. Thus, in 1876, we find him picturing the mechanical quarry supplied by "The Pneumatic Despatch Fox-Hunting Co., Ltd.," while two years later he is foreshadowing beam wireless, broadcasting, gramophones, and, in one prodigious flight of fancy, even television.

THE REVOLT AGAINST THE MACHINE



Signs are increasing that man is chafing under the shackles of the mechanical age into which he has inducted himself. I take three instances at random from recent news. Here is the Dean of Manchester laying the "wanness, the signs of nervous tension, the smallness of the stature" of her citizens to the charge of the mechanical unfitness of the city for the requirements of modern business. Then William B. Favile, sometime president of the American Institute of Architects, now on a visit to London, says he thinks the traffic problem will put skyscrapers out of business. "The New York authorities are already baffled by the problem of transporting the thousands of people who work in those 60- or 70-story buildings. There's not room for one motor-car in Wall Street when the offices are closing."

★

But it has fallen to so august a body as the United States Senate signally to hoist the red standard of revolt. Not long ago telephones of the new dial type were installed throughout the Capitol. As the result of their experience of its inconvenience, and of resentment against the labour entailed in manipulating it, they have said, in effect: "Take the —— thing away!" And away it is to be taken—within thirty days. President Hoover himself had led the way, in regard to his own office, some little time previously. When Senators lead the way, shall the mere commoner be dumb when the yoke chafes him? He will be very vocal, I doubt not. But can he break the machine? I have my misgivings.

FRENCH WAR MEMORIAL DESIGN REJECTED

It must be accounted a considerable merit when a Ministry of Fine Arts declines to make any award in an architectural competition for a war memorial commemorating the battle of the Marne. I don't know whether they acted from die-hard motives, or whether, after reviewing tons and tons of sculpture signifying this and that abstraction in terms of planed masonry, they could support the boredom no longer. The memorial they rejected is reproduced here for all to see, and it may become the headstone of the corner for all I know, but at this moment I am at one with Messieurs les Ministres. It has been estimated by someone with nothing better to do that the Great War has been commemorated in France by 60,000 tons of pious but imperishable balderdash.

The Marne Victory Memorial, banned by the French Ministry of Fine Arts.

NO HIGHER BUILDINGS FOR LONDON!

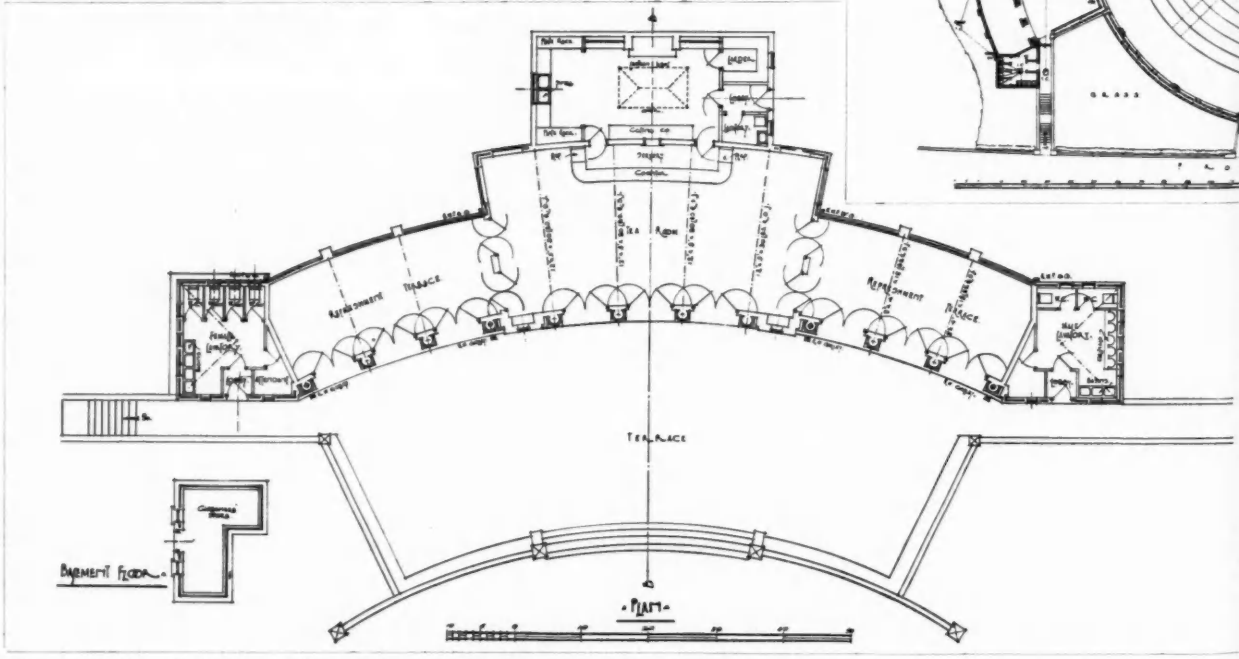
It is a good thing for us that public opinion and the daily press are at one in rejecting the possibility of higher buildings for London, for otherwise we should be delivered into the greedy hands of the business community and left in the shadow of vast sightless masses of skyscraping architecture. Goodness knows, the 80-foot limit made a general rule is quite high enough to rob us of the gracious London that foreigners come miles to see, without making it a second-rate imitation of New York. I do not fancy that the L.C.C. will relax the regulations in favour of a great hotel for the Canadian Pacific Railway, and it is to be hoped that, with its fine record of good building, it will see its way to fit into the picture of the town, instead of forcing the skyscraper issue where it is not desired.

ASTRAGAL

THE SKETCH CLUB

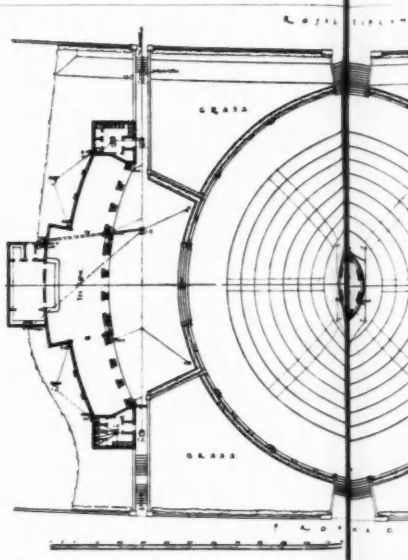
Entries for the first of the Holiday Sketches Competitions have already begun to reach the Editor of THE ARCHITECTS' JOURNAL. *The competition closes on July 15, and the result will be published in our issue for August 6. For conditions see advertisement pages.*

The three views reproduced across the tops of these two pages show the bandstand and the west and east pavilions that flank it, approximately in their relative



BANDSTAND, PAVILIONS, ETC.

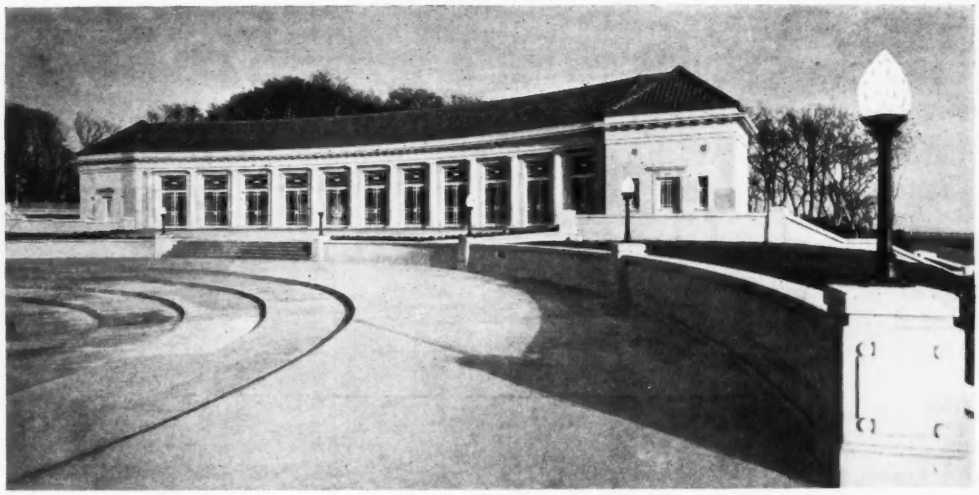
DESIGNED BY BASIL C.



THE new buildings which have been erected on the Ramsgate estate, known as St. Lawrence Cliffs, are the result of a competition held some years ago by the Corporation.

The estate, comprising some ninety acres, with a sea frontage of about three-quarters of a mile, was originally in the hands of private owners, and completely held up the natural development of Ramsgate in a westerly direction, until it was acquired by the municipality. The competition conditions called for a complete layout for the whole of this area, to include suitable amenities and the customary features of a modern seaside resort.

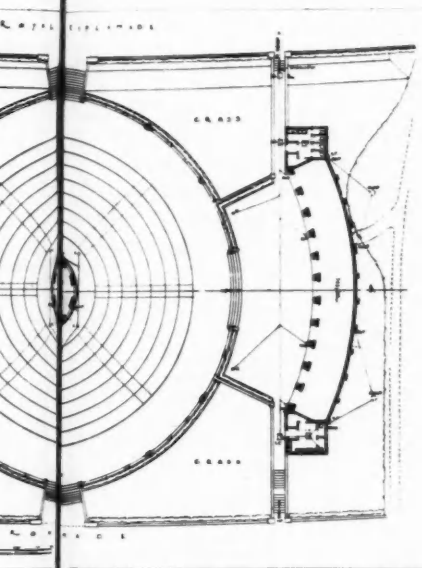
The general scheme (see page 967) consists of a fine boulevard road, 100 ft. wide, traversing the whole length at a distance of about 200 ft. from the edge of the cliffs, with intermediate roads running back at intervals to the main Ramsgate-Canterbury Road and providing extensive building frontages for good-class residential property. The whole of the 200-ft. strip of land in front of the boulevard road is reserved by the Corporation for up-to-date seaside



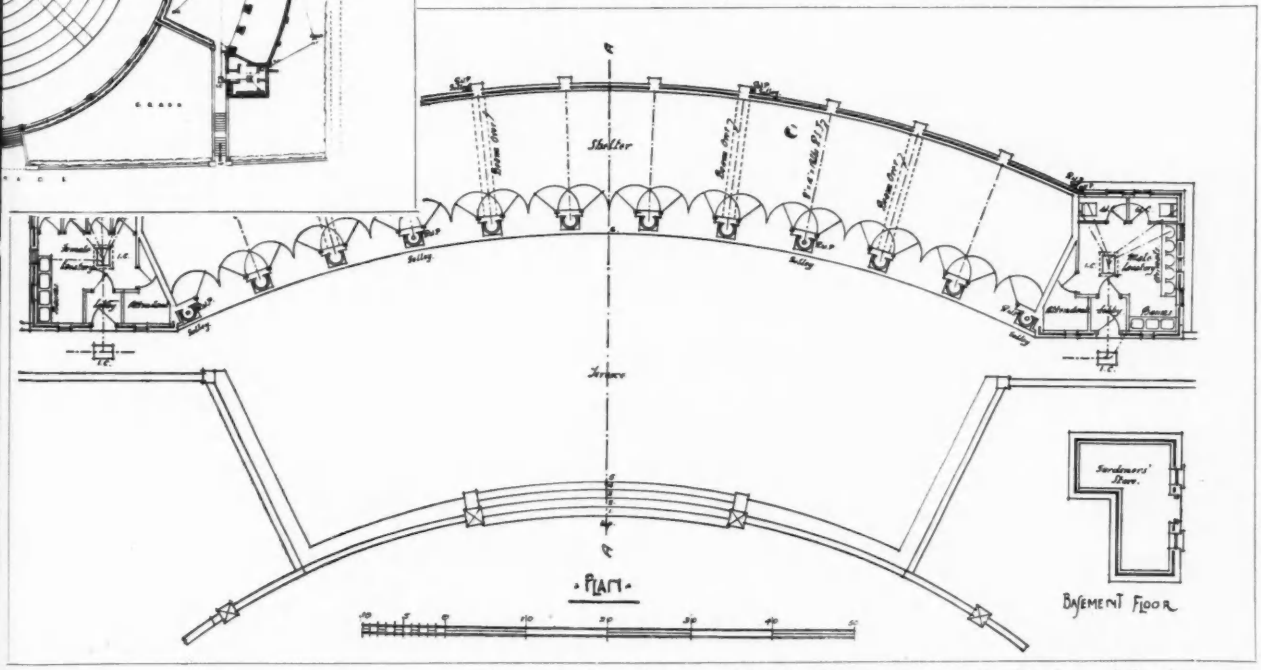
The ground floor of the west pavilion, with small basement plan. Here provision is made for the service of tea to visitors, and included under the same roof are two sets of lavatories.

The ground plan of the bandstand at the

positions, as seen from the south or cliff side, looking inland. The circular terracing is designed to accommodate 2,000 persons, seated in deck chairs.



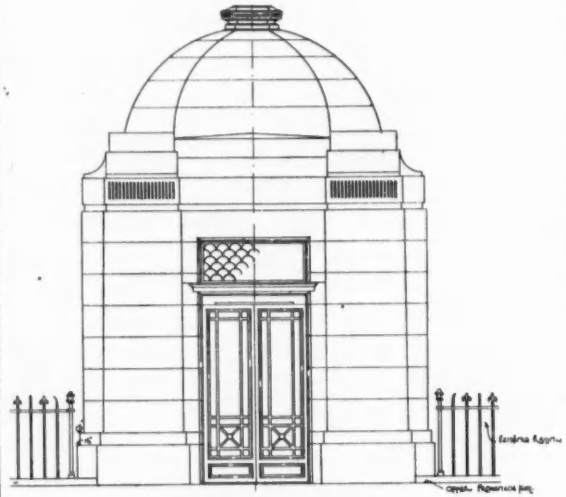
ETC. LAWRENCE CLIFFS, RAMSGATE



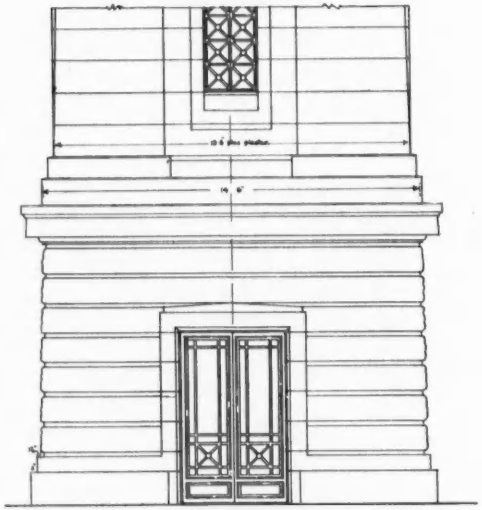
GNED BASIL C. DEACON

pleasure grounds, and has been laid out with a bandstand and pavilions as its centre, and with tennis courts, bowling green, miniature golf course, putting greens and children's playground, distributed along the remainder of the front, each sports ground being equipped with suitable pavilions and glazed shelters, arranged at frequent intervals throughout the estate.

At the eastern end a large electric lift (see overleaf) gives access to a fine undercliff drive, which runs the whole length of the estate, rising at the western end through a picturesque rock chine cut through the face of the cliffs. The bandstand is surrounded by circular-stepped terracing, capable of seating some 2,000 persons in deck chairs. On one side is a spacious tea pavilion, with lavatories, and, on the other side, a balancing shelter pavilion, which will be used for dancing.

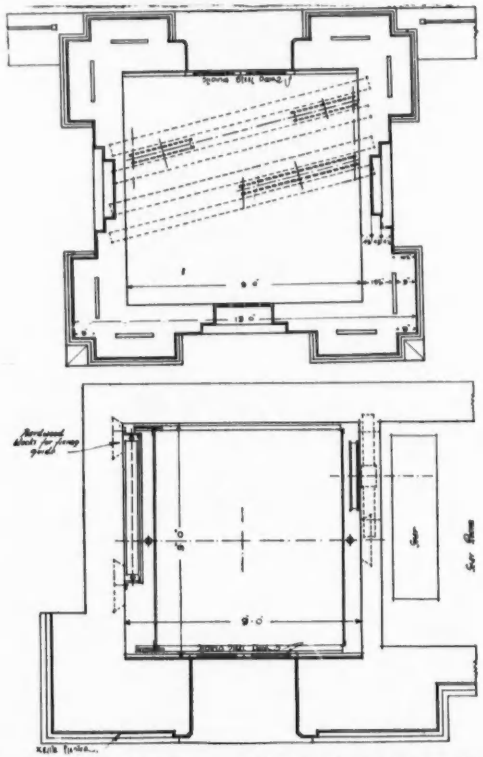


The whole of the fronts of these pavilions are fitted with steel casements, which fold out of sight behind the columns and piers, while the main cornices are equipped with intensive floodlighting, covering the whole area of the stepped terracing.

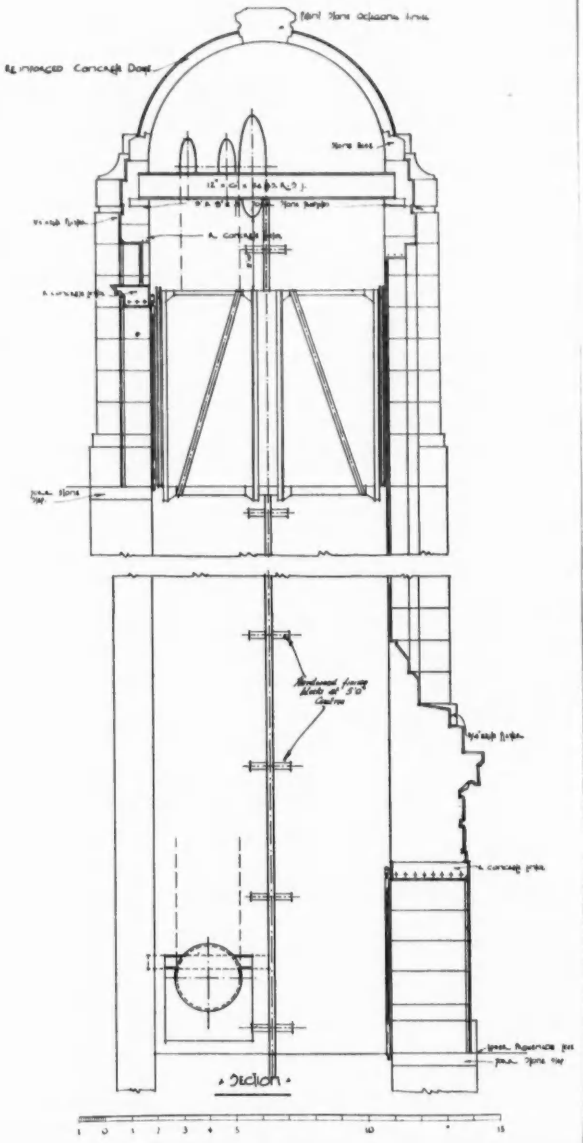


at the centre of the circular terraces.

The east pavilion, in plan. This building has been designed to be used for the purpose of dancing. Like its fellow, it is glazed with steel casements that fold back out of sight.

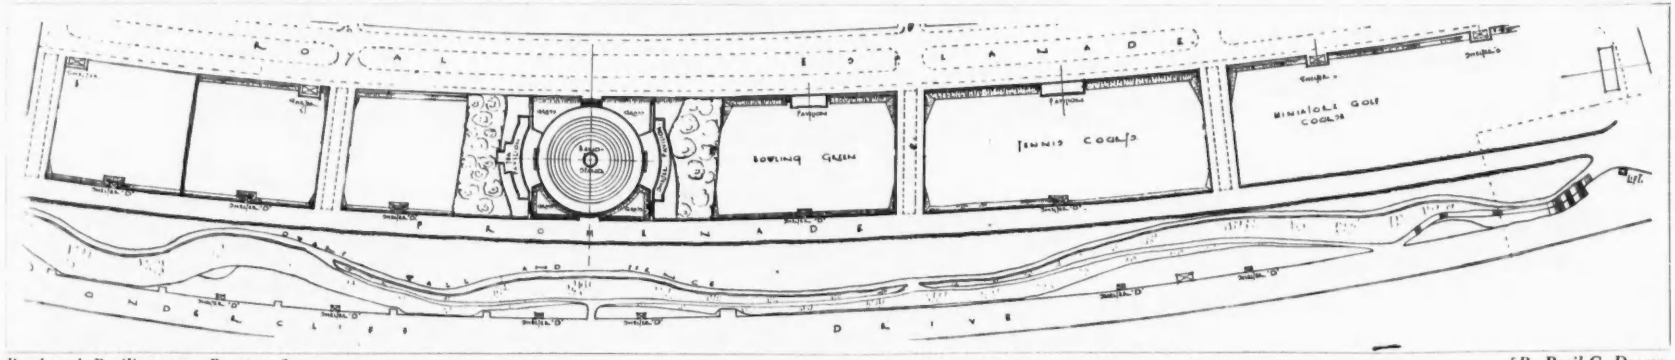


ELEVATION ABOVE PROMENADE

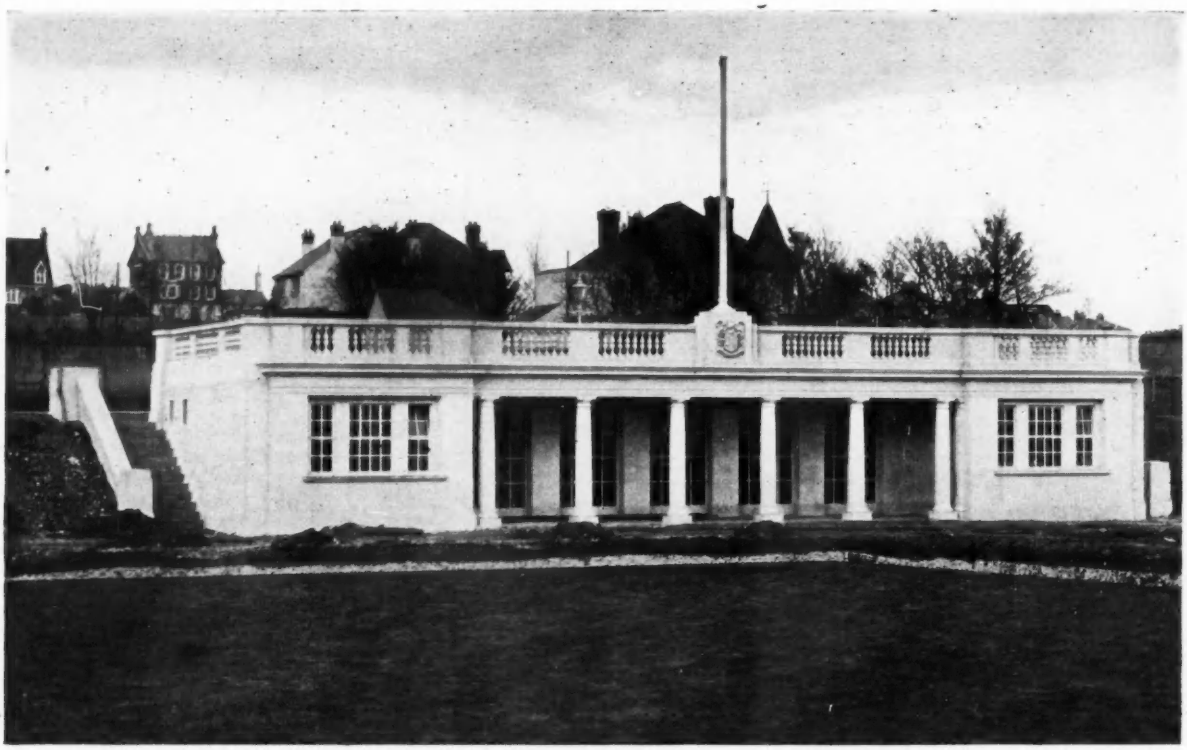


ELEVATION TO LOWER PROMENADE

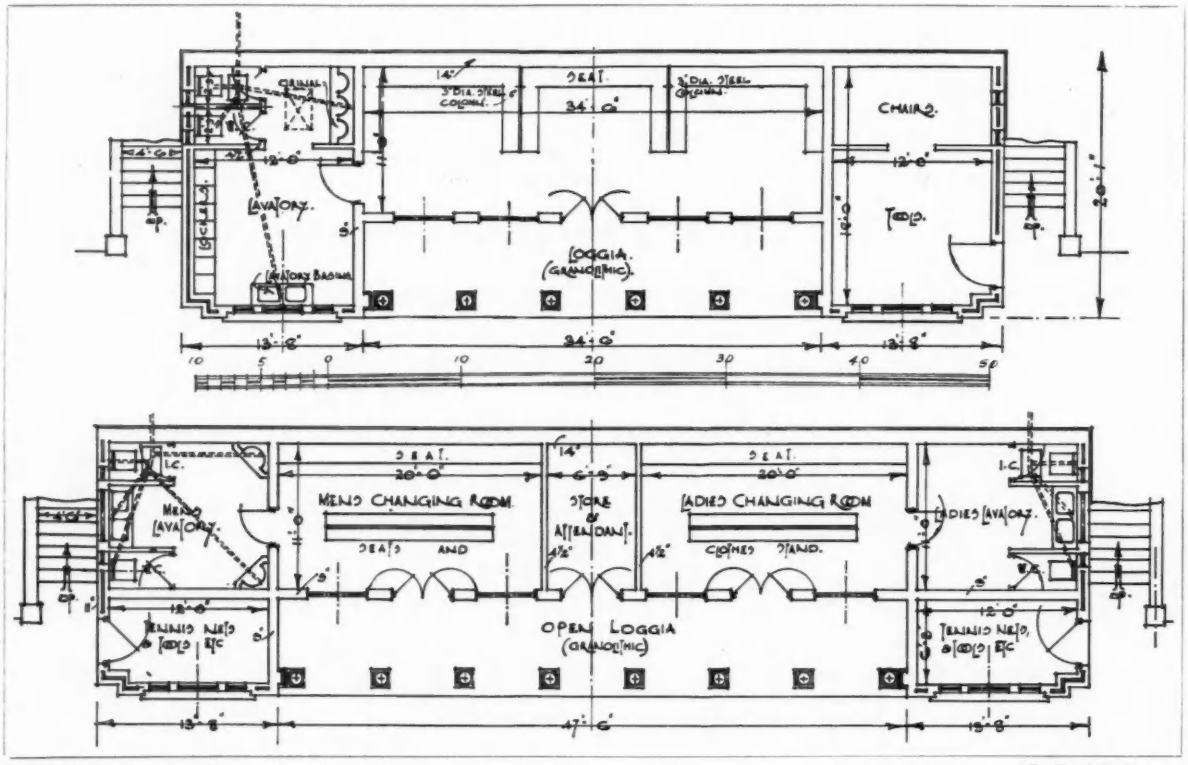
The architect's detail drawings of the essential portions and plans, at upper and lower promenade levels, together with a photograph, of the electric lift tower, running up the face of the cliffs, at the eastern end of the site, from the Undercliff Drive to the Upper Promenade. The long vertical channel in the face of the tower is embellished with metal grilles—a feature designed in keeping with the rest of the buildings in the scheme here illustrated.



SECTION



A general view of the band terrace, looking seawards from the north-east. On the right is Royal Esplanade, the broad boulevard road separating the cliff estate from ground suitable for the erection of good-class residential houses, to be served by subsidiary roads; on the left is seen a corner of the east pavilion. Facing it, across the arena, is the tea pavilion.



Bandstand, Pavilions, etc., Ramsgate.] [*By Basil C. Deacon.*

This small-scale sketch-plan of the bulk of the cliff estate is included to indicate the location and the relation, one to another, of the various buildings illustrated. A number of small shelters are also provided; and the site of the lift is seen on the extreme right. The idea underlying the scheme, which was chosen in competition, is described in the accompanying article.

The pavilion facing the bowling green. Facing the adjoining tennis courts is another, similar in design, but rather longer, and with eight, instead of six, pillars to the loggia. Both supply substantial changing and lavatory accommodation for the use of players.

Bandstand, Pavilions, etc., Ramsgate.] [*By Basil C. Deacon.*

These ground plans of the two pavilions referred to above, for the bowling green (above) and tennis courts (below), illustrate their similarity in character, but comparison will show some interesting variations (ladies presumably do not yet play bowls). Both are built on ground that slopes sharply, and are lit from the front.

THE RESTORATION OF ST. PAUL'S

IN view of the reopening of St. Paul's Cathedral today (June 25), when the King and Queen are expected to be present, an exhibition of models, masonry specimens, drawings and photographs, illustrating the work of restoration, is now on view at the R.I.B.A. Galleries. The operations have extended over seventeen years, and were passed under review in a lecture, prepared by Captain C. Stanley Peach and Mr. W. Godfrey Allen, FF.R.I.B.A., and delivered at a general meeting in the Galleries on Monday.

In its course the authors, who made use of the various exhibits to amplify their observations, presented an account from which the following points are summarised :—

Most of the defects which have been met with arose from two principal causes :—

(1) The settlements due to the foundations.

(2) The unsatisfactory materials and methods employed in construction, both of which led to consolidation of the building.

Had Wren carried his foundations through to the London clay much trouble would have been saved. There would have been little or no subsidence due to compression of soil, and the stability of the building would not have been a prey to the numerous underground operations which have taken place in its vicinity. First, the heavy masses which comprise the main piers, bastions and west towers settled in relation to the lighter walls surrounding them; later, as the weight of the dome piled up, further settlement took place between the piers and bastions. These settlements were, however, irregular, and comparative levels show them to have been greatest at the S.W. quarter of the dome.

The slight irregularities of settlement were probably due to the uneven temper of the soil and the partial compression of it by the old Cathedral. Some obscurity exists respecting the relation of the axes and the buildings to one another, but there are very few places in which the new foundations can have been entirely clear of the old, and apparently there is only one of the eight piers which stands on the virgin ground.

Another factor leading to consolidation is the use of uncoursed rubble as an infilling to the walls, and especially to the piers. In the crypt, where the piers are widened and project on each side beyond the faces of the piers above, the weight is entirely carried by the rubble. There is evidence in the building that compressions occurred and that the casing fractured in many cases. The results of the consolidation produced dislocation in many of the vaults, arches and walls, but this does not appear to have surprised or alarmed either Wren or the builder. While Mr. Penrose was surveyor trouble arose from corrosion of the iron cramps extensively used as a metal bond, and extensive repairs were carried out by Penrose. The work he did in removing these cramps was a valuable contribution to the preservation of the Cathedral.

In 1897 Mr. Somers Clarke had to face a yet more serious situation, which marks the beginning of the late restoration of the dome structure. He repaired the stone gallery and made it waterproof, and largely reconstructed the upper part of the colonnade, a work which took twenty years to complete. During this period building operations carried out in the vicinity of the Cathedral and requiring deep excavation and pumping, with consequent disturbance of subsoil, had caused slight movements in the structure, to which changes of temperature no doubt contributed. Also, the corrosion of the iron cramps was extending, causing first of all superficial disfigurement and then deeper damage, and as stone after stone fractured the ashlar casing to the piers became weaker and less effective in withstanding the pressure from the rubble core. Between all these causes there was continuous action and reaction which gave rise to defects of the building which Mr. Mervyn Macartney, who succeeded Mr. Somers Clarke in 1906, had to contend with. After consultation, it was decided to restore the two piers in the south transept, which disclosed the defective condition of the masonry and emphasized the grave views already held by Sir Francis Fox which became common knowledge in 1921.

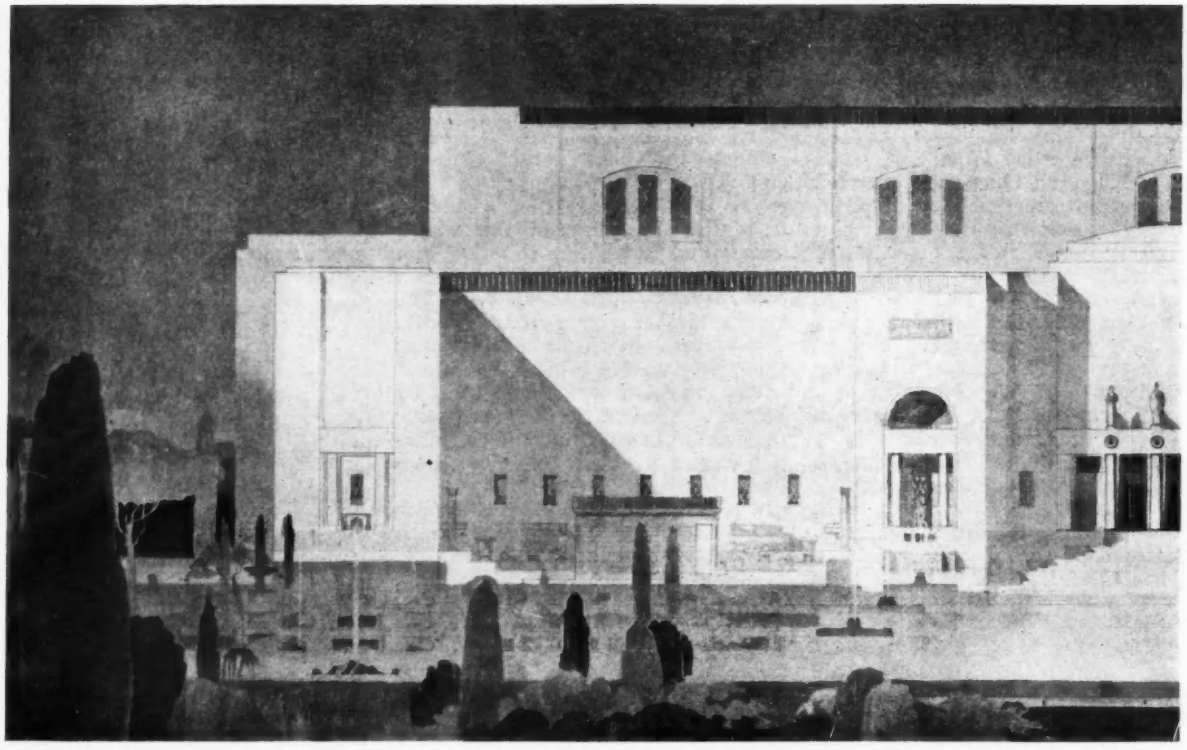
This led to the formation of a Joint Committee of Architects and Engineers consisting of Sir Aston Webb and Mr. Mervyn Macartney as architects, and Sir Basil Mott, Sir George Humphreys and Mr. Trench as engineers. This Commission inaugurated long and thorough examination of the dome structures and recommended the preservation now completed. A thorough survey of the building was commenced, and many experiments and useful research carried out. The Commission advised the closing of the dome area to facilitate the preservation work, and a Works Commission was appointed to carry out the work.

The restoration work can be classified as follows :—

(1) Engineering and architectural surveys and research.

(2) Work to the structure, including grouting and reinforced metal work, and the repairs to masonry and structural work incidental thereto.

The engineering survey consisted of the preparation of volumes of figures, levels and diagrams of measurements taken with the greatest care with the finest and most perfect instruments, giving measurements to one-thousandth of an inch. At any future time movement of the building can be detected, and its direction and extent ascertained and compared with established records.



The architectural survey consists of a series of complete and accurate plans, sections, and isometric studies as well as the consideration of many scale models made from time to time.

As part of the architectural survey, a complete model was made of the whole of the ashlar casing to the eight piers, and the condition of each stone was recorded.

As part of the work of strengthening the piers, a system of sixteen stainless steel tie bars, of which eight were 4 inches in diameter and eight 3 inches in diameter, were inserted at gallery level, to connect the end of the piers with the inner walls and bastions. They were attached at one end to the masonry and a system of bracing inserted on either side of the radial walls to tie the drums together, and thus restore the bond which Wren had intended.

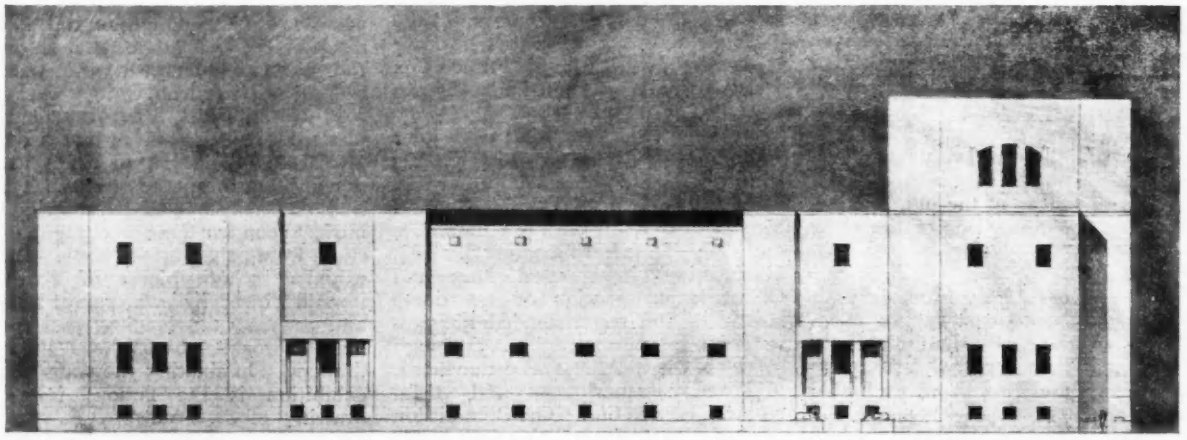
The aim of those responsible for the restoration work has been to fortify the building without marring its beauty, and as far as possible without interference with the historical value of Wren's craftsmanship.

In the exhibition are scale models, illustrating the method of boring previous to inserting tension rods in the drum walls; half dome area, showing the pier reinforcement, the tension rods through the drum walls, and the tie rods at triforium level and chains in stainless steel as used; and a dome pier from foundation to drum walls, showing accurate section cuts. There is also a Caen stone model, showing the intricate construction where the lantern rises from the brick cone. Other exhibits include pieces of Portland stone fractured by iron cramps rusting and concentrated loading, and specimens of worm-eaten oak from the roof timbers. Dominating the walls of the exhibition is the famous isometric drawing of St. Paul's by R. Brook-Greaves and W. Godfrey Allen.

The subject set was a "Museum of Archæology." The Museum was intended to provide accommodation for a large and valuable

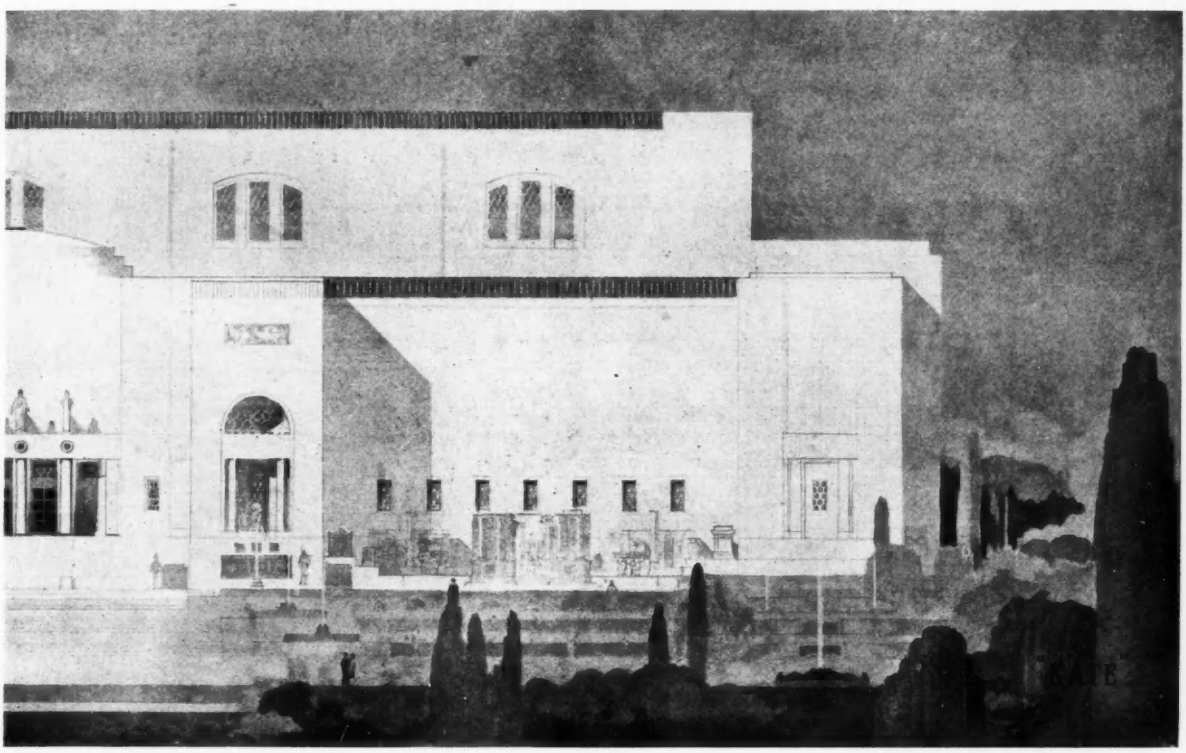
THE ROME SCHOLARSHIP

WINNING DESIGN BY



THE Faculty of Architecture of the British School at Rome have, as announced last week, awarded the Rome Scholarship in Architecture for 1930 to Mr. William Graham Holford, of South Africa, at present a fifth-year student of the School of Architecture, University of Liverpool.

The Rome Scholarship in Architecture is provided by an annual grant made to the British School at Rome by the Council of the R.I.B.A. It is of the value of £250 per annum and is ordinarily tenable for two years at the British School at Rome.



The subject set this year was a "Museum of Archæology," to be situated in the centre of an important Mediterranean city, and to provide accommodation for a large and valuable collection of architectural fragments found among the remains of an ancient city excavated in the neighbourhood.

According to the conditions, the building was to be designed on a rectangular site, 300 ft. by 275 ft. One of the elevations would face an existing public garden, from which it would be separated by a thoroughfare 60 ft. wide. It was not obligatory to build on the whole area, and it was suggested that a forecourt could be formed to isolate the building from the roadway. The other three sides of the site were to be surrounded by wide roadways.

The site of the Museum was level, but the gardens on the opposite side

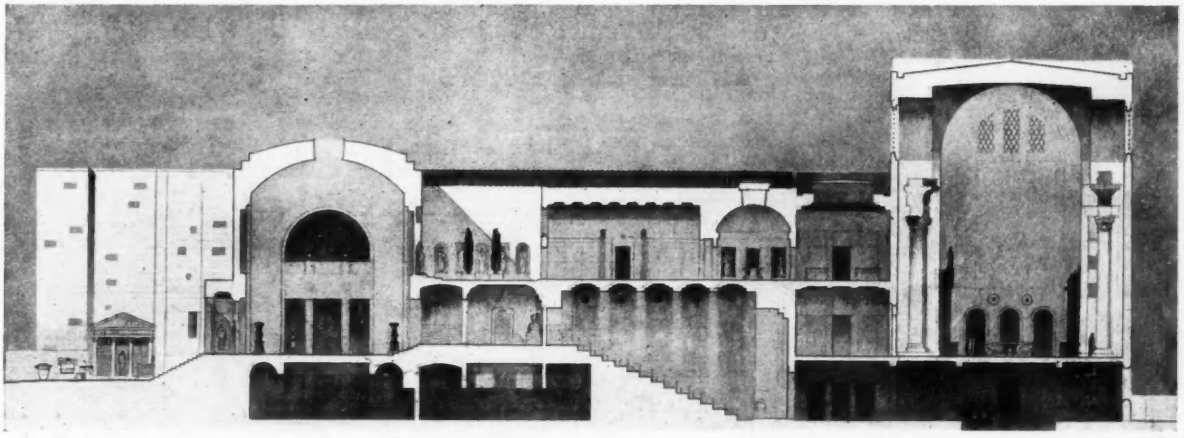
The side elevation; and transverse section. In the design of the building elaborate decoration and detail was not desired, and the effect of the building would depend, both externally and internally, on its architectural character and proportion. The

collection of ancient architectural and sculptural fragments. Reproduced above is the main elevation of the winning design.

IN ARCHITECTURE, 1930

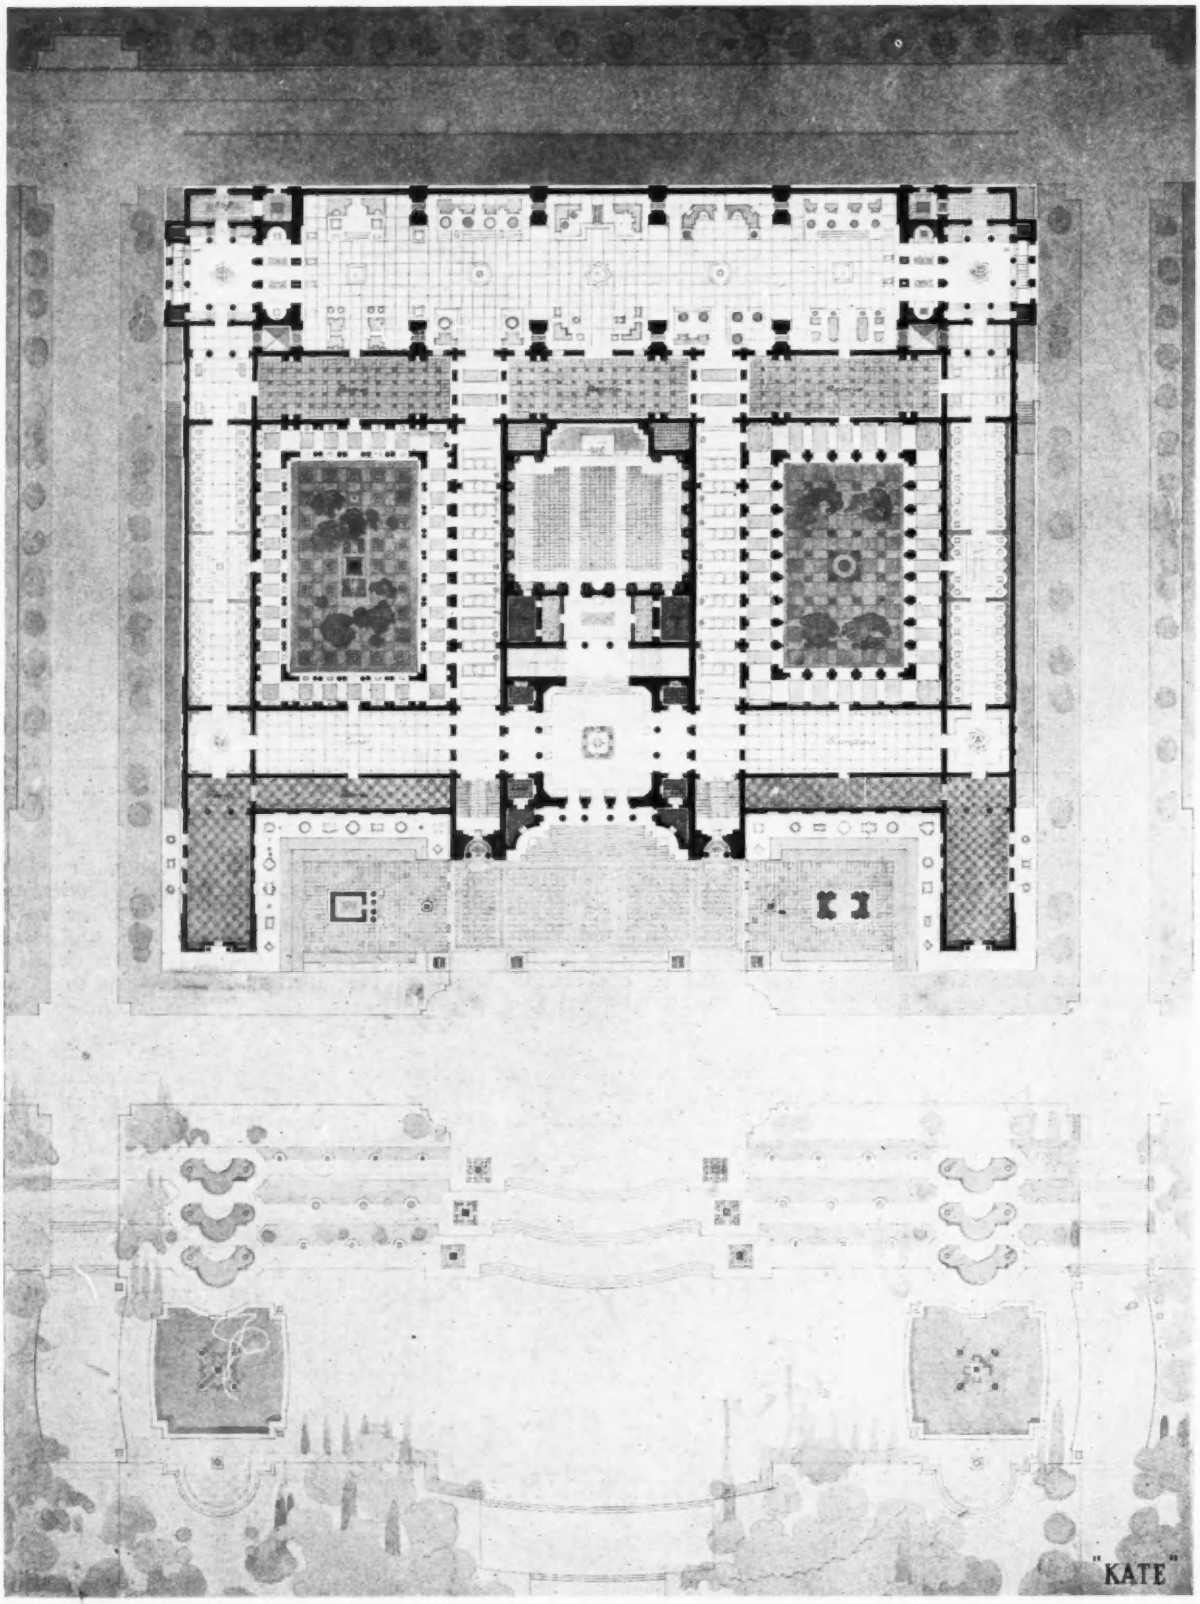
WILLIAM G. HOLFORD

of the thoroughfare sloped away from the road and were arranged in a series of shallow terraces, adorned with ornamental water, statuary and exotic trees and plants.



The main doorway would face the gardens, forming the only entrance for the public. Other entrances were required for the staff, lecture room, and for tradesmen in connection with the refreshment rooms.

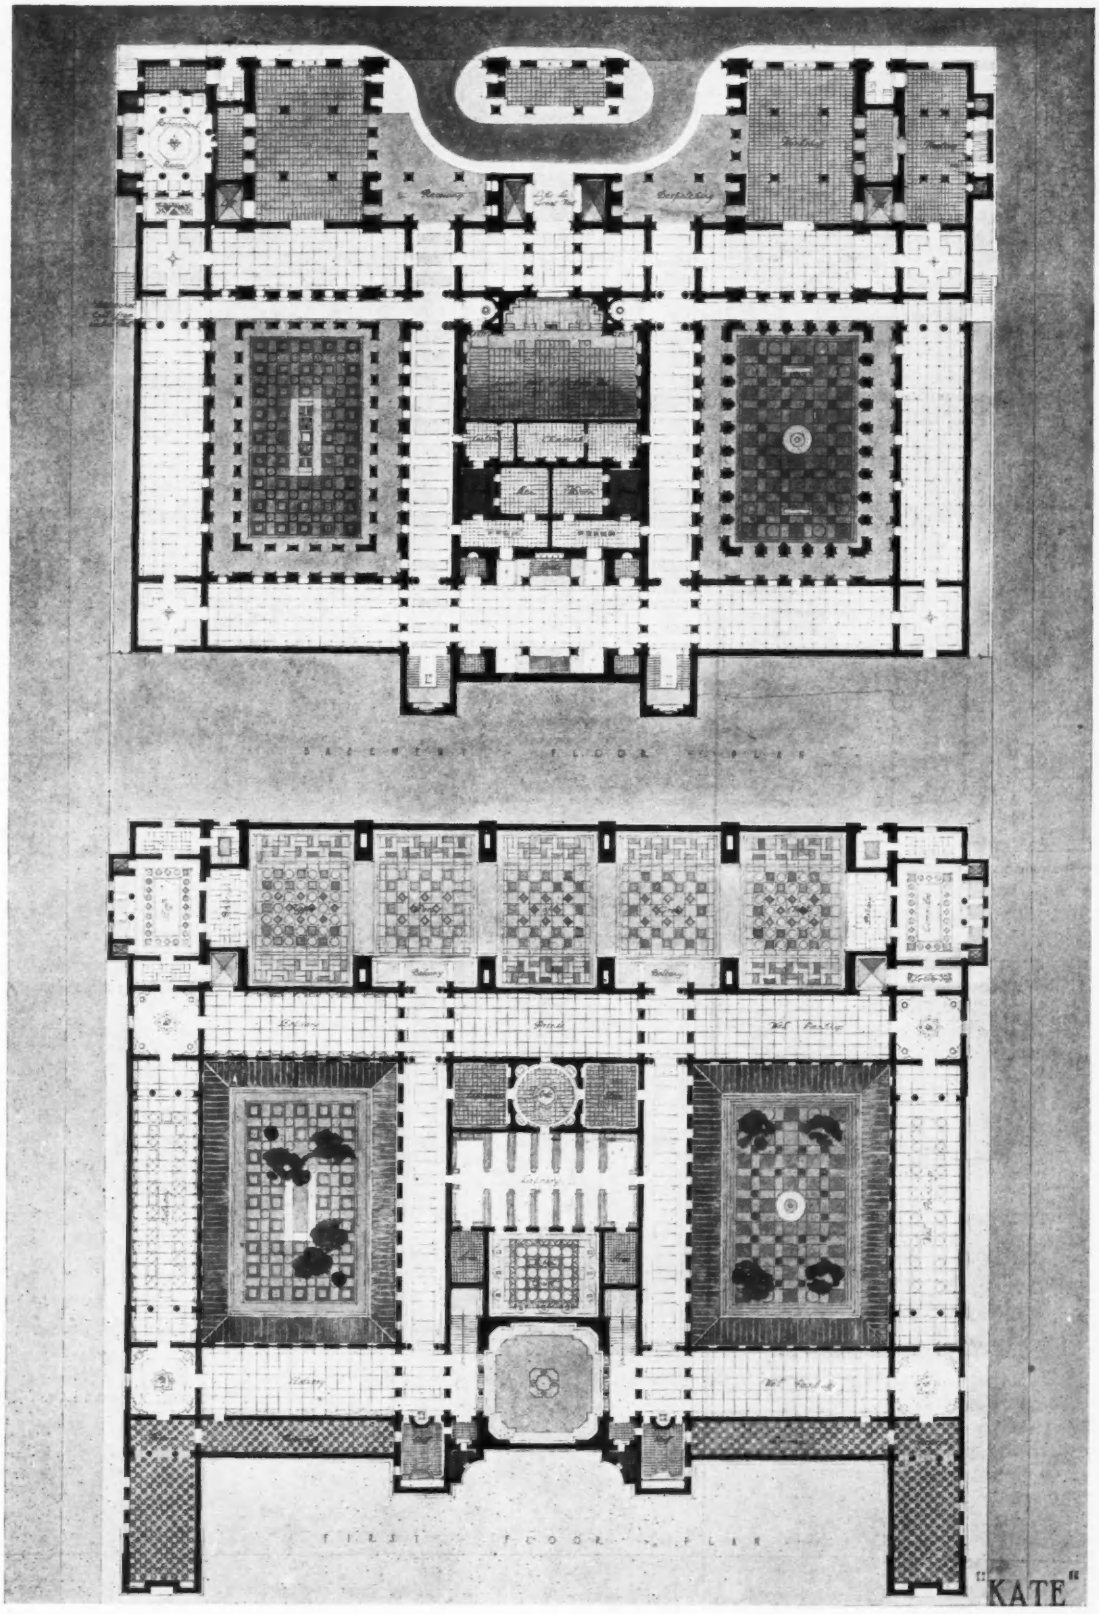
Access would be provided for cars to the main entrance and carts to the basement for the delivery and removal of exhibits, etc.



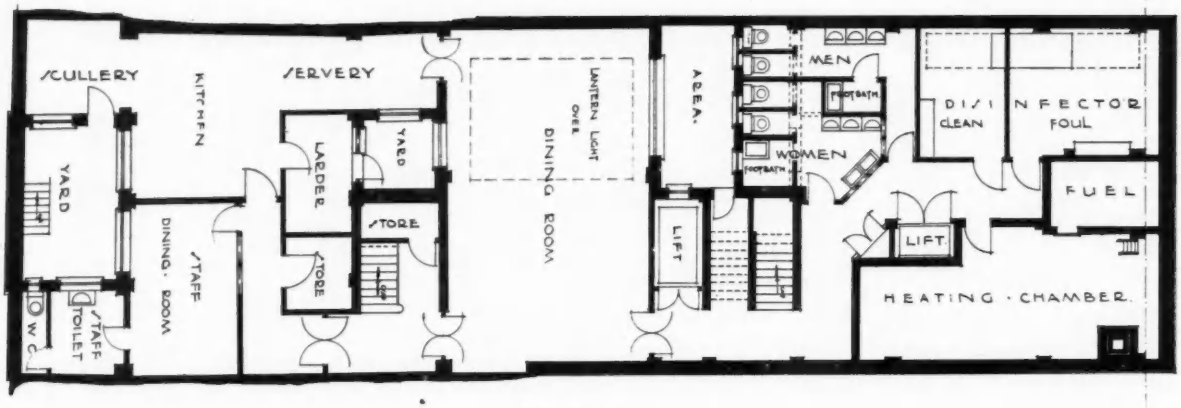
The Museum would comprise two floors and a basement. It was stipulated that every effort should be made to obtain an adequate area of exhibition space. The wall surfaces throughout should provide a background for statuary, and the lighting of galleries be arranged so that the conditions of exhibition would be as perfect as possible.

It was desirable that the doorways should not be too large, should be centrally situated in the galleries, and so arranged as to afford the easiest supervision possible and enable the public to make a complete circuit of the galleries without having to retrace their steps through rooms already visited.

The designs submitted in the final competition will be exhibited in the R.I.B.A. Galleries, 9 Conduit Street, W.1, from June 30 to July 5. Those of the winner are reproduced on this and the following two pages.

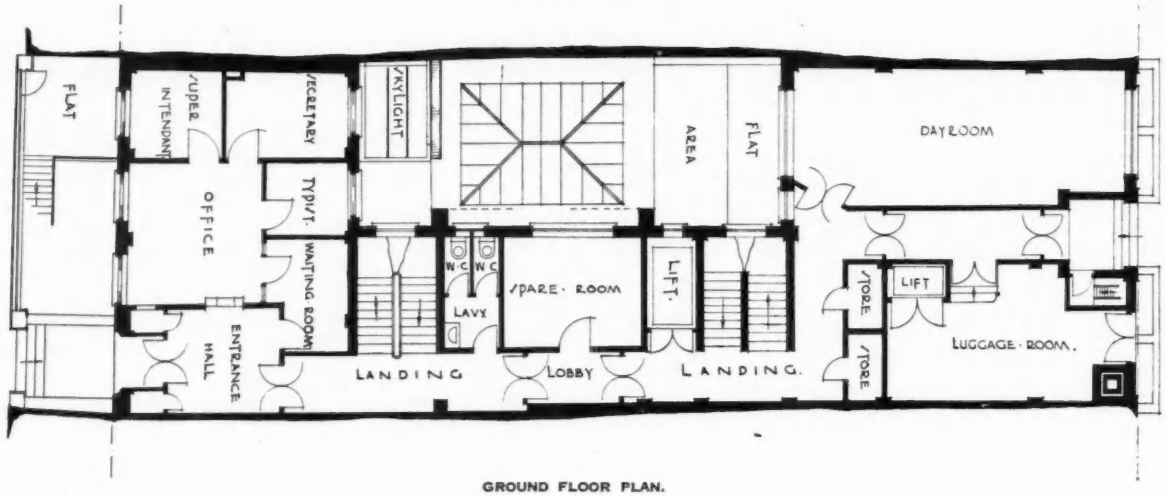


building was to comprise basement, ground and first floors. There was to be only one entrance for the public, other entrances being provided for staff and exhibits. The aspect of both drawings is taken from the right of the plans (see overleaf).

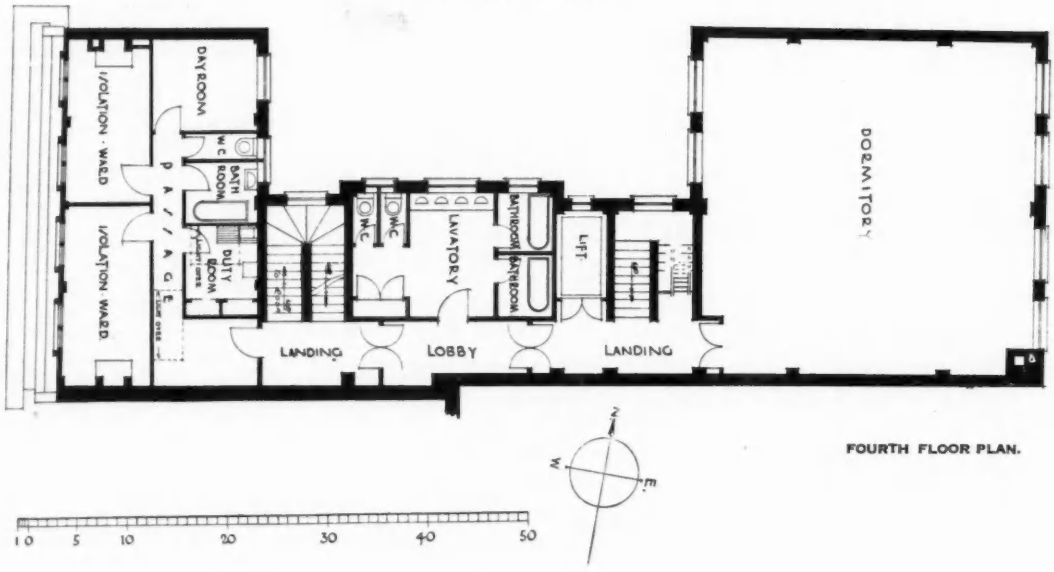


Rome Scholarship Competition : Winning Design.]

The museum would be erected on a site 300 ft. by 275 ft., with the main front facing an existing public garden, separated from the site by a thoroughfare 60 ft. wide. The other three sides of the site were to be surrounded by wide roadways. The main features of the ground floor (above) include entrance hall, lecture theatre, a hall for exhibition of large architectural fragments,



[By William G. Holford.

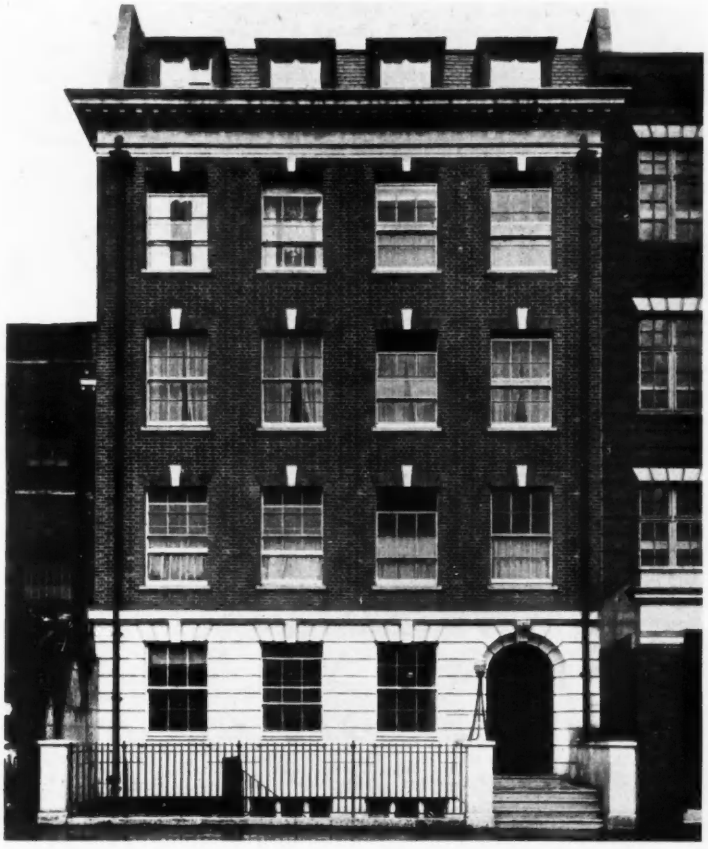


and a series of smaller exhibition rooms. The first floor provides exhibition galleries, print-room, library, committee room, and rooms for the administrative staff. The basement (upper plan on this page) comprises storage space, heating chamber and engineering department, refreshment room with kitchen and services, and lavatory accommodation.

BASEMENT PLAN.

GROUND FLOOR PLAN.

FOURTH FLOOR PLAN.



Jews' Shelter, Aldgate, E.1.] [*By Lewis Solomon and Son.*

Basement, ground- and fourth-floor plans. The building is six stories high. Each upper floor consists of a large dormitory, with baths and lavatory accommodation adjoining. The first and second floors are for women, the third and fourth for men. Isolation wards and superintendent's quarters are also provided.

JEWS' SHELTER

ALDGATE E.I

DESIGNED BY L. SOLOMON & SON

The front elevation, facing Mansell Street, is of multi-coloured stock bricks, with Portland stone dressings. The building is of fire-resisting construction. It is carried on a steel frame (see view below) and is designed to comply with the London County Council 1909 Act.

THIS new building, at 36 Mansell Street, has been erected to house the Jews' Temporary Shelter, which for forty years has carried on at 82 Leman Street, Aldgate, the work of assisting immigrants and trans-migrants in London, irrespective of their creed. It is six stories high and comprises basement, ground and four upper floors.

There are two entrances to the building, one from Mansell Street and the other from West Tenter Street. The former is the main entrance and leads through swing doors into the entrance-hall, on the left of which are the waiting-room, the general offices and the offices of the superintendent, secretary and typist. Beyond are two staircases and a lift, leading to the basement and upper floors, " dayroom " accommodation for the occupants, luggage and spare rooms.

Each of the upper floors consists of a large dormitory, each holding thirty beds, with baths and lavatory accommodation adjoining. The first and second floors are for women and the third and fourth for men. Other accommodation on the first three upper floors includes further administration offices and superintendent's quarters.

On the fourth (the top) floor, in addition to the dormitory, is an isolation department. This has been provided for cases of serious illness, and consists of two isolation wards, day and duty rooms.

A photograph of the steel framework in course of construction. It is taken from the same view-point as that of the front elevation reproduced above.

In the basement is a large dining-room, planned in the centre of the building between the two staircases and lift. On one side of the dining-room are the kitchen, scullery, staff dining-room and toilet; on the other the disinfector chambers, heating chamber, lavatory accommodation and foot-baths for the male and female occupants.

The foundation stone of the new building was laid in January last by Mr. Albert van den Bergh, whose grandfather, the late Simon van den Bergh, of Rotterdam, was a very prominent member of a similar society that did much to help co-religionists on their journey to America, before emigration to that country was restricted.

The present shelter was founded by the illustrious Herman Landau, with whom helping any human being buffeted by misfortune was a veritable passion. During last year the number of inmates who stayed at the old shelter was 1,784, of whom 1,708 were Jews and seventy-six non-Jews. The majority of them came from Latvia, Lithuania and Poland, and went to British colonies—1,426 to South Africa, thirty-two to Australia, and thirteen to Canada. The number of meals supplied for the year totalled 62,662 and the number of lodgings 13,853.

BRITISH ARCHITECTS' CONFERENCE

THE ninth annual conference of the R.I.B.A. was held at Norwich on Wednesday, Thursday, Friday and Saturday last. At the conference meeting at Stuart Hall, on Thursday, the President (Sir Banister Fletcher, F.S.A.) presided, supported by the Lord Mayor and Lady Mayoress of Norwich (Mr. and Mrs. H. Harper Smith), the Sheriff (Mr. C. Watling), the President of the Norfolk and Norwich Association (Mr. Stanley J. Wearing), and Mr. E. T. Boardman (Past President of the Norfolk and Norwich Association).

In the course of his address he said: I should like to put forward a plea to the people of Norwich to lend their aid to preserve the wonderful old churches, country houses and villages of East Anglia. Let us have a care of these buildings which have served well in the past, and, if possible, utilize them for the present.

Mr. W. Harding Thompson then gave his paper on "Regional Planning, with special reference to Norwich and Norfolk," from which the following is extracted:—

Norwich dominates its county to a degree seldom found in the capitals of other English counties. This dominance is due to its many attractions—economic, social and ecclesiastical. Moreover, its quite remarkable number of radial arteries link up the city with the whole region, and these radials are connected by an admirable number of circumferential roads within and without the city boundaries. This "spider's web" road system, together with a clearly defined central open space (the Tuesday Market Place), provides a sound nucleus for all future developments.

The intimate connection between Norwich and its satellite towns and villages suggests that no plan for future development, however efficient, should be confined to the existing borough boundaries. Traffic, ribbon development and sporadic building by the speculative builder, do not recognize any such limits except as a boundary line on paper. One has but to study for a moment the map showing the excellent system of bus services that ply on every radial road from Norwich to realize that all land with road frontage on these routes has a prospective building value. Time and cost factors are more important today than mileage in determining the areas where development may take place if land comes into the market.

It is essential, therefore, that some control over the region immediately surrounding the city should be obtained as soon as possible by a joint town-planning scheme. Such a joint scheme might comprise the county boroughs of Norwich and Great Yarmouth and the rural districts of East and West Flegg, Blofield, Hemstead, Forehoe and St. Faiths. This might be an executive committee under the Act, each local authority having representatives on the committee.

Much of the land in the above-mentioned area is purely agricultural, and it could be "zoned" on the plan as "undetermined," and building only allowed by consent of the authorities, or it may be possible to reach agreement with owners that the land may voluntarily be reserved for agricultural purposes so that the building development may take place round well-defined centres of population instead of straggling out along the existing roads.

The present town-planning scheme for Norwich appears to be admirable as far as it goes, but if any further encroachment is contemplated on its agricultural belt it should be borne in mind that extensions of the built-on area beyond that shown on the plan will probably increase the cost per head of population for administrative and other services out of all proportion to the benefits derived from increased rateable values. It may therefore be more economical to encourage the growth of the adjacent towns and villages rather than add unduly to the size of Norwich itself, which already exceeds 120,000 inhabitants.

Among those who took part in the subsequent discussion were Mr. Rodney Alsop (Vice-President of the Royal Victorian Institute of Architects); Mr. E. G. Cohen (Past President of the Royal Institute of Architects of Western Australia); Mr. Gordon West (hon. treasurer of the Royal Architects' Institute of Canada and Vice-President of the Ontario Association of Architects); Sir John Sulman, a pioneer of town planning in Australia; Mr. Stanley C. Ramsey; Mr. H. C. Hughes; Professor Patrick Abercrombie; Mr. J. A. Kidd; Mr. R. B. Walker (of Nigeria); Mr. Wightman (Past President of the Queensland Institute); and Mr. Stanley J. Wearing.

The conference banquet was held in St. Andrew's Hall on Friday.

Mr. Sydney D. Kitson, proposing "The City of Norwich," said: Your cathedral equals in architectural interest any other cathedral in England. Your fine, grand castle seems to have been designed with a particular vision, which is rare, even among architects, eight hundred years ahead, as a perfect setting for the reception which we were privileged to attend last night. Your mediæval Guildhall and your old churches, with their exquisite flint work which meet one at every turn, are a delight to the eye. The halls of your merchant princes have been preserved for the benefit of the public by the piety of Leonard Bolingbroke and of the Misses Colman. Your sober and sensible eighteenth-century brick buildings have been described by the President of your Architects' Association. Your great Roman Catholic Church of Gilbert Scott the Second, the gifted father of a still more gifted son, is one of the outstanding buildings of the nineteenth century. The various housing schemes which have been planned around this city of gardens are among the best in the country.

The Lord Mayor responded.

The Sheriff of Norwich (Mr. C. Watling) also replied to the toast. He said: We are sorry you are a little too early to see the finest block of municipal buildings and town hall in England. May the day come when one of you may bless the ancient city of Norwich for the chance of designing and erecting her new town hall, and, when you have done it, may the city find it still possible to bless you.

The Very Rev. the Dean of Norwich (Dr. D. H. Cranage) proposed the toast, "The Royal Institute of British Architects and the Allied Societies." He said: I should like the Institute and the Allied Societies some time to consider whether, in every respect, their rules of competitions are wise. You can scarcely expect a great body to take the one architect that the assessors choose and to give them no choice whatever. It would not be unreasonable to leave the final design to a responsible body like the Lord Mayor and Corporation of Norwich.

The President, responding, said: The time has come when some sort of control must be exerted in order that buildings ugly and ill designed should be prevented from being erected in any part of this country. In order to effect that a Rural Amenities Bill, as it is called, was introduced by Sir Hilton Young, once a very popular Norfolk Member. It was not successful in passing this year, but I am told by Mr. Greenwood, the Minister of Health, that he has in preparation a Bill of that kind which it is hoped to being forward in Parliament next year, and which will, I hope, receive assent.

Mr. Edward T. Boardman proposed "Our Guests," and Sir Bartle H. G. Frere responded.

Mr. Stanley J. Wearing, President of the Norfolk and Norwich Association of Architects, also responded.

ENGLISH PRECEDENT No. 121

SHOP FRONT, PULTENEY STREET, BATH

Pulteney Street is part of a finely-conceived extension of the Bath plan, carried over the River Avon on to the meadows beyond.

This shop and its vis-à-vis mark the widening from the bridge into a wide octagonal crossing, so that the projecting shop front is not only charming in itself, but a very essential part of the street design, as providing additional emphasis at the entrance or exit of the bridge approach.

The heavy, finely-finished appearance of the wooden front is exactly necessary to the work for which it is called, and though it is sombre in dark paint, it would perhaps be as wrong in white paint, being entirely removed from the strict wood tradition.

—[E. MAXWELL FRY]

LETTERS FROM READERS

Priced Bills of Quantities

SIR,—The Honeywood Papers appear to be developing on lines traditionally associated with Victorian Christy Minstrel entertainments of happy memory.

Karshish (seeking new worlds to conquer) emerges from the corner seat allocated to the leading comedian, and complicates the programme with melodramatic close-ups calculated to make the flesh of the youthful professional practitioner creep.

"How do, Karshish?" says, in effect, Karshish No. 1 (disguised as a funny man).

"Hullo!" replies Karshish No. 2 (disguised as the arbiter on problems of professional practice). "Kin you tole me, Massa Karshish, what am de diff'rence between . . ." etc., etc.

The situation is becoming so complicated that ordinary subscribers to your JOURNAL, such as myself, do not know exactly where Karshish No. 1 (the funny man) ends, and Karshish No. 2 (in his advisory capacity as arbiter on problems of professional practice) begins.

When, however, Karshish asserts, in italics, that an architect has no right to inspect a contractor's priced bills of quantities, I venture to submit that Karshish No. 1 is encroaching on the preserves of Karshish No. 2.

The situation should be clarified. Otherwise we may have Karshish (No. 1 or No. 2) questioning the established principle that a householder has the right to inspect the meter installed by the gas company in his own house.

F. R. JELLEY

The Economics of Steel

SIR,—In your issue of June 4, Mr. C. J. Kavanagh has stated a powerful case for the investigation of steel structural design and the building regulations relative thereto, and it is gratifying to know that the personnel of the committee presently engaged in formulating an interim report is so strongly representative of the science, commerce and practice of British steel construction at its best.

From his letter I extract the following: "Instead of one good national standard—if building must be controlled—there are a dozen indifferent ones, with various degrees of interpretation." These sentences state the case succinctly, and they are as significant as they are brief; not the least significant being the interpolated "if building must be controlled." This, in itself, raises a vast question on which there must be a variety of opinion. An eminent engineer remarked to me recently that *it might not be a bad thing if there were no building regulations at all*, and there is something to be said for this point of view. The expert steel engineer is as knowledgeable and conscientious as the building authority in control, and reactionary regulations imposed on him may be regarded as a penalty he has to suffer on account of the possibility of the less admirable practices of unqualified others. Also, modern building requirements are as changeable as women's dress, and the standard of today is old-fashioned tomorrow. Mr. Kavanagh says that "hitherto, regulations have been deplorably static"; but is it not in the nature of regulations to be static? Can regulations for such a thing as building construction be devised to march with the times? At the best, do they not restrict our advance to a series of jumps, at long intervals, which always land us behind one who has made continual progress? But these reasons for "No building regulations" are, I am afraid, for a society more perfect than ours is.

Therefore, postulating the necessity for some control, surely the consensus of opinion will be that the control should be good and uniform throughout the country.

Expanding Mr. Kavanagh's statement, the building controls throughout the country, applicable to steel construction, present the following varieties: (a) The London area, subject to the L.C.C. regulations and the interpretations of the District Surveyors; (b) Areas which have adopted the L.C.C. regulations; (c) Areas which have adopted the recommendations of the Institution of Structural Engineers; (d) Areas which have made bylaws under the Public Health and Police Acts; (e) Areas which have no bylaws.

In (b), (c) and (d), the interpreter is usually the borough or county engineer; in (d), the bylaws are usually incomplete, often out of date, and frequently neglected; in (e), anything may happen.

This variety of control, if it can be called control, reacts in more ways than can be described in a letter. Important effects are: (1) similar buildings cost more in one area than in another; (2) in a particular area the bylaws may be interpreted so strictly that steelwork is penalized in favour of some other method of construction; (3) efficiency and economy of design is not encouraged; or (4) ignorance is given a free hand.

The L.C.C. regulations are not ideal, but neither are the conditions ideal in an area without bylaws, where one official is the sole arbiter. Probably the majority of steel designers and users would prefer a happy medium code applicable throughout the country.

Of all building materials, structural steel is the most uniform and least affected by local conditions; so it does not seem reasonable that a design, acceptable in the north, might be rejected in the south, and *vice versa*. Further, however appropriate and necessary it may be, it should not be possible, as it is possible, to design steelwork more economically for the capital of Scotland than it is to do so for the capital of England.

If the L.C.C. regulations form a basic document of the investigation, it is to be hoped that no myopic vision will be concentrated on them, but that a telescope may be trained on the farthest parts of the kingdom and of the Empire. A high degree of efficiency has been attained in some districts, and some local engineers might not see advantage in a happy medium that meant advancement for London but retrogression for them.

There is also the danger that the recommendations of such a strong committee, by the very reason of its strength, may become more static.

There is no doubt in my mind that the committee have these considerations in view. I am also in full agreement with Mr. Kavanagh that our building regulations affecting steel construction are in a parlous state; that nothing short of the committee he has described can rectify the position, and that the code to be evolved should be of national application.

W. BASIL SCOTT
(Redpath, Brown & Co., Ltd.)

The Ionic Architectural Club

SIR,—On behalf of the members of the above club I would like to tender you our great thanks for your excellent advice on the art of sketching which appeared in the June 4 issue of THE ARCHITECTS' JOURNAL.

With every respect for your Sketch Club, I would like to say in passing that ours was founded by the example of the Doric Architectural Club at Oxford, now in existence for over two years.

Nevertheless, we hope to glean useful knowledge, not only from your club but also from the numerous instructive articles in your periodical.

Your Holiday Sketching Competition is an excellent idea; but don't you think that there should be an age limit? We younger students do not stand much chance against the more mature members of the profession.

Would it not be possible some time in the future to arrange a series of articles on architectural design or history for the benefit of students who do not attend full-time architectural schools?

Once more thanking you for your

advice and also for the great encouragement you have given the Club by billing us so prominently in your excellent JOURNAL.

S. A. G. COOK, Hon. Sec.,
Ionic Architectural Society.

Efficiency in the Drawing Office

SIR,—My Executive Council suggest that the readers of your JOURNAL, as representing the considered opinion of the architects and draughtsmen of this country, might be interested in the letter which this Association is sending to the responsible heads of British firms which have their own drawing offices.

This Association is aiming at extending the scope of its usefulness by taking into partnership on technical and scientific matters the users of its products; its members are willing to pool their own knowledge and place it at the disposal of any buyer who cares to put his problems forward.

ALFRED W. FOSTER, Secretary,
The Drawing Office Material Manufacturers' and Dealers' Association.

The letter sent out by the Association reads as follows :

DEAR SIR,

Some twelve years ago, in order to improve and give impetus to a trade that had fallen to a very low level, the drawing office material manufacturers and dealers of Great Britain came together and formed themselves into what is now known as "The Drawing Office Material Manufacturers' and Dealers' Association."

This association comprises the whole of the firms originally connected with our industry, many of them household names with world-wide reputations. Individually, these firms have rendered very great service to engineering as a whole by their inventions of instruments, apparatus and processes which have been of incalculable benefit to individuals as well as to employers in increasing the efficiency of the drawing office.

It is felt that, although great advances in technical processes have been attained by the manufacturers themselves acting in harmony, still further progress could be made if the co-operation of the actual users of our various commodities could be secured. Difficulties may be experienced by the practical engineer and draughtsman which do not suggest themselves to the scientific adviser of the manufacturers, but which, if the problem were presented to him, he might be able to solve.

The association has therefore established a permanent committee whose sole duty is to ascertain in what way this industry can help to increase the efficiency of the drawing office, and this letter is being addressed to the principal engineering firms of this country as an appeal for practical co-operation.

This association will greatly appreciate your notifying them of any matter in connection with your drawing office wherein their collective experience may be of assistance.

An answer will be appreciated, as by availing yourself of our offer you will be placing yourself under no obligation of any kind ; on the other hand, you will materially assist us by directing attention to new ways in which our organization may increase its usefulness to those whom it desires to serve.

Yours faithfully,
(Signed) ALFRED W. FOSTER,
Secretary.

Settling-Up Honeywood : v

DEFECTS ARE REPORTED

BY KARSHISH

(H. B. CRESWELL)

Honeywood has been in the occupation of the owner, Sir Leslie Brash, for some weeks. Serious complaint has been made of smells in the house, which Lady Brash attributes to the drains. Grigblay, the builder, however, can find nothing wrong, and Spinlove, the architect, has strongly discountenanced the idea that anything is. Grigblay has asked £1,500 on account of extras. Spinlove has called for statement of account showing how the figure is arrived at, and has assumed that Grigblay has overlooked certain omissions.

GRIGBLAY TO SPINLOVE

Dear Sir, 14/4/26.

We have been pressing on with our statement of account as you ask, and are arranging with Mr. Tinge to meet us for the purpose of measuring variations. We find that the total balance of extras on the variations account will be in the neighbourhood of £1,800, and shall be glad if you will pass us a further certificate for £1,000.

Yours faithfully,

SPINLOVE TO GRIGBLAY

Dear Sir, 16/4/26.

I am astonished to learn that your account will show extras to the amount of perhaps over £1,800. I was quite unprepared for anything of the kind, and I am sure Sir Leslie Brash will be shocked at the figure. I certainly have not authorized extras on any such scale, and have no idea how the figure is made up. I must have a summary of items, showing how the amount is arrived at, before I can consider drawing a further certificate.

Mr. Tinge has no authority to measure any work except as I may direct. It is necessary for me to have the summary before I can do this.

Yours faithfully,

SPINLOVE TO TINGE (QUANTITY SURVEYOR)

Dear Mr. Tinge, 16/4/26.

Grigblay is preparing his final statement of account. Will you please note, however, that no work is to be measured except as I may direct, as I have reasons to fear that the account is inflated with unauthorized extras. I have asked Grigblay for particulars of the work to be measured, and will let you know what is wanted in due course.

Yours truly,

Spinlove's arrangements are good, though his manners to Grigblay are not. The measuring of work by the quantity surveyor, or even by the architect, does not establish an authorized extra, but it certainly supports a claim for one. The quantity surveyor, also, has to be paid for the work he does in fees that are added to the account, so that it is the architect's duty to see that no other measuring is done than the needs justify. Extras often consist in differences between the value of work specified in the contract and the same work as carried out; and as the only way to arrive at this difference is to measure and value the whole of the work replaced, and also that which replaces it, and strike a balance, it may happen that the surveyor's fees for measuring and pricing £2,500 of work twice over is tacked on to a resulting extra (or omission) of only £50. It is therefore sometimes expedient for an architect to agree a figure with the builder. On the other hand, the builder will be inclined to charge as day work (time and material) extra work which ought in the interests of the client to be measured and priced at the contract rates, or at rates commensurate therewith.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 19/4/26.

May I be permitted to remind you that you have omitted to transmit Mr. Grigblay's report on the odoriferous effusions which, I regret to say, still persist in continuing.

We continue to be delighted with the house, which will be quite perfect when sanitary amenities have been safeguarded, but we have observed various slight defective flaws in the building work. These are not so far imperatively serious, but need preliminary attention. Dripping taps can speedily be renovated, I conceive, also little cracks in the plaster ceilings which may otherwise increase. Stains in the wall-papers are, I fear, a more serious apprehension. There are openings in the woodwork, specially in the overmantels to fireplaces in the first story, and *most alarming gaping cracks* in the exterior oak window frames, particularly on the outside. Steps should at once be taken to prevent these cracks increasing in dimensions. Some are several inches in length, and in breadth wide enough for me to almost insert the terminal edge of a sixpence. I have prepared and transmit under this cover, for your convenient guidance, a scheduled list of the defects I have noticed as obtaining; but your trained eye will no doubt have no difficulty in discerning others.

With regard to the Riddoppo, this has a delightful lustrous appearance, and its variegations of different tints is charming, but it leaves stains where the under bottoms of doors rub over the carpets, which will only imperfectly brush out; and it has failed, I am

informed, near the range in the kitchen. Mr. Grigblay should be notified.

Yours sincerely,

Brash's "scheduled list" is missing from the file, but if it is fairly represented in the above letter the "defective flaws" are nothing to complain about (so far) except, of course, Riddoppo. Brash has not realized what is happening to his new novelty super paint.

SPINLOVE TO GRIGBLAY (PERSONAL)

Dear Mr. Grigblay, 20/4/26.

I reported to Sir Leslie the substance of your letter describing your investigation of supposed smells, and he has since twice asked for a verbatim copy of your letter. I cannot possibly send it him—besides, it is a private letter—so will you let me have a version suitable for sending to Sir Leslie. I enclose the original in case you should not have kept a copy.

Yours truly,

Spinlove is unwise in allowing Grigblay to write to him confidentially, but more unwise in his method of disguising the fact. He has a frank, straightforward nature; slyness is foreign to him, and must be distasteful. He could perfectly well have replied to Brash: "Grigblay reports as follows: He says . . ." and completed an accurate paraphrase in that form. If Brash were so obtuse as to press for the original, he could be told it was a private letter.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 20/4/26.

The blemishes of which you send me a list are only what appear in all new houses, and do not point to serious defects. Grigblay will do all necessary restoration, but this will be in six months' time, when such defects as there may be have fully developed. Of course, if anything goes wrong he will send down and put right, but it appears that nothing has. Certain sulphates or other exudations appearing on the face of new plaster kill the colour in wall-papers, which is why I recommended only tinted lining papers, designed to serve as a foundation for the better papers you may afterwards decide to hang. The cracks in the oak frames are of no consequence. They are characteristic of English oak.

Yours sincerely,

PS.—I will send you copy of Mr. Grigblay's letter tomorrow.

This pretence of an afterthought in order to gain time is deplorable. Thus does one deceit involve others. Spinlove's comments are well-informed, but by omitting all reference to Riddoppo and thus including its failure with defects that are "not serious," he may be applying Grigblay's advice to "take no notice" too drastically.

GRIGBLAY TO SPINLOVE

Dear Sir, 22/4/26.

We enclose report for Sir Leslie Brash, and return original of Mr. Grigblay's letter.

Yours faithfully,

GRIGBLAY TO SPINLOVE (ENCLOSURE)

Dear Sir, 6/4/26.

I called at Honeywood on the 5th instant to examine into the effluviums and emanations complained of, but I could not ascertain any olfactory aggressions indicating blemishes in the sanitary provisions.

There was a bit of odoriferous exhalation in the scullery, and a whiff of noxious emanation in the yard, because the domestic staff had removed the grating out of the scullery sink instead of emptying the grease-trap. Unsavoury effluviums from the yard gully are due to the grating being missing and the drain being too small to pass the size of scrubbing brushes used.

The obnoxious exhalations in the bedrooms is due to windows being kept shut and chimney-throats stopped; but it is likely that there is down-draught in some of the flues owing to them being damp as yet.

Yours faithfully,

Spinlove asked for a report so worded as to be suitable for sending to Sir Leslie Brash, and it is probable that Grigblay supposed it was intended he should adopt Brash's euphemisms, and that his inveterate habit of irony, his lack of literary accomplishment and his impatience of nonsense, did the rest: he did not understand what was wanted and resented the folly of what he was doing. Grigblay's habit of veiling his irritation by irony is so ingrained that he is likely to be in great part unaware of the gorgeous effects he sometimes gets. Some such explanation seems necessary. We can imagine that Grigblay is unaware here, as elsewhere, of the vividness with which his letters reveal his state of mind.

SPINLOVE TO GRIGBLAY

Dear Sir, 23/4/26.

I am much obliged for Mr. Grigblay's report on drains, but I think that Sir Leslie Brash might misinterpret certain passages. I have, therefore, altered some of the terms and return the report. If Mr. Grigblay will copy it as amended and sign, I will send it to Sir Leslie.

I am still awaiting your summary of variations account.

Yours faithfully,

GRIGBLAY TO SPINLOVE

Dear Sir, 24/4/26.

We have re-written report as you suggest and enclose same. We hope that this now ends the matter.

Yours faithfully,

GRIGBLAY TO SPINLOVE (ENCLOSURE)

Dear Sir, 6/4/26.

I called at Honeywood Grange on the 5th instant to investigate complaints of smells, but could find nothing wrong with the drains.

A smell in the scullery was due to the removal of the grating of the sink, and to the container of the grease-trap not being emptied. The flooding of the yard gully is due to the grating being missing and scrubbing brushes getting into the trap.

The stuffy smell in the bedrooms is partly due to windows being kept shut and chimney-throats stopped up, but it is likely there is down-draught in the flues owing to their being damp as yet.

Yours faithfully,

A very colourless version! Spinlove has ventured, it will be noticed, to touch up Grigblay's grammar.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 24/4/26.

I note your comment anent the subject of blemishes. So long as we are not inconveniently incommoded I am quite willing to permit matters to stand over for the present, on the understanding that Mr. Grigblay is previously advised beforehand and comprehends that the increase in defects due to the remissness of his attentions is a matter for which he solely is responsible. I certainly consider, however, that it would be advantageously to his interests to intervene before the increase in blemishes become more aggravated, as I apprehend that a small defect is more readily ameliorated than one of greater magnitude, and that the anticipated augmentation of cracks, for example, is better prevented than cured. That, however, is a matter for your and Mr. Grigblay's eventual decision.

Since I wrote, a new defect has appeared, which needs immediate attention, as it is causing the establishment considerable unnecessary inconvenience. On Thursday afternoon last, at about 4.25—so far as I can precisely ascertain—it was observed that when the push in the drawing-room was depressed the front door bell rang; and it subsequently transpired all the other pushes rang the front door bell, and that the bell-pull at the front door rang the bell in the lady's maid's room on the second floor instead of its own. As the indicator has also ceased to appropriately function, the considerable consequent inconvenience can be imagined, and is not—may I be permitted to say—what I feel is compatibly to be expected when a house is designed by a qualified architect and erected by an expensive builder. I shall be gratified if you will ring up the house tomorrow and instruct us in what it is desirable to do.

Your communication omits to intimate anything regarding Riddoppo super paint. My apprehensions on this question are commencing to engender considerable doubts, as a small narrow

strip was yesterday observed to have detached itself away from the wall above the skirting of the inner lavatory compartment adjoining the front entrance, and investigation indicates that similar disasters threaten to immediately eventuate in various other different positions. Inspection also substantiates that serious ridges and rims of paint, which break away from the surface in little crumbs and flakes that adhere to the carpets, are accruing in diverse localities which conclusively demonstrates that *Riddoppo is beginning to commence to disintegrate.* Immediate attention is most desirably expedient, and I request that Mr. Grigblay shall be informed that I expect immediate remedial precautions to be embarked upon at once, before it is too late.

May I intimate the reminder that you have not yet transmitted Mr. Grigblay's report on the sanitary anomalies. These cause me increasing apprehension. Also the damp places over the chimneys continue, although the promised remedy was intimated to be on the point of eventuating several weeks ago. Other evidences of damp places are now ocularly discernible in the corners of some of the first-floor sleeping apartments.

I have transmitted cheque to Mr. Grigblay, but still await promised figure of total sum of extra cost, for reasons already communicated.

Yours sincerely,

We have seen Brash making heavy weather of "blemishes" which do not amount to defects, or are of no importance: he has yielded to the weakness, common with owners of new houses, of crawling over every part with the minute scrutiny of an ant, instead of enjoying his well-planned and soundly-built house. The Riddoppo failure is, however, a serious matter.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 27/4/26.

I do not know in the least what has gone wrong with the bells, but, as I telephoned today, I have arranged for Grigblay to send an electrician to the house tomorrow.

I enclose copy of Grigblay's report on drains. I am sorry I omitted to send this before.

The necessary work in preventing damp appearing in chimney-breasts will have to be put off till the summer, when the brickwork has dried out. I will inquire into the cause of the other damp places you speak of. The house has hollow walls, and there cannot be much wrong.

I assure you that your fear of faulty drains is without foundation. I really do not know what more can be done.

I am sorry to hear that the Riddoppo paint is proving unsatisfactory. As you know, I never had confidence in it, and Mr. Grigblay objected to its use.

Yours sincerely,

There is a directness and brevity in this letter which, though perfectly appropriate to the occasion, indicates that Spinlove is busy in other directions and is getting tired of Honeywood. He has not followed Grigblay's advice of repudiating responsibility for Riddoppo, but he perhaps does better, at this juncture, in implying that the matter is Brash's concern, only.

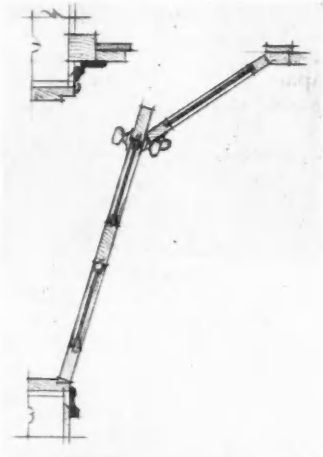
MISS PHYLLIS BRASH TO SPINLOVE

Dear Jazz, 30/4/26.

This is to warn you to form a solid British Square, and prepare to receive cavalry, as Dad is on his high horse. You *are* a mutt. Dad even suspects a practical joke. This is what happened; no guy, honest indian.

We had a big house-warming dinner-party tonight, very swell and solemn, all the poshest of the posh, no one under about seventy, all good gargantuans with digestions treasured by leading physicians—Dad simply wallows in that sort of occasion: when the writing wobbles it is because I am laughing.

Mum and I were out with the car, and didn't get to home sweet home till nearly seven, to find the kitchen staff—as Dad calls them—waiting *outside* the kitchen door, which was open just wide enough to allow a choking smell of burning glue and feathers to be nosed. They could not get in to finish cooking the dinner, nor to stop it cooking. The back entrance was bolted, the windows all fastened—except the little top ones—and the door jammed; it would not open nor shut. I pushed my arm through, and found the door of the cupboard just inside pressing against the knob of the kitchen door, and the knob of the cupboard against the other, so that the door would not move either way. How it got fixed no one knows. The servants found it so at half-past five, after they had run to see an aeroplane stunting at the front. The gardeners had all gone, not a man was about, and so the loonies just waited, with sauces burning and everything going wrong inside, and nothing being done to get the dinner ready. The chauffeur fetched a ladder and reached through one of the little top windows with a golf club and undid a lower window, and, by heaving himself up against the door, freed it. You can imagine the to-do with all the arrangements knocked sideways. Dad had decided to wear his decoration, and Mum her tiara, but the poor things hadn't the heart. Of course, it would not have mattered if it had not been such a swanky occasion; but not a word was said, and the seventeen seventies sat solemnly marking time in the drawing-room with cocktails and caviare sandwiches, while the servants struggled and sweated in the kitchen, and the hired men gloomed in the hall, till nearly a quarter to nine. It is a thousand pities you were not invited—as you should have been—as the triumphant architect of the arrangements.



Ever yours,

PUD

Spinlove appears to have a friend in the enemy's camp.

This accident is extraordinary. Spinlove ought to have been more wary than to allow any door to open against another in such a way as to block its swing; such a chance is always in mind for the planner. It happened, however, that the kitchen arrangements at Honeywood were altered after the trenches had been dug and the foundations begun, and this unlucky fouling of doors may be the bequest of that revision. Afterthoughts and alterations are a frequent cause of such mishaps. When the plan is originally made the whole scheme is subject to minute concentration; but when alterations are devised there is great danger that all consequences of the changes will not be foreseen.

Fantastic as this misadventure may appear, it will seem so to the experienced architect or builder only for the grotesque catastrophe associated with it. It is, in fact, typical of the kind of accidents that frequently happen. Pud's description makes pretty clear what occurred. It is a thing that the most exact detailing by the designer and anxious care of the builder could scarcely accomplish, so that had the thing been—as Brash's irritation led him to suggest—a practical joke, it would have done honour to the ingenuity and assiduity of its perpetrators.

Spinlove's Automatic Self-Locking Door

The sketch here given shows what apparently happened. The title I have given it seems justified; for if anyone hereafter discovers a right use for the device, Spinlove ought, most certainly, to have credit for the invention.

[NEXT WEEK: VI—RIDDOPPO COMES TO THE BOIL]

QUESTIONS THAT ARISE

Measurement of Ironwork

R. U. L. writes: "*I am at present trying to settle an account, where a question of measurement for wrought-iron ornamental balustrading has arisen. The work is elaborate, and a rather heavy price per foot run was agreed. There are ramps at each floor, and to the landings. The method of measurement was never agreed upon, and the contractors contend that it should be measured on the handrail and girthed the whole way up.*"

It would have been clearer if the actual measurement had been agreed upon before accepting the price, or at least if the estimate had stated that the price was inclusive of all bends and ramps.

However, I consider the correct method would be to measure from the outside face of the bottom newel, for the whole length of balustrade to the outside face of the top newel. Or, if the handrail finishes against wall face at the top landing, take the measurement to the wall face. The measurement should be taken halfway up the height of the balustrade.

H. S.

Travel in Sweden

"Traveller" writes: "*Is there any architecture worth seeing in Sweden beyond the much photographed Stockholm Town Hall and the other now well-known modern buildings?*"

There certainly is, but it must be remembered that Sweden is a sparsely-populated country and the towns are far apart. In the south the Gothic cathedral of Lund is worth a visit, and the old castle of Kalmar. Near Stockholm are the palaces of Drottningholm (with gardens laid out like a small Versailles) and Gripsholm.

Västerås, to the east of Stockholm, is full of interesting old work as well as containing a fine but little-known statue by Carl Milles of Bishop Rudbeckins; further east, on Lake Hjalmar, is Orebro, with a typical moated castle. At the northern end of Lake Vettern is Vadstena, with the convent of St. Brigit and the huge castle of Gustavus Vasa, now, alas! only a shell, with some remains of the interior decoration on the ceilings and walls.

On the opposite side of the lake is Hjo, and near this little port is the abbey at Varnhem and the cathedral at Skara. The smaller Swedish towns are built almost entirely of wood, and to eyes accustomed to more lasting materials they have an unsubstantial appearance, but much of the detail is worth studying. Filipstad, north of Lake Vennen, is typical, with the wide streets and squares of wooden houses and the large white stuccoed church. Many of the small wooden village churches contain quaint carved and coloured woodwork and frescoes, and nearly all have the detached bell towers of curious design in the churchyards. One of the most accessible of these is Patila church, which can be reached from Göteborg by motor-bus, but farther north, in Varmland and Dalecaria, at Fujesta and Atops, there are good examples.

Nearly every farmhouse in Sweden that has escaped destruction by fire is worth a visit, as they are usually filled with examples of genuine peasant crafts, in a country where beauty is little talked about but unconsciously followed.

LL. E. W.

Projection of Cornices

S. T. writes: "*What is the following secret of the old architects? When a cornice is designed exactly in accordance with the proportions of a Palladio or a Gibbs the projection appears much more than on the detail and is usually far too heavy. In old work this is not the case.*"

This is a common mistake and arises from the fact that the section of the cornice shown in the textbook is a "true" section, whereas that seen at the angle of a building is on an angle of 45 degrees. If the true section is designed as follows the distortion will disappear:

The lines AB and AD on the accompanying sketch show the "true" projections, and AC that across the angle. On section, AE = depth of cornice, and DA, projection on true face, while FA = projection at C.

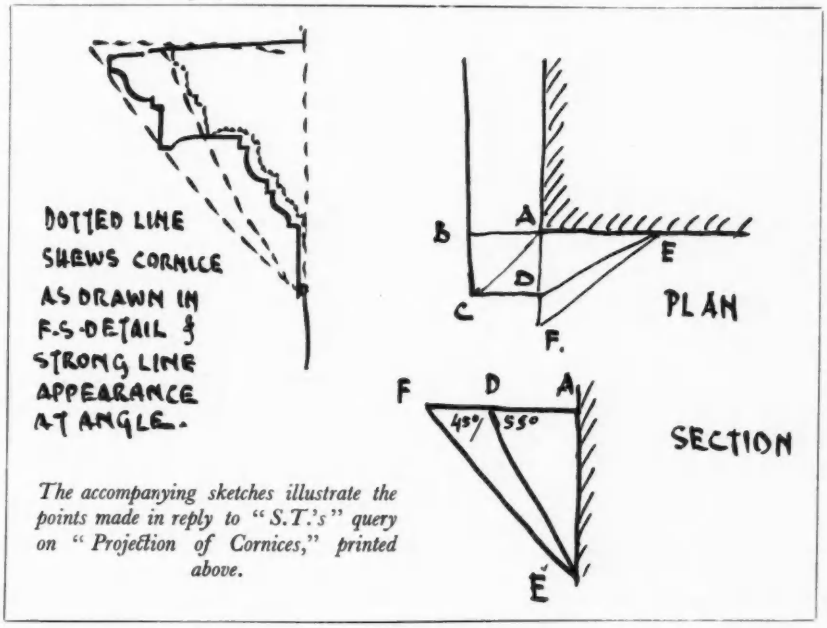
The angle AFE should not be more than 45 degrees to be pleasing, therefore the angle ADE must be more; actually it is 54 degrees 44 minutes, or in practice 55 degrees. Therefore in drawing the full-size detail the profile of the cornice should be contained within the triangle ADE so that when seen on the angle it will be within the triangle AFE.

Strangely enough the old writers do not seem to issue a warning on this matter, and draw their cornices at 45 degrees on face. But they practised better than they preached, and most of their cornices fall within the 55 degrees angle.

C. N. E.

Sewage Disposal

C. H. E. writes: "*What dimensions are required for the tank and filter for a sewage disposal plant for a country house? The total household, including maids and chauffeur, will consist of twelve persons.*"



It is usual to calculate the consumption of water in a household at 30 gallons per head per day; this will include all baths, w.c.s, etc., as well as domestic and kitchen use. Therefore, as there will be a filter attached to the tank, the capacity of the latter may be calculated at half the daily flow. $\frac{12\times30}{2}$ galls. $=180$ galls. $\frac{180}{6{\cdot}25}$ = say, 29 cu. ft.

Therefore a tank 6 ft. deep × 3 ft. long × 1 ft. 8 ins. wide is required.

The capacity of the filter should be 1 cub. yd. to 15 persons, but double this is best for so small an installation. Therefore $\frac{12\times2}{15}=1\frac{3}{5}$ yds.

A deep filter is essential, therefore 5 ft. deep × 4 ft. wide × 2 ft. 3 ins. long will meet the case.

W. L.

The accompanying sketches illustrate the points made in reply to "S.T.'s" query on "Projection of Cornices," printed above.

THE SPECIFICATION WRITER

The Group System

BY A. SEYMOUR REEVES

THERE is a good deal of misunderstanding both as to the purpose and application of the group method for specification writing, which was outlined in the report of the Conference on Specifications (*R.I.B.A. Journal*, June 15, 1929). Some persons regard the proposal as being too novel to be pursued; others consider that there is nothing new about it, except that it provides a definite order or system. The latter view is substantially correct, as the prime elements are based on recent practice. It has also been suggested that the method indicated for finishings is impracticable, or that it will involve difficulties which will be insurmountable with large contracts. Those inclined to this view may be assured that it has been in use for years for large contracts with considerable satisfaction to all concerned.

The group system provides the means whereby a specification can be rendered more simple, more lucid, and much more interesting. It is not an arbitrary, cast-iron, standardized system. On the other hand, it offers much opportunity for individual treatment.

If we ask, "Why is trade classification employed?" the first answer is, "Because it has always been so." The second answer is, "Because originally the trades were let separately." Many specification writers have broken away from trade classification and introduced group methods. One reason is that patent materials or patent methods of construction do not fit into the usual trade classification. Another reason is that the dissection of trades causes wide separation of items which are closely allied in the building operations and makes it difficult for the reader to grasp the relationship of the component parts. This applies more particularly to buildings with some complexity in the finishings and fittings.

While opinions may differ as to the need for group classification in specifications for new buildings, there is general agreement as to the advisability of this method when dealing with alterations to existing premises. Not only does the group system facilitate the discovery of desired information, but its use reduces the number of queries during the progress of work.

A clause which states that all walls are to be plastered "except where otherwise described," does not really convey any information. With a fair-sized job, if the specification is based on trade classification, a clause such as that just quoted will cause the reader to search almost every trade in order to discover the "other" descriptions and to understand their relationship.

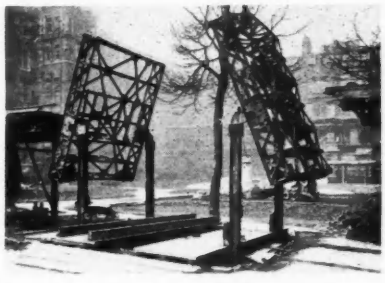
When trade classification is employed, a good deal of the specification is little more than a restatement of descriptions which appear in the quantities, with indications as to location but nothing as to relationship. The group system, being on a quite different basis, aims at providing this information in such a way as to enable the reader to grasp the architect's intentions in a comprehensive manner. The important thing about the group system is not the observance of particular details but the adoption of the general basis. This basis follows the progress of the building operations and is therefore suitable to almost any kind of building.

The opening section of Preliminaries would be in the usual form, but in the remainder of the document the explanation or description of work is separated from the general clauses. Thus, after the Preliminaries will come a section containing all general clauses under their trade headings, a series of subsections similar to the preambles in bills of quantities. Following this will be the description of work which, instead of being under separate trades, is divided into three main groups: (1) Structural and Carcass Work; (2) Finishings; and (3) Essential Services.

(*To be continued*)

A Glass Firm's Aid to the Architect

MESSRS. CHANCE'S latest collection of samples is a real attempt to meet the needs of the specification writer. Some forty different varieties of glass are contained in a metal case of four trays which, when closed, occupies no more space than a large book. The trays are hinged at the sides to arms, so that, on lifting the top tray, those below are extended and the whole of the samples are exposed to view at once. Those who remember finger nails broken in lifting the old trays, and that other abomination, the black box wherein the samples fitted vertically, with only their edges visible, will appreciate the advantages of this new pattern case.



Glass today has a wider sphere of application, and many of these patterns can be put to other uses than the opaque and semi-opaque door and window fillings for which they were primarily designed. "Luminating" glass, with one side raised into ribs six to an inch, and "Reflectalite," with a surface broken up into a number of small cones about twenty-five to the square inch, are new glasses and very suitable for artificial lighting schemes. "Maximum Daylight" has a ribbed and waved effect, with strong vertical or horizontal lines (according to the way it is fixed), combined with great brilliancy, and is one of the most decorative samples. "Stippolyte" and "Dewdrop" are obscured glasses which admit a large amount of daylight; the former has a smooth surface, which makes it easy to keep clean.

These and other already well-known varieties, combined with concealed electric lighting, and manufactured in either white or coloured glass, have endless possibilities in schemes of modern decoration. One or two of the older patterns might be discarded in favour of newer geometrical designs more in keeping with present-day schemes of decoration, and a sample of transparent silvered glass would be a novelty of interest to many architects. The sample of "Calorex" glass is worth noting, for a glass which admits light while excluding seventy-five per cent. of heat has many uses, not only for large skylights and under tropical conditions, but also in the humbler domestic larder, and other rooms requiring protection from actinic rays.

The booklet which accompanies the samples is all that a manufacturer's catalogue should be. Pleasantly designed, and printed, in two colours, in good clear type, it gives, among other concise information, a useful list of glasses with tabulated columns of sizes, thicknesses and percentages of light transmitted. If anything, the book is too condensed, and further expansion of the remarks on modern glass treatment and decorative uses would make it yet more welcome. Architects are more likely to be attracted by a well-printed catalogue of a convenient size than by lists of ungainly shape interleaved with loose pamphlets. Messrs. Chance's brochure will please the most fastidious. LL. E. W.

"IN *buildings today there is much design of a definitely engineering character that is incidental to and complementary of the work of the architect,*" *said Mr. Oswald Healing, in the course of a paper recently read before the Quantity Surveyors.* "*It is becoming more and more the custom for architects to consult engineers in relation to such special structures as deep concrete foundations, retaining walls, piling, structural steelwork, and reinforced concrete.*" *The author goes on to claim that the best results are derived from the collaboration of the architect and the engineer, who, it is his conviction, should be of the independent consultant type. This paper, entitled* "*Quantities for Engineering Works,*" *has now been issued as a reprint from the Journal of the Surveyors' Institution.*

Presented to London Hospital by Sir William Paulin, and designed by Gordon Jeeves, this covered way presented an unusual problem. To provide passage for fire engines and escapes, two bays were made to open, bascule-wise, pivoting upon the supporting columns and operated by electrical drive (in 15 seconds), or, in emergency, by hand gear, both concealed. The photographs show the movable bays in two positions, and the steel skeleton (designed by S. W. Budd, A.M.INST.C.E., consultant engineer for the work) before casing in African teak. The roof is covered with copper.

The Catadyn Method of Sterilizing Water

SOME years ago the influence of certain metals, such as silver and copper, in contact with water was found to have a destructive effect upon bacterial organisms in the water. Since then, a great deal of investigation into the phenomenon, which was given the name of oligodynamics, has been conducted. Recent research work by the Munich physicist, Dr. Georg A. Krause, indicates that such metals as silver, copper, aluminium, etc., in laminated molecular form, accumulate active molecular oxygen in quantities depending on the quality of the surfaces. This oxygen generates metal salts; the metal salts go into solution in the form of ions and kill the bacteria by transmission of the electric charge of the ions.

As the ions represent exceedingly small particles, the weight of silver used is very small, and is in fact practically negligible. The catalytic-dynamic character of this action has given the term " catadyn " method to Krause's process, which employs silver in a special spongy condition as the active metal, silver having the highest bactericidal properties without having any deleterious effects upon the cells of higher organisms such as the human body.

The catadyn silver definitely attacks bacterial organisms and destroys them, while leaving the higher or animal cells unimpaired. It kills off all water-borne disease germs, the time required for the process depending upon the concentration of the bacteria in the water, and the claim is made that bacterial counts such as those observed during epidemics of typhoid fever of recent years in Europe would be definitely destroyed within thirty minutes. In the general application of the process, however, a two hours' contact for the water to ensure sterilization is recommended. The properties of the treated water are not transient, there being apparently a large excess of potential activity retained by the water. The selective action of the process is important, for, while killing the germs and making the water sterile in respect of bacteria, leavens and other micro-organisms are not affected. The treated water undergoes no deleterious change in taste, smell, or appearance, but on the contrary is said to contain more oxygen and to have a fresher taste.

The sterilization of drinking water and water for other personal uses is the obvious first application of the process, and this is simply done by means of special flasks and containers. Catadyn sterilizing flasks are made of glass, clay, or porcelain. They are filled with porcelain rings coated with pure refined silver, prepared by the catadyn method. Infected water poured into such a flask can be withdrawn germ-free after having remained there for two hours. This action of the silver continues until the metal is consumed, but the latter process is so slow that the silver deposit in a sterilizing flask is sufficient to treat more than a million litres of water.

The process has been applied in Germany to drinking-flasks of all sorts; also jugs and portable vessels of any size can be similarly equipped, and even large sterilizing reservoirs can be constructed on the flask principle for the use of buildings or groups of buildings. These reservoirs are provided with elements for insertion, consisting of catadyn balls or rings, and since the treated water retains its sterility it can be stored without any precautionary measures.

The method can also be used in connection with filtering. When a normal filter is equipped with catadyn silver, the filter imprisons the germs while the catadyn destroys them and prevents their growth. For the treatment of water in medium and larger volumes the method employed does not pass the water through a filter, but carries the water in contact with a catadyn body for a given time until sterilization is complete. For treating large volumes of water, such as 20 million gallons per day, Dr. Krause uses silver compounds to be mixed with the water in quantities similar to those employed in the catadyn method.

A report on tests made at the Counties Public Health Laboratories, Queen Victoria Street, London, E.C., in which the effect on the *Bacillus Coli Communis* was tested, indicates that even in abnormally high concentrations a sufficient time of treatment secures complete sterility.

A. H. H.

LITERATURE

THE METROPOLIS OF TOMORROW

OF the many Utopias which have exercised the imagination of men from Plato to Mr. Wells none has ever approached reality; not because they were impossible of realization, but since the mind of man, unstable as litmus paper, sets before it a constantly changing ideal, the Utopia of one age is not the Perfect State of another.

The Metropolis of Tomorrow is another of these dream cities; this time the dreamer is an American architect, and it is built up, in the manner of Utopias, upon a reasoned probability. Mr. Ferriss divides his sixty drawings into three sections, prefacing each with a short essay and giving an explanatory note to every drawing.

The first part of the book illustrates actual buildings of the skyscraper type; the second deals with the development of forms governed by the American Zoning Laws; and the third is devoted to drawings of the dream city which is the logical end of the tendencies foreshadowed in the first two parts.

The future Metropolis is to be a city dominated by immense towers, for the skyscraper, under present restrictions, tends more and more to this form. Mr. Ferriss is alive to the dangerous traffic congestions that these enormous human hives create when they are concentrated in a small area. Today, out of the 377 buildings in the United States over twenty stories high, 188 are within the limit of New York City, and rush-hour conditions are almost intolerable. The illustrations of roadways on different levels are a suggested solution, but the city of the future will not require these.

Mr. Ferriss has learnt from M. Corbusier the value of towers placed at wide intervals and at definite local points, while the intermediate blocks of buildings rise only to moderate heights. To the European it is not an attractive prospect, and one feels that at times Mr. Ferriss himself is a little frightened of the Frankenstein monster he has evoked. One drawing of Night in the Science Zone is a veritable vision of a City of Dreadful Night. But one returns again and again to the fascination of these beautifully reproduced drawings of a master draughtsman.

The Metropolis of Tomorrow. By Hugh Ferriss. London: B. T. Batsford, Ltd. Price 35s. net.

The Dunmow Chair, or the "prior's chair" as this piece is termed, is actually a fragment of the fittings of an ancient religious establishment founded during the reign of King Henry III.

[*From* Ancient Church Chests and Chairs.]

ANCIENT CHURCH CHESTS AND CHAIRS

THIS valuable and very readable book by the leading authority on the subject has interest not only for the expert, but for the ordinary reader, who is likely to be misled by the inaccurate and often legendary information which gathers round old church furniture. One is left in doubt whether to wonder more at the spoliation and neglect of past ages, or at the number of treasures that actually do remain.

The book is usefully arranged as an itinerary, covering the Home Counties (with one excursion into Norfolk), the places visited being all within reasonable distance of one another and of London. The chests and chairs are fully illustrated and described with expert criticism; they are treated not as cold museum pieces, but shown in their actual surroundings and where possible located by the help of old prints; also other points of interest in the churches containing them are touched upon.

The reader may find himself stripped of a few pleasant delusions such as that of the "Armada chest," but as regards historical objects the solid and reliable truth has often more fascination than has anything that merely borders on fiction. It is especially interesting to note that many of the things described here may actually be seen at the present Exhibition of Mediæval Art at South Kensington Museum, and this book may serve as an excellent supplementary guide to that exhibition.

MODERN PUBLIC BATHS AND WASH-HOUSES

THIS little handbook should prove extremely useful to any architect employed to design a swimming-bath of any kind. It is divided into three main divisions, comprising (1) public baths and wash-houses, (2) swimming-baths for schools, (3) open-air baths. Each main division has several subheadings dealing with layout, materials, filtration, heating, diving fittings, etc.

Small as the book is, I cannot help feeling that a book giving so much data would be handier for reference if an index were added.

The book has been issued under the auspices of the Amateur Swimming Association, and as their recommendations and those of the Amateur Diving Association are embodied in the book, it is of great convenience in legislating for the planning of the bath itself, and the diving-boards, giving all heights, depths, etc., required for competitions of any aquatic nature.

Great stress is laid on the filtration and purification of the water, and the desirability of the compulsory use of more thorough cleansing facilities for the bathers before entering the baths.

I think, in the light of recent events, it would be advisable also to mention the importance of thoroughly disinfecting the bathing garments, but perhaps this is more a matter for the management.

The general advice on layout of swimming-baths of all descriptions is admirable and instructive. It is, of course, easier in the case of schools to ensure that the bathers pass through cleansing-rooms between their dressing-boxes and the bath, but we can heartily endorse the authors' hope that a similar arrangement in public baths will soon be adopted. The idea of having the dressing-boxes round the bath has always been a fetish attended with great disadvantages.

The authors make a passing note on aeration being required to impart sparkle to the water. I think there have been failures due to over-aeration, which has had the opposite effect of making the water flat.

The general advice as to materials is all very helpful, and for so short a book the whole ground is very well covered.

On the subject of inlets and outlets (page 45) I think the scheme outlined in THE ARCHITECTS' JOURNAL of June 11 last should be considered, as it overcomes all the difficulties named and provides better circulation.

TREES AND SHRUBS FOR ROADSIDES

IN *Roadside Planting* is a fairly complete list of trees and shrubs, under their botanical names, but with an index giving national names also. Subsections indicate those suitable for suburban, smoky or windy districts and those for producing special effects, and those best adapted to several kinds of soils. This is all excellently done, and one can find few faults; for the book has been read in manuscript by eminent authorities. A word should be added to the note on the aspen poplar, that it frequently blows over in a high wind; and on page 29, line 11, a negative is omitted. The book, however, omits to say which trees and bushes attract birds by their berries and their facilities for nesting; birds, being noisy themselves, generally are fond of railway embankments and main roads, and are quite ready to beautify them with songs, as witness the many pairs of nightingales which have nested between road and railway on the narrow bank from Salisbury to Wilton. The authors likewise should mention that tree-planting needs design, and not a haphazard choice of specimens from a horticulturist's catalogue, made by district councillors of uncertain taste.

THE PRESERVATION OF RURAL ENGLAND

The Gloucestershire branch of the Council for the Preservation of Rural England recently held a conference at Cheltenham, under the chairmanship of Sir Fabian Ware, K.B.E., K.C.V.O.

The chairman, in response to a welcome given to the conference by the Mayor of Cheltenham, said that the C.P.R.E. had been fighting a desperate but not unsuccessful battle, and they had received much encouragement, in particular from the results of their educational work.

Regional and Town Planning

Captain J. H. Trye, R.N., then read a paper on "Regional and Town Planning." Regional planning committees, he said, had no statutory powers and were simply advisory; they were intended to take a broad, comprehensive view of the whole district, draw attention to natural beauties which ought to be preserved for the general good, indicate the districts best suited for particular uses, having regard to their

Beech avenue, showing a Gothic effect of stems and branches.

[*From* Roadside Planting]

natural resources, the best through lines of communication between one district and another, suggest provision for open spaces and all such similar matters. These regional committees did not profess to go into details; they pointed out the lines on which, by general consent, development should proceed. It was then for the individual authorities to take the matter up in their own districts and work out the details for their own areas. Any rural or urban district council could become a town-planning authority. For their own benefit local authorities should formulate town-planning schemes of their own, because until that was done they had no control over the development of their districts. Captain Trye then described the process of forming a regional planning scheme, and pointed out that when the final scheme was prepared it had to be approved by the Ministry, and when that was done it became illegal to contravene it.

A discussion on regional town planning was then opened by Mr. G. L. Pepler, who remarked that the great value of the regional planning movement and of the work of the C.P.R.E. was that it was inducing the local authorities to exercise their powers, to study their districts and regions, and to determine what form the planning should take.

Traditional Buildings of the Cotswolds

Mr. H. Stratton Davies, F.R.I.B.A., in reading a paper on "Traditional Buildings of the Cotswolds," said it would seem that there existed towards the end of the sixteenth century in the Cotswolds all the essential conditions necessary for the favourable development of a virile and worthy style of building. The people were prosperous, owing to the English and Continental demand for the famous Cotswold wool, the great fifteenth-century tradition of church building lingered in the blood of the masons, and the local materials were beautiful and lasting. Transport was difficult; consequently, there was no temptation to indulge in materials foreign to the locality, and the builders were thrown on their own resources.

There was one indefinable factor which the lecturer called good manners in building. The Cotswold builder was a perfect gentleman in his craft; he always seemed to do the right thing in a simple, unaffected way; he never strained after effect and had a very proper sense of proportion and the fitness of things.

It would be difficult to think of any buildings that so harmoniously engage with their surroundings and so closely belong to the soil on which they were built, and he emphasized the importance of building whenever possible with local material. The soft multi-tinted bricks and tiles of the clay districts were as fitting there as was the stone on the hills.

Modern Buildings and New Materials

An address on "Modern Building and the Use of New Materials" was given by Mr. Thomas Falconer, F.R.I.B.A. He remarked that the destruction of rural amenities was chiefly due to the erection of new buildings of new materials built in ill-considered relation to their surroundings. What their movement lacked so far as new building and the use of new materials were concerned was a constructive policy.

The C.P.R.E. was not a popular body with all classes—by some they had been threatened with the poleaxe, and by others they were thought to be a body of antiquarian reactionaries who were anxious to preserve the countryside as a "museum piece," and to prevent in the Cotswold country any building which was not a copy of one of their sixteenth- or seventeenth-century types.

Perhaps, Mr. Falconer said, nowhere was there building more perfect in its simplicity and grace than that found in Cotswold houses; with those as examples to inspire the right use of good materials, by their just appreciation of proportion, by their carefully thought-out construction, and by their sparing but always effective use of good ornament, it should be easier to build well to-day.

ANNUAL MEETING OF THE A.A.S.T.A.

The annual meeting of the Association of Architects, Surveyors and Technical Assistants was held at the R.I.B.A. The president, Mr. W. H. Hamlyn, A.R.I.B.A., occupied the chair.

The President in his address alluded to the Association's persistent efforts to obtain some authoritative basis for salaries. As the official representative of the A.A.S.T.A. on the Council of the R.I.B.A., he said that the Council had authorized a scale of salaries with application to the staffs employed by public authorities, industrial corporations, etc. This scale, which was a basis and was not arbitrary, ranged from £150 per annum to £2,500 per annum, and the years of experience and the duties and responsibilities involved were to be taken into account in each case.

The annual report and balance-sheet were unanimously adopted.

The annual dinner of the Association took place at the Florence Restaurant, Rupert Street, W., on the same evening. The toast of the A.A.S.T.A. was proposed by Mr. W. T. Curtis, F.R.I.B.A., and replied to by Mr. W. H. Hamlyn. The dinner was followed by a concert and dance.

EXHIBITION OF SCHOOL BUILDINGS

An exhibition of drawings and photographs of the work of the architect's department of the Kent County Council was held in Mote Park, Maidstone, on June 21.

Among the exhibits were eighth-scale rendered drawings of the new standard Central Schools (north and south aspect types). These schools have been planned on "open-air" lines and are heated by low-pressure hot-water systems with oil fuel firing, whilst some are heated by electricity.

The county architect is Major W. H. Robinson, F.R.I.B.A., and the exhibition was arranged by Mr. S. H. Loweth, A.R.I.B.A., deputy county architect.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE.]

PARLIAMENT reassembled, after the Whitsun Recess, on Tuesday, June 17.

Steel Frames in Buildings

Mr. A. M. Samuel asked the Minister of Health whether his department laid down any regulations as to loads to which steel frames in buildings might be subjected; whether he was aware that steel frames were allowed by some local authorities to carry loads or stresses which were prohibited by other local authorities, although steel frames of the same quality, strength and design were used in both cases; and whether he would recommend local authorities to adopt uniform regulations applicable to identical conditions.

Mr. Greenwood said the position outside London was that the use of steel framing in almost all the large urban centres was subject only to a bylaw requiring due stability and proper construction. The actual practice of local authorities was now under investigation by the Department of Scientific and Industrial Research in a number of areas. In the light of that investigation he proposed to consider the possibility of suggesting to local authorities some working guide in deciding what was necessary to secure due stability.

Design of Steel Structures

Mr. Samuel then asked the Minister of Health whether he would arrange for the Steel Frame Act of 1909 to be examined by scientific authorities for the purpose of revising its provisions rendered obsolete by the improvements in steel-making since 1909, so as to correct building regulations under the Act which were now so out of date that local authorities frequently waived them.

Mr. Greenwood said that the Building Research Department had set up a committee to review, among other things, present methods and regulations for the design of steel structures.

The Act of 1909 was a London County Council Act applying only to London, and it rested with the County Council to propose to Parliament any measure for bringing it up to date. The County Council had express power in that Act and the Act of 1923 to waive its requirements in so far as they related to iron and steel construction. He was communicating with the County Council on the subject.

Building Regulations and Reinforced Concrete

Yet a further question was put by Mr. Samuel, who inquired of the Minister whether he would revise the 1915 regulations governing the use of reinforced concrete so that they might be applicable to the increased strength of cement developed in the last fifteen years; and, if not, whether he had any information about the action which local authorities were taking to bring their building regulations up to date in relation to the use of reinforced concrete.

Mr. Greenwood replied that the regulations of 1915 were regulations made by the London County Council, and it rested with them to propose their revision. The County Council obtained power in an Act of 1923 to waive any of the requirements in the regulations, and he was in communication with them on the subject. Outside London the use of reinforced concrete was nominally controlled by bylaws, which had almost everywhere been brought up to date. As a rule, they contained only a simple requirement that a wall built of reinforced concrete should be of sufficient thickness to secure due stability.

Decay of Historical Monuments in Ceylon

Mr. Ormsby-Gore asked the Under-Secretary for the Colonies whether he was aware that there was a vacancy for the headship of the Archæological Department in Ceylon; whether it was intended to secure for this post someone experienced in the preservation and scientific restoration of ancient buildings; whether his attention had been called to the neglect into which some of the most important historical monuments in Ceylon had fallen during recent years; and whether he would make representations to the Government of Ceylon to the effect that more energetic measures were required to arrest further decay.

Dr. Shiels said that there was a vacancy in the post of Archæological Commissioner in Ceylon, and steps were being taken to secure for the appointment a suitably qualified candidate. The Ceylon Government would be asked for a report on the condition of the ancient monuments in Ceylon.

THE ARCHITECTS' DIARY

WEDNESDAY, JUNE 25

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. International Exhibition of Modern Commercial Architecture. Until June 30.

ROYAL ACADEMY, Burlington House, S.W. Summer Exhibition open to the public. Open until August. **10 a.m.**

ROYAL SANITARY INSTITUTE. Annual Congress to be held at Margate, until June 28. Meetings of the Architectural and Engineering Sections. **10 a.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At Eastbourne. Summer Meeting. Assemble at Grand Hotel for Group Photograph, 9.15 a.m. Circular Motor Drive, 10 a.m. **9.15 a.m.**

VICTORIA AND ALBERT MUSEUM, South Kensington, S.W.7. Exhibition of English Mediæval Art, held in the North Court. 10 a.m. to 6 p.m. (Thursdays, 10 a.m. to 10 p.m.) **10 a.m.**

SIR JOHN SOANE'S MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Open every Tuesday, Wednesday, Thursday and Friday until September next. 10 a.m. till 5 p.m. **10 a.m.**

KING'S COLLEGE, Strand, W.C.2. College Term ends.

FRIDAY, JUNE 27

LONDON SOCIETY, Lancaster House, St. James's S.W.1. Visits to Deaf and Dumb Asylum, 179 Clapton Road, Hackney, and St. John's Institute, Hackney. Meet at the first-named place at 2.45 p.m. Tea will be provided at St. John's Institute. **2.45 p.m.**

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL SOCIETY, The Castle, Winchester. Excursion to the Joinery Works of Messrs. W. E. Chivers and Sons, Ltd., Devizes, and buildings of architectural interest in the neighbourhood. A General Meeting will be held after lunch.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. Meet at the Streatham Baths of the Wandsworth Borough Council for various visits of inspection (including Heston Air Park) at 10.45 a.m. Addresses will be given on "The General Layout of a Modern Air Port," by Major R. H. Mays, and "Communication Requirements," by Captain D. Sinclair. **10.45 a.m.**

KINGSTON PUBLIC BATHS COMPETITION. At the Tiffin Boys' School, Kingston-upon-Thames. Exhibition of designs submitted. Until July 23rd 2.0 p.m. to 8.0 p.m. daily. (Sundays excepted.) **2.0 p.m.**

SATURDAY, JUNE 28

Sunrise, 4.45 a.m. Sunset, 9.21 p.m.

MONDAY, JUNE 30

ROME SCHOLARSHIP COMPETITION. At the R.I.B.A., 9 Conduit Street, W.1. Exhibition of designs submitted in the final competition. Until July 5. 10 a.m. to 7 p.m. (Saturday 10 a.m. to 2 p.m.) **10 a.m.**

INSTITUTION OF MECHANICAL ENGINEERS. At the Henry Herbert Wills Physics Laboratory, University of Bristol. Summer Meeting. Until July 4.

TUESDAY, JULY 1

INSTITUTE OF QUARRYING. At the Grand Hotel, Scarborough. Annual Conference. Until July 5.

WEDNESDAY, JULY 2

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. Annual Exhibition to be held at Portsmouth until July 8.

THURSDAY, JULY 3

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS. Annual Summer Conference at the Town Hall, Sheffield. Papers will be read on "Small Bio-aeration Plants," by Dr. H. Kessener, Director, Government Institute for Purification of Waste Waters, The Hague; and "Biological Notes on Sewage Disposal Processes," by Mr. Harold Taylor, Chief Technical Assistant, Sewage Disposal Works, Sheffield.

UNIVERSITY OF LONDON, University College Gower Street, W.C.1. Assembly of Faculties: Session ends.

FRIDAY, JULY

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At Southampton. Joint Meeting with the Hampshire and Isle of Wight Architectural Association. Visits to the new Town Hall (description by E. Berry, Webber), the Old Bargate (description by H. P. Cart de Lafontaine), Guildhall, Empire Theatre, and Ocean Liners. Particulars are obtainable from the Hon. Secretary.

THURSDAY, JULY 31

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. "Alfred Stevens." By Miss M. Chamot. **3 p.m.**

LUTON TOWN HALL COMPETITION. Latest date for submission of designs.

DUDLEY SCHOOL COMPETITION. Latest date for submission of designs.

LAW REPORT

DAMAGES FOR REMOVAL OF BUILDINGS

Smyth v. *Luck Bros., Ltd. Chancery Division. Before Mr. Justice Farwell*

THIS was an action by Capt. Geo. Robertson Watson Smyth, of Wadhurst Castle, Wadhurst, Sussex, against Luck Bros., Ltd., of Wadhurst, for a declaration that all buildings, trade and other fixtures on or in the premises comprised in a lease of June 17, 1907, made between plaintiff's father and the defendants were the property of the plaintiff.

Defendants contended that they were entitled to remove the fixtures.

Mr. Lavington appeared for the plaintiff, and Mr. Elliott Batt for the defendants.

Mr. Lavington, in opening the case, said the action was by a landlord, and in the events that had happened the plaintiff claimed damages for alleged wrongful removal of certain buildings, etc., on his land. The action, as originally started, also claimed an injunction, but that was no longer material, as the buildings had been removed before a motion came before a judge dealing with the matter. The lease was made between plaintiff's father and the defendants, and the rent was £25 a year, but it was never paid in cash, as defendants did repairs on the plaintiff's estate and that was set off against the rent. The lease was for 21 years from June, 1907, and terminated in June, 1928. It contained a clause that upon the expiration of the tenancy, or at any time during the tenancy, the defendants having paid the rent, might at their option either remove or take away the buildings which they had erected. The present defendants and their predecessors had been in possession of the land for many years under the same landlord. The defendants, however, at the end of the lease, did nothing, and instead of giving up possession, held over. On July 20, plaintiff wrote the defendants a letter asking for possession, as he intended to sell. Defendants did nothing till August. The plaintiff then instructed his solicitors, and in reply to their letter the defendants denied that they were trespassers and inquired the price of the property. The parties failed to come to terms. The buildings were erected by the defendants, and consisted of a carpenter's shop, 40 ft. by 20 ft., a machine shop, 50 ft. by 25 ft., and an engine room, 18 ft. by 10 ft. These buildings were all of considerable value, and they had now been removed. In 1918 there were some negotiations between the plaintiff and the defendants as to the purchase of the property. Plaintiff put the value of the buildings at £275, and afterwards the price was raised to £300.

Mr. Batt said he agreed that the contents of the buildings were the tenants', and that the buildings belonged to the landlord.

Capt. Smyth gave evidence in support of his case. He said he was not inclined to buy the buildings, but was willing to sell, and thought he would put the place up for sale by auction.

Cross-examined: Defendants had been in possession of the land for some 60 years, he believed. Everything that was on the land was put there by the defendants. He wanted the defendants to carry out the terms of the lease.

For the defence, Mr. Charles H. Luck, of Little Farm, Wadhurst, was called. His father and grandfather had carried on the same business, and this plot of land had been occupied by them since 1850. The buildings were erected by them. In 1926 he made an offer for the land and other land of £1,000, which he increased to £1,200 in 1927. He had seen Capt. Smyth at the expiration of the lease, and he said there would have to be some rearrangement as to the rent, and witness said he expected that. He was not aware that on the expiration of the lease he had to give notice. He expected to hear from Capt. Smyth on the matter. Witness thought that if Capt. Smyth wanted terms, he (witness) would have received some intimation from him. When witness found they could not come to terms, they started on September 10 to remove the fixtures, etc., and finished by September 19.

His lordship, in giving judgment, said the lease gave the tenant the option to take away the buildings or the landlord the option of purchasing. He could not say that there was anything here to justify the defendants remaining in possession. The plaintiff's solicitors wrote defendants a letter that they were trespassers and offering certain terms. As defendants ought to have given up possession on June 24, or within a reasonable period, the solicitors' letter was a very unnecessarily hostile method of dealing with the matter. There was extraordinary delay in prosecuting this action that he did not understand. Defendants had removed these buildings, and they were not, in his opinion, justified in doing so, as they had not adhered to the privilege given them under the lease. Defendants were not justified in going on in possession till September 19. Defendants had removed property, which in fact was the plaintiff's property, and the plaintiff was entitled to damages in that respect. On the claim the plaintiff was entitled to a declaration that the three buildings on the land at the expiration of the lease were the plaintiff's property, and that the plaintiff was entitled to damages for conversion, there must be an inquiry as to the damages, and the costs of that inquiry would be reserved. It might be that the defendants would either pay into Court or make an offer of a sum as to damages, which would make unnecessary the expense of an inquiry. Judgment for defendants on the counter-claim for £2 17s. No order as to costs, having regard to the facts of the case.

COMPETITIONS OPEN

July 1.—The Royal National Eisteddfod of Wales, 1930, has issued a list of competitions in the arts, crafts and science section. Assessor: Percy E. Thomas, F.R.I.B.A. The drawings are to be delivered to W. H. Protheroe, General Secretary, Eisteddfod Office, Llanelly, not earlier than July 1, 1930, or later than July 5, 1930. Besides the architectural section there are also competitions for fine art, sculpture, applied art, and domestic arts and crafts. Programme giving full particulars, etc., is obtainable from James Davies & Co., Ltd., Murray Street, Llanelly. Price 1s. (post free, 1s. 3d.)

July 5.—The Worthing Corporation invites competitive designs for the erection of municipal buildings, etc., proposed to be erected in Chapel Road, Worthing. Assessor: H. V. Ashley, F.R.I.B.A. Premiums: £300, £250, £150 and £50. Application for particulars of the competition, etc., should be made to J. Kennedy Allerton, Town Clerk, Worthing. Deposit £1 1s. Latest date for submission of designs: July 5.

July 15.—The Isle of Man Education Authority invites architects to submit competitive designs for a new Grammar School at Ramsey, Isle of Man. Assessor, T. Taliesin Rees, F.R.I.B.A. Premiums: £250, £150 and £75. Particulars, etc., are obtainable from T. R. Lewin, Clerk of the Authority, Education Office, Strand Street, Douglas, until July 1. Deposit £1 1s. Latest date for submission of designs: September 30.

July 31.—The Luton Town Council invites architects to submit designs for the proposed town hall, which is to be built on the site of the old town hall at an approximate cost of £250,000. Assessor: Sir Brumwell Thomas, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Particulars may be obtained on application to W. Smith, Town Clerk, 2 Upper George Street, Luton. Deposit £2 2s. Latest date for submission of designs: July 31.

July 31.—The Dudley Education Authority invites architects having an office within a radius of fifteen miles of Dudley to submit competitive designs for a Council school to accommodate 320 children, to be erected on the Brewery Fields estate; also a school for 400 children on the Priory estate. Assessor: Herbert T. Buckland, F.R.I.B.A. Premiums: £150, £100, and £50. Applications for conditions of the competition, etc., should have been made to J. Whaley, Director of Education, Education Offices, St. James's Road, Dudley, by April 30. Deposit £1 1s. Latest date for submission of designs: July 31.

September 1.—The Bangor (Co. Down) Borough Council invites architects or town planners to submit designs in competition for laying out the sea front within the Borough. Assessor: Professor Patrick Abercrombie, F.R.I.B.A. Premiums: £150 and £50 for first and second places, respectively. Copies

of the conditions and plans will be forwarded on application to J. Milliken, Town Clerk, Borough Council Offices, Bangor, Co. Down. Deposit £1 1s. Latest date for submission of designs : September 1.

No date.—The Carlisle Corporation invites British architects to submit designs for the façade to English Street and the Victoria Viaduct, suitable for shops and business premises. The site was previously occupied by the Prison. The total length of the frontage is approximately 358 ft. Assessor : Francis Jones, F.R.I.B.A. Premiums : £300, £200, and £100. Particulars of the competition, etc., may be obtained from Percy Dalton, A.M.INST.C.E., A.R.I.B.A., City Engineer, 18 Fisher Street, Carlisle. Deposit, £1 1s.

No date.—The General Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums : £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2.

Mr. E. A. Jackson, L.R.I.B.A., of North Street, Ashford, has had accepted his designs for a new maternity and child-welfare centre to be built at Bermondsey for the South London Mission. The building, which, it is stated, will cost £17,000, will be the largest voluntary clinic in England, and the Queen is to be asked to perform the opening ceremony.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All enquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, London, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

16969. Pennington, A. M. Hollow reinforced-concrete beams. June 2.

SPECIFICATION PUBLISHED

330035. Bemis Industries, Inc., and Bemis, A. F. Building construction.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :—

Bandstand, Terracing, Tea and Shelter Pavilions and Cliff Lift, St. Lawrence Cliffs, Ramsgate (pages 964–968). General contractor, W. W. Martin. Sub-contractors: Excel Asphalte Co., Ltd., asphalt; British Reinforced Concrete Engineering Co., reinforced concrete; Roberts, Adlard & Co., tiles; George Jennings, Ltd., and Alfred Olley, Ltd., sanitary fittings; Alfred Olley, Ltd., door furniture, cloakroom fittings and supply of sanitary fittings; Williams and Williams, casements and window furniture; Xelite Plaster Co., Ltd., external plaster; Evans' Lifts, Ltd., lifts.

Bowls and Tennis Pavilions. General contractors, J. B. Sharman, Ltd. Sub-contractors : Xelite Plaster Co., Ltd., external plaster; Sharman, Ltd., internal plaster ; Ramsgate Gas Co., gas fittings ; Crittall Manufacturing Co., Ltd., steel casements ; Adamsez, Ltd., sanitary fittings ; Educational Supply Association, Ltd., cloakroom fittings.

Jews' Shelter, 63 Mansell Street, Aldgate, E.1 (pages 974–975). General contractors, Bovis, Ltd. Sub-contractors : Ragusa Asphalte Paving Co., Ltd., dampcourses and asphalt roof, etc.; J. J. Barnes, Ltd., stone and construction; Patent Impervious Stone and Construction Co., Ltd., artificial stone and stairtreads; T. C. Jones & Co., Ltd., structural steel ; Caxton Floors, Ltd., fireproof construction ; Ewarts and Son, Ltd., copper dormers ; W. Heywood & Co., patenglazing; J. F. Ebner, wood-block flooring; Art Pavements and Decorations, Ltd., terrazzo floors; Stuart's Granolithic Co., Ltd., granolithic flooring; J. Nicholson & Co., Ltd., central heating; Manlox, Alliott & Co., Ltd., disinfecting plant; Tyler and Freeman, electric wiring; Shanks & Co., Ltd., and Wilmer and Sons, Ltd., sanitary fittings; Wilmer and Sons, Ltd., iron staircases; Yannedis & Co., ironmongery; Crittall Manufacturing Co., Ltd., casements; Albany Forge, Wainwright and Waring, Ltd., metalwork; Art Pavements and Decorations, Ltd., and Brookes & Co., tiling; Penrose Lifts, Ltd., lifts.

TRADE NOTE

Messrs. Holophane, Ltd., after the keenest and almost world-wide competition, have secured the contract for the street lighting at Sao Paulo. About 16,000 street lighting units will be used. Other important street lighting installations secured by Holophane in South America include Buenos Ayres—reputed to be the largest in the world—where more than 30,000 units are installed, and Santiago, Chile, which is considered a very wonderful installation and where over 11,000 units are installed. A copy of the firm's latest street lighting brochure (just published) will be sent to any responsible person interested in street lighting. Application should be addressed to Messrs. Holophane, Ltd., Elverton Street, Vincent Square, London, S.W.1.

New staff restaurant kitchen arrangements have just been installed at Harrods, Brompton Road, by Messrs. Benham and Sons, Ltd. The cafeteria, a view of which is shown, has a counter 157 ft. long. The installation is one of the largest in the world, and enables from 3,000 to 4,000 persons to be catered for per day. The apparatus, including the sinks and tables, is constructed of stainless steel ; the bodies of all cooking apparatus are finished in mottled enamel, and the brass and gunmetal fittings are chromium-plated.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
If left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. 6 *in., per ft.*	0	1	3
DO. 9 *in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. 6 *in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½
STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft.	0	4	3
DO. 6 in., per ft.	0	5	0
DO. 9 in., per ft.	0	7	9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0

Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., Per roll	0	2	6
DO. 9 *in. per roll*	0	4	9
DO. 14 *in. per roll*	0	7	6
DO. 18 *in. per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0		6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. per hour; SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super.	0	11	0
York templates sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

Portmadoc Ladies	£14	0	0
Countess	23	0	0
Duchess	32	10	0

Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	£8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see "Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	Med. Green
24 in. × 12 in.	£5 0 0	£5 2 6
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0

Green randoms	6	7	0
Grey-green do.	5	9	0
Green peggies, 12 in. to 8 in. long	4	13	6
TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6

Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.

FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour;* JOINER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):			
7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0

STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded 1½ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in. with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra each	0	0	3
DOORS, 4-panel square both sides, 1¼ in thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labours, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick and bedding per ft. sup.	0	4	6
IRONMONGERY:			
Fixing only (including providing screws):			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0
